DRY SYRUP is the name given to concentrated medicinal compounds in powders, which when dissolved by the aid of heat in the proper menstruum, make the syrup of the article employed. The *Chemist and Druggist* says that the plan seems well adapted to almonds and similar articles, the liquid syrup of which is with difficulty kept from change.

At a special meeting of the Council of the Royal College of Surgeons of England, held on Wednesday last, Mr. J. Cooper Forster, M.B., F.R.C.S., Surgeon and Lecturer on Surgery at Guy's Hospital, was elected a Member of the Court of Examiners of the College, to the vacancy caused by the resignation of Mr. John Hilton, F.R.S.

At the annual general meeting of the Royal College of Physicians of London, held on Monday last, Sir George Burrows, Bart., M.D., F.R.S., Physician-in-Ordinary to the Queen, was re-elected President of the College.

A BAD accident occurred to a medical student of St. George's Hospital last week. The deceased was engaged in a football match, when from the abominable system of "hacking" now in vogue, he received such severe injuries as to cost him his life. This is not the first death from football, and if Mr. Branson's death should call the attention of the proper authorities to its many evils, the legacy of his painful end will perhaps save the lives of many others, and good will come out of evil.

MR. SAUNDERS, of the Dental Hospital, has expressed his wish that the sum subscribed for the purpose of presenting him with a testimonial should be invested for the endowment of a Scholarship in Dental Surgery. The acting committee draw the attention of the friends of the hospital to the subject, and hope that they will assist in rendering the Scholarship a suitable compliment to Mr. Saunders, and an object of consideration to the dental student.

It is stated by the *Freeman's Journal* that Dr. O'Leary intends to move in the House of Commons for a return which should show the sums paid out of the Exchequer to inspectors and medical officers in this country in 1873-4 under the Act of 1872, distinguishing in each case between the two classes of officers. The hon. member hopes to show by this the contrast between the practice in the two countries, and, having done that, he will proceed to further action, with a view to securing better treatment for the inspectors and medical officers in Ireland.

A MEETING of the Surgical Society of Ireland was held on Friday evening in the Albert Hall, Royal College of Surgeons, when the following communications were read: Mr. Wheeler, on "The Removal of a Sewing-needle from the Pharynx by Pharyngotomy;" Mr. Charles Fitzgerald, on "Some peculiar Symptoms connected with Obstructions of Lachrymal Puncta, Canaliculi and Nasal Canals;" Mr. H. Gray Croly, on "The Treatment of Fractured Patella by Position."

Literature.

THE IRISH MEDICAL DIRECTORY FOR 1875. (a)

THE growth of the profession both in numbers and in its public functions, within the last year, makes itself evident in the issue of the Irish Medical Directory, which is before us, and the perusal of the book has satisfied us that the editors have made a very successful effort to keep pace with the requirements of their constituents. The inevit-

(a) "The Irish Medical Directory for the Year 1875." A Reference Record of the Medical Profession in Ireland, their places of residence, qualifications, public appointments, &c., with a complete *resumé* of the Poor-law, Medical Charities, Legal, Military, and Medico-Educational Services in Ireland, &c., &c. Dublin: 23 Ely Place. London: Ballière, Tindall, and Cox, 20 King William Street, Strand. Price 5s., pp. 640, crown 8vo.

able faults of a first attempt at a serial publication of the sort have gradually disappeared from the Directory in its annual revision since its first issue in 1872, and it is now as nearly perfect as may be, only wanting extensions and corrections from year to year as the movements of the profession may require. We do not attempt to tell our readers what the book contains, because we find it an impossible task to say what it does not. There is no conceivable subject upon which a reference may be required by an Irish medical man which will not be found in its pages. Poor-law, vaccination, lunacy, registration, coronerships, police, Admiralty, sanitation, education, qualification, and a host of other subjects are provided for, not scantily, but in the fullest manner, and if there be anything wanting, it is in the carelessness of those whose business it was to supply the editors with information. It is indeed inconceivable that officials and individuals cannot be induced to attend to those matters for which they are paid, or which most nearly concern them, and it is an opprobrium to the character for business capacity of Irishmen that we find the phrase "No information" so frequently as we do.

The Irish Medical Directory has taken up a rôle of its own. It is not a mere catalogue of medical men, as other works of the same sort are; it aims at being a *vade mecum* of all medical matters, as the noted "Thom" is of public affairs, and it bids fair to be as successful as its revered and robust model. It has grown this year by nearly 160 pages, and though no dearer in price, is nearly three times the size of its first issue. Its extension has been forced upon it this year, for it has added to its pages all that may be gathered together in reference to public health. Accordingly it gives Sanitary Acts of Parliament, regulations, orders, digests, and salaries, and much other matter which we cannot epitomise here. The effort of the projectors of this Directory is in itself most beneficial to the Irish profession, and being thoroughly well carried out, it deserves the sympathy and aid of all Irish practitioners. Even if a medical man never looked into its pages, he might be satisfied to give his yearly support to the rather arduous and responsible task of providing such a volume for the profession in Ireland.

Correspondence.

ON THE PINK AND RED VULCANITES USED IN DENTISTRY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I am informed by friends in the dental profession that very great alarm has been caused to many nervous persons by the publication of my paper "On the Colouring Matter of Pink and Red Vulcanites used for Artificial Gums, Palates, &c.," which appeared in your impression of the 9th of December last. It is said that in consequence of this alarm many persons whose means do not allow them to use more expensive substitutes, refuse altogether the use of rubber-gums, &c., their prejudice in some cases extending even to the uncoloured or black varieties.

Although the Messrs. Ash, who are perhaps the largest, as I certainly believe them to be amongst the very best of the manufacturers of rubbers for dental purposes, have now introduced a *pink rubber without vermilion*, which would seem to satisfy those who are apprehensive of danger to themselves from this source, yet, as I venture to think my paper has been somewhat misunderstood, I crave a little space for explanation. As Wilkes, in the very flush of his popularity is reported to have said he was never a Wilkite, so I may remark that neither in your journal, nor in my paper read at the last meeting of the Odontological Society, nor by any words of mine, have I justified so sweeping an inference as appears to be drawn by those who would represent me as saying or even inferring that these cases of "chronic mercurial poisoning" are commonly produced by pink and red vulcanite. On the contrary, my first paper states that the five cases reported, with seven others not detailed, were all I had met with in the course of fifteen

years. Further, it states that "hundreds of people were wearing these plates, and the peculiar symptoms were only noted in one or two;" and again, "I found that very large quantities of this material were manufactured." [It may be said that the quantity amounts rather to tons than hundred-weights, much, of course, being exported.] Up to the present time, though on the constant watch for them, I have only met with fifteen cases. It is, therefore, quite clear that the poisoning, should there be no other explanation of the symptoms, is still only an occasional or exceptional occurrence. Again, in the paper read at the Odontological Society, I have shown that in all but one case the plates had some "fault," being of a loose and porous structure, defects which can be obviated by care in manufacture. Some obvious precautions as to cleanliness had also been neglected by the wearers in nearly all the cases. This is not intended as a retraction of any statements I have made. If only one in 10,000 of the wearers be affected, it is desirable that the cause should be investigated. But no good object is to be gained by exaggerated statements, and I have no wish to make a "sensational" affair out of these coloured vulcanites.

I am, dear Sir,

Yours very faithfully,

W. BATHURST WOODMAN, M.D., M.R.C.P. Lond.
March 19th, 1875.

DR. MARTIN ON CLAIMS OF DUBLIN MEN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I should be most willing to submit to the admirable strictures of Dr. Martin upon my communication concerning the "Antecedents and Treatment of Syphilis" were I quite sure that I deserved them. But Dr. Martin will see how warmly I have spoken in praise of the illustrious surgeon Wallace, the greatest benefactor of syphilitic patients that ever has appeared since the occurrence of that hateful plague among civilised men. He cannot accuse me of undervaluing the services of Wallace, for I only wonder that no monument to that surgeon is to be found in the Dublin College of Surgeons or elsewhere in that splendid school of surgery to which he belonged.

With respect to Dr. Carmichael, I was speaking only of men who had written against mercury in other diseases during the last few years, and hence spoke of Hughes Bennett and Habersham. It was Mr. Lane who spoke of Rose, not I. No one is more indebted than myself to Dr. Carmichael, of Dublin, for it was his pupil, Dr. Robert MacDonnell, who first pointed out to me the dangers of the indiscriminate use of mercury.

As to dualism, I know about Dr. Morgan's very remarkable results, and they have often worried me. Yet I am still a staunch believer that the soft sore is not syphilis.

Yours, &c.,

C. R. DRYSDALE.

CIRCUMCISION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—On reading in your two last numbers the letter of Dr. Greene and the remarks of Dr. Levits, it recalled to my mind an incident in my practice while serving as one of the surgeons of the 2nd (Cheshire) Regt., now some seventeen years ago, and which at that time numbered 1,200 men. On making the usual monthly medical inspection I noticed a great number of them had over-long prepuces, and also the fact that the regiment had a very large sick roll, mainly composed of syphilis and gonorrhoea. I constantly told the men that it was my belief that the long prepuce, by collecting filth and contagion, was a great reason why such numbers of soldiers contracted these diseases, and with the consent of the principal medical officers, and at the request of the men themselves, I circumcised over two hundred of them, and being with the regiment over three and a half years, carefully watched the result, which was all I could desire. The men themselves felt convinced it was a safeguard, and by speaking to their comrades, requested me to operate on them. Ever since I feel convinced that the operation is one that is to be commended.

I may mention that among the Jews I learn that masturbation in the young is all but unknown. Thinking these observations may be of interest,

I am, Sir,

G. D. POWELL,

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£1 2s. 6d. Subscriptions in advance for 1875, at the reduced rate of 21s. per annum, post free, must be paid before the end of this month in London, Dublin, or Edinburgh.

AN AFFECTING DISSECTING-ROOM SCENE.—The janitor of an Indiana-opolis medical college, says the editor of the *New York Medical Record*, was deeply affected on recognising his mother-in-law on the dissecting-table. His grief was the more poignant from the fact that he had himself carried the stolen corpse up three flights of stairs.

Dr. J. S., Manchester.—Your case simply confirms the old adage, "Quid de quoque viro, et cui dicas, sepe caveto."

READY FOR AN EMERGENCY.—According to the editor of *L'Union Médicale*, a female practitioner in Paris was recently so overcome by the gush of blood in a case of post-partum hæmorrhage that she fainted. By the time she recovered the patient was dead.

Mr. HOLLINGSWORTH.—The Registrar of the Medical Council is compelled by a recent statute to provide every newly-registered practitioner with a gratuitous copy of the last published official Register. The new offices of the Council are at 215 Oxford Street, London, W.

Mr. F. F. H., Bath.—The notices referred to contained a misprint, hence the mistake. It has been corrected, and your last communication has rightly interpreted the case. Thanks.

INFANT MORTALITY.—Speaking of the frightful waste of infant life in our large towns, notably in Birmingham, where, according to a recent return, 1,000 died out of 9,000 born during last year under three months of age, our contemporary, the *Pall Mall Gazette*, considers that the mothers and fathers of these children ought to be taught something about the early training of children. From inquiries into the subject, and from the medical report it was found great numbers of the children died from the fact of their having food given to them before their stomachs were able to digest it, and from their having received certain narcotics. Perhaps the best chance of remedying this state of affairs would be to require "all who wish to marry" to produce to the minister who is to unite them a certificate from the Civil Service Commissioners, or some other examining body, showing that they have at least some slight knowledge of nursery management.

Dr. TAYLOR, Nottingham.—It is very gratifying to see such an admirably edited journal as the *Enquirer*, and we hope that it may do much good. The figures by Mr. Stausfeld concerning constitutional syphilis are, in our opinion, the most telling. The Navy Medical Reports certainly tell in favour of the Acts, as also do Dr. Deprés' accounts from Paris. We hear that Mr. Acton intends reading a paper to show that Paris, Berlin, and Brussels are not so infected as London. It would seem, however, as Deprés says, that Paris could hardly be worse, if, indeed, there be 0.000 clandestine prostitutes there, and if all the work-girls are so volatile as he alleges. The *British Medical Journal* speaks of the indecency of sending papers against the Acts to people's houses; but I careful to put into its own columns in general plenty of details in favour of the Acts. Do you understand the editor?

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Lionel Beale, London. Dr. Rob. McDonnell, Dublin. Dr. Hoblyn, Bath. Dr. Kennedy, Dublin. Dr. Th. Thornburn, Manchester. Dr. O'Grady, Will, Aberdeen. Dr. A. H. Buck, New York. Dr. Bathurst Woodman, Finsbury. Dr. Bell, New York. Dr. Mackie, London. Dr. Nevins, Liverpool. Mr. J. L. Milton, London. The Secretary Local Government Board. Dr. Spackman, Harpenden. Dr. Morgan, Dublin. Dr. Sawyer, Birmingham. Dr. Villiers, Marylebone. Mr. Luan, Birmingham. Rev. Dr. Wilder, Sulham. Dr. Alex. Lane, Douglas. Dr. Martin, Portlao. Mr. Wharton, Dublin. Mrs. Baines, London. Dr. Keyes, Cappamore. Dr. O'Reilly, Ratoath. Dr. Kirkpatrick, Dublin. Dr. Graham, Kesh. Dr. Dobbin, Keady.  St. Thomas's Hospital, London. Assistant Obstetric Physician. Honorary. Applications to be sent at once to the Treasurer at the Hospital.
 Charing Cross Hospital. Resident Medical Officer. Board and residence, but no salary. Applications to the Secretary.
 West London Hospital. Administrator of Anæsthetics. Apply to the Secretary.
 Central London Sick Asylum. Election of Medical Officer. Salary, £300 per annum, with furnished house &c. Printed applications will be furnished by the Clerk at the Infirmary, Highgate, N.
 Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 63 Market Street, Bradford.
 Worcester County Lunatic Asylum. Assistant Medical Officer. Salary, £100 per annum, with board, &c. Applications to Dr. Sherlock, at the Asylum.
 Seaman's Hospital, Greenwich. House Surgeon. Salary, £100, with furnished rooms, &c. Address the Secretary.
 London Hospital. Lectureship on Comparative Anatomy. Applications to be sent to the Vice-Dean.
 Wolverhampton Hospital. House Surgeon. Salary, £100 per annum, with board and residence. Address the Chairman of the Medical Committee.
 Calne Union. Medical Officer. Salary, £200 per annum, without extras. Applicants must address the Clerk to the Guardians.
 Swansea Hospital. Assistant Resident Medical Officer. Salary, £70, with board. Address the Secretary.

APPOINTMENTS.

BLAKE, J. R., M.A., F.G.S., Lecturer on Comparative Anatomy at the Charing Cross Hospital Medical School.
 BROOKFIELD, J. S., M.D., M.R.C.S.E., Medical Officer of Health for the Denby Urban Sanitary District.
 BURNEY, W. C. S., L.R.C.S.I., L.K.Q.C.P.I., Assistant Medical Officer and Dispenser to the City of London Union Infirmary, Bow Road.
 CARMICHAEL, J., M.D., F.R.C.P.E., Physician to the Edinburgh New Town Dispensary.
 COE, R. W., F.R.C.S.E., a Consulting Surgeon to the General Hospital, Bristol, on resigning as Surgeon.
 CREAM, H., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer for the Cheetham District of the Fratrich Union, Lancashire.
 CUTBERT, C. M.D., L.R.C.S.Ed., Parochial Medical Officer and Public Vaccinator for the South-East District, Edinburgh.
 DAVIES, H. L., M.B., C.M., Medical Officer for the Whitford No. 1 District and the Workhouse of the Holywell Union.
 DE LAMBE, V. R., L.R.C.P.Ed., L.R.C.S.I., Consulting and Visiting Physician to the Waterford District Lunatic Asylum.
 FLEMING, W. J., M.B., F.F.P. & S. Glas., Surgeon to the Dispensary, Western Infirmary, Glasgow.
 HAMMOND, W., M.D., L.R.C.S.Ed., Parochial Medical Officer and Public Vaccinator for the North-West District, Edinburgh.
 HAUGHBY, A. R., M.D., M.R.C.S.E., Medical Officer for the Crews District of the Nantwich Union, Cheshire.
 HOGAN, Dr. E. M. A., Medical Officer for the Glane and Timahoe North Dispensary District of the Naas Union, co. Kildare.
 INGLIS, T., L.R.C.P.Ed., L.R.C.S.Ed., Assistant Physician to the Royal Edinburgh Asylum, Morningside.
 JERSON, E., M.R.C.S.E., a Surgeon to the Durham County Hospital.
 JOHNSON, J., M.D., C.M., L.M., Resident Medical Officer to the Birmingham and Midland Free Hospital for Sick Children.
 KEAL, W. P., L.R.C.P.Ed., M.R.C.S.E., a Surgeon to the General Hospital, Bristol.
 MACDONALD, J., M.B., C.M., Parochial Medical Officer to the Kilnichael District of the Glassary Parish, Lochgilphead.
 MURPHY, G. W., M.D., C.M., L.M., Medical Officer, &c., for the Ramelton Dispensary District of the Milford Union, co. Donegal, and Medical Officer to the Fever Hospital.
 MURPHY, S. F., M.R.C.S.E., Resident Medical Officer to the London Fever Hospital.
 ROBSON, R. N., M.R.C.S., Surgeon to the Durham County Hospital.
 WELSH, J., M.D., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Ballyshannon.

Marriages.

DAVY-COUSINS.—On the 18th inst., at the parish church, Croydon, Francis Arthur Davy, M.D., Staff Surgeon, to Florence Amy, fourth daughter of Chas. Cousins, Esq., of Croydon.
 REID-BASTARD.—On the 10th inst., at West Ham Church, Walter Reid, M.D., Staff Surgeon, R.N., to Florence Mary, only daughter of Richard Bastard, Esq., The Hollies, Stratford, Essex.
 STERLING-HILL.—On the 11th inst., at St. Michael's Church, Soho, Birmingham, James Sterling, M.D., Castlecomer, co. Kilkenny, eldest son of M. Sterling, M.D., Thomastown, to Charlotte Elizabeth, fourth daughter of the late Richard Hill, Birmingham.

Deaths.

BAGNALL.—On the 12th March, George Bagnall, M.D., of Cheltenham, aged 69.
 BOULTON.—On the 16th March, at Field House, Horncastle, Bernard James Boulton, M.D., in his 72nd year.
 GIBSON.—On the 7th March, Dr. Peter C. Gibson, of Picardy Place, Edinburgh, aged 74.
 INGLIS.—On the 18th March, Andrew Inglis, M.D., of Aberdeen.
 IRELAND.—On the 13th March, R. S. Ireland, M.D., of Stephen's Green West, Dublin, aged 87.
 LYNN.—On the 16th March, in Stephen Street, Sligo, at the residence of her sister, Miss Christian Mary, widow of the late Robert K. Lynn, M.D., of that town.
 PYLE.—On the 10th March, at the Cottage, Amesbury, Wilts, Charles Pyle, M.R.C.S., L.S.A., aged 69.

ABBEYLEIX UNION.—APOTHECARY WANTED.
 —The Board of Guardians of the above Union will, on Tuesday, the 23rd instant, appoint a properly-qualified Apothecary for the Workhouse at a salary of £40 per annum.
 By order,
JAMES FINNEGAN,
 Clerk of Union.
 Board Room, Workhouse,
 10th March, 1875.

THE CANCER HOSPITAL (Founded 1851).—SUBSCRIPTIONS will be most thankfully received for this Hospital, which is free. Diet required to be most generous, and medicines of the most expensive kind.—Brompton, and 187 Piccadilly, W.
 Treasurer—Geo. T. Hertslet, Esq., St. James's Palace, S.W.
 Bankers—Messrs. Coutts and Co., Strand, W.C.
 By order, **H. J. JUFF,** Secretary.

RESIDENT CLINICAL ASSISTANTS.—VACANCIES having occurred in the HOSPITAL for CONSUMPTION and DISEASES of the CHEST, those gentlemen who are desirous of becoming candidates for the vacant offices are requested to send in their applications, with testimonials, on or before Monday, the 5th April, and to attend the Medical Committee on the following day at 4 o'clock. Testimonials as to moral character, as well as to medical qualifications, are required. Further particulars may be obtained at the Hospital.
PHILIP ROSE, Hon. Sec.
HENRY DOBBIN, Sec.
 Brompton, March 10th, 1875.

ROYAL COLLEGE of PHYSICIANS of LONDON.—FIRST or PRIMARY PROFESSIONAL EXAMINATION for the LICENCE.—The next Examination will commence on MONDAY, APRIL 5. Students are admitted to this Examination after the termination of the Second Winter Session of Professional Study at a recognised Medical School.
SECOND or PASS EXAMINATION for the LICENCE.—The next Examination will commence on MONDAY, APRIL 12. Gentlemen who have completed four years of Professional Study according to the College Regulations, are eligible for admission to this Examination.
 Registered Medical Practitioners qualified before January, 1861, are admitted to Examination under special Bye-laws.
 Candidates are required to give fourteen days' notice in writing to the Registrar of the College, with whom all Certificates and Testimonials required by the Bye-laws are to be left at the same time.
 Pall Mall East. **H. A. PITMAN, M.D., Registrar.**

ROYAL COLLEGE of PHYSICIANS of LONDON.—THE next PROFESSIONAL EXAMINATION for the MEMBERSHIP will commence on Thursday, April 22.
 Candidates are required to give fourteen days' notice in writing to the Registrar of the College, with whom all Certificates and Testimonials required by the Bye-laws are to be left at the same time.
HENRY A. PITMAN, M.D., Registrar.
 Pall Mall East.

BALLYVAUGHAN UNION, COUNTY CLARE.—MEDICINES, MEDICAL AND SURGICAL APPLIANCES WANTED.—The Board of Guardians of the above Union will, at their Meeting to be held on Thursday the 8th day of April next, consider and receive TENDERS for supplying the Workhouse, Infirmary, Fever Hospital, and three Dispensaries with Medicine, Medical and Surgical Appliances for Twelve Months, from 25th March next. The Medicines must be of the best quality, and are to be delivered at the Workhouse and Dispensaries of the Union free of carriage. All empties must be removed at the Contractor's expense. All invoices to be made out in duplicate, and to contain a number corresponding with the number in the Tender. Form of Tender to be had on application to me (none else will be considered), and when the Contract is declared the Contractor will be required to furnish each Medical Officer with a copy of the Tender, and to enter into a bond with two solvent sureties for the due fulfilment of the Contract. No charge to be made for jars, bottles, &c.
 Sealed Tenders will be received by me up to One o'clock, noon, on the above day.
 By order of the Board,
THOS. COMYN,
 Clerk's Office, 11th March, 1875. Clerk of the Union.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.
PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.
 To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.
 The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.
 Pupils are admitted free by election, or by payment of £35 per annum. A higher rate is payable for separate accommodation.
 Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.
 Each donation of Five Guineas gives the donor a life-vote.
 Annual Subscribers are entitled to one vote for each half guinea paid.
 An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.
 Full particulars as to the working of both Institutions, terms, &c. can be had at the office,
 40 MOLESWORTH STREET, DUBLIN,
W. O'NEILL, Secretary.

THE CANTOR LECTURES AT THE SOCIETY OF ARTS FOR 1875.

ON ALCOHOL.

By B. W. RICHARDSON, M.D., F.R.S.

(Continued from page 225.)

Alcoholic disease of the heart.—The heart, not less than the rest of the vital parts, is subjected to deterioration of structure from alcohol. We need not wonder at this when we recall the strain to which it is subjected by the agent, the excess of work it is made to perform. I touched on the mechanical evils that befell the heart from these circumstances in my last lecture, and the structural evils which I have now to specify are not less grave. The membranous structures which envelope and line the organ are changed in quality, are thickened, rendered cartilaginous, and even calcareous and bony. Then the valves, which are made up of folds of membrane, lose their suppleness, and what is called valvular disease is permanently established. The coats of the great blood-vessel leading from the heart, the aorta, share not unfrequently in the same changes of structure, so that the vessel loses its elasticity and its power to feed the heart by the recoil from its detention, after the heart, by its stroke, has filled it with blood.

Again, the muscular construction of the heart fails, owing to degenerative changes in its tissue. The elements of the muscular fibre are replaced by fatty cells; or if not so replaced are themselves transferred into a modified muscular texture in which the power of contraction is greatly reduced.

Those who suffer from these organic deteriorations of the central or governing organ of the circulation of the blood learn the fact so insidiously, it hardly breaks upon them until the mischief is far advanced. They are for

years conscious of a central failure of power from slight causes, such as over-exertion, harass, broken rest, or too long abstinence from food. They feel what they call "a sinking," but they know that wine or some other stimulant will at once relieve the sensation. Thus they seek to relieve it until at last they discover that the remedy fails. The jaded, over-worked, faithful heart will bear no more; it has run its course, and the governor of the blood stream broken, the current either overflows into tissues, gradually damming up the courses, or under some slight shock or excess of motion ceases at the centre.

Other organic changes.—In the eyeball certain colloidal changes take place from the influence of alcohol, the extent of which have as yet been hardly thought of, certainly not in any degree studied, as in future they will be. We have learned of late years that the crystalline lens, the great refracting medium of the eyeball, may, like other colloids, be rendered dense and opaque by processes which disturb the relationship of the colloidal substance and its water. By this means even the lens of the living eye can be rendered opaque, and the disease called cataract can be artificially produced. Sugar and many salts in excess, in the blood, will lead to this perversion of structure, and after a long time alcohol acting in the manner of salt is capable, in excess, of causing the same modification. In the eyeball, moreover, alcohol injures the delicate nervous expanse upon which the image of all objects we have looked at is first impressed. It interferes with the vascular supply of this surface, and it leads to changes of structure which are indirectly destructive to the perfect sense of light.

In yet another mode alcohol perverts the animal mechanism. By some as yet obscurely definable interference with the natural transmutation of the colloidal substances into saline or crystalloidal, it gives rise to the production of an excess of some salines which appear in the fluid renal secretion. These saline matters accumulated in the blood from inability of the excreting organs to dispose of them, are directly injurious, and exist as possible causes for the promotion of cataractous changes in the crystalline lens, and varied changes in

other of the colloidal tissues and membranes. They are also a cause of a disease local in character and produced by the very aggregation of saline product, particle by particle, into a compact mass like a stone. I refer to what is called calculus. In writing the history of one of the districts of England in which calculous disease is very prevalent, I expressed many years ago the view that alcoholic indulgence was one of the most telling agencies in the production of the malady. I have seen nothing since that would lead me to alter that statement.

Organic nervous lesions from alcohol.—Lastly, the brain and spinal cord, and all the nervous matter become, under the influence of alcohol, subject, like other parts, to organic deterioration. The membranes enveloping the nervous substance undergo thickening; the blood-vessels are subjected to change of structure, by which their resistance and resiliency is unimpaired; and the true nervous matter is sometimes modified, by softening or shrinking of its texture, by degeneration of its cellular structure, or by interposition of fatty particles.

These deteriorations of cerebral and spinal matter give rise to a series of derangements, which show themselves in the worst forms of nervous disease—epilepsy; paralysis, local or general; insanity.

But not a single serious nervous lesion from alcohol appears without its warning. As a man who, when drinking at the table, is warned that the wine is beginning to take decisive effect on his power of expression and motion by certain unmistakable indications, so the slow alcoholic is duly apprised that he is in danger of a more permanent derangement. He is occasionally conscious of a failing power of speech: in writing or speaking he loses common words. He is aware that after fatigue his limbs are unnaturally weary and heavy, and he is specially conscious that a sudden fall of temperature lowers too readily his vital energies. The worst sign of impending nervous change is muscular instability, irrespective of the will; that is to say, an involuntary muscular movement whenever the will is off guard. This is occasionally evidenced by sudden muscular starts which pass almost like electrical shocks through the whole of the body; but it is more frequently and determinately shown in persistent muscular movements and starts at the time of going to sleep. The volition then is resigned to the overpowering slumber, and properly all muscular movement, except the movement of the heart and of the breathing, should rest with the will. But now this beautiful order is disturbed. In the motor centres of the nervous organisation the foreign agent is creating disturbance of function. The fact is communicated to the muscles by the nervous fibres, and the active involuntary start of the lower limbs rouses the sleeper in alarm. Ignorant of the import of these messages of danger, the habituated alcoholic continues too frequently his way, until he finds the agitated limbs unsteady, wanting in power of co-ordinated movement—paralysed.

Deeply interesting as these phenomena from alcohol are, I must leave them here, omitting many others equally significant and equally plain, when they are once pointed out, even to the unprofessional mind. Let it be understood that in each description I have recorded only what alcohol can physically do to the animal economy. It is not always the cause of all or any of these phenomena. They may be induced by other influences and other agents, but it is an agency capable of effecting them, and it is actively employed in the work.

On some of the mental phenomena induced by alcohol.—The purely physical action of alcohol has been so far treated upon in the preceding pages. To that must now be added a few sentences on the influence this agent exerts over the mental functions. Of course, such influence is actually manifested by and through physical means, but as yet these are not sufficiently clear to enable us to trace out the mental aberration through the physical process that has led to it. It is better, therefore, and simpler to treat the present subject in the mere abstract, passing from the agent to its results, without reference to the in-

termediate line of connection between cause and effect. These mental phenomena, in the chronic phase, correspond to the phenomena which belong to the second and third stages of acute alcoholic intoxication.

Loss of memory and speech.—One of the first effects of alcohol upon the nervous system in the way of alienation from the natural mental state is shown in loss of memory. This extends even to forgetfulness of the commonest of things; to names of familiar persons, to dates, to duties of daily life. Strangely, too, this failure, like that which indicates, in the aged, the era of second childishness and mere oblivion, does not extend to the things of the past, but is confined to events that are passing. On old memories the mind retains its power; on new ones it requires constant prompting and sustainment.

If this failure of mental power progress, it is followed usually with loss of volitional power. The muscles remain ready to act, but the mind is incapable of stirring them into action. The speech fails at first, not because the mechanism of speech is deficient, but because the cerebral power is insufficient to call it forth to action. The man is reduced to the condition of the dumb animal. Aristotle says grandly, animals have a voice; man speaks. In this case the voice remains, the speech is lost; the man sinks to the lower spheres of the living creation, over which he was born to rule.

The failure of speech indicates the descent still deeper to that condition of general paralysis in which all the higher facilities of mind and will are powerless, and in which nothing remains to show the continuance of life except the parts that remain under the dominion of the chain of organic or vegetable nervous matter. Our asylums for the insane are charged with these helpless specimens of humanity. The membranes of the nervous centres of thought and volition have lost, in these, the dialysing function. In some instances, though less frequently than might be supposed, the nervous matter itself is modified visibly in texture. The result is the complete wreck of nervous action, the utter helplessness of will, the absolute dependence upon other hands for the very food that has to be borne to the mouth. The picture is one of breathing death; of final and perpetual dead drunkenness.

Dipsomania.—A second effect of alcohol on the mental organisation is the production of that craving for its incessant supply, to which we give the name of dipsomania. In those who are affected with this form of alcoholic disease a mixed madness and sanity is established, in which the cunning of the mind alone lives actively, with the vice that ally themselves to it. The arrest of nervous function is partial, and does not extend to the motor centres so determinately as to those of the higher reasoning faculties. But the end, though it may be slow, is certain. And the end is, as a rule, that general paralysis which I have just described. The dipsomaniac is, however, capable of recovery within certain limits on one, and only one, condition, that the cause of his disease be totally withheld.

Mania a potu.—The effect of alcohol on the mental functions is shown in yet another picture of modern humanity writhing under its use. I mean in the form of what may be called intermittent indulgence, to dangerous excess. This form of disease has been named the *mania a potu*, and it is one of the most desperate of the alcoholic evils. The victims of this class are not habitual drunkards or toppers, but at sudden intervals they madden themselves with the spirit. They repent, reform, get a new lease of life, relapse. In intervals of repentance they are worn with remorse and regret; in the intervals of madness they are the terrible members of the community. In their final excitement they spread around their circle the darkness of desolation, fear, and despair. Their very footsteps carry dread to those who, most helpless and innocent, are under their fearful control. They strike their dearest friends; they strike themselves. Retaining sufficient nervous power to wield their limbs, yet not sufficient to guide their reason, they become the dangerous members of our community.

whom our legislators, fearing to touch the cause of their malady, would fain try to cure by scourge and chain.

To us physiologists these "maniacs a potu" are men under the experiment of alcohol, with certain of their brain centres (which I could fairly define to you if the occasion were befitting) paralysed, and with a broken balance, therefore, of brain power, which we, with infinite labour and much exactitude, have learned to understand. Our remedy for such aberration of nervous function, if we were legislators, would be simple enough; we should not whip the maniac back again to the potu; we should try to break up the mania by taking the potu from the maniac. But then, we are only physiologists. We have nothing to do with that £117,000,000 of invested capital, and we are not practical in reference to it.

Transmitted Disease.—The solemnest fact of all bearing upon these mental aberrations produced by alcohol, and upon the physical not less than the mental, is, that the mischief inflicted on man by his own act and deed cannot fail to be transferred to those who descend from him, and who are thus irresponsibly afflicted. Amongst the many inscrutable designs of nature none is more manifest than this, that physical vice, like physical feature and physical virtue, descends in line. It is, I say, a solemn reflection for every man and every woman, that whatever we do to ourselves so as to modify our own physical conformation and mental type, for good or for evil, is passed on to generations that have yet to be.

Not one of the transmitted wrongs, physical or mental, is more certainly passed on to those yet unborn than the wrongs which are inflicted by alcohol. We, therefore, who live to reform the present age in this respect, are stretching forth our powers to the next; to purify it, to beautify it, and to lead it towards that millennial happiness and blessedness which, in the fulness of time, shall visit even the earth, making it, under an increasing light of knowledge, a garden of human delight: a Paradise regained.

Summary.—In summary of what has passed, I may be briefness itself.

This chemical substance, alcohol, an artificial product devised by man for his purposes, and in many things that lie outside of his organism a useful substance, is neither a food nor a drink suitable for his natural demands. Its application as an agent that shall enter the living organisation is properly limited by the learning and skill possessed by the physician—a learning that itself admits of being recast and revised in many important details, and perhaps in principles.

If this agent do really for the moment cheer the weary, and impart a flush of transient pleasure to the unwearied who crave for mirth, its influence (doubtful even in these modest and moderate degrees) is an infinitesimal advantage, by the side of an infinity of evil for which there is no compensation, and, while the evil is promoted from its root, no human cure.

OPHTHALMIA NEONATORUM.

By JABEZ HOGG,

Surgeon to the Royal Westminster Ophthalmic Hospital, &c.

A PARAGRAPH occupying a prominent place among "Notes on Current Topics," in the *MEDICAL PRESS AND CIRCULAR* of last week, taken from the *Boston Medical and Surgical Journal*, must not be passed over in silence, or it may be the means of inflicting considerable mischief on a class of the most helpless sufferers from eye diseases.

Dr. Denby, writing on Ophthalmia Neonatorum, says that "Dr. Williams, of Boston, stands almost alone in his condemnation of the use of nitrate of silver lotions in this complaint." This is by no means the fact; I am indeed inclined to think that Dr. Denby knows but little of the modern treatment of the ophthalmia of new-born infants, or he would not have hazarded such an assertion. At all events, he would have been aware that strong solutions of nitrate of silver are now placed among the bygone thera-

peutical agents of the ophthalmic practitioner, in not only ophthalmia neonatorum, but in most other eye affections. For my part, I cannot too severely denounce the mischievous treatment propounded by this gentleman, namely, that of daily applying a ten-grain solution of the nitrate, and if this be found inefficient, then "the stick of nitrate of silver of Von Graefe, the *lapis mitigatus*, formed with twice the bulk of nitre to one of nitrate of silver." He goes on to say, "these are not dangerous remedies." On the contrary, I beg to warn your readers against such a mode of treating this affection, as it will generally be found to lead to grave complications that always aggravate the disease and retard or prolong the cure.

I can only gather from such statements as those just quoted that the ophthalmia of new-born infants is still, as in days gone by, looked upon by some practitioners as a purulent affection, the result of a direct specific inoculation, or application of puriform matter, gonorrhoeal or leucorrhoeal, to the eyes, during the passage of the head of the infant through the vagina, and consequently the disease must be met as in the old-fashioned heroic calomel and bleeding days. My experience of these cases tells me this is a great mistake, for even among the poor who crowd our hospitals only a small percentage of the cases can be directly traced to a previous gonorrhoea, and certainly among the middle classes it is quite an exceptional cause, and in a great many instances it appears to be a part of the dyscrasia of the mother, for I have been called upon to treat every infant born to the same mother on the third or fourth day after birth. The disease at the outset is nearly always a simple catarrhal affection, the result of cold or some atmospherical influence. The close and unwholesome air of the sick-room of the poor, and in which they are too often obliged to live and sleep, may often be the cause, or, as Dr. Mackenzie pointed out, it may be due to want of care in washing the infant—the careless intrusion of soap, or of whisky or gin, still absurdly enough often applied to the head "to keep the infant from taking cold." Ophthalmia neonatorum must be regarded in a vast proportion of cases as a catarrhal affection, requiring, if seen at the accession of the attack, the simplest remedies for its cure, the most important among which is strict attention to cleanliness, and the constant removal of the discharge from the eyes by the gentlest means as soon as it is secreted. The application of warm water alone, and when the secretion is profuse, followed by a very mild astringent collyrium, composed of alum, or a weak solution of the permanganate of potash, is all that we need employ. Should the case be neglected for a few days, and the papillae of the palpebral surfaces and vessels of conjunctiva become swollen and injected, then a very weak solution of one or two grains of nitrate to the ounce may be occasionally instilled with advantage, but this should invariably be followed up immediately by the free application of cod-liver oil. At the same time, it is of the utmost importance to look to the quality of the mother's milk, and see that she is well nourished and properly cared for in every way. The administration of ten drops of cod-liver oil to the infant is often a valuable adjunct to the means employed. On the other hand, if by any chance the medical practitioner should be induced to resort to the application of strong lotions of nitrate of silver, or the more dangerous "solid stick" of *mitigated* destructives, we must expect to see, in the majority of cases, the delicate epithelial and corneal layers quickly removed, and followed by chemosis and granular lids, or ulceration and opacity, with prolapse of the iris, and ultimate loss of sight.

CASE OF POISONING BY LINIMENT OF BELLADONNA.

By FRANK DAVISON, L.R.C.P. & S., Edinburgh, &c.

ON Sunday, 28th Feb., I was called to see Eliza Toner, æt. 36. On my arrival I heard a confused story of her

having taken a drink from a bottle she had received for the purpose of rubbing a pain in her back. On examining the patient I found she was insensible, and every five or six minutes a sort of convulsive shudder would creep over her frame. Her breathing was stertorous; pupils largely dilated; pulse normal; but when she was seized by one of these convulsive shudders the pulse would rise. I call these fits by the above name as they were not actual fits of convulsion, but were more severe than those we call a rigor. She was continually spitting out; but probably this may be attributed to her having had administered to her copious doses of salt and soot, which produced emesis. I then asked for the bottle she had taken the dose from, and found it was an ordinary 2 oz. bottle with a label directing a teaspoonful of the liniment to be rubbed to the part affected, and underneath a red poison label. I may here add Nature forgot to endow me with the sense of *smell*, so I was compelled to *taste* the contents, which I did cautiously. I perceived there was at least camphor in it, and I at once came to the conclusion that it was liniment of belladonna, and the symptoms presenting themselves were evidently those arising from an overdose of the plant. I had now to drive three miles before I could get any medicine; but the patient had been plentifully supplied with emetics in the shape of soot, salt, and butter, and I was informed these had done their work. As soon as I could procure medicine I gave her 15 minims of the tinct. opii every hour, and I had the satisfaction of seeing the effects of the belladonna gradually pass off. As it is rather amusing how the poor woman took the dose I shall give her own account of the story, as she detailed it to me two days afterwards:—

"My sister came in to the house to me and handed me a bottle, saying, 'Keep this till I come back, it is for Mrs. —.' I looked at it and read the label on the top, but never saw the poison label at all, although I can read. The woman it was for I knew to have *hives*, and I thought the bottle was for '*striking them out*,' and as I had a wee heat on my skin I jist thought I would taste it. So I took out the cork and took a sup of it, but I could not have taken more than about a teaspoonful of it. My sister called for the bottle again in about half-an-hour, and got it. In about an hour from the time I tasted the bottle I began to feel very queer, and to see like lightning flashing before my eyes. I was sittin' before the fire on a '*wee creepie stool*,' so I got up and took the child in my arms, and began to walk through the '*flure*,' but I could not keep my feet. I felt as if I was goin' to one side, but I did not feel as if I was drunk. I then minded that the woman the bottle was for had a pain in her back, and I began to think I was poisoned. I rthn off to my husband, who was over sittin' in his mother's, which is about three minutes' walk from our house. When I went in my mother-in-law says to me, 'What is the matter with you?' I said, 'There is plenty the matter with me, run for the clargy and the doctor, for I have drunk poison.' She made me sit down, and then I asked them to give me something that would make me throw off, and I said that soot was a good thing. I mind beginning to drink some soot mixed with salt and water, and then I like fainted, and I thought I was dying, and I mind nothin' more."

I may add it was 4 o'clock when the poison was ingested, and it was 11 p.m. before she began taking the tr. opii.

BELLADONNĀ AS A PROPHYLACTIC OF SCARLATINA.

By WILLIAM CARLETON, M.B. Univ. Dub., L.R.C.S.I., Medical Officer Delvin Workhouse and Dispensary, co. Westmeath.

ON the morning of 9th December last Mr. King, a respectable farmer, residing in Killucan District, came to my residence, and earnestly entreated me "to go at once

and do what I could for his son," who, he was afraid, had scarlatina, as his eldest boy, aged 14 years, died on previous day, and his youngest child, aged 12 months, was very sick. On the death of his eldest boy he removed the remainder of his family, except the sick infant, to his brother's residence, Delvin district, an unmarried man, thinking that by so doing the spread of disease among his family might be prevented; but it had attacked another of them, the boy whom I was asked to visit. I saw him as soon as possible, and found him suffering from malignant scarlatina. I drove on, in accordance with parent's strongly expressed wish, to his house in Killucan district, to see his infant, but was too late to be of any use—indeed, it was very doubtful whether treatment could be of any avail. The child died on that night from scarlatina.

The four remaining children were in their uncle's house, near Delvin—one in scarlatina, who made a good recovery; the others were given extract of belladonna, dissolved in distilled water, strength grs. iij. to ℥i, dose according to age, four drops twice a day to child aged two years, increasing one drop for every additional year. They did not take the disease.

I think that belladonna possesses prophylactic virtues.

REPORT ON SYPHILIS.

By C. R. DRYSDALE, M.D., M.R.C.P.L., F.R.C.S.E.,
Senior Physician to the Metropolitan Free Hospital.

STRICTURE OF THE RECTUM.

DR. ALFRED FOURNIER, in his classical lectures on tertiary syphilis, delivered at the Lourcine Hospital last summer, thus speaks of syphilitic stricture of the rectum (*La France Méd.*, Dec. 12, 1874): Three points are to be noted—1. The syphilitic stricture is met with most frequently in adults in the middle time of life. I don't know that any one has mentioned a case of rectal stricture in the child in consequence of syphilis. I have never seen any example of it. On the other hand, if you bring together a certain number of cases, as I have just been doing, you will find that the great majority are in persons between 30 and 45. The cases before or after these ages are rarer.

2.—There is a second peculiarity more remarkable: the syphilitic stricture is infinitely more frequent in women than in men. This is testified to by all published cases up to this day, statistics to which I could join my own, if it were not superfluous. It is not enough to say that syphilitic stricture is more common in the female sex than in ours. We must add that the frequency with which it affects women is truly surprising. In a quite recent statistical account, M. Godebert has come to this result—of 45 cases, 40 were in women, against 5 observed in men! a proportion of 8 to 1. These cyphers differ little from those which I could cite as observed by myself.

What interpretation shall we give to this fact? Persons have wished to explain it by saying that there exist in women a series of adjuvant causes, fit to bring the manifestations of syphilis towards the rectum. And they have cited as such: constipation, which keeps up near the rectum a permanent congestion; menstruation, which acts more energetically as a congestive of the pelvic organs; pregnancy and labour, which exercise by compression a stasis of blood towards the rectum. Thus it is, that of 200 women attacked with rectal stricture, Curling found 9 who traced the origin of the disease to a laborious birth; thus also it is that in several cases we have seen the first accidents of the affection produced in the course or after labour, &c. This interpretation has then, I believe, some truthfulness; but it is not enough to explain all the cases. Let us, however, pass beyond the why, and only remember the fact, explicable or not. This fact is a formal one, and the remarkable inequality of frequency

in the sexes is not, truly, one of the least curious traits of the lesion which now occupies our attention.

3.—At what age of syphilis does the rectal stricture arise? It is rather common at a more or less late period, that is after 10, 15, or 20 years from infection. But, and it is remarkable, it is or appears to be yet more frequent at an epoch less ancient of the tertiary period, that is between five and ten years. More than this, in certain cases it has been seen to arise sooner than this, and coincide with secondary lesions. I have noticed several examples of this, among others, quite lately, on a patient whom my excellent master and friend, Professor Verneuil, has pointed out to me in his wards, and from whom I have the impression of the stricture which I now exhibit. This woman, who was affected with stricture of the rectum of the severest description, still bore on several points of the skin, at the time I saw her, circular groups of papulo-squamous syphilitic skin disease, lenticular syphilitic rash, which was clearly of the secondary period.

Hence, syphilitic stricture of the rectum may sometimes, in the chronology of syphilis, figure among precocious tertiary accidents. It differs in this from other accidents which have for their almost invariable character not to appear until much later.

Varieties.—As complement of the description which precedes, I could now commence a long chapter upon the varieties of this disease. Of course, the different symptoms we have alluded to do not present themselves in all cases in an invariable form and with a constantly equal intensity. Very clearly they must differ and do differ from one person to another according to a host of conditions, such as the degree of the stricture, its form, extent, age, and complications, hygiene and medical care. But these are only varieties more or less, and the basis of the symptomatology remains constant: these are only, I should say, common-place varieties, of which everyone can give an account, and on which, consequently, it would be superfluous to insist.

One sole peculiarity merits a special mention here. Here it is: When the sphincter region is respected by the lesion (which is, as you know, commonly the case), there is no properly-speaking *stercoral incontinence*. At the most it happens that in the advanced period of the disease the patients allow sometimes the escape, accidentally, of some liquid motions, composed either of sanio-purulent serosity, or of thin stercoral matter. But it is not the same when the region of the sphincter is comprehended in the lesion, that is, when there is an ano-rectal syphiloma. In these conditions, the sphincter, half-paralysed by the new exudation which compresses and chokes it, no longer contains perfectly the intestinal contents. However little these matters become liquid for such and such a reason, they escape from time to time, without the patient being able to retain them. Almost always, besides, they escape only in small quantities, whether by *insensible infiltration*, as one of my patients expressed herself, or more frequently by gushes. Such was, for instance, the case with that woman of whom I have often spoken to you: affected with an ano-rectal syphiloma, from the margin of the anus for about 8 centimetres upwards into the rectum, she could only very incompletely retain the matters, above all when liquid, after a purge or an enema. From time to time she suddenly lost some teaspoonfuls of stercoral or sanious fluid; hence she was compelled to keep herself constantly dressed for the purpose.

Evolution.—From the preceding it results that, considered from this point of view of its general evolution, syphilitic stricture of the rectum runs through three successive periods, in the following way:—

I.—First period, latent or almost latent, during which the stricture comes on insidiously, without pain or appreciable functional disturbance.

II.—Second period, when the confirmed stricture is only revealed by exclusively local disturbances (constipation, difficulty in passing stools, &c.); at this period the general health is not yet touched.

III.—Third and last stage, where the local functional disturbances react on the organism in general, where the health is altered or depraved, where there is caused a general condition of body symptomatic of the local affection.

Duration.—What length of time do these three stages last, and what is the total length of the evolution of the disease?

I.—It is impossible to say anything precise about the first period, as you already know quite well. How long a time, in fact, does the neoplasm take to infiltrate the rectal coats, and how long does the transformation of this neoplasm into fibrous tissue require; or, again, how long time is there required for this fibrous tissue to form the stricture by consecutive retraction, all of this is obscure, or at least, we have no means of judging exactly. And why? Because generally, I repeat, the beginning of the disease escapes us, as it escapes the patient at first; because we never arrive to observe the lesion except at a more or less advanced period of the disease.

What we know in a general way is that the constitution of the stricture may be pretty rapid, since it is not rare to meet with rectal strictures already confirmed at the epoch of the diathesis still early, that is six years, five years, or four years after infection.

II.—The duration of the second period is contained within limits of most variable degree, and this because of the multiple condition which may at this time modify the natural progress of the disease, very different conditions indeed, some simply relating to the form of the stricture, which is more or less narrow, &c., others relating to the care taken by the patients, and the palliative and frequently happy intervention of art. Sometimes, indeed, the stricture not treated, or treated too late, rapidly ends in interfering with the general health. Sometimes, on the contrary, in the opposite conditions, the functional disturbances which result from the lesion, palliated, lessened, and rendered tolerable, remain for a shorter or longer time almost exclusively local, and compatible with a general state of health which is pretty satisfactory. There are even a certain number of cases in which we have cause to be surprised at the conservation of a middling state of health prolonged for a length of time with such a grave infirmity. It is thus that you can at present see in our wards a woman who, although she has been afflicted for eight years with a very extensive rectal stricture, is nevertheless fat and strong, rosy, and in short, in very good health. This woman has undergone three operations for her stricture with some years of interval, and has scarcely ceased to treat herself by dilatation. There is no doubt that in her the absence of general symptoms is due to the intervention of art. In the same way I have had occasion to see in private a woman who, affected for twelve to fifteen years with a similar lesion, and having always assiduously treated herself by uninterrupted dilatation, presented a state of health which was middling, and experienced no general disturbance from her stricture.

III.—On the other hand, once the stricture has reacted on the organism, the progress of the general symptoms is always rapid if art do not intervene. In the space of a few months the health falls off visibly, and the patient goes at a great pace towards a fatal termination. If, on the other hand, art intervenes, then things may change their aspect. A lucky operation, by removing the obstacle to the exit of fæces, is followed by an amendment which is immediate in the general health: the functions are re-established and health regained. Let us, however, remark that it is rare to observe a free and complete reconstitution of the health. Most generally the patients remain languishing, weak, and valetudinarian, suffering and maintaining a constant local malaise, which reacts on their general state. In these conditions, life, as we have seen, may be prolonged for several years, but only at the price of constant surveillance and permanent care. The free course of the fæces is only maintained by persevering dilatation, and too often even in spite of hygiene and the best therapeutic arrangements, the consecutive retraction of the

diseased tissue reproduces the stricture under a form and with accidents over which art cannot triumph.

Prognosis.—With exception of certain forms of valvular stricture, limited, and incomplete, the prognosis of syphilitic strictures is always most serious and most grave, and that for several reasons, such as these :

1.—Because the lesion is scarcely ever recognised soon enough to count upon an efficacious action of purely medical treatment.

2.—Because, further on, at the period of fibrous degeneration, the stricture constitutes a definitive lesion irremediable, against which medicine remains absolutely impotent, and against which even surgery only possesses palliatives. We may dilate, or incise the stricture, but the morbid tissue still remains there, with its retractile properties which are so fatal, and the radical cure is but too evidently beyond the resources of art. Besides, these surgical means are not without danger : some of them constitute very serious operations, where the risks to run are not less numerous than redoubtable.

3.—Lastly, the stricture is grave because it brings with it multiple dangers of various kinds : dangers of local complications (peripheric phlegmons, abscesses, phlebitis, peritonitis by propagation or by perforation, &c.), dangers of rectal suppuration not to be dried up, gradually exhausting the resources of the organism, ending in deteriorating the economy, and creating a state of cachexia, the direct or indirect consequences of which are equally threatening.

This very grave prognosis does not apply, it is true, to all cases indifferently, nor to all periods, or given conditions of a given stricture. Thus valvular or even annular strictures are much less serious than those of cylindrical form, forming a long fibrous canal. In the same way, strictures treated before the period of ulceration are much more accessible to the succours of art than those where there exists a large superior ampulla profoundly ulcerated. But let us remark that his last of favourable circumstances is singularly reduced. For, on the one hand, valvular and annular strictures are very inferior in frequency to cylindrical strictures ; and, on the other hand, it is rare that there is not a complication of a superior ampulla, which even most frequently does not fail to suppurate, whatever may be done to hinder it. So that in short, and all things considered, the prognosis almost always in practice brings with it the very grave perils we have enumerated.

(To be continued.)

CASES IN PRACTICE.

Reported by JOHN W. MARTIN, M.D.,

Assistant-Surgeon Mayfield Factory Dispensary, Portlaw.

Obstructive and Regurgitant Mitral and Aortic Murmurs—Hæmoptysis—Death.

JOHN B.—D, æt. 40, pensioner, overseer of labourers. Notes taken September 9th, 1869, *et seq.*

The patient, a well-nourished, strong-looking man, of temperate habits, came under my notice on the above date. Was seized suddenly during the preceding night with a severe attack of dyspnoea, the character of which at once excited my suspicions as to its being due to cardiac disease.

His history may be briefly given as follows : He served for twenty years in the East India Artillery Service ; was always strong and healthy, never having suffered from illness, with the exception of an attack of remittent fever. Some months previous to the date of notes, he suffered from a severe pain in the epigastrium, which at the time was ascribed to gastric derangement, and for which it was necessary to blister him before obtaining relief. His occupation as overseer of labourers exposed him to every variation of weather. He dated the first change in his

health to a severe wetting, received during the winter 1867-68, when he stood, one bitterly cold and frosty night, for seven or eight hours up to his knees in water.

Examining him, I found that the heart's action was laboured, the impulse at the apex being stronger than usual. Area of cardiac dulness much enlarged. A well-marked presystolic mitral murmur was heard in its maximum intensity at the point of impulse, an inch and a half below and to the right of the left nipple ; this distinctly preceded the impulse in the carotids, and led up to the first sound, which was slightly roughened and prolonged. There was no murmur at the base of the heart. Had a slight, dry, hard cough. Exertion of any kind brought on dyspnoea. Had no headaches, flushings of the face, palpitations, or fits of vertigo.

Respiratory and digestive systems normal, special attention being directed to the state of the liver.

As treatment, a blister 4 x 4 was applied over the heart, and a mixture containing iodide of potassium and tr. aconit. ordered :

R Potassii iodidi, ℥i ;

Tr. aconiti, ℥ij ;

Syrupi, ℥i ;

Aqus fontanæ ad ℥xij. M.

Two tablespoonfuls to be taken three times a day.

Continued this mixture steadily with benefit up to the end of September. During my absence for a short time from home he neglected himself, and exposed himself unnecessarily to the inclemency of the weather. Caught fresh cold, and again came under my care, October 15th, 1869. I found him suffering severely from oppression about the chest, the slightest exertion producing most distressing fits of dyspnoea. The heart's action was very excited. Frequent flushings of the face. Examining with the stethoscope, I discovered a well-marked double murmur at the apex, preceding and accompanying the impulse and first sound. I repeated the blistering, and placed him upon the same treatment as before, continuing it steadily until December 11th, 1869. At this date the general condition was much improved. He had lost completely the flushings of the face, and was capable of undergoing a greater amount of exertion without inducing dyspnoea ; has suffered, however, from occasional severe attacks at night, evidently cardiac in their nature. Was still troubled with cough and oppression about the chest, aggravated upon catching cold, however slight.

Area of precordial dulness measured 3½ inches in the vertical direction, from the lower border of the articulation of the third rib on the left side with the sternum, and 4 inches in the horizontal direction, measuring from midsternum over towards the left side of the chest ; the dulness was evidently connected with hypertrophy of the left ventricle. The heart's impulse greatly increased in force.

In addition to the murmurs already described, and which had become more pronounced, there was a well-marked double murmur heard at the base of the heart, in the second intercostal space, at the right margin of the sternum. The first of these murmurs, synchronous with the contraction of the ventricle and arterial pulse, was prolonged into the carotids and along the course of the arch of the aorta. The characters of the murmurs were striking ; that at the base was low in pitch, and resembled the noise of grinding or sawing ; that at apex was high in pitch, and whistling and blowing in character. The improvement in his general health continued for some time.

Feb. 6th, 1870.—Had a sharp attack of hæmoptysis. Losing ground. Attacks of dyspnoea at night more frequent. Lost flesh. Increasing muscular debility and tendency to sleep. Gives way to frequent fits of musing, a thing he was never accustomed to. Leeches were applied over the heart, and gave great relief to the feeling of distress and dyspnoea. The subsequent history of this man's case I received from my father, who attended him

until his death, which took place during my absence from home, on the 6th of May, 1870.

All the symptoms described became aggravated, especially the fits of dyspnoea and hæmoptysis. For some time preceding death orthopnoea was a very distressing symptom. (a) The fatal termination was hastened by his giving way to intemperance.

I regret greatly to say that no post-mortem examination was allowed. In the absence of such it is impossible to say whether from first to last the disease was endocardiac pure and simple, or whether it was complicated with pericarditis and effusion with its attendant changes.

The case appears to me to be one of great interest, as the heart seems to have been the organ primarily affected.

There was no history of arthritic or myalgic rheumatism, the force of the attack seeming to expend itself upon the endocardium.

The origin of his illness was evidently due to the severe wetting and exposure which he suffered in the winter of 1867-68.

The sequence in which the valvular lesions, as indicated by the symptoms, manifested themselves, is interesting.

On the 9th of September, 1869, the date of my first examination, there was decided evidence of mitral obstruction, the bruit distinctly preceding the pulse in the carotida. Whatever the exact nature of the lesion was, the physical signs appeared to indicate hypertrophy of the walls of the left ventricle—viz., the increased area of cardiac dullness, the laboured action of the heart, and its increased force of impulse.

This hypertrophy might occur independently of any valvular lesion as the result of obstruction in the capillary system and the necessary increased action on the part of the heart to overcome the resistance.

The absence of any systolic friction murmur seems to negative the supposition of the pericardium being involved.

Oct. 15th.—The mitral obstructive murmur was accompanied by one of regurgitation, both becoming more and more pronounced in the progress of the case, and finally, apparently as cause and effect, towards its close giving rise to congestion of the lungs and hæmoptysis.

It was not until the 11th of December that the double murmur at the base of the heart was detected. During the interval, no careful examination having been made, it is impossible to fix accurately the date of its appearance, or the order in which the murmurs presented themselves; probably the course of events was the same as that observed in connection with the mitral valves.

Upon theoretical grounds it has always seemed to me most reasonable to suppose that valvular disease the result of inflammatory changes in persons who have been exposed to cold, one of the principal exciting causes of rheumatic affections, should first exhibit itself in obstructive murmurs, the primary changes being exudation of organised lymph upon the valvular surfaces, and their roughening, the further changes being ulceration and destruction.

The present case, and that of D—l L—y, published in the MEDICAL PRESS AND CIRCULAR for March 11th, 1874, page 197, are decidedly favourable to such a supposition being the correct interpretation of the ordinary course of events in all cases of valvular lesion the result of rheumatic inflammation; if it be so, then would presystolic mitral and systolic aortic murmurs be those of commonest occurrence. Most of the cases that present themselves to the notice of the physician are signs of advanced disease, especially so in cases that come

under notice in hospitals; the real field for observation lies in dispensary and general practice.

I am assured that many cases of heart disease take their origin in a simple cold, where a tendency exists on the part of the patient to the rheumatic dyscrasia; and in such cases great attention should be directed to the heart, and the utmost vigilance exercised wherever there is morbidly excited action accompanied by roughening and "buffing" of the first sound. In such cases a knowledge of family tendencies to inheritable diseases will be of great service in guiding the physician in his treatment of what otherwise might be passed over as unimportant, and prevent such simple cases terminating in consequences the most disastrous.

Hospital Reports.

LONDON HOSPITAL.

(Under the care of Mr. RIVINGTON.)

Strangulated Right Femoral Hernia—Slight Symptoms at first—Operation without opening Sac—Stricture at Deep Crural Arch—Recovery.

Janet Dunk, 41, was admitted into the London Hospital on the 5th June, 1873. At 4 p.m. she had been attacked with what she called the "windy spasms." She had a femoral hernia on the right side, about the size of a hen's egg, with a continuation along Poupart's ligament. She had suffered from rupture for two years. The first year the tumour was very small, and scarcely anything was perceptible. The second year it was rather larger, and on three or four occasions it got larger than usual. At 5.30 p.m. taxis was applied for one hour by her medical attendant. Then she had ice applied for two hours. At 9 p.m. another taxis effort was made. At 10 p.m. she was taken to the hospital. Mr. Widdas, the house-surgeon on duty, applied taxis, and reduced the tumour considerably in size.

At 1 a.m., on the 6th, Mr. Rivington saw the case. There was not, and had not been any vomiting. The patient positively affirmed that the hernia was now of its ordinary size. Ice was ordered to be applied, and an enema commune to be administered. It was thought that the hernia might be an irreducible epiplocele.

3 p.m. Enema had acted; no vomiting; tongue moist; pulse 74, but small and weak. Took and retained milk. Some pain on pressure on abdomen. Some tympany. No headache. Seen by Mr. Rivington, who directed that he should be sent for in case of vomiting. Later in the afternoon she brought up about an ounce of fluid without smell, and experienced pain at the umbilicus.

7 a.m. Had passed a good night, but was troubled with flatulency. Tenderness on pressure of abdomen continued. Pulse small and weak, 80 in the minute. The patient had drunk a quart of milk in twenty-four hours.

9.30 a.m. The patient vomited eleven ounces of dark-coloured fluid, with faint faecal odour. In a good deal of pain. "A tight pain about the navel." Tenderness on pressure over abdomen. Anxious look. Tongue furred. Pulse small. Tumour not increased. Mr. Rivington was sent for to see the patient. He had not been sent for the previous afternoon, because the patient was only sick once, and very slightly.

12. Operation by usual small incision on the inner side of the neck of the hernia. Stricture not tight, and situated at the deep crural arch, which was divided. Sac not opened. Contents, feeling like omentum and serum, and probably enclosing a small knuckle of bowel, were returned into the abdomen. A quarter of a grain of the acetate of morphia was given subcutaneously, and ice ordered for the patient to suck.

This symptom was greatly relieved by repeated applications of ice.

Not having paid greater attention to the state of the secretions. It was examined frequently, but as no morphia was at the time, I have not alluded to it. The impression on my mind is that it was albuminous.

23.0. Very thirsty, but quite easy, and all the symptoms were relieved.

June 8th. Had slept at intervals during the night. Flatus occasionally. No sickness. Pulse 96, quiet. Took a pint of milk during the day. Bowels open slightly in the afternoon.

9th. Had slept well. No rigors or vomiting. Tongue moist, but furred. Thirsty, but quite comfortable. Sucked a quantity of ice, and took milk and soda-water. Wound looked well. Temperature 101.2°.

10th. A little redness and swelling, and pricking pain around the wound, which otherwise looked well. Temperature 101.2°.

11th. Edges of wound nearly united; pus squeezed out below; sutures removed. Temperature 99.4°. Furred tongue.

The only noticeable feature in the further progress of the case was that some burrowing of matter took place on the inner side of the wound, necessitating the slitting up of the sinus thus formed. This done, the wound granulated healthily from the bottom, and healed. This caused some delay in the application of a truss, which she was not able to wear till the end of July or the beginning of August. Soon afterwards she was discharged cured.

Strangulated Left Congenital Oscheocele—Operation without opening the Sac—Recovery.

John Alfred Edwards, 31, was admitted into the London Hospital on the 22nd of November, 1873. He had been subject to hernia on the left side all his life, but it never reached the scrotum. The left testicle was smaller than the right. The rupture came down on Saturday night at 11, and at 1.45 the patient came to the hospital. Mr. Rivington was sent for, and saw the patient on Sunday morning, 23rd November, 1873. There was a swelling on the left side from the internal inguinal ring to the bottom of the scrotum. The testicle could not be felt, and there was a distinct constriction in the tumour midway between the external ring and the ordinary position of the upper end of the testicle. No impulse was imparted on coughing, and on adopting Mr. Luke's method the impulse ceased opposite to the external ring. Tumour was very tender and soft, without transparency. He had been sick three times since admission. Taxis and the pneumatic aspirator were used without effect. The patient would not consent to an operation till four in the afternoon. Mr. Rivington then operated, under chloroform, in the usual way. The stricture was at the external ring, and the sac was not opened. One vessel was twisted.

24th. Not sick since operation. Temperature 101°. Bowels not open since operation. Tongue rather furred. Scrotum tender. Abdomen a little sore, but not at all tumid. The bowels were relieved on the third day. A troublesome cough came on soon after the operation, with copious mucous expectoration. He had never had bronchitis, and the attack passed off in a week or two. On the 15th an abscess which had formed in the scrotum was opened, and a large quantity of matter removed. He then progressed very favourably, and was discharged with a truss on.

Strangulated Right Congenital Oscheocele—Stricture at Neck of Sac—Operation—Sac opened—Opening in the Sac Closed by Ligature—Recovery.

Samuel Carvosso, about 30 years of age, was admitted into the London Hospital on the 20th of January, 1874, with a strangulated right inguinal hernia. The testicle was behind the hernia, and obscured by it, and there was a distinct constriction in the swelling about an inch and a half below the external ring. The hernia was therefore of the congenital variety. The patient had been "ruptured" for five years. A truss had been worn for three years and then left off, as no sign of a hernia could then be detected. Whilst lifting a not very heavy weight between ten and eleven that morning the hernia came down. At 1.30 p.m.

he came to the hospital. There were the usual symptoms of strangulation. Warm bath, ice, taxis proving ineffectual. Mr. Rivington operated seven hours after the occurrence of strangulation. By practising the method of Luke the stricture was ascertained to be situated close to the external ring. The obstacle to the return of the hernia did not, however, exist in that structure, or in the intercolumar bands, but in the sac itself, across which passed a strong band of fibres. This band could not be teased or scratched into relaxation; to remove the obstruction it was necessary to divide it and open the sac. The contents were a little fluid, and intestine healthy, and not much congested. This was returned, and then a silk ligature was tied round the opening in the sac to prevent the entrance of pus, &c., into the sac, and thereby diminish the risk of peritonitis arising by the spread of inflammation to the abdominal cavity. The ligature was brought out of the wound, the edges of which were approximated with sutures. No signs of peritonitis ensued.

The temperature, 103° the first day, fell to 100° the second, and soon became normal. There were no untoward symptoms. The ligature fell in about three weeks, and, excepting a little delay in the closure of the upper part of the wound, the case progressed very favourably to a successful issue.

The patient was discharged cured with a well-fitting truss in February.

INDIAN MEDICAL NOTES.—No. XXXIII.

(FROM OUR SPECIAL CORRESPONDENT.)

MEERUT, February, 1878.

TREES—DISEASES—QUARANTINE.

"DINED yesterday with Lord Holland; came very late; found a vacant place between Sir George Robinson and a common-looking man in black. As soon as I had time to look at my neighbour, I began to speculate as to who he might be, and as he did not for some time open his lips, except to eat, settled that he was some obscure man of letters, or of medicine—perhaps a cholera doctor."

To the surprise of the supercilious Greville, his neighbour was the great Macaulay. This passage catching the eye raises the speculation—shall we or not have cholera at Meerut this year? Very possibly mildly, for 1878 is the proper time when to a certain day it will appear, to subside just as mysteriously. It is our business to enforce sanitation—to strengthen the human body to resist, to get the men out of barracks as much as possible, thus avoiding vitiated air, far more dangerous than the sun's fiery rays. We must do our little utmost to prevent overworking, fatigue, and dietetic irregularities, ever bearing in mind the difficulties, the dangers connected with water, which may be contaminated in transit from the well to the stomach. The planting of trees is a subject just now of great sanitary as well as financial importance in India, where for fuel and cooking purposes the magnificent forests are annually destroyed without remorse, for the native chiefs will take no trouble to replace the trees which have been sold, felled, burnt by incendiaries, destroyed by woodcutters, cows, sheep, goats, or camels, or have withered away through neglect or drought. At some stations the want of rain, white ants, or the presence of Reh will induce fatal atrophy. Trees are very sociable, hating solitude, sickening when planted alone instead of in clumps. Here and there about Meerut will be found solitary palms and pines, looking like soured yet well preserved old bachelors. Now and then a very chatty, comfortable community of flourishing groves and avenues appear to have their own little secrets about malaria—the modern Mrs. Harris depending on chill according to many. Nearly 50,000 trees are annually felled at Simla, the calculation being fifty trees to the acre. People must eat, must be kept warm, besides requiring timber for house-furniture. The use of close

stoves and kitchen ranges will be economical measures ; but the great suggestion is to employ convalescents or weakly soldiers at hill stations in planting and tending young trees, which require special knowledge, tender nursing, and the protection of fences. The *Eucalyptulus globulus*, now growing at Simla, burns well, at the age of eight being ready for felling. The conifers take ninety years to arrive at an average girth of six feet. The pines useful for building are provisionally unsuitable for fuel. In the *Simla Civil and Military Gazette* appears a very long, elaborate, exhaustive paper on this subject, interesting to all—interesting to the medical man whose patients, after learning all about the subject at convalescent depots, might come down to the plains, there to rear horse-chestnuts, firs, the castor-oil plant—in fact, trees, shrubs, fruits, flowers, without end. People say things will not grow, nor will they without care and skilled experience. A very nice book by Colonel Corbett will repay perusal ; were it not mislaid some very pertinent quotations would be inserted here. Whether or no the fever which this morning, Ash Wednesday, still keeps up the sick-list depends on subsoil drainage, irrigation, or chill, we do not know ; but it is a matter of fact that certain men who suffered from fever in 1873 so as to require removal to Landour and Kusowlee appear now to be feverproof in the plains, though living under the same conditions as those affected. On first arrival, indeed, for a long time persons may suffer from fever at any altitude, until gradually the disease becomes eradicated. Very many people do admirably in the plains without any change, an infinity depending on individual domestic hygiene. The great thing is to make the most of the situation, thoroughly to adapt ourselves, instead of whining for new barracks, new climate, hill stations, a new sun who draws not rotten humidity from the earth, or a new moon, no longer governess of the floods, who, pale in her anger, washes all the air, that rheumatic diseases do abound.

The medical officers ordered here should know that *variola*, conspicuously absent occasionally in cholera years, runs on from November to June—none in July or August, yet very severe in April.

Cholera, absent in 1863, 1864 (one case), 1866, 1868 (two cases), ran high in 1860, 1861, 1862, about six cases in 1865, then 159 in 1867, and 17 in 1869 ; then a lull until the terrible epidemic of 1872 ; none in 1873 nor in 1874 ; so 1875 or 1876, about August 20th, be prepared.

Intermittent fevers, high in 1862, 1863, low in 1865, are now annually increasing in severity, especially in October—no month free, yet a lull in February.

Remittent fevers, lowest in December, run on every month, arriving at a climax in July ; 1860, 1861, 1863, 1865, heavy years ; 1867 very light, 1872 heavy.

Apoplexy commences in March—high in June, diminishes in September ; no month is safe.

Dysentery lowest in February, highest in August.

Diarrhoea the same ; no month free.

Hepatitis.—November the worst time, when the days are hot and the nights so cold. In April, too, the liver appears to suffer rather more.

Phthisis. From April to October cases do badly, then improve. February a good month for all respiratory affections. Rheumatism either in very hot or very cold weather appears influenced entirely by damp.

Syphilis to be combated by the Contagious Diseases Acts, by temperance societies, and by encouragement of active exercises, amusements, trades occupation, and sport of all kinds, should be treated, if possibly non-mercurially, in my humble opinion. Anyhow, inunction or fumigation are the safest methods.

The other day, at another hospital, there was a history of blood-vomiting, neuralgic pains, and constipation, connected with a fatal case of enteric fever. The ilium was black, or reddish-black, the ulcers not so distinct as usual. The yellow liver enlarged, the yellow stomach dotted with vermilion patches, and somehow one thought of yellow fever. In an old book runs a horrible tale of an Italian physician, who diluting pestilential matter with *variola* gastric juice

of frogs and oil, applied this compound to the eyelids or bowels of cases of ophthalmia or peritonitis, all in the interests of science, with a view to publication, until, after an experience of thirty cases, the secret was discovered, the drugs destroyed, and the doctor's head sliced off, a warning to theoretical scribblers. Depend upon it the best doctors never put pen to paper except to write prescriptions. There are records of physicians who, scoffing at quarantine, denied the doctrines of contagion or infection, even when dying after inoculation with matter taken from plague buboes, the experiment performed to prove their case. Insults, oppositions, heart-breaking difficulties, experienced by medical men in days of old, were encouraged as they are this day by those who verify the lines that "a little learning is a dangerous thing." The scientific use of the imagination was put to the test the other day when a native, bothering for a charm to drive away ague, was directed to wear on his stomach a large placard with the magic words inscribed, "Vote for Hardwicke, Central Coroner for Middlesex," which reminds me that the London plague of 1665, commencing in November in Drury Lane, reached the City in June, rose to a climax in September, then burst out in the provinces, the only place affected simultaneously with London being Southampton. At Bath no Italians, Germans, or French, at other places no Jews suffered, whilst in Flanders the English alone were attacked. In May, 1720, a vessel imported typhus into Marseilles, the passengers, after short quarantine, allowed to wander at liberty. In spite of disbelief the disease spread, unchecked by fires, and out of 233 convicts offered liberty for burial of the dead, 221 died in ten days. Isolated buildings, vessels, nunneries escaped compared to a foundling hospital, where the imported disease killed the 400 children, besides nearly all the officials, lay, clerical, and medical. In 1771 the Moscow plague, so virulent in cloth manufactories, was traced to two soldiers. One September evening the mob broke through quarantine, kissed the dead whom they buried within the city, broke into the hospitals, hunted the doctors, smashed their furniture, obstetric bags, stethoscopes, thermometers, sphygmographs, yet the plague continued.

At other places the undertakers, wearing cloaks, gloves, and masks, were directed never to touch a corpse with naked hands. Physicians compared to manipulating surgeons often escaped. The Foundling Hospital, containing 1,000 children, 400 adults, all but escaped, for the servants detected breaking through quarantine were isolated.

In March, 1813, the plague brought by ship to Malta was disbelieved by the Faculty, and to avoid all the privations and discomforts of quarantine, the disease was concealed only to become more virulent. In religious houses, hospitals, prisons, where quarantine was preserved, the pestilence was kept at bay. At Winchester the visitor, after noticing the plague column, should read the sanitary arrangements ; and I rather think in the writings of Trousseau and Guy there are wonderful narratives, but, as said before, there are but few books of reference here. The complete works of Trousseau would be an acceptable present, but, alas ! presents in India are not so numerous as in England, nor has any Rajah offered an elephant or a gigantic ruby, emerald, or diamond. Indeed, the tendency is to offer an old family fowling-piece in exchange for the most modern rifle. The story of the box of clothes sent from London to Eyam in 1665, conveying pestilence which killed 267 out of 350 inhabitants, is very interesting. Deaf to his wife's entreaties, Mr. Mornpesson, the clergyman, refused to desert his post, nor would she leave him, so sent her children away, and shared his noble work connected with quarantine, sanitation, hygiene, besides clerical ministrations. Walking together in the cornfields one Sunday, the wife noticed the sweetness of the air, and then he knew that they must part in this world. Years and years after many persons were afraid to touch or be in the same room with Mornpesson, the hero of Eyam.

The medical officer who has the good luck to be ordered here will be interested to know the calculations of hospital

admissions in former years. As said before, variola was conspicuously absent in 1867, a bad cholera year; breaking out in April, it may run on to the hot season. From Bryden's invaluable tables it appears that during ten years no cases occurred in July and August; March, April, May, the worst months; but excepting July and August, every month is risky, therefore the importance of vaccination and re-vaccination is so imperative. If re-vaccinations fail, try and try again, when the golden opportunity of a healthy European infant just vaccinated turns up. Cholera bad in 1861, or rather, to put it more accurately, out of an average strength of 6,000—in 1860 there were 59 admissions, 29 deaths; in 1861 about 228 admissions, 155 deaths.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, MARCH 31, 1875.

DIPSOMANIA AND CHRONIC ALCOHOLISM.

THERE is evidently a great feeling in the ranks of the profession that something must ere long be done to stem the current of opinion among the laity to the effect that alcoholic drinks are universally permissible to healthy persons. Not a medical journal comes to hand at this moment that does not give an account of some meeting or debate wherein the subject of alcohol is introduced. We published last week such a lecture.

Among other signs of the times we notice that an important meeting was held on the 11th February last at Willis's Rooms, St. James's, London, under the presidency of Lord Shaftesbury, to bring forward a scheme for the establishment of an asylum for drinkers, desirous of being reclaimed, in the neighbourhood of London. Mr. Carsten Holthouse, Surgeon to Westminster Hospital, is the promoter of this idea, and he has engaged the sympathy of a number of the leaders of the profession, among others of Sir George Burrows, Sir Thomas Watson, Dr. C. J. B. Williams, Sir W. Jenner, Sir W. Gull, Dr. R. Reynolds, Dr. Radcliffe, Dr. Monro, Dr. W. Wood, Dr. Maudsley, Dr. Blandford, Sir J. Paget, Sir W. Fergusson, Mr. P. Hewett, and Sir Henry Thompson. These able gentlemen have appended their names to the following declaration:—

“We, the undersigned, fully alive to the prevalence of this disease, and to the great want of an institution specially devoted to its treatment, are of opinion that such a one as you propose—which shall afford to its inmates the comforts of a home and the pleasures of

society, while, at the same time, they are protected from temptation—would be a great boon both to the patients and their families, and is well entitled to our recommendation and support.”

In addition to this declaration, many other letters of adhesion to the idea of the society were read by Mr. Holthouse, and he announced that subscriptions to the amount of £1,600 had been already received.

Mr. Holthouse remarked that in the case of dipsomaniacs they must be considered as usually labouring under disease, their digestive organs being generally much out of order. Besides which, such patients are usually nearly in a state of delirium tremens, and require the care of a medical practitioner, and it is of very little use to do anything to such patients by way of argument or moral suasion until the alcoholic poisoning has left their system. It is when they are rid of this that they become amenable to arguments addressed to their intellects and affections. He proposed that the institution to be formed should be a home as well as a hospital—a home for those unfortunates who, having by their habits separated themselves from their friends, relatives, and connections, are, to a certain extent, the outcasts of society. It should be to them a refuge and place of retreat where they might, in fact, pass a great part of their lives. He was quite certain that a large number of persons might be quite cured in this way. Others might be much benefited by the treatment, and always have the institution to fall back upon when they relapsed into drinking habits. Many, very many, persons would be thankful to go voluntarily into such an asylum and place themselves under the slight amount of restraint necessary to keep them in a good state of health.

Mr. Holthouse then stated the main difficulty of the case. He said that it had been urged that, if force were not allowed, no patient would remain in the institution a month. He admitted that this was a difficulty, and that it would always happen in the first month of the stay in the home. He proposed to meet the difficulty of want of legal power by, in the first place, framing a rule that each patient should pay in advance a sum for three months' residence. Amongst the rules would be restriction of the bounds, and strict supervision. Besides which there would be medical and clerical resident gentlemen to act as friends and advisers of the patients, who were to be divided into three classes, according as they rise in self-control. Thus he hoped to be aided not only by the medical officers, but by those patients who had been in the home longest, and were most fit to be trusted not to relapse. He intended finding occupation for every patient, not merely amusement, which, when done, would be fruitless. They should be set to some task likely to prove of service to themselves, and this would strengthen the habit of self-control from the moment of entering the hospital.

After Mr. Holthouse had explained his plan, with these details, Sir George Burrows, President of the Royal College of Physicians of London, moved:—“That this meeting, looking to the great and increasing prevalence of intemperance, and the misery resulting, both to the community and the individual, is of opinion that the institution proposed to be established by Mr. Carsten

Holthouse is both desirable and much needed. This meeting, therefore, pledges itself to promote the success of the undertaking." He was glad to appear on the present occasion to support Mr. Holthouse in his philanthropic movement to help those unfortunate persons who had lost the power of self-control. Many of these poor people were by no means lost to shame, or entirely abandoned; they often deeply deplored the condition into which they had fallen. They were not at all suitable inmates of lunatic asylums, and should never be lowered to that level, so that the scheme proposed was a great public blessing.

Dr. Wood, Physician to St. Luke's Hospital, in seconding the motion, remarked that he had had ample opportunities of observing the terrible effects of drinking. Nothing could be truer than that dipsomaniacs were quite unfit to be sent into lunatic asylums; but it must be remembered that a great, a very great, number of drunkards ended in lunatic wards if not arrested in their downward course towards destruction of the brain by drink. Hence the value of a home such as that proposed by Mr. Holthouse, which will encourage self-control, and prevent many patients falling into the horrors of insanity.

Archbishop Manning and the Rev. Dr. Fraser spoke in favour of Mr. Holthouse's project, and the former speaker observed that he was glad indeed to find the plan originating among the medical men of London, since no class in the country knew so much of the evils of drinking as they. Dr. Fraser moved a resolution that a fund of £6,000 should be raised by shares of £25 each, at 5 per cent, secured on the property, and partly by the help of voluntary contributions.

Mr. Ernest Hart seconded this proposal, and made the remark that the great safeguard of such an institution as this was that it was under the public eye and public management to a great degree. This is very true indeed.

Dr. Charles Drysdale moved a resolution in favour of the appointment of the trustees mentioned in Mr. Holthouse's speech, and, in doing so, spoke of the terrible cases of secret drinking he had seen among ladies as well as gentlemen of excellent education. Nothing was more deplorable, he said, than to see such cases.

Mr. Robert Rae, in seconding the resolution, said that he was secretary to a temperance society, and that he was often asked by men of high position where they could send some member of their family out of harm's way.

Lord Shaftesbury made a telling speech in favour of the establishment of such an institution as that planned by Mr. Holthouse, which he thought was greatly needed. At the same time he said that it would be necessary to take heed as to the name given to the movement, and suggested that the word dipsomaniac was a dangerous one, and likely to make patients shun entering the home.

There is much truth in the observation of Lord Shaftesbury, and we do not see why the word "sanitarium" might not be employed, with a sub-title such as "Home for Persons of Intemperate Habits." That there is great need for such a home as that projected by Mr. Holthouse is evinced by the fact that many of the patients in hydrophobic asylums are already of this unfortunate class of drinkers who have lost power of self-control. Besides

this, there are numerous cases where persons of intemperate habits go to reside for a time in the house of some medical man, and many of these would naturally greatly prefer to seek a home where they could enjoy pleasant society, and have some occupation suitable to their turn of mind.

In a work by Dr. Magnan, of Paris, entitled "De l'Alcoolisme," which has obtained the prize of the Académie de Médecine recently, the author, in his second chapter, classifies the patients who are the subjects of alcoholic delirium, and bases his classification upon the degree of the poisoning. This gives valuable hints to practitioners, particularly with regard to the necessity for, and duration of, confinement in asylums. In his third chapter, also, he gives the symptoms and diagnosis of febrile delirium tremens—a subject which has puzzled many persons. It is a difficult matter in some cases to distinguish between the dangerous condition of febrile delirium and the comparatively more simple case of simple delirium tremens. Hence the divergence of authors concerning the gravity of the disease and the methods suitable for treating it. When delirium tremens exists with other diseases it may often be misunderstood, and thus erroneous treatment may be pursued.

In febrile delirium tremens, as Dr. Magnan teaches, fever is an essential element in the disease, and has an existence of its own; whereas, in the other form of delirium tremens, the fever may originate in pneumonia, erysipelas, pericarditis, or wounds, caused either by injury or therapeutic appliances. The fever progresses according to the cause—in the one case following a normal cycle, in the other varying with the intercurrent affection.

With regard to the remedy hydrate of chloral, which has been so much praised by some physicians in the treatment of delirium tremens, M. Magnan says that it has unquestionably a place in the treatment of brain diseases, since it affords a very soothing effect in giving repose in mania and in melancholia accompanied by insomnia; but it is not a good remedy in cases of poisoning by alcohol of grave nature, or in febrile delirium tremens. The best treatment for such cases are to protect the patient from injuring himself or others, to get rid of the poison, if possible, and to sustain strength.

Dr. Magnan's views as to chronic alcoholism, contained in his fourth chapter, are very instructive. He admits with former writers that the termination of chronic alcoholism is, in many instances, in general paralysis and dementia, and he explains why this is the consequence of prolonged courses of drinking. In many cases of confirmed drinking there is noticed to exist muscular debility, loss of general sensibility, and special sensibility.

It is a hopeful sign of the times in which we live that such questions as those of chronic alcoholism, health of towns, and other kindred topics in hygiene are coming to the front. The world will be less of a vale of tears when drunkenness is combated by the medical faculty—the only class of men who can thoroughly comprehend the enormous evils of chronic alcoholic poisoning.

Notes on Current Topics.

Dr. Beale's Lumllean Lectures.

THE nature of life is a question, says Dr. Beale, which has engaged the attention of the most thoughtful minds of all ages. But we still speak of the mystery of life. Many of those who are teaching at this day that physical and chemical processes constitute the life of the higher animals are perfectly aware that there are certain phenomena which cannot be explained by physics and chemistry.

Dr. Beale expresses himself as strongly opposed to the doctrines now generally taught and fast becoming widely diffused. It is dogmatically asserted, he says, in the plainest language, that all living things are machines, and all their actions mechanical. It is said that the sun forms living beings; that the brain and all organs are built up by the sun; that all the actions of living beings are mechanical, and that all things alive are machines; that living organisms, as well as crystals, are the product of molecular forces; that the mind, the intellect, the will, thoughts, and emotions, as well as the body, were all once latent in a fiery cloud; and that the present world and all its inhabitants, past and present, as well as those to come, lay potentially in the matter which was once cosmic dust; that the lowest forms of living approximate very closely to non-living material: whilst only matter and material forces—only atoms and atomic forces—have been and are concerned in the formation of all things, living as well as inanimate.

Dr. Beale then points out that up to this time no one has succeeded in showing that the above propositions contain the vestige of a substratum of truth.

Those who force such views on public attention, says Dr. Beale, incur a serious responsibility, but I am not sure if scientific men who strongly disapprove of the course taken, and who know full well that many of the extravagant assertions now made in the name of science, and from a scientific platform, cannot be supported by facts, do not, by their silence, incur a responsibility equally grave, inasmuch as they permit arguments which they know to be unsound to be advanced in the name of science without objecting to them.

Dr. C. J. B. Williams on Vivisection.

AT the annual meeting of the Royal Medical and Chirurgical Society, held on March 2, Dr. C. J. B. Williams delivered his annual address. He spoke with feeling of the loss to the profession caused by the deaths of Dr. Anstie and Sir Ranald Martin. Sir Ranald Martin, throughout his long and busy life, both in India and after his return to England, was quite as much occupied in honorary and gratuitous employment as in making provision for his large family. Merchants, planters, and civil officials of high rank return from India with large fortunes after much less labour and shorter terms; but the most distinguished military medical officer, when obliged by ill-health to return, after 23 years of active service, finds himself obliged to resume practice for 34 years more, without any enjoyment of that *otium cum dignitate* to which he was so fully entitled. Do not the

lives of Anstie and Martin reflect honour on the profession by their noble and unselfish exertions in the cause of humanity? Nay, do they not represent the general character of the lives of medical men, who find themselves called on—and refuse not—to toil night and day, often sacrificing their health, sometimes their lives, for the relief of suffering, without, or with very inadequate remuneration. Doubtless it is a noble and God-like work, and assuredly they have their reward; but this comes not from the gratitude of the public, nor from the appreciation of their services by the upper ranks of society; because, unfortunately, the numbers and needs of medical men are commonly so great that some are ready to proffer their services at any or at no price; the public expects from them gratuitous work which would not be thought of with any other profession or trade.

Dr. Williams then referred to the proposition made by the Royal Society for the Prevention of Cruelty to Animals, that their secretary, with two others, shall be present whenever we have to perform experiments on living animals. Those only profoundly acquainted with physiology can be competent judges of the necessity of making experiments on living animals, and of the most merciful modes of conducting them, and such experts, being also practitioners of the healing art, a great aim and constant object of which is to relieve pain and mitigate suffering, may be implicitly trusted without the espionage and surveillance of impulsive and unqualified observers. In justification of vivisection for strictly humane and scientific ends, it has been fairly argued that if whole hecatombs of animals are habitually and ruthlessly sacrificed, not only for food, but for luxury and for sport, and often with little or no consideration for their individual tortures, there is a much more natural and cogent plea for the use of a few for instructive investigations which have an intimate bearing on the relief of suffering humanity.

The Treatment of Syphilis.

IN the debate at the Medical Society of London following upon Dr. C. R. Drysdale's paper on the "Antecedents and Treatment of Syphilis," Mr. Acton said he should have much liked to hear from the author of the paper his experience of cases of syphilis treated without mercury. He was glad to find that Dr. Drysdale was no longer afraid of that most useful remedy in primary and secondary lesions, and hoped that he might be induced to use it in certain cases of tertiary disease also. He had not remarked that women suffered more from tertiary syphilis than men.

Mr. L. Brown said he supposed that the last remark of Mr. Acton arose from the fact that Mr. Acton's experience was chiefly among private patients. He was much in favour of local treatment with nitrate of silver in such cases.

The President, Mr. V. de Méric, said that the question brought forward by the author was chiefly this: Do long courses of mercury tend to prevent tertiary syphilis? He decidedly thought so, but would not like to lay down a fixed rule for the treatment of all cases of syphilis in order to prevent tertiarism. At any rate, it was very wrong to do as had been done by some surgeons and physicians in

Edinburgh—i.e., to attribute tertiary syphilis to mercurial treatment.

Mr. Spencer Watson thought that sometimes, when iodide of potassium failed in tertiary syphilis, arsenic might be useful, and asked the author if that was his experience.

Brighton Provident Hospital.

We are glad indeed to see that the town of Brighton is taking the lead in inaugurating a hospital on the system of providence, so frequently praised by ourselves and other medical journals in the interests of the profession and the public together. At a late meeting in Brighton the question to be decided was whether a provident and self-supporting hospital should be erected, or whether the accommodation already existing at the Sussex County Hospital might, to a certain extent, be made use of. It was found on inquiry that the present hospital has no power to make such an alteration as to admit of this experiment being carried out. It seemed generally to be thought at the meeting referred to that the provident system was quite applicable to the in-patients of hospitals. It is argued, most truly, we think, by the advocates of the provident system that the actual system tends to improvidence and pauperism of the lower middle classes and skilled workmen, when these classes know well that they can obtain gratuitous advice and treatment when diseased. It would be far easier in the country to find out the circumstances of patients applying for relief to hospitals, and the experiment may therefore well be tried first of all in a city like Brighton. We therefore wish all success to the future Brighton Provident Hospital, and we trust that its inauguration may ere long be followed universally by our provincial towns, and perhaps, finally, that it may come to the aid of that distressed class—the hospital physicians and surgeons of London.

Coffee, Cocoa, &c.

DR. DUSART (*La Tribune Méd.*, January 24th, 1875) says that it is curious to think upon what slight grounds opinions are often founded in physiology. Thus, Dr. Gasparin, some years ago, asserted that the miners of Belgium, very robust men, eat only a little bread, some potatoes, and a very strong infusion of chicory. This gives an explanation of the marvellous tales believed by many concerning the power of coffee and coca to give strength.

Cocoa, coffee, and tea, having no more right to the title of azotised foods than alcohol itself, which is so different in composition, and yet so similar in its effects to these substances, have at length been classed as stimulant medicines.

Here theories abound, and with them various denominations, such as "medicines to save the tissues," *anti-perditeurs* "dynamophore foods." This last term, proposed by Dr. Gubler, gives a good idea of the notion this learned professor has conceived as to the part played by these substances. He thinks, indeed, that these substances are charged with a certain dose of force they have the power of handing over to the nervous system at once.

Evidently this mode of action does not appear to Dr. Gubler to apply to all exciters of the nervous system. But

how are we to reconcile this theory with the one ordinarily received? For one of two things must be true: either force has an existence independently of chemical and physical reactions, then certain bodies may absorb a certain quantity of it and transport it to other bodies, thus fully meriting the name of dynamophores; or force is indeed the result of chemical and physical action, and is only developed proportionally as these actions proceed, so that to a certain quantity of muscular work there corresponds an equivalent proportion of combustion and metamorphosis of the elements of the economy. In this case there is no transmission of force, but simple transmutation, as everyone knows is the case.

But, if so, where do we find in coca, or in coffee, &c., the principles whose transformation determines the production of the ascertained forces?

To M. Gubler, who compares the action of such substances to electricity, or fulminates, we may reply, that electricity itself is but the consequence of chemical reactions, and an example of transmutation of forces, and the fulminates are all composed of elements of which each passes into the state of gas, of which the force may be calculated. There is no analogy between them and the action of coffee, &c.

Of late years Dr. Masraud has made experiments on himself with these substances, and finds that coffee, tea, &c., excite the muscular activity, whilst they make the integuments anæmic for the moment, and thus diminish the peripheral combustions. He concludes that they are at once excitants of the cerebro-spinal nerves and depressors of the ganglionic system.

It would seem, however, more rational to say that they excite both of these systems of nerves. During muscular effort, whilst a part of the heat produced is transformed into useful work, another very considerable part, absorbed by the production of the sweat, and by the elevation of the temperature which radiates from the whole of the body, constitutes a loss and a powerful cause of exhaustion. Is it not evident that, if we can suppress, or at least diminish the superfluous peripheral combustions, we shall diminish in the same proportion the fatigue of the worker and the expense of his food.

Ligature of Arteries.

DR. ED. LANG gives (*Centralblatt für Chirurgie* No. 32, 1874, and translated in the *Boston Medical and Surgical Journal*) a résumé of 11 cases of ligature of arteries in their continuity. The common carotid was tied twice, the lingual four times, the subclavian once, the external iliac once, the femoral once in Scarpa's triangle, and once under the sartorius. The following is a résumé of the cases:

1. Gliosarcoma of the right tonsil. Osteo-plastic resection of the lower jaw, ligature of the right common carotid previous to extirpation of the tumour. Death at the end of ten days. Immediately after the ligature, bluish discoloration of the right side of face and temple; also enlargement of the temporal artery. The operation was bloodless. Embolism of the *arteria fossæ Sylvii* brought on apoplectic symptoms and death.

2. Recurrent sarcoma of lymphatic glands on the right side of neck. Extirpation. Ligature of common carotid.

during the operation. Recovery. Recurrence of the sarcoma, accompanied by hæmorrhage, rendered an operation necessary; during the operation, the bleeding was so excessive that the carotid was tied.

3. Carcinoma of tongue. Extirpation after ligature of the right lingual artery. Recovery. Subsequent return of the disease, with usual result.

4. Carcinoma of the tongue and of the floor of the mouth, and of the lower jaw. Ligature of both lingual arteries. Extirpation. Oedema of the glottis. Tracheotomy. Death from septicæmia. In this case the larynx was so low down in the neck that the incision for tracheotomy had to be extended to the sternum and the thyroid cartilage drawn up by hooks and forceps.

5. Carcinoma of tongue and floor of mouth. Preliminary ligature of one lingual artery. Extirpation of the growth. Diphtheritis, pyæmia, death. A pyæmic inflammation of one sterno-clavicular joint existed.

6. Union, with deformity, after fracture of the neck of the humerus. Resection of the projecting end of the lower fragment. Hæmorrhage from a resulting abscess; ligature of the subclavian under the clavicle; recovery.

7. Compound fracture of the right thigh. Hæmorrhage from an abscess. Ligature of the right external iliac. Death from exhaustion, on the twenty-third day after ligature. At the autopsy, the ends of the arteries were thickened to double their size by growth of the middle coats; there was also amyloid degeneration of the liver, spleen, and kidneys. At the seat of fracture, a hollow cylinder of new bone enclosed the fragments, which were still movable.

8. Severe injury to the left leg. Amputation through condyles of femur. Ligature of femoral in Scarpa's triangle, of the external iliac, and, finally, of the branches of the femoral in the triangle, for secondary hæmorrhage. Recovery.

9. Total necrosis of left femur. Removal of sequestrum. Ligature of femoral under sartorius for uncontrollable hæmorrhage. Recovery. Ligature difficult, owing to the inflamed and thickened tissue.

Therapeutical Effects of the Paullinia Sorbilis, or Guarana.

DR. JOHN C. VAN WYCK, in the *Pacific Medical and Surgical Journal*, says he was first induced to try its virtues in the following case of headache, which had for some three years resisted nearly every known method of treatment:—

"Mrs. — had been for nearly eight years subject to headache, and was a confirmed dyspeptic. For several years past the slightest exposure to cold or dampness would affect the mucous membrane of the stomach, and a headache would invariably ensue. So intense was the suffering concentrating in one or the other eye, that a subcutaneous injection of morphia became a necessity for the temporary relief. Again, either a day preceding or subsequent to the catamenial period, a violent headache was sure to occur, despite every means suggested by numerous physicians to avert it. Without much faith on my part, and with far less on that of my patient, I commenced the administration of Grimault's powders of Paullinia or Guarana, each of which contains thirty-three grains. At the time of taking the first powder there was considerable gastric irritability, and it was thrown up in about half-an-

hour. The severity of the attack was, however, somewhat mitigated. Two days after, experiencing all the premonitions of another attack, she took and retained a powder which not only afforded entire relief, but produced a feeling of vitality and force long a stranger to her. Towards night, the head again threatening, she took a second powder, and after a pleasant night's sleep awoke, feeling better than for months past.

"Nearly three months have elapsed since the first dose was taken, during which period there has occurred but one severe headache, and in that instance the administration of the remedy was postponed until the pain had become quite intense, and it then failed to arrest the progress of the attack. I had a letter from her a few days since, in which she says: 'God bless the discoverer of Guarana! It has never but once failed me, and I believe in that same instance had I taken it sooner should not have realised the severity of that attack. Nothing I have ever tried is at all comparable to it. Apart from the relief it affords, I feel afterwards a partial renewal of my once wanted vim.'"

Dr. Wilkes, of Guy's Hospital, some time ago drew attention to the power of this drug to correct sick headache, and he was confirmed by others. Dr. Rawson has since published in the *Irish Hospital Gazette* a statement of the cure of lumbago in his own person by the same remedy, after the failure of other means. He took fifteen grains at first, with relief for twenty-four hours. The pain returning, he increased the dose to forty grains, taking it twice a day for a week. The lumbago disappeared, but again returned, requiring a repetition of the medicine. He adds, as the result of many trials on other patients, that when the pain is acute and lacerating, Guarana acts like magic; but when it is dull and aching, the drug is slower in its action. Dr. Rawson comes to the conclusion that whenever the fibrous envelopes of nerves, the aponeurotic sheath of muscles, the fascia or tendons are the seat of pain, Guarana gives, if not instantaneous, at least very speedy relief, lasting from twelve to twenty-four hours.

The Rules for the Regulation of Irish Lunatic Asylums.

It will be recollected that much of our space was occupied this time last year in a discussion of the rules promulgated by the Irish Privy Council for the regulation of district asylums. As we then pointed out, these rules were framed, as has been the legislation on the same subject for many years, with the purpose of making the governors and visiting physician of the asylums mere puppets, and concentrating the entire authority in the resident medical superintendent and, through him, in the inspectors. In pursuit of this policy every important supervising function of the Board of Governors was either restricted or taken away altogether, and *inter alia*, it was ordered that all tenders for asylum supplies which were rejected by the governors should be sent to the inspectors in Dublin for inspection. This impertinence exhausted the patience of the governors of the Limerick Asylum, and, as the authorities refused to withdraw the rule, several of the leading members of the board resigned their governorship, and the subject seemed to have dropped. We learn, however, that after the lapse of many months the Castle authorities have given in.

At the meeting of the governors, last week, a communication was read by the clerk from the Under Secretary, stating that, in deference to the unanimous wishes of the Board of Governors, the Government had agreed to rescind the Privy Council rules, which required that all rejected tenders received by the Board of Governors should be sent to Dublin Castle for inspection. The Government had now

arranged that the inspector should examine the rejected tenders in the office of the lunatic asylum.

Lord Emly observed that the Government had entirely met the wishes of the board in rescinding a rule which the entire of the board had agreed in regarding as most objectionable, if not insulting.

It was agreed that Lord Emly should communicate with the governors who had recently resigned in consequence of the existence of the rule referred to, with a view to ascertaining whether they had any objection to be re-appointed.

We hope we may read this concession as evidence of a coming termination to the "Nugent Dictatorship" under which the Irish district asylums have suffered for so many years, and from which these obnoxious rules are the direct outcome. The domination of this policy has been most injurious to the Irish lunacy system, and we trust it is coming to an end.

Legalisation of Foreign Medical Diplomas for Women.

MR. COWPER has obtained leave to bring in a Bill to amend the Medical Act of 1858, as far as relates to the registration of women who have taken the degree of Doctor of Medicine in a foreign university.

The "Deutsche Klinik."

DR. ALEXANDER GOSCHEN, the editor of this well-known Berlin periodical, has just died somewhat suddenly of pneumonia, in the sixty-second year of his age. He founded the *Deutsche Klinik* twenty-six years ago, and edited it to the time of his death (the number for the 13th inst. containing an article by him on Servetus), it being the first great medical weekly journal ever established in Germany.

Statistics of Suicide in Prussia.

THE statistical office of Prussia has just published a table of the suicides in that country, from 1869 to 1872, drawn up with characteristic minuteness of detail.

Suicide amongst men was, on an average, four times as frequent as amongst women. With regard to age, the tendency increases with age in men. The greatest number kill themselves between from ten to fifteen years of age, and between fifty and sixty. In women the tendency to suicide is most marked from fifteen to twenty years of age, and when they have passed their seventeenth year. Married people contributed 452 suicides per 1000; unmarried persons above fifteen years of age, 339 in the 1000.

Some more of Mr. Solater-Booth's "Usages of Trade."

At the Hanley Police Court a grocer was summoned for selling pepper as genuine which was adulterated. The analyst's certificate was to the effect that the pepper was adulterated with sharp sand to the extent of 6.96 per cent. The sample was further adulterated with wheat, linseed, and other vegetable matter to the extent of 20 per cent. It was so adulterated as to be distinctly injurious to health.

At the same court another grocer was summoned for

selling a bottle of adulterated pickles. The analyst's certificate stated that the pickles were adulterated with sulphate of copper to the extent of 3.27 grains to the imperial pound, which made them very injurious to health. The defendant was fined 10s. and £3 4s. costs. He complained that he was being punished for another person's offence, the pickles having been sold as they were received from the manufacturer. The bench told him that he was not fined for adulterating the pickles, but for selling them.

Pharmaceutical Society of Great Britain.

THE next evening meeting will be held on Wednesday evening, April 7, 1875, at eight o'clock. The Chair will be taken at half-past eight precisely.

It is generally understood that Dr. Fayer, physician to the Council of India, will accompany H.R.H. the Prince of Wales during his contemplated tour in that country. As the time H.R.H. takes his departure is somewhat remote—seven months—it is not impossible that this arrangement may be subject to alteration.

LAST Wednesday, the annual dinner in aid of the funds of the Jews' Hospital, was held at the London Tavern, after which a subscription list by those present, amounting to £1,600, was read by the secretary.

DR. HORACE DOBELL has been presented with a vote of thanks, handsomely illuminated on vellum and framed, on his retirement from the post of Physician to the Royal Hospital for Diseases of the Chest, City Road, after sixteen years service. At the sixty-first annual general court of governors held recently, Dr. Dobell was unanimously elected a consulting physician to the hospital.

AT the annual court of the governors and subscribers of University College Hospital, held on Wednesday last, the report showed the receipts of the past year to have been £16,501, and the expenditure less that amount by about nearly £3,000. In the evening the annual dinner was held, under the presidency of Lord Houghton, when the sum of £1,010 was subscribed.

WE regret to announce the sudden death of Dr. Silas Palmer, F.S.A., the well-known archæologist, which took place at his residence at Newbury, on Wednesday last. Deceased had an extensive medical practice, but found time to carry out many researches of archæological and antiquarian interest in Berks and the adjoining counties. He was little more than sixty years of age, and had compiled a vast amount of information on antiquarian subjects.

A MARRIED woman has died last week from an overdose of "bitter apple," or colocynth, taken to cause abortion. The druggist sold two-pennyworth of the medicine (120 grains) to a child without any warning and without any label on the paper covering, and, as a consequence, the woman took the whole quantity and died of purging. Nothing could be got from the shopboy who sold the drug but a flippant declaration that he considered the druggist

"a better judge of what it was right to do than anyone at the other side of the counter." We are told that a verdict was returned in accordance with the evidence. If so, it should have been "manslaughter against the chemist's assistant."

THE Fellows of the Royal College of Surgeons, Ireland, met on Thursday last, to witness the election of a Professor of Chemistry in the place of Dr. Emerson Reynolds, recently elected to succeed Dr. Apjohn in the University of Dublin. The candidates for the chair were Dr. Cameron the Analyst of the City of Dublin, and Lecturer on Chemistry in the Ledwich School, and Dr. Davy, Professor of Forensic Medicine in the College School. Dr. Cameron was elected. By his promotion the Chairs of Chemistry in the Ledwich and Stevens' Hospital Schools, and the Professorship of Hygiene in the College of Surgeons become vacant.

Literature.

HEREDITY (a).

By heredity Professor Ribot means to intimate that biological law by which all beings endowed with life tend to repeat themselves in their descendants. In other words, the term heredity is used to designate the law which states that certain personal characteristics tend to be transmitted by inheritance. M. Ribot says that the physiological side of this question has been studied, but not its psychological side, and he proposes to supply the deficiency by the publication of the present work. But the hereditary transmission of mental faculties, considered in its phenomena, its laws, its consequences, and especially in its causes, is so closely connected with physiological heredity that the psychological and physiological aspects of the subject can scarcely be separated from each other by a sharp line of demarcation, and M. Ribot frequently touches on physiological as well as psychological questions in the course of his book.

The work before us is divided into four parts—viz. : I. The Facts ; II. The Laws ; III. The Causes ; IV. The Consequences. To these is prefixed an introduction on Physiological Heredity.

In Part I. M. Ribot first treats of instincts, natural and acquired. He thinks it possible that instincts may be only habits fixed by heredity. In the chapter on the Sensorial Qualities some curious instances of heredity are given. We select a few :

It has been observed, says P. Lucas, that parents transmit to their children the most singular perfections and imperfections of touch. There are, probably, in the skin no modes of hyperæsthesia or anaesthesia that could form an exception to this rule. A woman whose tactile sensibility was so exalted that for her the slightest hurt was an agony, married a man endowed in the highest degree with the opposite quality. He did not lack intelligence; but his heart and his skin were impassible. A daughter was born to them, and she is as insensible to external pain as her father himself. We have seen her endure, without complaint, and even without appearing to notice it, pain which would have been very acute for ourselves.

A family from the south, says the same author, who was acquainted with the persons, came to Paris some time ago. Several of the children were born in Paris; but those born there, as well as those brought there from the south, were, in childhood, extremely sensitive to cold. One of the daughters married a man from the north, who is insensible to cold, provided it is not excessive. The child born of this union is more sensitive to cold than even its mother; like her, he shivers at the slightest fall of temperature, and so soon as the air becomes cold, he is afraid of leaving the house.

(a) "Heredity: a Psychological Study of its Phenomena, Laws, Causes, and Consequences." From the French of Th. Ribot, Author of "Contemporary English Psychology." London: Henry S. King and Co., 1875.

He also gives some curious cases of hereditary idiosyncrasies :

Cases are on record of families all of whose members are tormented with the fixed idea that people want to murder them or poison them. A woman affected with lypemania was sent, at the age of 42, to an asylum, and there died. It was discovered that her grandfather and her mother had been insane; and her son, barely 15 years of age, already gave signs of lypemania. (a) In 482 cases of this disorder Esquirol found 110 to be insane.

Here is a story about Montaigne of special interest to doctors :

Montaigne, who took an interest in the question of heredity, because he derived from his family a tendency to stone, inherited also an invincible repugnance for medicine. "The antipathy," he says, "is hereditary. My father lived 74 years, my grandfather 69, and my great grandfather almost 80, and never tasted nor took any kind of physic, and for them anything not in common use was a drug. My ancestors, by some secret instinct and natural inclination have ever loathed all manner of physic—the very sight of drugs was an abomination to my father. The Seigneur De Gerviac, my paternal uncle, who was an ecclesiastic, and sickly from birth, and who, notwithstanding, made his weak life hold out to the age of 67, falling once into a high protracted fever, the physicians had word sent to him that he must surely die if he would not take some remedy. The good soul, affrighted as he was at this horrible sentence, said: 'Then it is all over with me!' But God soon made their prognostications to prove vain. Possibly I have received from them my natural antipathy to physic."

Professor Ribot gives some curious instances of hallucination of the senses, many of which, as being of especial interest to our readers, we would quote, did space permit. The following is certainly a rather uncommon form of hallucination :—

A man in the Lyons Hospital was subject simultaneously to hallucinations of taste and smell; tormented by disgusting odours and tastes, he spent whole hours in blowing his nose and spitting. His father had died in the same hospital from the effects of mania with hallucination.

The following instance of optical hallucination is also interesting :—

Abercrombie cites a case of hereditary hallucination where the reason remained intact. "I know a man," says he, "who all his life has been subject to hallucination. This disposition is of such a nature that if he meets a friend in the street, he cannot tell at once whether it is an actual person or a phantasm. By dint of attention he can make out a difference between the two. Usually he corrects the visual impressions by touch, or by listening for the footfalls. This man is in the flower of his age, of sound mind, in good health, and engaged in business. Another member of his family has had the same affection, though in a less degree."

Instances such as the following are, unfortunately, only too familiar to most of our readers :—

Trélat, in his work "Folie Lucide," states that a lady of regular life and economical habits was subject to fits of uncontrollable dipsomania. Loathing her state, she called herself a miserable drunkard; and mixed the most disgusting substances with her wine—but all in vain, the passion was stronger than her will. The mother and the uncle of this lady had also been subject to dipsomania.

On the subject of presentiments, M. Ribot quotes an anecdote which, though familiar to many, may have been forgotten by other readers. Here it is :

The following curious case is taken from Brierre de Boismont. If we accept the anecdote as true, we must, says Dr. Delasiauve, recognise the principal cause of the phenomenon in the heredity of a nervous affection :—

"Marshal de Soubise related, in presence of Louis XIV., that as he was one day conversing in his cabinet with an English lady, he all at once heard the lady utter a shriek, and saw her rise to go away and fall unconscious at his feet—this without any external cause. Filled with surprise and concern, the Duke de Soubise rang the bell. The servants ran in and attended on the fainting lady, who soon came to

(a) *Gazette des Hôpitaux*, October 19, 1874. See also Moreau, 192; Maudsley, 376.

herself. 'Do not detain me,' she said to the marshal, excitedly, 'I shall scarcely have time to put my affairs in order before I die.'

"She then told M. de Soubise that both sides of her family had the gift of divination; every member of it had been able to name the very hour of their deaths a month beforehand. She added that, in the midst of the conversation she had held with M. de Soubise, her own double had appeared to her in the mirror before her. She saw herself wrapped in a shroud, over which was a black cloth, sprinkled with white tears; at her feet was an open coffin.

"A month after this occurrence M. de Soubise received a letter informing him that this mysterious premonition had been proved true by the event." (a)

It is natural to suppose that these sudden visions are due to a certain mental constitution hereditarily transmitted; imagination does the rest, and on the appointed day brings about the catastrophe, which is thus an effect, not a cause.

The loose way in which people constantly speak of hereditary talents, vices, and virtues is admirably exposed by our author, and on this important subject we give another extract:

We often hear of hereditary talents, hereditary vices, and hereditary virtues; but whoever will critically examine the evidence will find that we have no proof of their existence. The way in which they are commonly proved is in the highest degree illogical; the usual course being for writers to collect instances of some mental peculiarity found in a parent and in his child, and then to infer that the peculiarity was bequeathed.

By this mode of reasoning we might demonstrate any proposition; since in all large fields of inquiry there are a sufficient number of empirical coincidences to make a plausible case in favour of whatever view a man chooses to advocate. But this is not the way in which truth is discovered; and we ought to inquire not only how many instances there are of hereditary talents, &c., but how many instances there are of such qualities not being hereditary.

Until something of this sort is attempted, we can know nothing about the matter inductively; while until physiology and chemistry are much more advanced, we can know nothing about it deductively.

ON BRITISH WILD FLOWERS CONSIDERED IN RELATION TO INSECTS. (b)

THE author of this interesting little volume, one of the "Nature Series," believes some apology is due, from the circumstance that, although a naturalist, he has made no "serious study of botany until recent researches brought prominently before us the intimate relations which exist between flowers and insects." Sir John Lubbock is well known for his love of natural history, and for a rare power of placing a subject in a popular and attractive form before his readers, and no apology is needed for an attempt, which is undoubtedly a successful one, to direct attention to the intimate and important relation that exists between wild flowers and insects.

The intimate relation now known to exist between flowers and insects was first brought to light so long ago as the year 1793 by Springel. He pointed out that the forms, colours, scent, and honey of flowers are related to the visits of insects, and that this busy, useful tribe of little creatures transfers the pollen from the stamens to the pistil, and consequently forms and colours of flowers were modified and influenced by those visits. His work did not, however, attract much attention until the publication of Darwin's researches, who also was the first to discover that insects transfer the pollen from the stamens of one flower to the pistil of another. The importance of this cross fertilisation has since been proved by Darwin's continued researches, followed up by those of other naturalists, Hooker, Bennett, and H. Muller. The latter observer has brought together

the observations of previous writers, and added to them an immense number of his own. As flowers are highly important to insects, so in many respects are insects an absolute necessity to flowers. Beside those properties adverted to, as scent, colour, &c., the ornamental parts of flowers have special reference to the position of the honey. These honey-guides to insects are, it appears, altogether wanting in night flowers; and it may be laid down as a rule that those flowers which are not fertilised by insects possess neither colour, scent, nor honey. Sir John Lubbock, after describing the parts of the flower engaged in the fertilising process, refers to a number of very interesting examples of cross fertilisation, as well as other curious experiments. "But if flowers have been modified with reference to the visits of insects, insects have also in some cases been gradually modified so as to profit by their visits to flowers. This is especially the case with reference to two groups of insects—namely, bees and butterflies. Although the whole organisation of the insect might be said to have reference to these relations, still the parts which have been the most profoundly altered are the mouth and the legs. If we are asked why we assume that in these cases the mouth and legs have been greatly modified, the answer is, that they depart greatly in type found in allied insects, and that between this original type and the most modified examples various gradations are to be found."

The author conclusively exemplifies this in a number of carefully executed drawings of the mouth and legs and parts concerned in the process. That the perfume of flowers exerts a considerable attraction to insects, no one who has watched a bee in a green-house will be inclined to doubt. Bees also are much attracted by odours agreeable to ourselves; while flies, on the contrary, prefer colours and odours which to us are decidedly unpleasant. In some cases the author observed that the effect of colour and scent on insects is also greatly enhanced by the association of several flowers in one bunch, as in the lilac, wild hyacinth, &c., while some insects confine themselves to particular flowers. Perhaps no group of flowers show so many remarkable adaptations in their special relations to insect fertilisation as orchids. To Darwin we are indebted for an immense amount of curious and highly instructive information about these beautiful flowers.

A remarkable peculiarity of plants and flowers with reference to their relation to insects is the habit of "sleeping" which characterises certain species. The habit of closing their petals during rain is obviously to prevent the pollen from being washed away. But why should flowers go to sleep?

"In animals we can understand it; they are tired, and require rest. But why should flowers sleep? Why should some flowers do so, and not others? Moreover, different flowers keep different hours. The daisy opens at sunrise, and closes at sunset, whence its name, 'day's eye.'" Many open and close, it appears, at particular hours, as if to guard against the robbery of the pollen by insects incapable of fertilising flowers; while wind-fertilising flowers never sleep, and night-flowering blossoms are generally deficient in the attractive scents, spots and lines which serve as honey-guides to bees.

We have said enough to show the interesting nature of the subject, which, as our author observes, "is as yet only in its infancy," while it offers "a rich field for observation and experiment," and we sincerely trust he may have the leisure and inclination to pursue these investigations, and thus materially aid in completing a work so promising in results as that of the fertilisation of flowers by insects.

ESSENTIALS OF THE PRINCIPLES AND PRACTICE OF MEDICINE (a).

THIS is a handbook upon the Principles and Practice of Medicine, by the Professor of Hygiene in the University

(a) Brierre de Boismont, "Des Hallucinations," p. 536.

(b) "On British Wild Flowers considered in relation to Insects." By Sir John Lubbock, Bart., M.P., &c. Macmillan and Co. 1875.

(a) "Essentials of the Principles and Practice of Medicine." By Henry Hartshorne, A.M., M.D. 4th edition. 550 pages. Philadelphia: Henry C. Lea. 1874.

of Pennsylvania, and, as the title-page reveals the fact that it has reached a fourth edition, we presume that the voice of the profession in America has pronounced an opinion so favourable as to place it beyond the influence of adverse criticism. Unquestionably it deserves the success it has achieved. The author manifests a complete acquaintance with the latest researches of European physicians upon questions touching the principles of medicine; and in the chapters devoted to practice, it is evident that he has carefully studied the accepted authorities, and has condensed the theories and practice of the latest writers, whose voluminous works form the ordinary text-books of the medical schools. That portion of Dr. Hartshorne's handbook which is devoted to the Principles of Medicine will at once attract the student and practitioner by the excellence of its arrangement and the really valuable information compressed within a very small compass—witness the chapters upon general pathology, the examination and microscopic appearances of the urine, the physical diagnosis of disease, the use of the laryngoscope, the application of electricity in the treatment of disease, the spirometer, and the other modern aids to diagnosis. This section, extending to 160 pages, forms a very valuable handbook in itself, upon various topics, and not generally put before the student in works devoted to the principles of medicine. The author's style is clear and forcible, and he possesses in a remarkable degree the art of condensing without obscurity the conclusions which the original authors have stated at great length; and, while he fairly represents and balances conflicting views, he does not hesitate, guided by his own practical experience, to inform his readers of the line of practice to which he gives a preference. The illustrations throughout the volume are exceedingly good, the definitions are satisfactory, often original and valuable, and we do not remember any work which combines so much reliable information, and presents it in so clearly arranged and compact a form. To the student who has carefully read the larger works on the practice of medicine we can safely recommend Dr. Hartshorne's book as a very complete synopsis of the latest phases of medical theory and practice, and the busy practitioner can with advantage consult its pages when he is desirous of refreshing his memory upon some special point. The student ought to use this handbook in the manner that he may be supposed to use his own note-books upon the subject of the practice of medicine, namely, as a condensed *résumé* of the facts to be more laboriously acquired from a prolonged study of the ordinary text-books, its value consisting in the circumstance that it presents in a very concentrated form the varied information acquired at a great expenditure of time and labour in the perusal of original works comprised in many volumes. Valuable as such a synopsis of medical practice is as a compendium for the student, he must not trust to it alone, and for this reason, that the tenacity with which the acquisitions of his student days are retained in his memory depends not alone upon the amount of attention he may give to the study of medicine, but still more to the duration of the effort of such sustained attention. Manuals such as this, which contain in the most condensed language the views of many writers, cannot be legitimately used for the acquisition of knowledge, although they may be invaluable for awakening the recollection of facts already acquired and treasured up by varied and continuous study. With this caution we can strongly recommend Dr. Hartshorne's handbook to the students of the Dublin schools.

ON SPERMATORRHOEA. (a)

THE subject of "*pertes seminales involontaires*," or, as the disease is called in this country, *spermatorrhœa*, has

(a) "*On Spermatorrhœa: its Pathology, Results, and Complications.*" By J. L. Milton, Surgeon to St. John's Hospital. Tenth edition. 1875. London: Hardwicke, Piccadilly. Pp. 163.

always been confessedly a difficult one to treat. Love and marriage are sore subjects to the human race, especially in old and densely populated countries like England, France, or China. This is the fundamental reason why the subject of involuntary seminal emissions has been always more or less avoided by writers on medicine. For what, after all, is to be done? A young man comes to us, say of the age of 19, suffering from three or four emissions of semen a week. Are we to say, like one of the greatest London surgeons of the day—"Go to the other sex, I cannot cure your emissions, but I can cure you of gonorrhœa or syphilis?" or are we to advise the young man to marry, and bring unfortunate paupers into the world to be supported by their grandparents? or, finally, are we to give the patient some placebo, and tell him not to mind being ill? For to these conclusions must we come in some way or other.

Mr. Milton makes a good remark on this point in page 7, where he narrates how "some inventive genius at Paris conceived the happy idea of getting rid of the venereal disease altogether by turning out those affected with it to die of cold and hunger, much in the same way as lepers and idiots were caged, flogged, and tortured, with an eye to their improvement, moral as well as physical." He adds (page 10): "In my opinion there is only one remedy for this state of matters, and that is, for the leaders of professional opinion openly to recognise the disease. That the disease exists to a very great extent, far greater than is generally thought; that it yearly reduces hundreds, if not thousands, to impotence, and all its attendant evils, hypochondria, weariness of life, insanity, and so on; that not only every town, but every village could show victims to this neglected malady, are facts which I feel assured will not be disputed by those who have looked into the matter. And the remedy for all this misery is to leave matters to take their course! Certainly human ingenuity could devise no more efficient system for cutting the patient off from all chance of relief, and encouraging those who are ready to plunder him and aggravate his sufferings. Not one patient in fifty would, if he could avoid it, go to a quack; that he is driven to such a step is in a certain degree due to the present state of professional opinion on the subject."

Mr. Milton's work is divided into five chapters. The first of them is introductory. Chapter II. treats of the pathology and complications of spermatorrhœa. Involuntary seminal emissions constitute a large proportion of the cases about which the medical man is consulted, and he thinks that it is to this class that the name of spermatorrhœa ought to be confined. There is also, he says, an imperceptible draining away of semen, which may occasionally be found in the lower layers of the urine. This latter case, we suspect, is very rare indeed. Mr. Milton confesses that (p. 15).

Nocturnal emissions may be said to require treatment when the patient feels worse from them, and in men after 23 or so more than one emission a month requires attention. Mr. Milton alleges that he has often been consulted by young men suffering from acne, a disease which is supposed to have some connection with seminal emission; but most of the patients were continent. Emissions, says Mr. Milton, are invariably more or less injurious.

Diurnal emissions are not very common, says Mr. Milton; but when patients are travelling by railway or on horse-back they are occasionally subject to them. Many diurnal emissions are merely prostatic mucus.

Mr. Milton protests against the idea that an emission causes no more loss of power than a single connexion. Mr. Milton is too fond of harsh language, and applies epithets to Everard Home, and to Rousseau, that may be English in downrightness, but are dangerous weapons to play with. Could he not omit them in his next edition?

Mr. Milton, p. 26, gives the case of a patient going to physician after physician complaining of emissions, and by some is recommended tonics, by others connexion: "At last I know that scores of patients have told me that this was the answer they received. If the patient try

this and find himself unable to effect it, he is certain to be seriously and unnecessarily alarmed; if he succeed, he will go on substituting one form of emission for another till the first period of continence warns him by a return of the discharges that he is no nearer a cure than he was before. Then the patient wanders from one practitioner to another, and if he do not meet with some one who will grapple thoroughly with the disorder, purge his bowels well, blister the back of the neck and groins, put him on low diet, and cauterise the urethra, &c., till he has stopped the nocturnal emissions, he will go on injuring his health by the use of tonics and worrying about his symptoms till he makes shipwreck of it. I am putting no imaginary case; I merely describe what I have heard scores of times."

This last sentence shows that Mr. Milton is fond of cauterising the urethra and other operative procedures. We really thought all these things had been weighed in the balance and found wanting, and have come to the conclusion that the only rational cure for nocturnal emissions is connexion with the other sex. There are, of course, frightful cases of such gravity that our poor patients are exhausted by continual emissions, and quite perhaps permanently impotent. These are, like phthisis, incurable diseases in some cases; but in the vast mass of cases of nocturnal emissions marriage, i.e., exercise of the organs, is a rapid and brilliant cure. But, alas! how dangerous it is to give our advice in such cases. The whole of the problem of society lies in our appreciation of this point. And it is a heavy responsibility which any practitioner consulted about involuntary seminal emissions has to take on himself, whatever be the advice he gives.

Mr. Milton's book is worth reading, because so few books are published on this subject.

Foreign Medical Literature.

SIMPLE ULCER OF THE STOMACH—CURE BY MILK DIET—ADVANTAGE DERIVED FROM THE SIMULTANEOUS USE OF PEPSINE AND EXTRACT OF MALT.

(Translated from the *Journal de Médecine* by FRANCIS M. LUTHER, M.D.)

QUITE recently M. Siredey had an opportunity of observing a young man of three-and-twenty who had been sent to him as suffering from cancer of the stomach. He certainly had black vomits, but the vomiting, generally very copious, often brought up a considerable quantity of red blood. Pain was likewise complained of on a level with the xyphoid cartilage, and acute pain in the spine opposite to it. These symptoms had appeared suddenly. Not finding any tumour, and considering the youth of the subject, M. Siredey concluded it was a simple ulcer of the stomach. He submitted the patient to a rigorous milk diet, and a rapid cure soon confirmed his diagnosis. As soon as the vomiting and hæmorrhage ceased, the wasting and alteration of the features which had been considered signs of cachexia diminished. During his sojourn of six weeks in hospital the young man increased fourteen pounds in weight.

Cases of the kind are not very rare; the diagnosis cancer is apt to be made, an error which should be guarded against, because they are curable cases. However, it is often necessary to feel one's way; and in another case where milk completely failed, M. Siredey obtained a cure by quite different treatment, intended to compensate by chemical means for the insufficiency of digestion. In this case, as in the preceding, M. Siredey thinks that the age, the peculiar pain, and the hæmorrhages allow one to establish the diagnosis simple ulcer.

A man, aged 26, came under M. Siredey's treatment in the year 1873. This man had entered the navy at fourteen, and while voyaging about for four years had never been sick. During a sojourn of two years at Senegal, at the age of eighteen or nineteen, he had fevers, which lasted eighteen months. He was treated with ipecacuanha and quinine, and on the third day was seized with vomiting. Alcoholic stimulants, especially when introduced into the stomach, caused pain. Acute burning pain was felt on a level with the ensiform cartilage. The vomited matter sometimes consisted of food, sometimes was black, like coffee-grounds. After being under treatment for a considerable time he got well. Then, one day, as he was returning to France, the vomiting suddenly began again, and from this period he had numerous intermissions and attacks alternately of rest and of vomiting, with real hæmatemesis.

In 1872 he took a situation with a wine-seller, and frequently indulged in alcoholic potations, which appear to have singularly aggravated his complaint. In the month of January, 1873, the hæmatemesis returned, and he had to enter La Pitié, where he was six weeks under treatment.

In the month of April, 1873, he was again taken with hæmatemesis, after new alcoholic excesses. He then came to the Hospital Lariboisière. The pain at the xyphoid appendix was acute; he vomited absolutely everything he took. Ice, milk with Vichy water, were vomited immediately after being ingested. M. Siredey then prescribed 150 grammes of raw meat (about 5 ozs.), and 30 grains of pepsine wine (1 oz.). During ten days the patient had no vomiting, taking only ice instead of drink, and no other food except raw meat, increasing the quantity to 500 grammes, and following it up with the pepsine wine. He then tried to eat bread, but he soon vomited it up. Fifty centigrammes, or close to ten grains of diastase (made from barley) was then prescribed, to be taken after the bread, still continuing the pepsine wine with the meat. For five days there was no vomiting. It returned upon the patient taking a "tisane." After several days, the diastase running short, the lad was again taken with vomitings. These disappeared when he was able to get a teaspoonful of extract of malt at each meal.

After two months the patient left the hospital, in tolerably good condition, continuing to take every day the pepsine wine after the meat, and the extract of malt after the bread. He was seen again, after the expiration of two months, in very fair health, with the exception of slight gastralgia and difficult digestion. He had gradually left off the extract of malt, but continued to use the pepsine wine, taking a dessertspoonful at each of his repasts.

One should not count too much on the chemical effects of drugs; but neither should one reject them altogether. It may be seen from the preceding observations that amylaceous food was digested upon the introduction of diastase into the stomach, and azotised matter upon the introduction of pepsine. This artificial digestion succeeded wonderfully, and, the patient being able to retain his food, recovery gradually ensued, leaving only very trifling derangement of the digestion.

A NEW DISSOLVENT OF PHOSPHORUS.

By M. GERRARD.

(Abridged from *l'Union Pharmaceutique* by A. VICKERY, Chemist and Druggist of the Pharmaceutical Society of Great Britain.)

THE new substance proposed by M. Gerrard is resin, the residue of the distillation of turpentine; it can dissolve 4 per cent. or more of phosphorus. He gives to this new preparation the name of résine phosphorée. It is prepared as follows: Take a wide-mouthed stoppered bottle of strong glass, weigh it, heat it, and fill it very nearly with melted resin; again weigh it, and for every 98th part take 4 of phosphorus. Being careful that the

resin is still completely melted, the phosphorus is introduced, and the bottle immediately well stoppered. Place the bottle in a sand-bath, previously warmed, and digest at a temperature of 200° C., frequently agitating until solution is complete.

The resin should be quite free from water, and certain precautions must be observed. The phosphorus should be added in a single piece if possible, and be immediately sunk beneath the melted resin, otherwise it will take fire. The bottle should be almost full, or there is risk of accidents, and in addition the volatilised phosphorus will be deposited in the upper part of the bottle. The sand-bath should be maintained at a temperature between 200° and 210° C.; at a higher temperature the resin boils, and phosphorus takes the amorphous state. Formula proposed is as follows:—Résine phosphorée, strength 4 per cent., and powdered white sugar, quantity sufficient for pills containing each 1 milligramme of phosphorus; pulverise the resin, add the sugar, and make a pilular mass by means of tincture of balsam of Tolu.

M. Abraham recommends that balsam of Tolu be used instead of resin, as it is fusible below the temperature of boiling water, and at the same time denser. By this means a fertile source of danger to the operator is avoided, and the phosphorus is not liable to oxidation. The baume de Tolu phosphoré of M. Abraham therefore appears a preferable preparation.

Correspondence.

CIRCUMCISION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I cannot agree with Mr. Powell as to the necessity of circumcision regarding Christians. I think this gentleman would do well to reflect that amongst savage races venereal diseases were not known till introduced by the white races. The savages never practised circumcision. I have been a close observer of their habits and customs in various parts of the world. They are, as a rule, a water-washing race, particularly the women. Moses made a religious edict of circumcision because he had to manage a notoriously unclean lot in his day. The habits of the Continental Jew race up to the present period speaks for itself. A correspondent of the *Telegraph* last year described the European Eastern Jews and their habits, enough to nauseate even a doctor. There is no question in my mind and experience that woman creates in herself, by promiscuous sexual intercourse, vaginal diseases, developing into venereal, and men afterwards, when infected, spread it. Cleanliness is next to Godliness, and women should always frequently wash their persons, as their vaginal secretions invariably alter if they do not do so. Let men also wash their persons, and no circumcision will ever be necessary. On the contrary, Nature is a far superior surgeon or doctor to man. She did not give a covering to the glans penis, or eyelids to the eyes, without a perfect reason. I look on a Rabbi as having religious circumcision on the brain, and many young surgeons—aye, old ones too—have in my experience “operation” on the brain largely developed. Several Jews told me that circumcision induced constant excitement of the penis. The result was chronic seminal discharge and debility following.

Yours truly,

A SURGICAL OBSERVER OF EXPERIENCE.

FUNGUS DISEASE OF THE EAR.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Noticing in your issue of March 24 a review of Dr. J. P. Cassells' paper on “Fungus Disease of the Ear,” in which you very properly draw attention to the fact that Dr. Cassells is mistaken in his statement that fungus affections of the ear have been overlooked in England, basing such conclusion on Mr. Hunter's statement in 1874, “that he had not seen such a form of ear disease, nor did he know of an aural surgeon who had,” in which you also mention that

Mr. John Grove had published a case in the *Quarterly Journal of Microscopical Science* in 1857, illustrated by some admirable drawings of these affections, I think it but fair to draw attention to the fact that in my work on “Deafness and Diseases of the Ear,” published by Messrs. Baillière and Co. in 1873, I devoted a chapter to the diagnosis and treatment of fungus growths occurring in the aural structures, and which are by no means of such rare occurrence as some writers would lead you to suppose. To discriminate between fungoid and polyloid growths in the ear requires a certain amount of careful investigation, but when such care is given the diagnosis is attended with but little difficulty.

I am, Sir, your obedient servant,

J. P. PENNEFATHER.

57 Harley Street, Cavendish Square, W.

THE DISEASE CALLED SCARLATINA, OR SCARLET-FEVER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—It appears that this disease, like some others, carries off its victims before the doctor has had time to think about it; the poison in such cases must be of a very virulent character, and it seems to me in cases I have heard and read of that the doctor might just as well have remained at home for all the good he did or could do. When this disease appears in public seminaries, or other such places, the precaution taken is the dispersment of the inhabitants, with the permission to carry with them the seeds of the disease for the purpose of dissemination. Is this prudent? Let us look at this disease in a scientific manner. What is scarlatina? It appears that the surface of the body becomes of a scarlet red, that is, the microscopic arteries of the cuticle are injected with arterial blood, the result of a peculiar poison having been absorbed into the sanguiferous system, accompanied by many of those symptoms incident to the absorption of such poisons. If the poison is mild the cuticle alone will suffer; it will be destroyed and may be scraped off in scales, and a new one is quickly formed; there is not much suffering, and the recovery is easy; but great care should be taken to prevent a relapse. When the poison is more virulent the mucous coat of the throat and mouth are attacked, and in very severe cases no doubt the disease proceeds further down, and these cases are almost always fatal. This disease, then, is simply inflammation of the cuticular and mucous surfaces, the result of a particular poison. In all such cases we may receive it as a general law that the blood is disorganised. The treatment by sudorifics or diaphoretics is, in my opinion, little better than saying, “I will do what I can,” as they cannot act upon the blood in such a state. The scientific treatment should be what I call purification and repression; the blood should be purified by the nitrate of potash, and the arteries of the mucous surfaces repressed by the muriated tincture of iron. The worst case I ever had was that of a newly-married lady, and I saved her life by this mode of treatment. The discovery of this mode is not mine, it belongs to my son, Dr. J. W. Lane, of Bishop's Castle, who has been very successful in his mode of treating this malady. The tincture may be used in its purity if diluted with water, equal parts of each, or one of water to three of the tincture, and applied with a camel-hair pencil every two hours. In the case I have spoken of, the husband told me afterwards that, on observing the relief his wife obtained from the application of the tincture, he applied it himself every hour, thereby, as he thought, hastening the recovery. No time should be lost in the active treatment of this malady, nor should the patient be left, if possible, to an ignorant careless nurse that might sleep nearly the whole night. Nauseating medicines in this disease will not arrest the heart's action, nor diminish the injection of the arteries. Patients should not be crowded together; free ventilation and plenty of room; there should be a fire in the room if possible, and the heat about 60° Fahr.; do not force food when there is any reluctance to take it, as it only annoys and irritates the stomach. Experience has proved that a change even from room to room in the same house has had a salutary effect. If the doctor's orders are not carried out to the very letter he should not be blamed if from their neglect the case

should prove fatal; and we cannot overlook the most extraordinary fact that, a convalescent returning home, the whole family may be attacked. But there will be always this to be said, that they might have been attacked had the person not returned, as, how did it first originate?

I am, Sir, yours most obediently,

Douglas, Isle of Man,
March, 1875.

ALEX. LANE, M.D. R.N.

Gleanings.

Milk Kept by Chloroform.

THAT milk can be kept sweet by the addition of a little chloroform is a suggestion for which we have to thank Mr. Barnes, of London. When added in sufficient quantity to fresh milk, the lactic fermentation is prevented. To two eight fluid ounces of fresh milk was added respectively, ten and twenty minims of chloroform; they were kept in a warm place, and occasionally agitated; after five days had elapsed, that containing ten minims had developed lactic acid in quantity sufficient to separate the casein, whilst that containing twenty remained fresh and good. It might be found convenient to preserve milk in this manner, always taking care to boil it just before using, in order to drive off the chloroform.

Statistics of Physicians and Druggists in America.

A WRITER in the *American Journal of Pharmacy* gives some tables from the last three census reports, by which it appears that the physicians have increased in about the same ratio as the population, the variation being very trifling for the past twenty years, while the druggists have increased in very much greater proportion; the ratio being, for the ten years from 1850 to 1860, 79.7 per cent., while the increase of population was 34 per cent.; and for the period from 1860 to 1870, they increased 57.4 per cent., while the population increased but 23 per cent. The patent medicine manufacturers have increased at each interval over 100 per cent.

In 1850 there was one physician to 572 persons; in 1860, one to 576, and in 1870; one to 638.

The Pathological Anatomy of the Insane.

PROFESSOR MEYNER sustains the view of Baillarger, that certain conditions are found on the surface of the brains of patients with progressive paralysis and mental disturbance, especially a destruction of the superficial cerebral layers with a thickening of the membranes, which is looked upon as an evidence of a chronic diffuse periencephalitis.

He also finds in the substance of the brains of those who have had typical progressive paralysis, with an acute exacerbation of the symptoms, the so-called serous softening of the brain-tissue. This was found, by the microscope, to be an active inflammatory process, and could not possibly be looked upon as a post-mortem change.

The results of such pathological investigations have strengthened him in the opinion which he expressed ten years ago, that the similarity in the changes in the ganglion-cells in the connective tissue, and in the vessels which are found in the brains of paralytics, with the changes in the oedematous zones about acute encephalitic deposits in the brains of others with cerebral disease, points to the previous existence of an affection related to encephalitis which has run its course in the brains of paralytics. He has found precisely the same conditions in the atrophied horn of Ammon of epileptics and in the brains of paralytics. He divides these changes into two series: the one an evidence of existing stasis, the second a proof of the solution of pre-existing stasis. By the discovery of the existence of stasis, the process which goes on in the brains of patients who suffer with progressive paralysis is proved to be of an inflammatory character.—*Wiener Med. Press*, No. 3, 1875.

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£1 2s. 6d., at the offices in London, Dublin, or Edinburgh.

M.R.C.S.—Your letter arrived too late for insertion in this number. It shall appear in our next.

Mr. C. J. T.—Received with thanks.

SEVERAL communications, letters, &c., are unavoidably held over for want of space.

VACANCIES.

Consumption Hospital, Brompton. Clinical Assistant. Board and residence in the Hospital. Full Particulars of the Secretary. (See Advt.)

Charing Cross Hospital. Resident Medical Officer. Board and residence, but no salary. Applications to the Secretary.

Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 63 Market Street, Bradford.

London Hospital. Lectureship on Comparative Anatomy. Applications to be sent to the Vice-Dean.

Wolverhampton Hospital. House Surgeon. Salary, £100 per annum, with board and residence. Address the Chairman of the Medical Committee.

Queen Adelaide's Dispensary, Bethnal Green. House Physician. Salary, £100, with furnished apartments. Address the Hon. Sec.

Liverpool Royal Infirmary. Resident Medical Officer. Salary, £100 per annum, with board, &c. Address the Chairman of Committee.

Kent Lunatic Asylum. Senior Assistant Medical Officer. Salary, £220, with furnished apartments, &c. Applications and Testimonials to Messrs. Beale and Hoar, Maidstone.

Asxminster Union. Medical Officer. Salary, £23 per annum, exclusive of midwifery and other fees. Address the Clerk to the Union.

APPOINTMENTS.

ANDREW, H., F.R.C.S.E., Medical Officer of Health for the Truro Urban Sanitary District.

BALLANTYNE, A., M.D., L.R.C.S.Ed., Medical Officer to the Dalkeith Union Poorhouse.

BARLOW, T., M.D., M.R.C.P.L., M.R.C.S.E., Assistant Physician to the Hospital for Sick Children, Great Ormond Street, London.

CAMERON, C. A., L.K.Q.C.P.I., F.R.C.S.I., Professor of Chemistry at the Royal College of Surgeons, Ireland.

CHAMBERS, J., M.D., C.M.Q.U.I., Professor of Anatomy in the Indiana Medical College, Indiana State University, U.S.A.

COLMAN, T. J., M.D., M.R.C.S.E., Medical Officer for No. 3 District of the Clifton Union.

DICKSON, H., M.B., Assistant Medical Officer to the Bristol Lunatic Asylum, Stapleton, near Bristol.

DOBELL, H. B., M.D., M.R.C.P.L. (for sixteen years Physician), has been elected a Consulting Physician to the Royal Hospital for Diseases of the Chest, City Road.

EVANS, W. H., M.R.C.S.E., L.R.C.P.Ed., L.M., a Surgeon to the St. John's Wood and Portland Town Provident Dispensary.

FAUSSETT, J. D., L.M. & T.C.D., Assistant Medical Officer to The Friends' Retreat, near York.

GEE, S. J., M.D., F.R.C.P.L., a Physician to the Hospital for Sick Children, Great Ormond Street, London.

HAYDEN, W. G., L.R.C.P.L., M.R.C.S.E., L.M., Medical Officer to the Workhouse, Wycombe Union.

KIRKPATRICK, J. E., M.B., F.R.C.S.L., L.K.Q.C.P.I., Medical Officer to the County Dublin Prison, Kilmalham.

Deaths.

BEATTIE.—On the 17th March, Wm. Beattie, M.D., of Upper Berkeley Street, aged 82.

HEMINGWAY.—On the 17th March, Henry Hemingway, Surgeon, of Dewsbury, aged 85.

MAY.—On the 14th March, Henry Storme May, M.D., of Summerlands, Exeter, aged 86.

MOLONY.—On the 21st February, at Stoney Hill, Golden Spring, Jamaica, Dr. J. F. Molony, formerly of Banis, co. Clara.

RALES.—On the 12th March, Samuel Rales, L.R.C.P.Ed., of Turnham Green.

ROBERTS.—On the 4th March, at Llanidan Rectory, Denbighshire, David W. Roberts, M.D., late of Llanfairfechan.

SMITH.—On the 17th March, Henry Bennett Smith, M.R.C.S.E., of Walkern, Herts, aged 77.

SMITH.—On the 12th March, John Smith, M.R.C.S.E., of Alford, Lincolnshire, aged 75.

TAYLOR.—On the 19th March, Dr. James Taylor, of Viewraig House, Aberdeen, aged 84.

WATSON.—On the 15th March, at Morningside, Edinburgh, Robert Watson, L.R.C.S.Ed., Surgeon-Major late 18th Royal Irish.

LECTURES ON HOMŒOPATHY, instituted by the British Homœopathic Society.—Dr. RICHARD HUGHES' Course of Lectures on HOMŒOPATHIC MATERIA MEDICA.—The next Lecture—Subject, ARSENIC—will be delivered on Thursday, April 1st, at 5 p.m., at the London Homœopathic Hospital, Great Ormond Street, Russell Square, W.C.
Members of the Medical Profession will be admitted on presentation of address card. Medical Students can obtain admission on application to Dr. Bayes (Hon. Sec. Lectures Committee), 58 Brook Street, W.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE.

50 LINCOLN'S INN FIELDS, W.C.

J. BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.,
 &c. (Kirk's Coll.), and Author of *VIA MEDICA*.

Has always upon his books a large number of desirable Investments and available Appointments for negotiation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

PRACTICES AND PARTNERSHIPS NOW OPEN for Negotiation (in addition to those advertised in Dr. Langley's List, which is sent post free on application).

- Z139. SURREY. Good class COUNTRY PRACTICE yielding over £450 a year. Appointments £75. Situate about 30 miles from London. Convenient house. Rent £65 a year. Satisfactory reasons can be given for retirement. Premium would depend upon the length of introduction required.
- Z137. GLOUCESTERSHIRE. Pleasant COUNTRY PRACTICE, realising about £500 a year, for transfer. Midwifery cases chiefly £2. 2s. No opposition. Appointments bring in £60. The house is convenient, with stabling, coach-house, &c. A thoroughly efficient introduction can be given.
- Z134. DEATH VACANCY. A most eligible opportunity is afforded to a gentleman of active habits, to enter upon a MEDICAL PRACTICE capable of immediate increase. It has been held by the late incumbent for thirteen years, is unopposed and wholly transferable under suitable conditions. The actual receipts during the last three years have averaged £450 a year. Easily-worked appointments produce £180 a year. No assistant required, and one horse sufficient—in fact, the patients reside within such a narrow area that the practice could be worked on foot. Population about 2,000. There is a convenient residence recently erected, for a surgeon, fitted with every modern appliance. It contains ten rooms, with two gardens, stabling, coachhouse, &c. Rent £40. An efficient "locum tenens" is in charge. The locality is easy accessible by rail from town. Distance under 70 miles.
- Z133. PARTNERSHIP in a LONDON CASH PRACTICE. Half share for disposal. The receipts average over £1,250 a year. There are about 50 cases of midwifery annually, but this department can be increased to any extent. Expenses about £8 a week. An effective introduction can be given. Premium £750.
- Z132. Within 30 miles of London, a select RURAL PRACTICE, held by the present incumbent for nearly half a century. Receipts £600 a year. No opposition within four miles. Very little midwifery; fees £1 1s. and upwards. Appointments, easily worked, produce £150 a year. The house contains ten rooms, with detached surgery, consulting room, stabling, coach-house, &c. Rent £40. Twelve months' introduction would be given if desired, but the vendor would continue to reside in the locality, and thus give the best guarantee of good faith. Premium dependent on the length and character of the introduction required.
- Z130. Within 50 miles of London, and six miles from the sea, a pleasant COUNTRY PRACTICE, held by the present incumbent for twelve years, and realising £950 a year. No opposition within three miles. Appointments produce £260 a year. The residence contains twelve rooms, with good gardens, stabling, coachhouse, &c. Rent £60. An effective introduction can be given, and a suitable man would secure the whole connection. Premium one year's purchase.

RESIDENT CLINICAL ASSISTANTS.—VACANCIES having occurred in the HOSPITAL for CONSUMPTION and DISEASES of the CHEST, those gentlemen who are desirous of becoming candidates for the vacant offices are requested to send in their applications, with testimonials, on or before Monday, the 5th April, and to attend the Medical Committee on the following day at 4 o'clock. Testimonials as to moral character, as well as to medical qualifications, are required. Further particulars may be obtained at the Hospital.

Brompton, March 10th, 1875.

PHILIP ROSE, Hon. Sec.
HENRY DOBBIN, Sec.

SURGICAL SOCIETY OF IRELAND.—THE NEXT MEETING OF THE SOCIETY will take place on FRIDAY EVENING, 2nd APRIL, 1875.

Chair will be taken at half-past Eight o'clock precisely.

B. WILLS RICHARDSON, F.R.C.S.I., } Hon. Secs.
HUMPHREY MINCHIN, F.R.C.S.I., }

Royal College of Surgeons, Dublin,
17th day of March, 1875.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £25 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote. Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office.

40 MOLESWORTH STREET, DUBLIN.

W. O'NEILL, Secretary.

NITROUS OXIDE GAS,
OR PROTOXIDE OF NITROGEN,

FOR

PERFORMING DENTAL OPERATIONS PAINLESSLY.

Mr. A. CLIFFORD ESKELL, Surgeon-Dentist, of 11 Clara Street, Dublin, administers the Nitrous Oxide Gas with the latest improved apparatus, and in the most approved methods. Hours of attendance, from 10 to 5. Only London address, 8 Grosvenor Street.

MIR. I. SANDHEIM,

Dentist,

16 SUFFOLK STREET,

DUBLIN.

N.B.—A Vacancy for a Pupil.

BUTLER'S MEDICAL HALL,

53 & 54 LOWER SACKVILLE STREET,
DUBLIN.

ESTABLISHED A.D. 1817,

For Compounding Prescriptions and Supplying Genuine Medicines, is conducted, as formerly, under the careful superintendence of

WILLIAM STARKEY, M.D.,

Licentiate Apothecary

The Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

THE LUMLEIAN LECTURES.

ON LIFE, AND ON VITAL ACTION IN HEALTH AND DISEASE. (a)

By LIONEL S. BEALE, M.B., F.R.S.,
Physician to King's College Hospital.

LECTURE II.

Of the Constitution of Living Matter.—This most difficult problem has been very little considered, probably because the absolute distinction between the living and the non-living matter of a living body has not been recognised. Indeed, authorities who have written very recently, evidently do not admit that the distinction I have drawn between living matter and formed material exists in nature.

Feeling confident that ere long the remarkable characteristics of living matter, and its distinction from all formed matter will be admitted, I shall venture to speculate upon the constitution of the bioplasm in the living state. In the first place I would remark that all bioplasm contains moisture. Water is necessary to its constitution, and is invariably present in every kind of living matter, and in every state in which living matter can exist. As I have before intimated, movement of particles from centres is involved in my idea of life. Each movement would be impossible in the absence of water. The moment a particle of bioplasm is deprived of its water, it must therefore die. In cases of resuscitation after desiccation, the bioplasm has not been perfectly dead—has not been entirely deprived of its water.

Water must be very intimately associated with the particles of matter that live. These living particles cannot be regarded as dry solids, suspended in water and moving

freely amongst one another in the fluid, for, as already intimated, every particle is composed of smaller particles which are likewise in constant motion.

Now let us, guided by observation, try to realise what must be going on in every centre of the most minute of the multitudes of living centres which constitute the most minute living particle. And in the first place it is necessary to bear in mind that each central point when magnified seems to have circumference as well as centre. We may follow on in our imagination, nevertheless keeping true to the line of observation, and pass into the region of speculation, and still we shall find it impossible to reach in conception a true centre. One may imagine excessively minute compound semi-fluid molecules of pabulum, moving in fluid and coming within the sphere of the operation of molecules of living matter. We may conceive the lifeless passing among the very minute living particles, but to conceive how the atoms of the particles of lifeless pabulum separate from one another, and then become re-arranged and acquire new living powers like those which existed before them in a living state is not yet possible. There must be transference of power from the living to the non-living, the latter gaining power from particles which have imparted that power without having lost or created anything. In fact a vast amount of non-living matter may acquire living property or power in a very short period from an extremely minute particle of matter already in a living state. There seems no limit to the capacity of power of making alive—no loss being occasioned by the repetition of the process—no failure or exhaustion.

Such then I believe to be the nature of the wonderful changes which occur in the minute particles of every form of bioplasm in nature, from that of the bacterium to that of man. Not only do they characterise the bioplasm of health, but that of every disease-carrying particle, which has resulted by descent from the normal bioplasm of man or the higher animals, as long as its vitality and active powers exist. Between living particles and globules of oil and fragments of albumen or any non-living matter whatever, there cannot, therefore, be the remotest analogy.

That new centres of living matter appear in pre-existing living matter is a fact that has been proved by observation.

(of the Royal College of Physicians on Friday, March 27th.)

The so-called nuclei arise in pre-existing living matter, and nucleoli in the nuclei. In the new centres themselves a second series of new centres may appear, and in these a third series, and so on; and, what is still more remarkable is, that the properties or formative powers of these different series, and of the bioplasts resulting from their division and sub-division, may be different. The new power seems to be acquired by the matter at the time when, or just before, it comes into being as a new centre. The centres in question from which matter inherits vital properties and acquires the power of transmitting these onwards, must be extremely minute. Indeed, as to the real size of the most minute particles that are made to live, one hardly dares offer a suggestion more definite than the following—that on the one hand, they must be hundreds of times more minute than the smallest particle visible under an amplification equal to five thousand diameters; and, on the other hand, they must be larger, or at least heavier, than the ultimate atoms of their component non-metallic elements. It is remarkable that those who have spoken of *living atoms* should have thought so little about the matter as to have permitted themselves to suggest an absolute impossibility,—for it is obvious that *no single atom can be thought of as alive*. The idea of a living atom of oxygen or hydrogen or carbon or nitrogen is clearly untenable. We might as well talk of a living atom of sulphur or iron or lead. And it is absurd to talk of *dead* carbon, oxygen, or hydrogen atoms, since a living state of the atoms of these and other bodies is thereby implied; but such living state is inconceivable. Every form of matter that is alive is composed of several elements, and it is probable that the most minute particle of matter that lives consists of multitudes of atoms of several different substances in a state of collocation that cannot be compared with any other state of combination that is known.

But it is not merely the power of moving from centres, of progressive movement, of transforming pabulum, of forming new and peculiar chemical compounds that is acquired, but powers far more wonderful than these, by virtue of which the living matter produces living particles, generation after generation, from which definite organisms and definite and very different tissues in each single organism result. These powers are peculiar to the living world, and there are no forces, no behaviour of non-living matter which can be said in any way to resemble them, or to exhibit the most distant analogy to them. How these powers are acquired it is too soon to speculate, but I should, nevertheless, like to refer now to one or two points. First, I would remark that time exerts an important influence in the transmission of powers from living matter to that which descends. The time required for the production of a given result, though constant within certain limits for forms of life of the same kind, varies greatly with respect to different kinds of living things. Precisely corresponding changes take place within very different periods of time, and the influence of temperature, food, and external conditions is uniform only in the case of the same organisms. One particle of living matter much less than the one-fifty-thousandth, may take weeks or months to acquire its full powers. Another only a few days. We have not at present the data upon which to found general deductions, and we must withstand the temptation of framing laws and applying them to vital phenomena, until a good deal more shall be known than we have yet been able to discover, or assuredly the exceptions to the laws laid down will multiply faster than the exemplars.

Powers and properties have been attributed to pabulum, and some have said that the organism is only what it feeds upon. What the organism is, depends far more upon what the organism was that produced it than upon the particular material that constituted its food.

The pabulum of the tissues of complex animals is undoubtedly peculiar, and must be properly prepared before it can be taken up, but by what means is the preparation effected? The bioplasm of the tissues selects pabulum out of blood. But how is the blood itself formed? By bioplasm. Living matter takes up pabulum of the proper

kind and grows, at last becoming resolved into formed matters, which constitute the pabulum of other bioplasm, and this process occurs several times before our food becomes converted into our tissues. Whatever act of life we investigate we soon trace the phenomena back to bioplasm, and then we find ourselves face to face with the question of the nature and mode of working of vital power.

If the method by which non-living matter is converted into living matter is understood, by all means let it be explained. If conversion like that effected by living matter can be carried out in the laboratory let it be done; but if the change can be effected by living matter alone, let this be openly admitted, and let it be clearly stated, and in the most public manner possible, that the phenomena in question are peculiar to living matter, and cannot be shown to be due to physical and chemical changes.

By admitting vital power I am able to explain results without attributing metabolic influences to cell walls, cell contents, intercellular substance, walls of vessels, and other textures, which, in reality, are passive. I need not assume hypothetical actions and differentiations, or attribute to some hypothetical force, said to be akin to aggregation and crystallisation, phenomena which have not the faintest analogy with those processes, nor have I need to assume governing powers of which the mind cannot conceive, or matter-guiding forces acting in some unexplained way through all sorts of matter. *Vitality* acts in living centres upon matter only infinitely near the centre. This is all that is demanded by the terms of my hypothesis. I venture to think that few who consider the facts of the case will be indisposed to grant me thus much.

Origin of Life.—The far-fetched conjectures seriously advanced by some physical speculators concerning the origin of life serve to show what extreme difficulty has been experienced by those who have attempted to construct a plausible hypothesis by which the conversion of the non-living into the living might be reasonably accounted for. One great authority, dissatisfied with every suggestion, and being evidently convinced that no physical explanation of the origin of life upon our globe would ever be discovered, despairingly submits to us the proposition that life did not begin here at all, and that our earth was first peopled by the offspring of germs brought to us upon a fragment broken off from some distant orb that teemed with life. Whether even the simplest living forms would have survived after such a ride through space, unfortunately had not been determined by experiment, so the idea of our fauna and flora being derived from those of another world found little favour, and probably all who have considered the subject would now agree that it is probable that life-forms originated upon our globe, though there might be great difference of opinion concerning the precise mode of their origin.

“Evolution” is now supposed to solve the difficulty of life formation, but this term has had at least two meanings assigned to it. By some it has been restricted to the living world, while others have given to the term evolution a much wider signification, and have maintained that it should include not only the evolution of living forms from pre-existing living forms, but the formation of the living out of the non-living. There is, it is scarcely necessary to point out, the widest possible difference between these two doctrines, for while the one teaches that all living forms came direct from living matter without accounting for the origin of life at all; the other is a tenet of the fiery-cloud philosophy which teaches as a cardinal point that the evolution of life is but one of that great series of changes in which the evolution of all is comprised. But surely such an idea may, for the present, be regarded as a conjecture so extravagant as to be unworthy of serious consideration. Facts are wanting, and the arguments advanced in favour of the hypothesis are such as cannot have much weight, since it has been deemed necessary to bring forward, in their support, utterances of a prophetic character.

If, then, evolution is restricted to the living world, the origin of the first living thing will be still unaccounted for. The presence of a very simple living form seems to

have been assumed; but whether that being came of itself from the non-living or arose in consequence of some prior changes, or was formed by an act of creative interference is not suggested by the terms of the particular form of the hypothesis under consideration. Neither is the precise nature of the first living substance indicated, and we are even left in doubt whether one or two or many forms of living matter existed when the first beginning of life appeared.

Now with reference to the origin of the first living matter several not improbable suggestions present themselves to the mind, in all of which, however, it is assumed that the change from the non-living to the living was sudden and abrupt, and not gradual.

First, we may conceive that one form of living matter was produced direct from the non-living, and that from this all future living was evolved.

Secondly, we may prefer to imagine that more than one form of life originated from the non-living at or about the same time.

Thirdly, we might think it more in accordance with facts to conceive that several different kinds of bioplasm originated in the beginning of an epoch of life, from which all life of that epoch was derived. New forms originating anew in the next epoch, the results of evolution from the first gradually dying out as those of the second epoch increased and became dominant. As life-epoch succeeded epoch, new forms of bioplasm may have appeared as old forms of life died out.

But the above by no means exhaust the list of what I would term the reasonable hypotheses concerning the origin of life that may at once be suggested. All of them involve in some form or other the admission of a remarkable change in capacity or power not to be accounted for by physics. In all, the communication to matter of powers or forces which it did not always possess, and which it is conceivable might never have been communicated at all, is suggested.

Whether this communication of new powers occurred once only or was repeated at many successive periods in the remote past,—whether it be reasonable to consider a recurrence of the process in the future as probable or improbable, I shall not now venture to discuss.

What I particularly wish we should keep before our minds is that facts and arguments render it much more probable that the passage from the state of non-living to living is *sudden and abrupt, than that it is a gradual transition or scarcely perceptible gradation*. I should, however, clearly state that this inference is in opposition to the views of many authorities, and in particular is opposed to the clearly expressed opinion of one of the greatest discoverers and most acute thinkers of our time, who maintains that the conversion of physical into vital modes of force is continually taking place. It is suggested that the change from non-living matter to living matter is a transition easily effected and continually occurring. Of the facts in support of so startling a proposition I confess I am ignorant, nor have I succeeded in my efforts to discover any facts in the writings of those who appear to have accepted the conclusion in question, which has never failed to enlist advocates in its support from the time when it was believed that highly complex living forms were produced from earth or dew, to the present day, when the advocates of the doctrine are so terribly restricted in the discovery of parentless living particles.

We have now reached the point where we are brought face to face with the modern developments of the old doctrine of spontaneous generation.

I cannot but remark that the more minutely investigation is carried out—the more thoroughly and intently facts bearing upon the matter are examined—the more improbable, in my judgment, does it appear that any living form should be derived direct from the non-living. Notwithstanding all that has been recently written upon this subject, I cannot but feel surprised that at this time many good reasoners should decide in favour of the *de novo* origin even of bacteria. Whether we consider the matter from

the experimental side only, or study the evidence obtained in a general survey of nature, or carefully reflect upon the facts learnt from investigations concerning the properties of living and non-living matter, with the aid of the most perfect instruments of minute research now at command, or from other standpoints, the conclusion seems to me irresistible that the verdict of a jury of well-educated men would be against the direct origin of any form of living from any form of non-living.

Driven from one position to another, the advocates of spontaneous generation have entrenched themselves in the unassailable stronghold of experimental investigation. Here they may hold their own for any length of time, for no one can say what may be demonstrated by new experiments in the time to come. Nay, although the conflicting results of different skilled experimenters, whose experiments have been conducted upon the same principles and professedly in the same way, even to the minutest details, may shake the confidence of some in the experimental method of inquiry, it is certain that the teachings of experiment will prevail over all other information.

But the modern advocate of abiogenesis should be skilled not only in explaining facts, but in explaining facts away. The fact that bacteria germs exist in all parts of the higher organisms, in the most internal parts as well as upon the surface of man's body, is to be accounted for by their spontaneous origin! Although millions are to be found about the mouth and upon the surface, and it can be shown that it is easy enough for them to get from the outside amongst the tissues within, we are asked to believe that those inside originated there direct from the non-living, or, as an alternative proposition, that they were derived not from parental bacteria, but by transmutation from some of the constituents of the tissues, on the principle that a living fungus comes not from a fungus germ, but from a dying tree. The next suggestion will be that man, after all, is but an aggregation of lower forms, peculiarly conditioned for a time, but which assume their ordinary forms when their environment shall be modified, as it must be at death.

Erroneous conclusions of many kinds have been employed as facts in support of abiogenesis. When one finds that it is believed that fungi may be developed from oil globules, and other living organisms of a much higher type produced without parents out of organic matter, one fails to see any limit to the support that may be gained to the cause. Volumes of facts and arguments hitherto advanced in favour of abiogenesis may be republished without in the slightest degree modifying the real state of the case. What is now required is well devised experiment, and that is all. No resuscitation of old arguments and doubtful facts, however ably the task is performed, will in the slightest degree increase the cogency of experimental proof, and in the absence of new experiment such facts and arguments will avail nothing.

I think we may be satisfied that before long the advocates of spontaneous generation will have to rely upon the production of the lowest organisms only. The only view in any way tenable at this time is, that such organisms as bacteria are the only ones that can, under any arrangement of conditions possible to an experimental inquirer, be formed anew, and that these alone, at any period of the world's history, sprang direct from the non-living. All are of extreme minuteness, many of the forms being so very small that they could not be identified with a magnifying power of less than eight hundred diameters. These are the smallest, simplest, and probably lowest forms of life known. That multitudes do now spring from pre-existing forms is absolutely certain, for the process can be seen. Whether some spring direct from the non-living is the question. Those that are supposed to be formed anew are very like those that have had a progenitor, and from those supposed to have been produced anew, forms exactly like those derived from undoubtedly pre-existing forms result. It cannot be pretended that new forms of existence are produced anew. No matter how the conditions are varied, the living forms supposed to result resemble

known living forms, and give rise to forms of the same kind.

But, as I have before remarked, the question of the origin of bacteria can be only determined by experiment. All irrelevant considerations in favour of abiogenesis ought now to be left in abeyance. The assumed *de novo* origin is contrary to what goes on throughout the whole kingdom of nature, and the only exception which there is the remotest possibility of establishing, is the spontaneous origin of some of these lower forms of life. While, therefore, it is allowable to permit ourselves to be influenced by general evidence against a new and exceptional doctrine, which a few observers seem very anxious to establish, we may fairly insist that only evidence of the most convincing and demonstrative kind should be accepted in its support. As regards the validity and reliability of the most recent experiments for and against the doctrine, I offer no opinion. Time must be allowed for others to repeat the experiments; and, for my own part, I could express no opinion unless I had been present, and had carefully watched each experiment in every stage. As far as I can judge, the reports of recent results are not more convincing than were those that were adduced years ago, many of which have been discarded and proved to have been unreliable from want of care, or from defects in the method of procedure.

If the formation of a bacterium germ, direct from non-living matter, be possible, three very remarkable series of changes, as it seems to me, will have to be brought about. Whether any means will ever be discovered of effecting these changes is surely most doubtful.

First, the atoms of the non-living substances must be separated from their combinations.

Secondly, the atoms will have to be re-arranged to constitute groups of which the organic matter is made up.

Thirdly, the groups of atoms must be made to live.

What facts known, I would ask, render it likely that air, rarefied or condensed, or pressure of any degree or of any special kind, or any degree of heat, or light, or any conceivable modification of physical or chemical conditions, would, at the same time, account for the pulling asunder and joining together of atoms, and for the conference of new and peculiar powers of growth, of movement, of division, and the formation of new substances? In short, it is not easy to conceive, in the imagination, the several steps which result in the formation of a living bacterium even from *organic matter*. But the first germ must have sprung direct from matter that never had lived nor manifested phenomena in any way like those of life. Let us try to imagine a living germ being produced out of non-living matter. Atoms of many substances must be conceived as separating from one another, and then recombining. Attractions and affinities must, in the first place, be overcome, then the forces that effected the change must cease to operate; and these must, somehow, be exerted again. By what means the separation of atoms is effected cannot be suggested, neither can we conceive how the atoms are caused to recombine in a definite way. The supposed phenomena would be really more complicated than I have represented. For atoms are not related to one another—atom to atom, but group to group. How the atoms are grouped, and how the groups are related, how the groups act and react upon one another, and new groups are formed—what makes the atoms combine and begin a new course which may continue on and on for ever, cannot be conceived. Upon the whole, the production from non-living matter of any living form, however simple, must be regarded as most improbable.

ZYMOTIC disease seems at present rather prevalent in Lambeth, and the water supply is said to be in fault.

THE HARVEIAN Society is about to establish a lectureship, after the example of the Medical Society of London.

OBSERVATIONS ON THE TREATMENT OF STRANGULATED HERNIA: ILLUSTRATED BY CASES IN PRACTICE. (a)

By B. F. McDOWELL, F.R.C.S.,
Surgeon to Mercer's Hospital, &c.

THE vital urgency of a case of strangulation of the intestine, and the consequent importance of its appropriate treatment, will be at once admitted by every practical surgeon. The remarkable diversity also which has been found to exist in cases of this lesion, seems to invite every practitioner to place upon record such cases coming under his observation or treatment as present peculiar features, either as regards their clinical history or pathological conditions. This acknowledged diversity has provoked, no doubt, in some measure, the different modes of treatment at present in use, each of which has found strenuous advocates amongst eminent surgical writers. Under these circumstances I feel that the particulars of the following cases of this lesion, and the treatment adopted, will be received with the attention they deserve by the members of the Surgical Society of Ireland.

CASE I.—*Oblique Inguinal Hernia of twenty years' standing; Strangulation-period, three days; Herniotomy.*—Caroline E., æt. 51, was admitted to Mercer's Hospital, under my care, upon the 3rd April, 1869, suffering from symptoms of strangulated hernia. Upon examination I found a tumour in the left inguinal region, which was tense and painful; no appreciable impulse was imparted to it on coughing. There was general tenderness over the abdomen upon pressure, particularly in the site of the external ring, and slight tympany. She suffered from hiccup and gulping, but there was no stercoraceous vomiting. Pulse 110, small, and intermitting. She stated that about twenty years previously, after a prolonged effort to escape from a wild bull, that she felt "a lump in her groin," which, however, "went back at the time." After this it troubled her from time to time, but she was always able to press it back herself; so that she never had to apply for surgical advice, except upon one occasion, when she was admitted to the Richmond Hospital. The late Mr. Hutton relieved the strangulation, under chloroform, and provided her with a truss. She continued to wear a truss ever since; nevertheless, the bowel used to come down upon any unusual exertion. Three days before her admission to Mercer's Hospital she was frightened by her husband, when the bowel, which had been down for some time previously, became so strangulated that her experienced efforts to get it back, after her usual fashion, utterly failed, and, having had recourse to various remedies suggested by her friends, she was again obliged to seek hospital relief. She was admitted at 10.30 p.m. The resident pupil, a young gentleman of high intelligence, administered an aperient enema, using O'Beirne's long tube; only a small quantity of hardened feces came away. I saw her very soon afterwards, and made a careful effort to reduce it by the taxis. My colleague, Professor Morgan, also tried, adopting the method by inversion, but failed. She was now placed under the full influence of chloroform by my late much lamented colleague Dr. Eames, and I again applied the taxis. A notable diminution in the size of the extrusion took place during this operation, and I thought I detected something like the well-known gurgle of a returning intestine. I determined, under these circumstances, to leave the case until the next morning. She was ordered iced beef-tea, and a full opiate draught for the night.

April 4th.—Saw her at 7 a.m. She had slept for some hours, but awoke with hiccup. Her bowels had not been moved, and she complained of much pain and tenderness over the abdomen. The tumour remains in much the same

(a) Read before the Surgical Society of Ireland, February 12. The discussion will be found at page 296.

condition as we left it last night. I now determined to perform herniotomy, as I felt that this proceeding could do no harm, whereas if a portion of the intestine were left unreleased, the patient might lose her life. The operation was conducted in the usual manner, the only circumstance worth of note in regard to it being that the several layers of fascia commonly met with were indistinguishable. When the supposed peritoneal sac was opened about three drachms of clear glairy serum escaped. The extreme thickness of this sac was in itself remarkable, but what surprised me most was the utter absence of any included intestine. Upon introducing my finger I found that there was no passage leading from the process of peritoneum (which I have no doubt it was) into the cavity of the abdomen. The tumour which had existed before this last operation had now entirely disappeared, its bulk being fully accounted for by the thickness of its walls, and the amount of fluid discharged.

This woman made a fine recovery, and has ever since enjoyed excellent health, the operation having had the effect, in her case, of establishing a radical cure. She passed, however, through an anxious time after the operation, her life for many days having been in imminent danger. It would, in the record of a series of cases such as this, be occupying time unnecessarily long to dwell upon this case in all its details, although all are most interesting; but there are two further unusual features in it which I cannot let pass without a brief notice:

1. The prolonged constipation after the operation—extending over ten days.

2. The prodigious tympanitis.

The tympanitis was certainly most extraordinary. I have seen a good many cases, but never one to equal this before or since. Mr. Porter also, who kindly saw the case with me, said he had never seen a case in which there was such extensive tympanitis. I tried various means to relieve this and the obstinate constipation, upon which, no doubt, it largely depended, such as enemata (with long tube), aperients, hot fomentations of many kinds, &c., but all were of not the slightest use. At length, on the tenth day after the operation, I gave the patient ten-grain doses, at intervals of two hours, of *assafoetida* (as was first, I believe, suggested by Graves). The apparent effect was most satisfactory. The bowels were freely moved after the second dose, and after this frequent explosions of flatus escaped *per anum*. Next day she might be said to be convalescent. All abdominal tenderness had subsided, the wound had quite healed, and she left the Hospital perfectly well three weeks after her admission.

I should be sorry to be so hasty as to attribute entirely the happy termination of this case to the action of the *assafoetida*, but it will be admitted that the coincidence is worthy of note.

CASE II.—*Femoral Hernia; Strangulation-period, four days; Peculiar Cyst springing from outer side of Sac.*—The following case appears to possess so much of novelty, as well as practical importance, in regard to the operation for the relief of strangulated hernia, and the pathological conditions discovered in it were so remarkable, that I make no apology for including it in this paper; it seems, moreover, to throw much light upon the perplexing case I have just recorded. Eliza T. was admitted to Mercer's Hospital on Sunday evening, 14th April, 1872. Although her intestine had been strangulated for three—probably, indeed, for four—days previously to her admission, there were, literally, no urgent symptoms present. She was bright and cheerful, and spoke freely upon subjects which had no relation to her illness. She probably would not have come into hospital at all, only Dr. Shaw saw her, and, detecting the nature of her illness, gave her an order for immediate admission. There was but slight nausea, and no hicough, or persistent vomiting; there was complete absence of abdominal tenderness, not even over the femoral ring, the seat of strangulation, did she complain of pain upon pressure; there was, moreover, no tympanitis; her pulse was perfectly normal. A momentary examination, nevertheless, proved the case to be strangulated femoral hernia.

The tumour was about the size of a *bantam egg*, and had springing from its outer side a second tumour about half that size. It appeared that about eight years ago she first observed the hernia, which she stated was caused by some slight muscular exertion; she was, however, able to reduce it herself without difficulty whenever it came down, and it had caused her no uneasiness. Upon this last occasion her efforts were, unfortunately, unavailing. After her admission, beyond the gentle manipulation necessary to a correct diagnosis, the tumour was not meddled with until she was placed under the full influence of chloroform; at the same time, the instruments were at hand to operate if necessary. I had on this occasion the able assistance of my colleagues Mr. O'Grady and Mr. Morgan. Applying the taxis in the usual way for the reduction of a femoral hernia, I succeeded in returning the great bulk of the tumour. The greatest gentleness was observed. In femoral hernia, particularly if the strangulation-period exceed twenty-four hours, I think that the taxis should be employed, if, indeed, it is advisable to have recourse to it at all, with the greatest caution. The tumour in its entirety, however, did not retreat into the abdomen, and this is the point to which I wish to direct particular attention. It was the feature in the case fraught with the greatest interest. What was this remaining tumour? It felt extremely like a small knuckle of intestine; but then, against this view was the fact that two-thirds of the original extrusion had unmistakably returned. Or, was it a portion of omentum, which we know so often to accompany a femoral hernia? But its elasticity and uniformity seemed to exclude this idea. Or, was it a gland which was pushed before the hernia, in its early development, and had since become adherent to the outer wall of the sac. These speculations caused me much anxiety, but under every consideration I determined to leave the case until morning without further interference. The patient was accordingly replaced in her bed, with a pillow under her thigh, and a cold lotion over the femoral canal. She had an opiate draught, containing a few drops of hydrocyanic acid, to allay sickness after the chloroform and procure sleep. She was allowed a little milk and soda-water, with ice, for the night, if required.

April 15th, 9 a.m.—She passed a quiet night, and partook of a small cup of fresh tea at 7 a.m., which she retained. At about 8.30, half an hour before my visit, during the temporary absence of the nurse, she got out of bed and walked to the water-closet attached to the ward, when, "suddenly," as she said, "I felt something give way within me." When I saw her her eye was glassy, her features pinched, her pulse like a thread, and intermitting; she was painfully restless; she sank rapidly, and expired before 10 a.m. The nature of her condition at this time is too obvious to deserve observation. I was fortunate enough to obtain a post-mortem examination.

The skin and several layers of fascia over the tumour having been divided, as in the operation for strangulated hernia, a structure, which proved to be an extraordinary cystic outgrowth, made its appearance. I could not, of course, tell at first what this really was, but in colour and consistence it resembled a knuckle of strangulated intestine. The abdomen was now laid open in order to examine the state of things from within. The first feature that attracted my observation was the highly vascularised condition of the great omentum and of the peritoneum, which latter contained a considerable quantity of *fæcal matter* and fluid resembling serum. The strangulated portion of intestine was now examined; it was situated about a foot from the *cæcum*, and about two inches were included in the strangulation. This portion of the bowel was in a state of general disorganisation; at its neck it was surrounded by granular lymph, whilst its apex, the part which had given way, was quite gangrenous, showing clearly that no operative measures at the late period the poor creature came into the hospital could have saved her life. The femoral ring was now sought for and exposed; the tip of the little finger could be introduced into it. Surrounding the orifice of the femoral canal a considerable quantity of lymph was found effused. The sac of the hernia was next laid fully

open, and now, for the first time, the remarkable cystic outgrowth which sprang from its outer wall was clearly revealed.

In addition to the peculiarities I have detailed, which, in a clinical as well as a pathological sense, must be regarded with great interest; it is a matter of practical importance to consider what course would have been pursued in the event of the taxis having entirely failed, and that operative measures were proceeded with. How perplexing would it have been to encounter a structure so closely resembling the intestine and yet so thoroughly incorporated with the sac itself. There is another point of surgical interest to my mind in this case, which is that the evidences of peritoneal inflammation ceased abruptly at the femoral orifice; they were not prolonged below the ring, and did not enter into any part of the sac. I think it may be inferred that the sacs of old hernia become altered in their character and susceptibilities, and are not so likely to be affected by injury as the peritoneum proper.

CASE III.—*Enormous Inguino-scrotal Hernia; Strangulation-period, forty-two hours; Herniotomy; Inflammation of the Tunica Vaginalis; Orchitis; and Acute Hydrocele subsequently to the Operation.*—Upon Sunday evening, 8th February, 1874, a gentleman called to ask me to visit Mr. Edward J. M. I learned that his age was about 50, and that he was unmarried, but I could obtain no exact information as to the nature of his illness. I came at once, and found a spare man sitting up in his bed; his face was flushed, but his eye was sunken. He had hiccough and gulping; his pulse was up to 110, intermitting, and very compressible. I was led at once to diagnose strangulated hernia, but I had great difficulty in inducing the patient to allow me to make any proper examination. The gentleman who came for me had informed me that he was a retiring person, and, although an excellent man of business, that his habits were peculiar. The man himself told me simply I might "go away," as he would be "well in a short time." It was only when I impressed strongly upon him that he was imperilling his life that he submitted to an inspection of his body. I found an enormous inguino-scrotal hernia of the left side. The rupture first took place, he stated, about twenty years previously, whilst he was making an effort to defecate after a long constipation. He pushed it back upon that occasion himself, and he had never since consulted a surgeon or worn a truss. It had frequently, he told me, come down during this interval, and was often painful, tense, and difficult to reduce, but he had always succeeded in getting it back himself, this being the first occasion on which he had failed.

The hernia had been down and strangulated for forty-two hours before I saw him, and, although all his efforts to relieve himself were futile, he had persisted up to this in an absurd aversion to seek professional advice or assistance. He permitted me now, however, to try to relieve him. A careful application of the taxis, in my hands, did not succeed. Accordingly, I determined to put him under the influence of chloroform and perform herniotomy at once, if the taxis, again employed, should not prove effectual. I experienced no small difficulty in prevailing upon him to consent to these measures.

Within an hour, having obtained the services of Mr. Shaw and Mr. Abraham, the resident gentlemen in Mercer's Hospital, and having made meanwhile all necessary preparation for the operation, I had him fully anaesthetised by the chloroform. Now, again, I made a careful and well-sustained effort to effect the reduction of the extrusion, but could not succeed. Herniotomy was, in consequence, at once proceeded with. I divided the skin by transfixion to the extent of about four inches over the external ring—the seat of strangulation—the section being, of course, in the long axis of the tumour; the several layers of fascia were now raised and split upon a flat director in the usual way. I found it necessary in this case to lay open the sac. This having been accordingly done, about a foot and a-half of claret-coloured, but still glistening bowel, came into view, and about two tablespoonfuls of highly-coloured sanguineous serum escaped. I now felt

for the stricture, and divided it, cutting directly upwards, and was proceeding to replace the strangulated intestine when suddenly the patient became sick, and vomiting followed, which had the effect of expelling several feet more of the bowel. I succeeded, however, in a short time in replacing it all within the cavity of the abdomen. The lips of the wound were now brought together by four stitches of interrupted suture, and a pad and spica bandage applied.

He was ordered a linseed and mustard poultice over the epigastrium, ice and iced beef-tea for the night, and a mixture containing bicarbonate of sodium, hydrocyanic acid, and tincture of opium to be given every third hour if awake.

At 12 p.m. I saw him again. He has not slept, but the poultice and mixture have done good service. He is composed; the sickness of stomach has entirely subsided. He feels that he will have a good sleep. He was left in charge of an excellent nurse.

Monday, 9th Feb. (morning after operation), visited him at 6 a.m. Has had a splendid sleep of five hours, having wakened only a few minutes before my visit. He seems much refreshed. Pulse 94, regular; pad and bandage secure.

Time forbids me to dwell upon the particulars of this case. On the third day after the operation an enormous tumour occupied the position of the hernia, and so closely resembled it that I almost feared the hernia had returned. But his bowels had been moved, and there was no stomach irritation. The pad and bandage also were in their place, and the stitches undisturbed. These circumstances, to my mind, soon precluded the possibility of a fresh descent of the bowel. It was not, however, so easy to convince him of this. He protested he was as bad as ever, and with difficulty prevented from making fresh attempts to reduce it. Hot fomentations were assiduously applied, and he was ordered alterative doses of mercury. I removed the stitches on the fourth day.

He remained under treatment for over two months, but he made a good recovery. Gradually the fluid effused into the tunica vaginalis became absorbed, and the inflammatory thickening of that structure resolved itself, so that I was able to detect an enlarged testicle. The final treatment consisted of iodide of potassium and decoction of bark, with the local application of mercurial plaster.

CASE IV.—*Strangulated Inguinal Hernia; Strangulation-period, twenty-eight hours; Successful Employment of the Taxis under Chloroform.*—Upon Friday evening, 19th January, 1872, I was called for, and came at once, to see Mr. Robert G—, a young gentleman, æt. 22, who had "strained himself" the evening before whilst rowing at his club at Ringsend. Although he had suffered a great deal, no suspicion of the gravity of his accident was entertained either by himself or his friends about him until the next day. It was a festive night at the club, but not for him; he was most restless, and when I saw him, about 6 p.m., he was in a high state of feverish excitement. His pulse was up to 120; tongue dry; skin very hot; much thirst, and incessant dry vomitings. Upon examination, I found a small, tense tumour, low down in the left inguinal region. It was exquisitely painful upon pressure; he could scarcely bear it to be touched. A blush of redness pervaded its surface. He told me that he had recently contracted a gonorrhœa which was not yet quite well, and that he felt sure this was the cause. Notwithstanding this deliberate assurance, I could not—having regard to the history of the case, and the great constitutional disturbance existing—but look upon it with suspicion, or overcome the belief that it was one of strangulated hernia. Accordingly, I directed him to be removed at once upon a stretcher to his lodgings in Leeson Street, as there was no accommodation of any kind available in his club.

At 9 p.m. I saw him again. I now had the advantage of the assistance of Dr. Chapman, of Pembroke Road. My patient bore the journey well. He felt the comfort of his bed, but the extreme restlessness, the local pain, and

the vomiting all continued. I brought chloroform with me and the instruments to operate, in order that no time should be lost.

I confess I felt timid about applying the taxis in this case at all, but upon reflection I came to the conclusion that I might try it when the patient had been placed under the full influence of chloroform. Dr. Chapman kindly administered the chloroform, and when my patient was fully anaesthetised, all spasm having subsided, and the profound state of coma I looked for having been obtained, I applied the taxis, and successfully, the rupture, which it proved to be, returning completely into the abdomen. It is not necessary to say more than that he made an excellent recovery, and has continued quite well. I advised him to wear a truss, which he has done ever since; but the last time I saw him he said he thought it was not necessary, as the rupture had not come down since the operation. It is probable that in his case, after such an interval, the pressure of the truss may have acted as a radical cure. This case seems worthy of being noted, as demonstrating that in a strong young man herniotomy may be avoided after a strangulation-period of twenty-eight hours, and the taxis employed with success.

CASE V.—Oblique Inguinal Hernia; Strangulation-period, twelve hours; Successful Employment of the Taxis; Subsequent Strangulation; Herniotomy.—Joseph F—, *et. 57?* (but looking older), was admitted to Mercer's Hospital, under my care, on the 14th December, 1873. He was suffering from symptoms of strangulation of the bowel. Upon his admission I was sent for. The symptoms had existed for about twelve hours. I succeeded in at once relieving him by the taxis without having recourse to any anaesthetic.

The bowel had been twice before strangulated, and he had been on each occasion relieved in the same way by other surgeons. On the third day after the successful employment of the taxis on this occasion I ordered him to be discharged "cured." In the evening, however, of that day (17th), after dinner, he became suddenly ill; his stomach had violently rejected his dinner, and in the persistent vomiting which followed his bowel became again so strangulated that the resident pupil failed to relieve him by the taxis. In my hands the taxis also failed. He was now, at 10 p.m., placed under the full influence of ether by my colleague Prof. Morgan. I tried the taxis again, but it proved unavailing. Herniotomy was now performed in the usual manner. Strange though it may seem, I had in this case to lay open the sac. Although the extra-peritoneal constrictions were fully divided, I could not get the bowel home. The extreme tenuity of the body of the sac was remarkable; it was not thicker, certainly, than gold-beater's leaf; at its neck, however, there were, as it struck me, evidences of old attempts at repair. The peritoneum was thickened by organised lymph, and I had a long and tense stricture to sever before I could restore the bowel. Beyond the unusual pathological conditions above described as existing in this case, there is nothing further worthy of note. The wound healed kindly, and my patient left the hospital quite well within a fortnight after I operated upon him. I saw him this week, when he was in excellent health. He has continued to wear his truss.

CASE VI.—Strangulated Inguinal Hernia of Left Side, followed by Profuse Effusion of Blood into the Cellular Tissue of the Scrotum and neighbouring parts; Strangulation-period, about an hour; Successful Employment of the Taxis; Complete Absorption of the Effused Blood; Subsequent Orchitis; Recovery.—The last case I must content myself by detailing briefly, although it is not the least interesting of these series; indeed, so far as my knowledge informs me, it is without a precedent. I had this wax-cast taken of it by Mr. Woodhouse, which is faithfully and beautifully executed. It represents accurately and vividly the condition of the parts thirty-four hours after the patient met with the accident. The history of the case is simply this: Mr. Richard J—, *et. 26*, an extensive manufacturer in one of our southern counties, came to town on business on the 1st December last. He

had a "long day," and in the evening was much fatigued. He went to the theatre, having partaken of no nourishment, save a sandwich and a glass of ale during the day. Feeling hungry, he left his place of amusement for some refreshment; he ate and drank rapidly, and whilst running back quickly a portion of his repast irritated his larynx and brought on an immediate and violent attack of coughing, and subsequently vomiting. He suddenly felt he had sustained an injury in the groin, became "crippled," and was brought for relief to Mercer's Hospital. When I saw him, which was very shortly after the accident, he was doubled in two. He complained of agonising pain in the groin, and cramps in his stomach. I found a small tumour in the left inguinal region. I diagnosed the case to be one of strangulated hernia, and got him to bed. I gave him two grains of tartar emetic and twenty grains of ipecacuanha in a warm drink. In the course of ten or fifteen minutes his stomach became sick, his skin soft and clammy, and his muscles relaxed. I thought this a favourable moment to apply the taxis, which I accordingly did, and the strangulated gut returned by the exercise of gentle concentric pressure. A pad and spica bandage were now applied. Next morning I found that this enormous effusion had taken place.

Under treatment this was entirely reabsorbed, and the man made a fine recovery. He was, however, attacked by orchitis, which was not quite well when he left the hospital, which was thirteen days after his admission. I have recently had a letter from him, in which he says the testicle had come back to almost its natural size.

In this paper I have not attempted to advocate any special line of treatment for this chameleon-like lesion. The "peritoneal," the "extra-peritoneal," the "early" operation, and the "never-failing taxis" have each found able and enthusiastic supporters. I have not entered upon this still-vexed question nor sought to generalise the cases in which any of these proceedings is most advisable as a rule of practice. In the present state of our knowledge it would, I think, be unphilosophical to do so. The accumulation of recorded cases will, it is to be hoped, afford us materials for improvement. Meanwhile, the practical surgeon must not, in his reverence for authorities, forsake his own judgment, but treat each case according to its exigencies, its clinical history, and its special pathological conditions.

There is one point which I cannot pass over before closing this communication—I allude to the momentous importance of seeking *early advice* in cases of strangulation of the bowel. It is much to be deplored that, either from ignorance or false—too often fatal—modesty on this subject, sufferers are allowed to pass hopelessly beyond the reach of surgery. As compared with this, the question of special operations fades into insignificance, and the death-roll from this cause would, I am sure, be an alarming document. It is to be hoped the time will come when the surgeon will get fair play in the saving exercise of his art.

SOME NEW RESEARCHES ON THE CAUSE AND ORIGIN OF FEVER FROM THE ACTION OF THE SEPTINOUS POISONS. (a)

By B. W. RICHARDSON, M.D., F.R.S.

THIS was a continuation of the author's paper read before the Society ten years ago, viz., in 1865. The author commenced his present lecture by giving a *résumé*

(a) Abstract of a paper read at the Society of the Medical Officers of Health.

of that which he had read in 1865. In that communication he had shown, from a series of experiments made with the serous fluids derived from a patient suffering from pyæmic fever, and under the care of Mr. Spencer Wells, that such fluid when inoculated into healthy animals, produced a distinct and fatal disease which could be transmitted to other animals through several series or generations. To the poisonous matter thus produced he had given the name of *septine*, and he had laid before the Society specimens of salts obtained from the septinous matter, viz., a hydrochlorate and a sulphate, both of which possessed poisonous properties similar to those belonging to the mother liquor. He had inferred, therefore, that the poisonous substance was of an alkaloidal character. He had also, in the same paper of 1865, stated the following conclusions as the result of his experimental researches.

1. All the organic disease-producing poisons are modified—*i.e.*, poisonous secretions.

2. The secretions are rendered poisonous by two processes: (i.) by contact with organic poison pre-existing; (ii.) by direct decomposition.

3. The poison of each secretion possesses several qualities: it can only be absorbed by particular channels, and it can only provoke farther disease by coming into contact with a secretion allied to that from which it was itself derived.

4. The reproduction of the poisons depends on the continuance of the process of physical changes in a continuous secretion. The force of secretion is the force of reproduction.

5. The poisons kill by various means: (i.) by the secretion causing obstruction of necessary function; (ii.) by exhaustion from excessive secretion; (iii.) by extreme irritation of nerve and reflex injury; (iv.) by the absorption of the poisoned secretion into the blood and disorganisation.

From this point Dr. Richardson went on to describe that since the announcement of the facts had been put forward originally respecting septine, similar results had been obtained by Coze and Felz, Davaine, Béhier, Vulpian, and M.M. Thin and Clementi. It had further been discovered by Davaine that the intensity of the poisonous matter increased in the most marked degree, and in a manner that seemed to defy computation, with the transmission of the poison through fresh series of animals.

The author now proceeded to the details of his new research, illustrating it step by step by experiment. He had put to himself the question, Why does the poisonous septinous matter produce a definite order of morbid symptoms, and why, specially, does it produce fever? In the first parts of this inquiry he had put aside altogether the animal body, and had tried to learn what effect the poisonous substance would exert when it was brought into contact with other organic bodies of unstable composition. Would it act like ferment on saccharine substances? Would it modify the process of acetification? Would it interfere with the oxidation of readily oxidisable matters? Without entering into details that were negative, he found, he said, one affirmative fact from his experiments, upon which he should base to-night a new theory on the cause of the fever and other symptoms that occur in the living animal under the influence of septine. He found that it was the property of all the septinous poisons to liberate oxygen from that solution of oxygen known as peroxide of hydrogen. This fact was illustrated by showing the action of minute portions of pyæmic poison, vaccine, pus, decomposing blood, and other similar bodies. The solution, which contained ten volumes of oxygen, was placed in tubes, and was inoculated with the various specimens of septinous matter, with the effect in each case of causing a rapid evolution of the oxygen. The same result was produced by the action of fibrine on cellular tissue, but was shown to be negative with mucus, upon which fact, the author incidentally remarked, a new diagnostic test between mucus and purulent matter is established. The septinous matter

in every form seemed, from its action upon peroxide of hydrogen, to have been derived, either from fibrine or from cellular tissue, or from derivations of these bodies.

From the action of the septinous product on oxygenised water, the author indicated their action on oxygenised blood. To a specimen of blood which had been charged with oxygen, he added solution of the peroxide to saturation. Into this he now plunged a thermometer, the bulb of which was armed with a little fibrine. Upon this oxygen began to liberate from the blood with evolution of heat, the mercury in the thermometer rising four degrees.

After adding some other experimental facts and summing up the results of all the facts he had placed before the Society, Dr. Richardson stated the theory at which he had arrived as to the effects of the septinous matter on the living organism, with special reference to the febrile state. The theory was that the septinous product acts upon the blood in the extreme circulation, when it has accumulated in sufficient quantity by liberating a portion of the oxygen. Upon this occur the same phenomena as had now been observed in experiment; but, as the poisonous organic product is itself destroyed in the process, the effects it produces may remit until a new charge of the poison has been produced in sufficient quantity to cause a repetition of the febrile state. Thus the theory suggested a simple reason for the remittency of fevers.

The various phases of febrile disturbance were next adverted to. It was indicated that in some instances, as in the most malignant forms of small-pox, the blood may be so charged with septinous matter as to be unable to take in oxygen in the process of respiration, then death takes place by asphyxia after a brief period of febrile heat. In another variety of cases the liberation of the oxygen is so persistent that remission of the fever is hardly perceptible; and in other exceedingly light cases, where the quantity of poison is very small and is not reproduced, one sharp paroxysm of febrile phenomena may be all that is witnessed. In cases of abscess or of cavity in the lung this same order of phenomena may be observed in a modified degree.

The lecturer continued by showing that some chemical agents added to water charged with the peroxide solution tended to fix the combination and to neutralise the action of substances which liberate the oxygen. An experiment illustrating this fact by the action of quinine brought the lecture to a close.

ON THE CURE OF BENT KNEE,

WITH ILLUSTRATIVE CASES.

By JOHN MORGAN, F.R.C.S.I.,

Surgeon to Mercer's Hospital, Professor of Surgical Anatomy
R.C.S.I., &c.

In a former communication I brought forward some cases of cure accomplished in very young children. I have had since that date, from the extension treatment, some very successful results in older persons. One of these shows a case where the cure was accomplished in two separate steps, as when the adhesions are found to be very firm and difficult of disruption, it may be judicious to be satisfied with an incomplete extension at any one time.

In February, 1873, a boy, G. H., aged nearly ten years, came under my care, with the knee bent at a very considerable angle. He had suffered from disease of the joint for several years; it had gradually ankylosed in the position shown in the illustration. There was very little mobility of the joint, but his general health was now good. I found the biceps tendon resisting, and having put him under the influence of ether, I divided it, and straightened the knee very considerably, notwithstanding a great deal of resistance. In two months the boy went to the country, and I lost sight of him till November,

Appearance after Final Extension, Dec. 1874, Cured.

ON THE CURE OF BENT KNEE.—ILLUSTRATIVE CASES.

CASE OF B— MoC—.

Appearance of the Limb, Dec. 27, 1874, Uncured.

Appearance when Cured, Jan. 20, 1875.

1874, when he came to me with the knee still somewhat bent; he used a crutch, though the front part of the foot reached to the ground and served in progression.

On November 29th, 1874, I put him under ether, and forcibly extended the joint, without finding it requisite to divide any tendon. I had two lateral stays applied, with a leather padded strap at the knee; he went to the country in three weeks, walking well, without any assistance.

In this boy the deformity had been very great indeed; he was apparently a hopeless case; he now walks boldly and firmly, with but a slight limp.

The succeeding illustrations show the result of extension used at one operation. The first of these is taken from a boy, B. M'C., of eleven years. He described himself as having a bad knee as long as he could remember. It had been in the bent position for over five years; abscess had formed, and he had suffered the usual long and tedious consequence of joint disease. He came to me in order to get the limb straightened; its appearance was as is shown by the photograph taken December 27th, 1874. On December 30th I put him under the influence of ether, and divided the outer tendon. I closed over the wound immediately. On January 2nd I again etherised him, and extended the knee in the way I have already described. The result was most satisfactory, and the photograph taken January, 1875, shows how well the patient could stand and walk without support, even in the short time that had elapsed after the operation.

Another instance of successful treatment is furnished by the case of J. R., a stout lad of eighteen' from the country. He had suffered for years, the joint had suppurated, and the limb finally recovered, bent at a very considerable angle indeed, so much so that when the photograph was being taken the foot had to be supported and steadied. The limb had wasted, while the other had become immensely muscular. In November, 1874, I put him under ether, and divided the biceps, and by making extension I extended the limb steadily. An angular splint was applied, and in a few days later lateral supports. A troublesome abrasion formed on the heel, and he got a dyspeptic attack, which delayed treatment. The limb, as represented in the drawings, became a useful one, and he returned to the country without a crutch, and able to get along with a stick only, and this chiefly to give him confidence at first in using the limb.

In February this year, a girl, aged nineteen, was sent to me suffering from a bent knee of long duration. She could get her foot to the ground with the aid of a very high-heeled boot, but could not walk without support.

I extended the knee, under etherisation, by force, and without the necessity of dividing any tendon. The adhesions gave way with some difficulty. The recovery and utility of the limb were both most satisfactory.

On March 4th she thus writes in reporting her state:—"I take a pretty long walk every day since I came home. Words would fail to express my gratitude, for I never expected to walk as I can at present. I gave up all hopes of that. As you already know, I never went without either a crutch or stick for more than twelve years."

The illustrations, taken from photographs, prove that these patients even in a few weeks obtained wonderful command over a limb that had been useless for many years. The first one, of G. H., shows the boy as he "posed" himself in the attitude of ease shown in the woodcut; the others, "posed" with the arms crossed, show the steadiness of posture which had been obtained in so short a time.

These cases illustrate one remarkable phase of conservative surgery where, instead of removing a limb from its becoming inconvenient as well as useless, we may restore it nearly as whole as before, and practically as useful. Some of those I have cited were instances of deformed joints, the result of long past inflammatory action, and where the adhesions were old and firm, others were of more recent date, yet in all equally favourable results were obtained. It requires at first sight some fortitude to use such force as would alter a joint which has, it may be for years, been in a formal position, but the fact is that it is

one of the essentials in the treatment, judgment and care in the selection of the proper case, and of the proper time, being the others. This treatment is applicable to all joints, even to the hip under certain circumstances, when assisted by myotomy. The numbers of cases which we see "going on crutches" show that the attainment of ankylosis, or "bent knee," is sufficiently frequent, whether intentionally sought for, or consequent on neglect, and allowing the limb to stiffen in a position it most naturally assumes when the subject of disease, as proved by the interesting experiments of Bonnet, who, by forcing fluids into the synovial cavities of the different joints, arrived at definite conclusions, as the joint always assumed the same position and figure, irrespective of the posture of the limb at the time of practising the experiment, the knee-joint assuming (as it is found to do in life) an angle of about 120 degrees—an angle, unfortunately, which, when once established, would leave the owner with but imperfect use indeed of a limb so important to his comfort and utility.

The use of an anæsthetic dispels any possible objection on the score of pain.

The small incision made by the tenotome hardly deserves the name of one, while the rapidity of the reduction may fairly be titled instantaneous. I can hardly conceive anything more satisfactory to a patient than the sudden regaining of the use of a limb long given up as hopeless, and which has been a constant worry from giving pain and inconvenience, and I have myself experienced the pleasure of restoring to activity those who were cut off from their enjoyments, and limited in their hopes by the misfortune of a bent knee, which, after even many years of incapacity, I have seen used with vigour and intense enjoyment in two or three weeks after my manipulation.

Transactions of Societies.

THE DISCUSSION AT THE PATHOLOGICAL SOCIETY.

The following is an abstract of the paper with which the forthcoming discussion will be opened, entitled,

THE GERM-THEORY OF DISEASE; BEING A DISCUSSION OF THE RELATION OF BACTERIA AND ALLIED ORGANISMS TO THE VIRULENT INFLAMMATIONS AND TO THE SPECIFIC CONTAGIOUS FEVERS.

The analogy between zymotic processes and fermentations is one which has been long recognised, though the "germ-theory of disease" in its present form is a doctrine of modern growth. It has been based on the supposed resemblance between the two sets of processes. *Contagia* seem to be considered as allied to, if not identical with, *ferments*; and hence, after the promulgation of the vital or germ-theory of fermentation by M. Pasteur, which was founded upon the belief that all the ferments were bacteria, torulae, or allied organisms, it became an easy step to imagine, and even adopt, the notion that all contagia might also be similar low independent organisms.

Recognising the vast importance of such a doctrine for medical science, the writer was induced to undertake a series of researches in order to test the validity of Pasteur's underlying doctrine of fermentation. Its general acceptance would almost of necessity have entailed most important modifications in our notions as to the true pathology, and consequently as to the treatment, of the most important diseases to which the human race is liable. As a result of these researches, the truth of Pasteur's exclusive theory has been challenged in favour of broader physico-chemical doctrines of fermentation; and the whole question is now (as the writer supposes), in the opinion of the most impartial critics, to be regarded as still *sub judice*.

In the interval, therefore, we may look into the truth of the germ theory of disease from an independent point of view.

The principal foundations of this theory seem to be of a theoretical nature. It is contended, with a considerable show of reason, that the multiplication of contagium within

the body of the infected person is a process which can only be compared to organic growth and multiplication. There are, however, other means of accounting for the increase of contagion within the body which will hereafter be more fully explained.

In addition to the germ theory of disease in the most generally accepted sense of the term, there is a rival doctrine advocated by Dr. Beale which will be briefly referred to.

Applicability of the germ theory to virulent inflammations and their sequela: (gonorrhœa, purulent ophthalmia, diphtheria, erysipelas, hospital gangrene, pyæmia, septicæmia, &c.)

The notion that bacteria have a causal connection with the process of infection in these diseases having been stated, and its origin explained, an opposite doctrine is then enounced, viz, that instead of being themselves the infective agents, or "carriers of infection," bacteria and their allies when met with in diseased fluids and tissues are for the most part actual pathological products engendered within the body. There is, in fact, the writer contends, a bacterial degeneration, which, though not so common and widespread in its occurrence, may claim to rank side by side with fatty degeneration.

The facts and arguments in favour of these respective views are then briefly summarised.

It is true that some of the considerations advanced in support of the latter doctrine may be explained by the hypothesis that all the tissues of man and higher animals are densely interpenetrated by undeveloped and indistinguishable germs of the lowest organisms. This hypothesis is held by Dr. Beale, but it may be met, and, so far as it appears to be an answer to the writer's doctrine, set aside by evidence of the most convincing nature.

But the notion (1) that germs of bacteria and allied organisms pre-exist (in some obscure way) within the tissues, (2) the notion that they enter from without and are habitually very numerous distributed throughout the tissues of the body, or (3) that they are very numerous engendered by a process of degeneration taking place within tissue elements, all seem equally opposed to the views of Professor Lister, and inimical to the theoretical basis on which he has allowed his antiseptic system of treatment to rest, however admirable this system may be in itself.

Applicability of the germ-theory to artificial tuberculosis, syphilis, typhoid, typhus, relapsing fever, cholera, measles, scarlatina, small-pox, and other contagious fevers.

Although no real boundary line exists between the diseases considered in this section and those referred to in the last, the adoption of some such division is a matter of convenience in regard to the present discussion.

Many of the facts and considerations previously advanced in support of the writer's doctrine as to the relation of bacteria and allied organisms to the latter class of diseases are also applicable in regard to the present series. No positive facts of much weight seem to be forthcoming in favour of the germ theory as applied to contagious fevers. Although these affections have always been regarded as "blood diseases," in only one of them does it appear that independent living organisms are to be met with in the blood of affected individuals at any stage of the disease. There is, therefore, here a *prima facie* inherent weakness in the whole theory, which a more thorough examination tends rather to confirm than dissipate.

The facts and considerations which may be opposed to the existence of any causal relationship between bacteria and allied organisms and the specific contagious fevers are then briefly enumerated.

After some statements and explanations concerning the occurrence of organisms in the blood of relapsing fever patients, and in connection with diseased tissues in ovine small-pox and typhoid fever, as revealed by the researches of Dr. Klein, the writer will make some brief concluding statements concerning (1) Pasteur's recent important modifications of his germ theory of fermentation; (2) upon the degree of relationship existing between zymosis and fermentation; and (3) as to the probable mode of action of ferments and contagia.

H. CHARLTON BASTIAN.

OBSTETRICAL SOCIETY OF LONDON.

DISCUSSION ON PUERPERAL FEVER.

At the meeting this evening (Wednesday) Mr. Spencer

Wells will open a discussion on the "Relation of Puerperal Fever to the Infective Diseases and Pyæmia." The attention of those who take part in the discussion is directed to the following questions:—

1. Is there any form of continued fever, communicated by contagion or infection, and occurring in connection with childbirth, which is as distinctly caused by a special morbid poison, and as definite in its progress and the local lesions associated with it, as typhus or typhoid, scarlet fever, measles, or small-pox?

2. May all forms of puerperal fever be referred to attacks of some infective continued fever—as scarlet fever or measles—occurring in connection with childbirth, on the one hand; or, on the other, to some form of surgical fever, or to erysipelas, caused by or associated with the changes in the uterus and neighbouring parts following the process of childbirth?

3. If all cases of contagious and infectious diseases which occur under other conditions than that of childbirth are set aside, does there remain any such disease as puerperal fever?

4. Assuming that a form of continued fever—communicable by inoculation, contagion, or infection—does frequently occur in connection with childbirth, how can its spread in private and in hospital practice be most certainly prevented or checked?

5. What relation have bacteria and allied organic forms to the pyæmic process in the puerperal state?

6. What is the value of antiseptics in the prevention and curative treatment of puerperal fever?

The meeting will commence at eight o'clock, and the necessary preliminary business will occupy but a short time.

Mr. Wells will limit himself to fifteen minutes, and it is expected that the speakers generally will not exceed this limit.

Dr. Braxton Hicks, Dr. Barnes, Mr. Jonathan Hutchinson, Dr. Hall Davis, Dr. William Squire, Dr. B. W. Richardson, and others are expected to take part in the discussion.

THE SURGICAL SOCIETY OF IRELAND.

The Society met on Friday evening, the 12th March, the PRESIDENT of the College in the chair.

Mr. B. F. McDOWELL, F.R.C.S., read some

OBSERVATIONS ON THE TREATMENT OF STRANGULATED HERNIA, ILLUSTRATED BY CASES IN PRACTICE.

which will be found at page 290.

The PRESIDENT said no apology was needed from Dr. McDowell for bringing this interesting paper before the Society. He wished to know what form of truss Dr. McDowell used.

Dr. McDOWELL said he preferred Salmon and Ody's truss, as being the most convenient for the patient.

The PRESIDENT: In cases where the hernia had become persistent, the late Mr. LeStrange used a truss which proved very effectual, and I have seen several cases where a permanent cure was effected in a couple of years after wearing his truss. I should like to know which of the two anaesthetics, chloroform or ether, Dr. McDowell prefers.

Dr. McDOWELL: There is a more persistent state of muscular relaxation obtained by chloroform, but I think the anaesthesia is just as perfect with ether.

Dr. DARBY said he felt some disappointment that Dr. McDowell had not given them any point on which to hang a discussion. He had come there that evening for the purpose of hearing the opinions of the members of the Society on the different methods of treating hernia. He had had twenty-seven cases of strangulated hernia, and he read a paper before the Medical Society of Oxford on the mode of treatment he adopted. He regretted that Dr. McDowell had abstained from recommending any particular method. He deserved much credit for his paper, in which the several cases he brought forward were very well put.

Professor STOKES said that in the fifth case described by Dr. McDowell the strangulated hernia, shortly after it occurred, had been successfully reduced by the taxis, and subsequently the hernia returned and herniotomy had to be performed. Dr. McDowell stated that the sac had to be opened, and he wished to know what were his reasons for opening the sac in that case. He (Professor Stokes) had drawn attention to many cases of strangulated hernia, and he had operated on a

sufficiently large number to enable him to form an opinion on this most important point. He thought the mortality depended on whether the sac was opened or not, and in his opinion in all cases where the strangulation was recent the sac should not be opened. In Dr. McDowell's case, which was recent, he stated that the sac had to be opened, but he gave no reason for making that statement. Dr. Darby's views as to strangulated hernia ought to be more generally known—namely, that the tumour should be reduced without division of the ring. He thought in all cases that this should be done if possible, for the opening of the ring was attended with the disadvantage of weakening the parietes of the abdomen.

Mr. STAPLETON said if there was one thing more than another in which he agreed with Dr. McDowell it was that in treating these cases the surgeon should not be led away by rules. Each case should be taken on its own merits and treated as it required. It was very well to theorise and say this case ought to have the sac opened and that case ought not. They might have a very fine sac, as thin almost as goldbeater's leaf, but where would the stricture often be found? In the neck of the sac, and they might divide all the parts about it and apply pressure, and yet be unable to reduce the hernia till the neck of the sac was divided. As to the time of reducing the hernia, it required much consideration. If the taxis were used in femoral hernia after two or three days there was a risk of rupturing the intestine, because the peritoneal coat of the intestine had been cut through. When he met with a femoral hernia that was more than twenty-four hours old then he let the taxis alone. If it were an inguinal hernia the taxis might be tried, but he had known in both classes of hernia cases in which relief had been obtained by operation, but where, on the man getting a fit of coughing, the intestine gave way from the peritoneal coat, having been partially cut through before the operation. He was of opinion that in all these cases the bowels ought to be left undisturbed as long as possible, and if any inconvenience occurred an enema of warm olive-oil might be used. In one of the first cases he had, the patient's friends thought they could not get the bowels freed soon enough, and they freed the patient out of the world. In one of the cases described by Dr. McDowell there was a swelling in the tunica vaginalis. Now, was it not possible that the tunica might have been slightly wounded in the operation. As to ether or chloroform, he should prefer the chloroform. There was more excitement, more vascular disturbance, more drunken excitement (if he might use the expression) from ether, and in such cases as these therefore he thought chloroform was decidedly the better. He had seen patients under chloroform where the spasms continued all through. The proper thing was to resort to the old practice and give the patient tartar emetic. On one occasion, when returning from attendance on the late Mr. O'Reilly, a man stopped him and asked him to see his wife. He went into the house, and saw a basin containing stercoraceous vomiting. He asked the woman if she had a tumour in the groin, and she said she had. He manipulated the tumour, and it went up with a gurgle. Believing that a hernia like that could not have produced such violent symptoms, he made a further examination, and found in the other groin a tumour about the size of a walnut. She said it had been there about four or five days, and that she did not pay any attention to it. He tried the taxis, but it was so painful that he had to desist, and he then offered to go at once for his instruments and perform an operation. The husband, however, said it would be time enough in the evening; but when he was coming back in the evening he saw crape hanging on the door. If femoral hernia had existed twenty-four hours the sooner it was operated on the better. They could not say in any form of hernia the quantity of hernia that was present. A woman was brought to Jervis Street Hospital, said to be suffering from strangulated hernia. She walked down to the table and was operated upon. The hernia went up. She wanted to walk upstairs to her bed, but this of course was not permitted. The operation was performed between 3 and 4 o'clock in the day, and when he went at 8 o'clock that evening to see her he found the woman was moribund. The next day a post-mortem examination revealed an amount of peritoneal inflammation which he had never seen exceeded, and yet she had no symptoms of it, and was able to stretch her legs out. Some years ago he exhibited a case of strangulated hernia in an old woman, who would not allow herself to be operated on; she sank and died. There was not a single sign of inflammation of the peritoneum to be seen. The large and small intestines were free up to the strangulation.

Professor MACNAMARA said they owed a debt of gratitude to

the author of the paper for the interesting cases he had brought forward, and also to Dr. Darby for pointing out that it would have been better if Dr. McDowell had suggested some points to be discussed. The result had been that a diffuse discussion had arisen on one of the most important subjects in surgery. He had had some success in the treatment of strangulated hernia, and he adopted many of the views which had been mentioned that evening. There was one point to which he attached great importance, and that was the leaving the patients alone after operating on them. The great point was to get the intestine back into the abdomen, and when he got it there he left it alone. He might mention two cases which had come under his care. One was the case of a nurse in the Meath Hospital. She had a femoral hernia which was down six days. She would not allow an operation, for she said that all the strangulated hernias that were operated on died. She was, however, persuaded finally to allow the operation to be done, and she was now alive and well. There was another case in which the strangulation had existed for five days, and in that also the operation was perfectly successful. The great point was not to make any attempt to move the bowels. The patient got a little opium, nine or ten days were allowed to elapse without any interference, and then the bowels acted of themselves. One of the greatest mistakes was the anxiety of the surgeon to see the result of his treatment at once. He ought to remember that the bowel had been seriously injured, and required rest. If a man had a broken arm, would the surgeon try every two or three days to bend the limb backwards and forwards in order to see if it were perfectly united? Just so with the bowel. Let it alone and it will act well of itself without any interference. He congratulated the Society on the presence amongst them that evening of the seniors of the profession. The case recorded by Dr. Stapleton had taught him a valuable lesson, viz., that in which, having removed one hernia, he found another. He (Professor Macnamara) confessed that if it had happened to him, after the reduction of the one hernia, he would probably have walked away, thinking all was right. That case, therefore, had taught a lesson which he hoped the juniors of the profession would not allow to lapse from their minds.

Dr HENRY KENNEDY remembered when a degree of force was used in these cases which appeared to him perfectly successful, and with success. He saw the late Mr. Peile succeed in two cases in using the taxis with very great force. He remembered the late Sir Philip Crampton succeeding in the same way with a lady having a femoral hernia, and he succeeded after a previous surgeon had failed, by a long and very forcible pressure. He (Dr. Kennedy) did not, however, for a moment advocate the practice. The aspirator had lately been used in some of these cases for the purpose of reducing the tension of the tumour, and thus facilitating its reduction. Another mode which had been used was the suspension of the patient. He was in one sense the exponent of the principle, for he was the person employed to suspend the patient who had strangulated hernia, and in that case it was successful. He mentioned these methods because he thought every plan ought to be adopted before having recourse to the knife.

Mr. H. GRAY CROLY said he had performed the operation probably as often as any gentleman present, and he had brought forward several papers on the subject, and in listening to Dr. McDowell's paper he felt a deep interest in each of the cases he had detailed. It was a difficult matter for a surgeon recording five or six cases, each presenting peculiarities, to lay down any fixed line of treatment to be adopted. As to the first case, he mentioned that inversion of the body had been used by Dr. Morgan. Now, if there was anything he (Mr. Croly) would condemn it was inversion of the body. In that case it was not successful, the hernia being apparently reduced and then returning again, and that bore out what he had known to have occurred in the City of Dublin Hospital. Many years ago the late Professor Geoghegan tried inversion in a case of strangulated hernia. The woman was lifted up and the hernia disappeared, but it went beyond the surgeon's reach and she died. He thought the operation was a fatal one, and ought to be expunged from surgery. As to constipation, he had followed the rule, when the stricture had been divided, of keeping the patient on ice, chicken-broth, and opium, and letting the bowels continue undisturbed. He had seen cases where, the stricture having been relieved, the bowels moved on the table. This was a favourable symptom, and the patient recovered. Constant doses of opium allayed the peristaltic action of the bowels, but ultimately the opium acted as a purgative, and the bowels became freed. Sixteen years ago, when assistant in

the City of Dublin Hospital, a case occurred in which the patient had a cyst. She had ganglions on the wrist and on the dorsum of the foot. She was seized with vomiting, and suspecting hernia, he examined the hernial ring and found a tumour. Dr. Geoghegan was sent for, and cut down on the tumour, when a squirt came up that almost hit the ceiling. The stricture was divided, but the patient did not recover. The hernial tumour had not existed more than five or six hours. He made the post-mortem examination, and could not find anything to account for the patient's death, except the shock following the operation. In his opinion operation was too frequently delayed in these cases, and he thought if, having tried the taxis once fairly, the operation was then performed, there would be very few deaths. Generally, the surgeon got a case where someone had been previously trying to reduce the tumour and thumbing it. One case was admitted under his care where the marks of the surgeon's four finger-nails and thumbs were imprinted on the hernia. He had always endeavoured to teach students that early operation was the great thing to be attended to; that the structures cut were nothing but skin and fascia, and that as it was an extra-peritoneal operation, it was much safer than the taxis. As to the hernia coming up and down, he did not think it made the slightest difference. If it had room to go up it would also have the opportunity of coming down, and it was accustomed to the old sac, which could not be reduced. He was strongly opposed to the administration of tartar emetic, and did not think they were justified in giving it in any case of strangulated hernia. He thought more persons died from shock than from any other cause. He did not think any surgeon could go to a case of hernia saying, "I will open the sac," or "I will not open the sac." If it were a recent hernia it ought not to be opened, as a general rule; but the stricture was often found in the sac, so that it became necessary to open it. Out of a large number of femoral hernias, he never divided Gimbernat's ligament, and he could safely say that Gimbernat's ligament rarely, if ever, causes strangulated hernia. He did not believe chloroform or ether was of any assistance in reducing a hernia. Desault's remark ought to be printed in every hospital—"Think well of the strangulated hernia where taxis has not been used."

Dr. RICHARDSON: Mr. Stapleton alluded to latent inflammation in one of the cases that had come under his notice. A valuable work has been published by Mr. James, of Exeter, in which he gives a large number of cases where the patients had died without any symptoms of peritonitis, and yet they had most extensive inflammation.

Mr. STAPLETON said the administration of tartar emetic was suggested by the late Dr. Neligan in his work on medicines.

The PRESIDENT said that a few years ago he was sent for to see a case of umbilical hernia. All the symptoms of hernia existed, and there was an umbilical tumour. He operated with the assistance of Drs. Geoghegan and Hargrave. There was no hernia however, but merely a fatty tumour. The woman died, and it was found to be a case of intussusception, what was supposed to be an umbilical hernia being merely a coincident tumour.

Dr. McDOWELL, in reply, said his object was not to lay down any rule of practice in the treatment of strangulated hernia, for he did not think any absolute rule could ever be laid down. His only object was to bring forward peculiar cases which might suggest improvement in their present practice. Mr. Stokes had asked why in the fifth case he opened the sac. The reason was that there was a very tight and thick stricture about the body of the sac and at its neck, and he was obliged to divide it. Dr. Stapleton had asked whether the tunica vaginalis had been wounded in the case where bloody extravasation into the scrotum had occurred. He did not think so, and he thought the hydrocele arose from inflammation of the tunica. As regards the taxis, he agreed with Dr. Stapleton, that they must be cautious in using it all when the strangulation had lasted very long. He feared they would never agree on the question of opening or not opening the sac, and therefore he had not referred to it in his paper. As to giving tartar emetic, which Mr. Croly objected to, he could only say that it answered its purpose, and that the patient was alive and well. He gave him 2 grains of tartar emetic and 20 grains of ipecacuanha, and in ten minutes his stomach became sick, his skin clammy, and his muscles relaxed. He had been asked if he gave opium. He always did so, and it was a strange thing that opium, which was known in other cases to act as an astringent, should in cases of strangulated hernia have an opposite effect.

WEDNESDAY, APRIL 7, 1875.

THE FRAUDULENT TRADING PROTECTION BILL.

THE Committee on Mr. Sclater-Booth's Bill has undergone a series of postponements from the 19th to the 22nd of March, and again until an early day this week, when it will probably be dealt with. As the amendments are very numerous, and involve important principles, they will no doubt be warmly debated on the one side by the representatives of honest trade and on the other by those of smart shop-keeping. The leading opponent of Mr. Sclater-Booth's proposal to make things pleasant and profitable for the concoctors of mixtures is Dr. Lyon Playfair, a doughty champion, who combines in himself a considerable experience in diplomacy, a profound knowledge of the adulteration question, a high rank amongst our legislators, and an honesty of intention unpurchasable either by popularity, by votes, by place, or by money. He will give Mr. Sclater-Booth something to do to pass his adulteration protection clauses, and being encouraged by the approbation of almost every newspaper in the United Kingdom (saving those which directly represent the interests of grocers, mixers, and druggists), we have some hope that he will succeed in forcing an abandonment of the concessions to dishonest money-making which are the characteristics of Mr. Sclater-Booth's Bill.

The Council of the Pharmaceutical Society, which we spoke of last week as occupying an inconvenient position between the public and the adulterators has, if we may judge them by the sentiments of their editor, taken sides with the traders, and we find their journal giving utterance each week either to a half-encouragement to the adulterating druggists, or to a faint condemnation to this form of dishonesty. It argues the week before last in favour of retaining in the Bill the word "knowingly," pleading that retail vendors can not be expected to test or answer for the purity of their goods. Naming butter as an article to the purity of which it is difficult to testify, it says: "Would the enthusiasts for purity first fine a dealer £50 and send him to the treadmill for six months for being imposed on in the wholesale market by this commodity?"

To this childish special pleading we reply without hesitation, that we *would* impose upon a trader who sold lard for butter the statutory penalty, whatever it might be, *not* because he was imposed upon in the wholesale market, but because (presuming that he did not know what he was buying from the wholesale dealer) he did not take the trouble to ask, or purposely made no inquiry. We repeat that we see no hardship in asking a grocer to adopt the precaution which is required of every other trader by asking the manufacturer for a warranty that the article is what it professes to be. The vendors of adulterated goods do not forget to ask for such a guarantee; they intentionally omit to ask any questions, well knowing that the article sold to them and which they retail is fraudulent, and desiring to cheat their own consciences and the public into the idea that they buy and sell in innocence of the fraud. We insist that it is fair and reasonable to require from them that they shall make sure that what they sell is what is paid for, and if it should ever occur that they were deceived by the manufacturer or the wholesale dealer in the purity of the article supplied they would, with their invoice in hand, be perfectly safe from loss either of money or reputation.

We have pointed out already that there is almost no conceivable evidence, except the culprit's own confession, which could be produced to prove that he "knowingly" sold a fraudulent article. The *Pharmaceutical Journal* says: "Under the Bill proof of innocence would be open to him (the retailer) by the retention of the word "knowingly." It cannot for a moment be supposed that the onus of proving *actual knowledge* would be thrown on the prosecutor. It may be granted that the druggist's assumed knowledge should be *presumptive* evidence against him, but that should not be final; he should be allowed to purge himself of the charge of fraud."

If the editor will study the Bill he will find that his interpretation of its clauses is entirely incorrect, for Mr. Sclater-Booth's measure as it now stands does indisputably require the prosecutor to prove by distinct evidence that the seller *knew* the goods sold to be adulterated. Our contemporary thinks that the seller "should be allowed to purge himself of the charge of fraud," in which view we entirely concur, but we differ as to the method of his doing so. Our contemporary apparently thinks that he might do so by swearing that he knew nothing about the matter, and that he never thought of asking any questions of the person from whom he got the goods. We hold that the only satisfactory proof that he sold in innocence would be the production of a written warranty from the firm who sold to him. This warranty would be always available in his invoice if he took care that the goods were accurately described therein, and we would be perfectly willing that any retail trader should be free of responsibility if he could show by such evidence that he had been deceived by the manufacturer or wholesale dealer.

The simple issue between the consumer and the trader hangs upon the plain honesty of the transaction. However the question may be clouded with sophistries, the fact is that the public are deliberately and almost universally cheated by the substitution of other articles for those for which they pay. They are subject to having

things put upon them by false representations which they might probably refuse to have at any price if they knew their nature, and would certainly object to pay for at the price of pure articles. This is the existent state of trade in adulterated goods. It is roguish, and, like other forms of roguery against which the buyer is not capable of protecting himself, it ought to be put a stop to by law.

IRISH MIDWIVES.

THE relation which these trained women are in future to assume towards the profession and the public promises to become a question of first-class importance. For a long time they were thought to be an unmixed blessing to the community. Facts are, however, now accumulating, both here and in England, which must painfully undeceive the public in this respect. It was never intended that these midwives should, no more than the more ignorant class which they were designed to supersede, ever undertake any case which called for more than mere nursing ministrations. The training which is given them, and which their limited education alone enabled them to receive, fits them for none other. Unhappily, however, while the training is so limited, the only limit set to their practice is that imposed by the assumed intelligence of the public. The latter were supposed to be acquainted with the limits of their sphere of usefulness, and so to know when to trust to them and when higher aid became necessary. Then the midwife, too, was supposed to be as modest as her small stock of information should make her, and so prove an exception to the proprietors of small stocks of information generally, and then there was the law of the land to fear. All this was very well in theory, but it now turns out to have badly stood the test of practice.

In a large city all things are well, but things are quite different in the provinces. There the public are not in every instance so intelligent as was taken for granted. The midwives, too, in many instances turn out hardly a bit more modest than the utterly untrained handy old women whom they were intended to supersede. In the sister country sufficient of mischief has been wrought by the present system as to call for the serious consideration of leading members of the present Ministry towards devising a suitable remedy. In this country the letters of a country practitioner which have appeared in these columns show how keen is the interest which the question is exciting.

Following on those letters, we have reason to know that a well-known provincial practitioner has officially laid before the Masters of the Coombe and Rotunda Hospitals the details of a case where life has been clearly lost by the presumption of a midwife in taking charge of a case which lay entirely outside the domain of her class. The case has been reported to those authorities as the persons who, having let these women loose on the public, will be held by the latter responsible for any ill consequences which it may be in their power to either modify or correct.

Our midwifery training establishments are indebted to the public and to the State for the means of being able to train these women, as well as for far more valuable privileges, and we are satisfied that they are too enlightened and too sensible of their responsibilities to neglect to discharge the correlative obligations which these privileges impose.

Two proposed remedies are at present before the public: one would grant conditional certificates to these nurses, of which they would be publicly deprived in the event of their attending any case beyond their sphere; the other would

interdict them from exclusive attendance on any case whatever.

Additional facts are necessary to determine the most effective remedy to be devised. We think that, meanwhile, provincial practitioners ought to report (not necessarily over their names) every flagrant case that occurs in their practice.

In conclusion, let us say that no more important question has for a long time been brought under public notice.

Notes on Current Topics.

Conviction of a Quack Doctor for Murder.

QUACKS in this country have a very pleasant time of it, unless in the course of their illicit practice the death of a patient brings them within the pale of the law, as was the case last Friday, when one of them, named Alfred Thomas Heap, who had been practising at Manchester for some years as a surgeon, but without any legal qualification, was convicted at the Liverpool Assizes of the wilful murder of a single woman, in his attempt to procure abortion, on the 12th of March last. The indictment was that the prisoner had caused death by endeavouring to procure abortion and using a sharp instrument, with which he had pierced the deceased's body, and it was contended that this was murder in the eyes of the law just as if he had actually intended to kill the woman. In vain did the prisoner's counsel plead that, inasmuch as there was no intention to kill, the prisoner was not morally guilty of murder; the judge very properly pointing out that if in the execution of any illegal deed death resulted, a person was legally as guilty of murder as if his intention was to commit it; he further remarked that there was little chance of the recommendation of the prisoner to mercy by the jury being acceded to; the sentence of death would in all probability be carried out. So far so good. It gives us great pleasure to chronicle the fact that this miscreant has been brought to the bar of justice, and will probably meet the fate he so richly deserves. But what shall we say of the law which enables these fellows openly to practise in every large town, to the bodily and pecuniary injury of so many thousands, and even to advertise their villanous traffic in half the newspaper press of Great Britain? We have protested until we are well nigh sick of seeing the work "quack" in print; perhaps when a few more lives have been sacrificed the Government of the day may be disposed to *think over* the matter. We hardly dare hope to see any decided action taken. France in this respect is ahead of us: there the law prohibits, under severe penalties, anyone pretending to the title of doctor or practising medicine unless legally and properly qualified. Would that it were so here!

Definitions of Adulterated Articles.

WE have recorded that within the last few weeks certain chemists were prosecuted to conviction for selling milk of sulphur which was more than one-half of powdered plaster of Paris. We observe that the manufacturers of this article have sent to their wholesale customers the following letter:—

'GENTLEMEN,—As the Corporation officials appear de-

termined to continue the prosecution of chemists for the sale of milk of sulphur, and as some of them may be involved in doubt as to the course they should pursue, we would suggest that the wholesale druggist should advise his customers not to sell it without attaching a label declaring its mode of preparation.

The words at foot would suffice for the label.

We are, gentlemen, yours truly,
SIMPSON & BURELL.

MILK OF SULPHUR.

Lac Sulphuris, not Sulphur Præcipitatum.

This is just one of those cases in which an attempt is made to evade the law by attaching to the article sold a label which gives no information whatever to either customer or dealer, and which does not in anywise convey to the buyer an honest or truthful definition of the article sold to him. The manufacturers and dealers very well know that if they described milk of sulphur as what it really is they must be content either to sell it at a much less profit than they do or else not sell it at all. Accordingly they will call the mixture of gypsum and brimstone "*lac sulphuris, or milk of sulphur,*" or any name which will lead the uninitiated to believe that they are really getting sulphur for their money, but they will not—until forced by the law—tell the real truth about the matter. We shall hope to see the day when the law will not tolerate the obtaining of the consumers' money by such a deception; but that day will not come until the public show themselves to be stronger than the shopkeepers, and until trade honesty counts for more than it does at the present day.

When may a Syphilitic Father procreate a Syphilitic Child?

DR. TAYLOR, Surgeon to the New York Dispensary, speaks of the well-known communicability of syphilis by the blood, and adds: To apply this fact practically, supposing, as is most probably the case, that a man's blood is contagious during the whole secondary period, which on the average we state to be two years; now, during that whole time, if by chance that fluid is placed in proper conditions, contagion ensues; while even if a patient has the most inveterate attacks of mucous patches, they certainly are present, and therefore contagious, but let us say for one-half of that time at the most. "I have been struck by the want of attention paid, and I may say by the ignorance displayed, by very many as to this contagious nature of the blood, and I have seen numerous undoubted instances in which newly-married women have become syphilitic through this means, in consequence of the physician not having warned the syphilitic husband prior to marriage." In several instances he has learned that they were informed of the probabilities of occurrence, and of the danger of mucous patches, and assured that they were the only dangers to be feared. So strongly has this fact been impressed upon his mind that he in every instance, when it is necessary, warns patients solemnly of the danger of chafes and fissure about the penis. When advising men, of course he insists as far as possible on the lapse of at least two years from contagion, and even longer if the manifestations of syphilis show an unusually active state of the disease. At the end of this time, in seemingly auspicious cases, he informs them, if

they have been treated regularly and for a certain time, that they are as well as they could be, perhaps are even cured, but that there are certain precautions to be observed and danger to be avoided. He then carefully explains or reiterates the nature and danger of mucous patches and of ulcerative lesions, and goes minutely into the liabilities of contagion by the blood.

Ovarian Cyst.

MR. KNOWSLEY THORNTON showed a specimen of ovarian cyst with a papillomatous growth in its interior at a meeting of the London Pathological Society on March 10th. The patient had suffered for three years from pain in the hip, and came under the care of Mr. Spencer Wells, showing signs of cystic disease of the ovary. Tapping was practised, and the fluid, besides presenting the character of fluid from simple cysts, contained a large quantity of round cells and masses of protoplasm. The ovarian character being established, it was removed. The cyst was found to be unilocular, its walls formed of delicate vascular connective tissue, and its interior lined by a layer of squamous epithelium. Spruing from the lining membrane were cauliflower-like masses, consisting of a papillomatous outgrowth in various stages of development. Mr. Thornton described in detail the growth of these papillary buds from the lining membrane, his description coinciding with that given by Dr. Wilson Fox, only he believes them to be more common than Dr. Fox thinks. These cysts are evidently enlarged Graefean follicles, and to be distinguished from parovarian cysts, the seat of which they may come to occupy as they increase in size. The specimen shown by Mr. Wells earlier in the evening was one of parovarian origin which had come to occupy the site of the ovary. The distinction was very important, because of the risk involved in tapping ovarian unilocular cysts, from the transference of the epithelial elements to the peritoneal surface, and their growth in that membrane. He had seen two cases of this mode of dissemination of these active elements. From this point of view an ovarian cyst arising from dropsy of an ovarian follicle must be regarded as malignant, and only to be treated by ovariectomy. Mr. Spencer Wells spoke highly of the value of microscopic investigation of the fluids in such cases.

Case of Favus.

DR. DYCE DUCKWORTH showed a case of favus to the Clinical Society of London on the 12th March. This disease is certainly rare in London, although frequent both in Edinburgh and in Germany and France. The patient was a boy, *æt.* 8, and had had the disease for sixteen months, having been nearly cured for a time. The head was now nearly covered, and there were one or two patches on other parts of his body. There was no history of contagion. The case presented the typical characters of this disease—yellow cupped crusts and mousy smell, and the achorion Schonbeinii was found in abundance under the microscope. The treatment adopted was poulticing, followed by epilation and local application of hyposulphite of soda and sulphurous acid, and good diet and cod-oil. Sir William Jenner noticed that these cases were usually very obstinate to cure.

Dr. Whipham read the notes of a case of fatal pleuro-pneumonia in an opium-eater. When first seen the patient was in the habit of injecting two or three grains of morphia at a time into the rectum, and repeating this with intervals of fifteen minutes, until he regained confidence. The bowels were regular, but the pupils were contracted to half their size. He was kept to ten grains of morphia daily. He also took about a drachm of chloral daily. His regular daily dose of morphia was twenty grains. De Quincey used to take as much as fifty-three grains daily. Sir William Jenner observed that the use of chloral seemed to be increasing daily, but opium-eating is by no means so common. People take chloral now for weeks, months, or years, and seem to think nothing of it.

Intestinal Obstruction.

At a meeting of the Pathological Society of London on March 16th, Dr. Mahomed showed a recent specimen of intestinal obstruction from a young man, aged 18, admitted into hospital on March 5th. Eight days before death there was vomiting, which became fecal, constipation, but no passage of blood, and no tumour. Slight symptoms of general peritonitis. The pulse was full, quick, and temperature normal. Death ensued in a week. At the autopsy a loop of intestine thirty inches long was found to be included within a fibro-vascular cord, which passed from the free border of the mesentery three feet above the ileo-cæcal valve to the walls of the abdomen at the umbilicus, making one turn and a-half round the included bowel. Immediately below the point where the band was given off was a small diverticulum, probably the remains of the vitelline duct of the ileum. The cord, which was completely invested in a fold of the peritoneum, divided into two branches before reaching the umbilicus, one being continuous with the superior vesical artery. Dr. Mahomed thought that the cord was formed by the hypogastric artery, which took an abnormal origin from a branch of the superior mesenteric, being joined by a branch of the superior vesical just below the umbilicus. The obstruction occurred at the point where the cord joined the mesentery, but there was no strangulation. There was slight local peritonitis.

Antiseptic Surgery.

MR. LISTER says that there are some circumstances in which oily solutions of carbolic acid are of service, as for lubricating instruments introduced into the bladder, such as catheters, bougies, sounds, or lithotrites, where he has for some time past used a solution of one part of carbolic acid in twenty parts of olive-oil—a proportion which is not irritating to the urethra, and yet is trustworthy as an antiseptic; and there can be no doubt that the avoidance of putrefaction fermentation within the bladder is in many cases a matter of vital importance.

Chloride of zinc has the remarkable property among all antiseptics that he has tried, that a single application of it to a recent wound in a solution of the strength of 40 grains to the ounce of water, although it produces no visible slough, yet prevents the occurrence of putrefaction on the cut surfaces for days together, in spite of the action of the septic material; and if the discharges have oppor-

tunity to flow freely away, as after the removal of a tumour of one of the jaws or a portion of the tongue, there may be absolutely no odour from first to last, the divided textures being thus guarded from the bad effects of the putrefaction during the dangerous period, before they have been covered by the protecting layer of granulations.

Addison's Disease.

DR. GREENHOW, in his Croonian Lecture at the Royal College of Physicians of London, says that Addison's discovery has not yet been generally accepted, nor even generally understood. The connection of the constitutional symptoms and bronzing of the skin with the disease in the supra-renal capsules is still regarded by many rather as a matter *sub judice* than as a certain and definite relation. He has himself, on twelve occasions, diagnosed Addison's disease of the supra-renal capsules, in the presence of medical students and friends, and in eight of these cases the correctness of the diagnosis has been shown by the autopsy. It is still argued, however, that although a diseased condition of the supra-renal capsules may frequently coincide with certain clinical symptoms, it is by no means essential to their development, and consequently cannot be the cause. But medical records have as yet produced no single case exhibiting the really characteristic features of Addison's disease in which this particular lesion of the supra-renal capsules was not also present. He mentions 228 cases where the supra-renal capsules are reported to have undergone the one particular morbid change which he has described. In 101 of these cases the train of constitutional symptoms and the peculiar changes in the skin colour were observed during life in a more or less developed form. In all the 101 cases the supra-renal capsules were found after death to be diseased, and the disease was in every case of the same nature, corresponding with one or other of the stages of the particular lesion which he has described; and lastly, in none of the 101 cases did any other organic lesion exist which could be of the slightest importance.

Dr. Peter about Tobacco.

DR. PETER (*Jour. de M. et de Ch. Prat.*, March, 1875) makes great war against tobacco, and accuses it of many evil effects on the organs of the economy, and among great smokers in particular, he says, it produces most commonly a flatulent dyspepsia. It is very remarkable that in such patients charcoal-powder produces no effect. Above all it is necessary to diminish and forbid the use of tobacco. Pretty good results are obtained from the use of strychnine, especially from the tincture of nuxvomica. But these are difficult of administration, and, besides, patients know their names and fear them. He therefore recommends the following prescription:—One drachm of bitter drops of baumé, five drachms of tincture of rhubarb, made into forty pills, one or two of which are taken before each meal.

Statistics of Suicide in Prussia.

THE Statistical Office of Prussia has just published the following table of the suicides in that country from 1869

to 1872, which shows that in 1869, 3,186 persons killed themselves, of whom 2,570 males, and 616 females. In 1870, 2,963 suicides occurred, of whom 2,334 males, and 633 females; in 1871, 2,723 suicides, of which 2,183 males, and 540 females; lastly in 1872, 2,950 suicides took place, of which 2,363 were among males, and 587 among females. Hence four times as many men as women destroyed themselves. The greatest number of men kill themselves in Prussia between 10 and 15, and between 50 and 60. In women the tendency to suicide is most marked from 15 to 20, and past 17 years. Married people contributed 452 suicides per 1,000, and unmarried persons over 15, 339 per 1,000. Fear of the conscription, tobacco and alcohol are doubtless the main causes.

Electrolysis in Nævi.

MR. S. J. KNOTT (*Lancet*, 20, 3, '75) says that with one of Stöhrer's continuous batteries, six or eight cells usually being used, he has generally cured nævi. If the nævus is small he uses one or two needles attached to the negative pole and one to the positive, and passes these into the tumour; but if large he puts on several needles in the negative cord, and uses charcoal points with the positive. After the needles have been in the tumour a short time, decomposition begins, and this is shown by bubbles of gas passing by the side of the needles. A clot is then formed, the tumour turns bluish-white, and in this clot fibrous degeneration takes place, and cure. The advantages of galvanism are its certainty, safety, and the faintness of the scar, whilst the pain ceases at once after the operation. In one case, in an infant aged four months, there was a venous nævus at the end of the nose, making the organ look blue and bulbous. Two needles were applied on the 4th December, 1874, and the child was quite cured. In another case, in an infant four and a-half months old, there was a capillary nævus on the inner side of the right labium of the vulva. Two needles were applied, and the child was discharged cured on April 26, 1873, after being in hospital a month. In a third case, a child aged five months came on the 21st October, 1873, with a capillary nævus on the right eyebrow, about the size of a sixpence. Two needles were used. The child had a second application on the 30th, and was discharged cured on November 12th.

Cellar Dwellings in Berlin.

BERLIN has long been known to be a very unhealthy city, and Dr. Schwabl has written a very interesting paper upon the effects of underground habitations on the health of the poorer inhabitants of the capital of Prussia. He ascribes one part of the unhealthiness of Berlin to the increased supply of water which has recently been granted to the city, without, at the same time, making due provision for the draining off of the water when used. It seems that the death-rate at the last census was 21.6 per 1000 for persons living in the first-floors; 22 per 1000 in persons living on the ground-floor; and 25.3 in the case of persons living in cellars. But it seems that the death-rate of those who lived in garrets was as high as 28.2 per 1000. This is, then, only the old tale, that the chief factor of death is poverty. Poverty, in short, is the reigning evil of the human race, and kills more persons than all the wars in history.

Phosphorus in Bone Disease.

PROFESSOR JACOBI, of New York, says that in a number of cases of bone disease he has resorted to a rather novel treatment. He referred to phosphorus. It was a number of years ago that a German anatomist fed a great many hundreds of rabbits, whose bones he had broken, on phosphorus. He found that fractures of bones would heal rapidly when the animals were fed on food containing minute quantities of phosphorus. When phosphate of lime is given in rickets, it is found that it is just as speedily eliminated as it is introduced into the system, and then it is really doubtful whether it is of much use or not. He was in the habit of prescribing phosphate of lime, because it is still believed that some portion of it will be retained in the system; but eventually it will be found that there is but a very unsatisfactory result. With phosphorus it is different. This gentleman found that when he fed these rabbits on phosphorus, a large amount of callus was thrown out, and in a very short time relatively, the bone was healed. He says himself that he had no chance to try his method on the sick. When Dr. Jacobi read this paper, it occurred to him to try phosphorus in bone disease. He had since done so in a large number of cases, both subacute and chronic, both in private practice and in his clinique, and a large number of these had undoubtedly been benefited by it; he had now a number of cases of caries, subacute and chronic; and pure periostitis got well under this treatment when it could hardly be expected.

The dose should be not more than one-twelfth to one-tenth of a grain to an adult, or one-thirtieth to one-fortieth of a grain four times a day to an infant, in the proper menstruum. It should be given after meals, mixed with mucilage, or barley-water, and at the same time a little iron given. The use of phosphorus as a remedy for bone disease should be remembered, for it cannot yet be found in books or journals.

Hereditary Syphilis.

DR. JACOBI says that it is probable, that the large number of diseases we see in childhood, extending into manhood and adult life, and exhibiting themselves in the abdominal cavity, are due to syphilis. If placed on a mercurial treatment, a great number of these would recover. He would repeat the observation he had already made many times, that the great reputation which calomel had gained in the treatment of every sort of disease is in consequence of the fact that a large number of forms of disease are due to hereditary syphilis. Whenever the physician has to deal with syphilitic diseases, no matter of what description, generally, mercury will do good. There may be suppuration and pus, and other consequences, due to syphilis: give calomel, give mercury in various forms. There may be chronic pneumonia, or pericarditis, or consumption, due to the same cause: give calomel, and success will follow in many cases, in a very short period, when success was not thought possible. It appears that we are menaced by a revival of mercury in America of formidable dimensions.

Cancer of the Cervix Uteri.

DR. CHARLES LIEBMAN read a paper at the meeting of the Obstetrical Society of London on the 3rd March in

which he narrated the particulars of four cases seen by himself, which showed that cancer of the uterus spreads much higher on the lining membrane of the cervical cavity than on the exterior part of the neck. He considered amputation of the cervix useless in all cases of cancer, except those of pedunculated, canceroid, papillary tumours of the cervix. In the discussion which followed, Dr. Heywood Smith said he had tried Dr. Gibb's method of treatment with plugs of strong perchloride of iron, and had had bad symptoms, like those of septicæmia, supervene. Early removal should in all cases, when practicable, be had recourse to. Dr. Priestley said he had seen cases where cancer of the uterus had commenced in the cervical cavity, whilst the external labia were quite unaffected. Cancer beginning first in the fundus uteri was not uncommon. He had seen cases where cancer had commenced in the fundus and eaten into the peritoneum, whilst the cervix was to all appearance quite healthy. Dr. Rogers thought it impossible to cure cancer by escharotics, although bromine was the most useful of these. Dr. Barnes thought that the safest way to remove the cervix was by means of the galvanic cautery, and if the diseased mass projected into the vagina, so as to be able to be surrounded by a wire, it should be removed flush with the vaginal wall. There was rarely any serious-bleeding, sometimes almost none. In those cases where the disorder did not project, the button galvanic cautery could be moved over the surface and destroy the necrosed portions. In all cases but one reprieve and benefit to the symptoms had ensued from this operation. In one case the patient lived five years after the operation, but the disease returned. Dr. Wynn Williams said that the cancerous matter may be deposited in any of the tissues of the uterus. He did not think that anyone could well mistake the peculiar odour of a cancerous mass in the later stages for a fibroid of the uterus. The cancerous mass, wherever seated, should be destroyed by the *écraseur*, or galvanic cautery, and bromine should be injected into the parts that cannot be reached. One case had lived seven years after such treatment being applied. Dr. Routh said that if there were pain at night which persisted for any length of time, with menorrhagia, it was safe to put down the case as one of cancer. The wire *écraseur* was usually preferable to the galvanic cautery, because the electric wire was so thin. He was not satisfied with leaving the case to heal at will after such excision; but after waiting four or five days he destroyed the surface by means of bromine, or the actual cautery. In cases of hopeless cancer, accompanied by *fœtor* and loss of blood, he thought interference useful. Destruction of the ulcerating surface often both stopped the general cachexia and gave great relief, and the patient gained temporary restoration of health. He introduced the dry perchloride of iron into the uterus in some cases. Dr. Aveling stated that, after scooping away the diseased tissues, he had found that nitric acid was as useful an application as the actual cautery. Dr. Wiltshire said he had used chromic acid with great benefit. Dr. Bloxham spoke well of iodine and iodoform, the latter being applied in powder on wool. Dr. Edis agreed with the author of the paper as to the way in which uterine cancer originated, and had been accustomed to use a pear-shaped bulb of actual cautery to

destroy the lining membrane and interior of the cervix. Some patients had lived for years after this operation. Dr. Braxton Hicks said with regard to the deep burning of the galvanic wire that this was obviated by making the battery more powerful and screwing up the wire more quickly. The galvanic wire had this advantage over the *écraseur*—it cut quite clean and knife-like. He agreed that the remaining diseased parts should be destroyed by burning. Dr. Murray quite agreed with Dr. Priestley as to the difficulty of diagnosis between cancer of the fundus uteri and uterine fibroids.

Appointment of a Surgeon to the Tyrone Infirmary.

At a special meeting of the Governors of the Tyrone Infirmary, held on Saturday week, it was proposed, seconded, and unanimously passed—"That Edward Charles Thompson, Esq., be appointed Surgeon of the Infirmary."

There were four other candidates for the office.

At a meeting held on the 20th March, the following was passed. Resolved—"That the Governors of the Tyrone Infirmary at this their first meeting after the lamented death of Dr. Thompson, hereby record their sorrow at that event, and their sincere sympathy for his widow and family. Having so recently expressed their sense of the loss sustained by the institution and neighbourhood in consequence of his removal, they feel it to be unnecessary to add anything on that subject."

The Waterford District Lunatic Asylum.

DR. VERNON DELANDRE, Senior Medical Officer Waterford Dispensary, was on Wednesday appointed Visiting Physician to the Lunatic Asylum, vacant by the promotion of Dr. P. R. Connolly as Resident Medical Superintendent.

Hot Baths.

THE following practical rules have been suggested by Prof. Lasegue :—

No hot bath ought to exceed twenty or thirty minutes in duration.

The initial temperature ought always to be lower than the final temperature.

The increase of temperature ought always to be gradual.

The maximal temperature is usually 103°, but 108° can be easily tolerated if the patient does not remain in this temperature longer than eight or ten minutes, and that the unpleasant sensation produced by the vapour on the part of the body which is not immersed is avoided. On leaving the bath the patient goes to bed, and soon loses the sensation of unusual heat. Cold douches, which are so agreeable after hot-air baths, are not well borne after hot baths.

Lasegue has found a prolonged course of hot baths very useful in chronic rheumatic arthritis. Under their influence the movements of the articulations have become less difficult and painful. A similar mode of treatment has been found useful in chronic abdominal complaints, such as protracted diarrhoea, and even in obstinate chronic bronchitis.

Pharmaceutical Society of Great Britain.

A meeting of the Pharmaceutical Society of Great Britain will be held this (Wednesday) evening at half-past eight precisely.

Professor Hofmann will exhibit and briefly describe the specimens used in illustration of the Faraday Lecture, on "Liebig's Contributions to Chemical Science."

The following papers will be read :—

On "The Identity of Chrysarobine or Araroba and Goa Powder." Mr. E. M. Holmes.

"Notes on the Pharmacy of Atropine." Mr. Willmott.

"Ergot and its Liquid Extract." Mr. Gerrard.

Surgical Society of Ireland.

THE last meeting of the Surgical Society of Ireland took place on Friday evening, in the Albert Hall, Royal College of Surgeons. The chair was taken at half-past eight o'clock precisely, and the following communications were read :—Mr. H. G. Croly, on "A Case of Popliteal Aneurism cured by Digital and Instrumental Pressure;" Surgeon-Major Gore, on "A Case of Aneurism of the Arch of the Aorta communicating with the Left Bronchus, the opening being closed by Clot;" Mr. A. H. Corley, on "A Case of Necrosis." The President of the Royal College of Surgeons, Mr. Jolliffe Tufnell, then delivered the valedictory address, and the Society adjourned until next November.

DEPUTY SURGEON-GENERAL C. R. FRANCIS, M.B., of the Indian Medical Department, has retired on an allowance of £456 per annum, together with an additional pension of £250.

DR. HANDSEL GRIFFITHS has been elected to the Chair of Chemistry in the Ledwich School of Medicine, rendered vacant by the appointment of Professor Cameron to the Chemical Chair in the Royal College of Surgeons in Ireland.

THE discredited *ruse* of constructing an *ad captandum* paragraph out of the penny newspapers is again resorted to by the *Lancet*, which gravely, and in the oracularly professional vein, contradicts a little scrap of penny-a-liner gossip about the Prince of Wales and His Royal Highness's health, which, being assiduously circulated amongst editors, becomes a useful advertisement. We observe that the *Lancet's* contradiction is flatly contradicted by another journalist, who probably knows quite as much about the Heir Apparent's ailments as our Delphic contemporary, so that there is another opening for a recriminatory puff in the penny papers of next Thursday. Our contending medical contemporaries are so rabid for publicity that we may be well assured that they would not conceal under the bushel of their modesty the light of their "exclusive" information if the indiscretion of the Prince's attendants permitted them to get hold of any scrap of truth; and it may therefore be assumed that they know as little as they give utterance to, or they would not be driven to repeat the pseudo-medical chatter which may be had any evening by the investment of a halfpenny in an *Echo*.

Literature.

OUTLINES OF ZOOLOGY AND COMPARATIVE ANATOMY. (a)

THESE Outlines have been suggested to the author by the want which exists of a handbook of the subject suited for those who desire merely a general knowledge of zoological arrangements. The author frankly prefaces that "he lays no claim to originality, but that he has merely endeavoured to arrange and condense the leading features of zoology and comparative anatomy suitably to those who have not time to read larger works on the subject." Accordingly we find that within reasonable limits Dr. Ward has condensed an amount of information in Zoological Outlines that will ensure a wide use and appreciation of his little work. In the introduction the author gives an outline of the cell formation, and in the general subject matter he commences, contrary to the more general habit, from the head man to the last link between the animal and vegetable creation. The modern and most usually adopted classifications are selected, and are judiciously exemplified. The larger section of the book being devoted to the vertebrata, leaves perhaps rather too limited a space to the less familiar and less interesting invertebrates. The author has adopted a most practical method of simplifying the various zoological terms, by giving their derivations, with the original words and translation, and has illustrated the kind of knowledge which he seeks to extend by quoting a series of questions given at the various examining boards. Mr. Ward, in publishing a manual of modest pretensions, as he intimates, as to originality, has put together a concise and convenient handbook which, we doubt not, will be valued by the student and by anyone desiring a condensed and useful treatise on these subjects.

Correspondence.

PHARMACY IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The enclosed correspondence has appeared in the *British Pharmaceutical Journal*; but as the readers of your paper naturally take an interest in and are much more concerned in the subject of pharmacy legislation for Ireland than the English trade, I should therefore be obliged by your inserting these letters in your next issue, that the medical profession may judge the relative merits of the questions at issue, and the chemists and druggists are satisfied to abide their judgment.

I am, Sir, yours respectfully,

WILLIAM HAYES.

Hon. Secretary of the Chemists and Druggists' Society of Ireland.

12 Grafton Street, Dublin, March 25, 1875.

To the Editor of the *Pharmaceutical Journal*.

SIR,—I must take exception to your article of the 27th February, inasmuch as you appear to be labouring under a delusion with regard to the different classes connected with pharmacy in Ireland. You speak of chemists and druggists and Irish pharmacist classes of gentlemen to my knowledge non-existent. Apothecaries we have in this country, and we have druggists, the former being the only recognised body qualified for the dispensing of medicines. They have to undergo a searching examination in "arts" before being articulated, after which, in anatomy, physiology, practice of medicine, chemistry, botany, and materia medica—in fact, there is little difference between the requirements of an Irish apothecary and an Irish physician. The druggist's shop, as at present constituted, is a kind of general store where goods of every description can be purchased, drugs included; but

(a) "Outlines of Zoology and Comparative Anatomy." By Montgomery A. Ward, M.B., &c.

whether the druggist's knowledge thereof would even meet the requirements of the minor examination I very much question; and I must confess my surprise at the pharmaceutical organ even suggesting that Irish pharmacists should form the nucleus of a Pharmaceutical Society for Ireland. There is certainly no analogy between the pharmacists of England and an Irish druggist in point of qualification, and I see no reason why the latter body of gentlemen should expect to derive more benefit from a pharmacy act than the humblest shopkeeper. I feel confident that Sir Michael Hicks Beach will frame a bill acceptable to the majority of apothecaries, and I am assured by many that it will be acceptable if based upon the same principle as the Pharmaceutical Society of Great Britain. A humble suggestion of mine I trust will not come amiss. Would it not be as well for the country at large if the Apothecaries' Hall as a medical body ceased to exist, and turned its attention to pharmacy only.

I must apologise, Mr. Editor, for not sending this letter last week. I certainly should have done so had I seen the journal in time.

Signed, CHARLES H. HARTT.

107 Grafton Street, Dublin, March 9th, 1875.

To the Editor of the *Pharmaceutical Journal*.

SIR,—I have hitherto refrained from entering into a paper controversy on this subject, but my attention having been drawn to a letter in your last week's issue signed C. H. Hartt, in which truth is so grossly misrepresented for the sake of shop, I cannot refrain saying a few words in reply. In the first place this gentleman appears to ignore the existence of the chemists and druggists; he graciously permits them to retain what he considers the humbler grade—viz., "druggists;" but if they are *entitled* to this name as being vendors of drugs, much more are they to that of chemist, as being both vendors and also to a large extent manufacturers of chemicals; and if I mistake not, their knowledge in this branch would contrast very favourably with very many who hold the title of apothecary. Mr. C. H. Hartt glories in the fact that the Irish apothecaries are the only recognised body for the dispensing of medicines, and that they have to undergo examinations and pursue studies which would qualify them for the degree of M.D., which consequently most of them follow, leaving the pure pharmacist almost extinct. Consequently, the necessity for immediate legislation on the subject which we now seek. The next item of valuable information in Mr. C. H. Hartt's letter is that "the druggist's shop is a kind of general store, where goods of every description can be purchased, drugs included; but whether the druggist's knowledge thereof would even meet the requirements of the minor examination I very much question."

Now with regard to this sweeping assertion, I wish in the first place to say that his description of what he calls the "druggist's shop" is not applicable to the *Irish chemists and druggists' shops*, in which "every description of goods CANNOT be purchased." But supposing the description to be true, it will also be true of the larger apothecaries' establishments, including the Apothecaries' Hall, but with the addenda of "Prescriptions Compounded;" but to apply this latter portion of the sentence to this respectable body of men I will require with your leave to paraphrase or perhaps alter it a little. I think the following will be about correct: "But when the employes, including the compounders, could pass any kind of examination is a matter of doubt, at least, if the following were put as a test question of their competency: Describe the difference between carbonate of ammonia and cyanide of potassium." While on this subject I may mention that, as far as my memory will carry me, I can say no accident to the public has occurred in Ireland through the ignorance or incompetence of any chemist and druggist or their assistants. Perhaps Mr. C. H. Hartt can inform you if he can say the same for the apothecaries. With regard to his humble suggestion "that the Apothecaries' Hall as a medical body should cease to exist and turn its attention to pharmacy only," perhaps if Mr. Hartt used his influence with that worthy corporation he might be able to accomplish his wish; but I fancy they consider themselves quite as competent as Mr. Hartt to manage their own affairs, and I think if he would take a hint it might be better for both his own interests and those of the public if he would mind his. One word more and I have done. It is with reference to Mr. Hartt's want of visionary instinct in "not seeing why the Irish druggists should expect to derive more benefit from

the Pharmacy Act than the humblest shopkeeper." I can only attribute such a remark to the grossest ignorance or wilful blindness, and I should be making little of the common sense of the readers of your valuable journal to say another word on the subject. Apologising for the trespass on your space,

I am, dear Sir, your obedient servant,

WILLIAM HAYES,

Hon. Secretary to the Chemists and Druggists' Society of Ireland.

12 Grafton Street, Dublin, March 17th, 1875.

IRISH POOR-LAW MEDICAL CONTRACTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A few days since, four of the largest houses in Dublin sent in tenders for supplying medicines and medical appliances to a Poor-law union. I subjoin in four columns the prices at which they proposed to furnish twelve articles in general use. I leave it to you to supply the comments which these columns suggest, and to the public to draw their own conclusions.

Your obedient servant,

T. E.

s.	d.	...	s.	d.	...	s.	d.	...	s.	d.
2	6	...	1	10	...	3	6	...	3	0
1	4	...	1	8	...	3	0	...	2	0
2	10	...	2	6	...	4	0	...	6	0
1	9	...	2	0	...	2	8	...	2	4
1	6	...	2	4	...	1	4	...	3	6
2	0	...	2	6	...	3	8	...	3	0
3	0	...	4	0	...	6	0	...	3	0
2	0	...	2	4	...	3	6	...	2	0
5	0	...	3	6	...	10	0	...	4	0
26	0	...	18	0	...	30	0	...	24	0
1	6	...	2	0	...	3	4	...	2	4
1	4	...	0	4	...	0	6	...	0	8
£2 10 3		...	£2 3 6		...	£3 11 6		...	£2 15 6	

[Without entering on a discussion of the prices charged, we may deduce the reasonable conclusions from these figures:—

1. That if 43s. be a fair price for twelve genuine drugs, the contractor who charges 71s. for the same *must* be an extortioner.
 2. That if 71s. be the just commercial price of the twelve drugs, the contractor who undertakes to supply them for 43s. *must* contemplate supplying fraudulent goods.
 3. That amongst contractors who charge 30s. and 18s. for the one article, 1s. 4d. and 4d. for a second, 2s. 6d. and 6s. for a third, 10s. and 3s. 6d. for a fifth, there *must* be a bare-faced rogue somewhere.
 4. That a public department which permits such gross imposition with reference to one of its most important duties to continue cannot lay claim to the confidence of the public.
- Such a method of supply of medicines is a travesty on Poor-law medical relief.]

Medical News.

Seven cases of diphtheria in children have appeared amongst the soldiers' families now quartered at the Red Barracks since their removal from the huts on Woolwich Common, and five of them have been fatal. The new colony in the Red Barracks has by this time been comfortably established, and its general health is good. Several days have elapsed since the last case of fever appeared, and it is confidently hoped that the epidemic has at length worn itself out.

At a meeting of the Society for the Prevention of Cruelty to Animals held in Glasgow last week, it was agreed, on the motion of Sir William Thompson, to petition Parliament in favour of a bill to impose proper restrictions on the practice of vivisection. In moving this the learned Professor observed that it was far from his intention to join in any movement which would unduly restrict men of science in whatever operations might be necessary for advancing knowledge, but he considered that the repetition of cruel experiments on the lower animals, merely for the purpose of showing students what had been done, was altogether unnecessary.

Professor Menetrier has just published a scientific work in which he declares the weight of the earth to be about 5,000,000,000,000,000,000,000,000 tons. The learned professor is not particular about pounds and ounces; perhaps he is right in leaving these to imaginative minds.

The London Temperance Hospital.—The success of this institution is stated to be so pronounced, that it has induced the board of management to adopt measures for the erection of a larger building. For this purpose a site in the Hampstead Road has been purchased for £3,300.

Gleanings.

Accouchement in a Patient who had submitted Two Years previously to Gastrotoomy.

DR. FOURRIER communicates the following case to the *Bull. Gén. de Thérap.* for January 30 :

The operation for gastrotoomy which had been performed by himself was reported in the *Bulletin* for August 15, 1872. It was undertaken for the relief of rupture of the uterus with passage of the fœtus and appendages into the peritoneal cavity.

Since the time of this operation the general health of the patient had been as good as possible. She had been obliged, however, to wear an abdominal bandage, in order to support a threatened hernia of the intestines at the point of cicatrization.

Becoming again pregnant in 1873, the patient was removed, when the time for her confinement drew near, to the hospital, where her accouchement was accomplished, August 15, 1874, without any accident. At the moment when the pains assumed an expulsive character, the hands of an assistant were employed in supporting the cicatrix, in order to keep the intestines in place, while Dr. F. himself supported the uterus.

The fortunate termination of this case is especially worthy of record, says Dr. Fourrier, since in similar cases the production of abortion at an early date has been suggested. Even in the present instance, indeed, the question was discussed.

To watch the labour, and to terminate it by version or by the application of the forceps in case it becomes too long delayed or too painful, should be, Dr. F. thinks, the duty of the physician, and he feels that in the case just described he has reason to congratulate himself on not having interfered too precipitately.

Action of Conium upon Cutaneous Sensibility.

M. GUBLER reported, at a recent meeting of the Société de Thérapeutique, certain facts which show that hemlock modifies sensibility, and called attention in particular to the well-known phenomena attending the death of Socrates, and the observations recorded by Hunter, where a man who had taken a large dose of hemlock had lost the use of his fingers. He then went on to relate a case coming under his observation, where this action upon sensibility had been most evident.

It was that of a woman who had applied a pomade containing conium, with the fingers of her right hand, to a tumour of a cancerous nature situated upon her husband's body in the

region of the liver. After a time, the fingers which had been used in making the friction lost their sensibility. The woman then ceased using the right hand and employed the left, covered with a glove: but in spite of this the fingers lost sensibility. All these symptoms disappeared rapidly upon ceasing the employment of the ointment.

Dr. Gubler draws attention to this fact in order to show the reality of those modifications of sensibility brought about by conium, a proposition which he had already recorded in his "Commentaires de Thérapeutique."—*Bull. Gén. de Thérap.*, January 30, 1875.

A Case of Hysterical Hemiplegia.

(Dr. W. Svetlin: *Wiener Med. Presse*, No. 4, 1875.)

THE patient, a single woman, æt. 24, on the 12th of November, 1873, was exposed to cold just at the close of a menstrual period, consequent upon which she had spasms of the entire body very similar to those which result from poisonous doses of strychnia. Other symptoms of affections of a nervous character came on, and lasted for some time, but a gradual improvement took place which continued until February, 1874. On the 10th of the month, the patient, upon the receipt of news of a startling character, sank on her chair in a condition of unconsciousness. On the next day it was found that there was total paralysis of motion of the right side, with a diminution of sensibility.

About the end of March, treatment of the paralysis with the induction-apparatus was commenced, and after forty sittings there was some improvement in the motion of the upper extremity, and the voice, although still unintelligible, became more sonorous. From July the use of electricity twice a week was continued, and hydropathic treatment was also employed. The patient was twice a day rubbed down in baths the temperature of which was lowered one degree daily. By the end of the month, the patient was able with but little assistance to walk about the garden of the establishment, dragging the right foot but slightly, and could even go up-stairs.

ONE of the most foolish of the many extraordinary utterances of coroners is reported from the lips of a coroner named Couchman, at Stratford-on-Avon, which taxes our credulity, accustomed as we are to the stupidity of inquest judicial pronouncements. The investigation was as to the death of a man who perished from neglect, never having had medical advice, although he was dying of acute bronchitis. A druggist named James had made up some "stuff" without ever seeing the patient, and the poor man died probably for want of reasonable care and competent advice. Coroner Couchman, the exponent of law and justice on the occasion, appeared to think this circumstance very gratifying, for he launched into a panegyric upon the druggist. We are told that he "complimented Mr. James on his capacity, and observed that the country was greatly indebted to such a class of persons. He was a registered chemist, and qualified to give prescriptions, and remarked that such chemists as Mr. James were conferring a great benefit to people by their ministrations, especially to the poorer classes."

The judge in this precious inquiry must have his own private reasons for thus belauding the prisoner, but those reasons are certainly not to be found either in knowledge of the law or in good sense. If he was incapable

of discerning the fact that it is undesirable for uneducated tradespeople to prescribe for life or death illnesses without even seeing them, he might, at least, be expected to know that it is totally contrary to the law for his protégé, the druggist, to prescribe at all, and such persons have been many times punished for doing what he thought himself justified in eulogising.

A more humiliating display of judicial indiscretion we never heard of.

DR. WILLIAM STOKES, the venerated Senior-Physician to the Meath Hospital, has resigned his connection with that institution which has so long existed, and which his high professional character has rendered so valuable to the hospital. The vacation of this appointment by Dr. Stokes has been long expected, but had not been anticipated just now. The profession will learn with surprise that a successor to Dr. Stokes has been already appointed in the person of Dr. John William Moore, of Cork Street Hospital. Dr. Moore has, though not long entered on his profession, distinguished himself already as an ardent worker in science, a physician of great promise and a man of high culture, and it is to be regretted that his appointment to the Meath—which, of itself, would receive unqualified approval—should be shadowed by the fact of its being an uncontested "walk over." The method of his appointment does credit neither to Dr. Moore nor to the hospital, and must be unqualifiedly condemned as constituting a bad precedent.

WE have reason to believe that Mr. Croly, of the City of Dublin Hospital, will offer himself for a seat on the Court of Examiners of the Royal College of Surgeons in Ireland at the coming election in May next. An intention is spoken of on the part of the Council of the College to obtain a change in the bye-laws so that they may be enabled to increase the number of examiners from seven to eight, which it is considered will be a more convenient number for the examination of the four candidates who are now simultaneously submitted to examination. If Mr. Croly should seek the Examinership he will vacate his seat on the Council, and the vacancy will be contested at the general meeting of the College on the first Monday in June.

CLOTTING OF THE BLOOD.

IN the earlier volumes of "St. Bartholomew's Hospital Reports" Mr. Savory treated at length the subject of Thrombosis and Embolism. In the second volume attention was drawn by Sir James Paget to cases of phlebitis attacking preferentially the veins of the lower limbs in persons of gouty constitution. In the new volume Dr. Henry M. Tuckwell records three cases illustrating the great danger of embolism in gouty phlebitis, and shows that other abnormal states give rise to the same danger, one of these being chlorosis. In gout, he observes, the clotting usually takes place in the superficial veins, mostly of the legs, from which it creeps upwards. In chlorosis, on the contrary, clotting may occur in any vein—in the femoral veins, the cerebral sinuses, or even in the cavities of the heart. A further distinction—in gout the veins are inflamed prior to the clotting, in chlorosis not. Hence we should speak of gouty phlebitis and chlorotic thrombosis. Dr. Tuckwell relates three cases of the latter, and quotes a fourth from the "Pathological Transactions" which he thinks admits of the same interpretation.

NOTICES TO CORRESPONDENTS.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£1 2s. 6d., at the offices in London, Dublin, or Edinburgh.

✉ SIR JOHN GRAY, M.D.—We regret to be informed that our respected confrere has dangerously ill at Bath.

DR. J. H. A.—The matter is not yet before the House of Commons. CLINICAL SOCIETY OF LONDON.—On Friday evening, at 8½ p.m., Dr. Buzzard will exhibit a Patient with Disseminated Sclerosis. Dr. Dowse: "An unusual Case of Lead Poisoning." Mr. Jonathan Hutchinson: "On a Case of Intra-cranial Aneurism diagnosed during Life, and in which spontaneous Cure occurred and the Patient lived eight years." Dr. Hermann Weber: "On three Cases of Pyæmia caused by Acute Suppuration of the Middle Ear;" and a "Case of Acute General Tuberculosis caused by Chronic Inflammation in the same locality."

F.R.C.S.—If possible in our next.

FOUNDATION OF THE LINNEAN SOCIETY.—The Linnean Society, it would appear, like many another great institution, had its origin in an accident. The late Sir John R. Smith, then a medical student, was breakfasting one day with Sir Joseph Banks, when the latter told him that he had just had an offer of the memoranda and botanical collections of the great Linneus for a thousand pounds, but that he had declined to buy them. Young Smith, whose zeal for botany was great, begged his father to advance to him the money, and at length persuaded him to do so, though not without difficulty. It may appear strange that Sweden should consent to part with the treasures of the far-famed naturalist; and indeed the king, Gustavus III., who had been absent in France, was much displeased, on his return, at hearing that a vessel had just sailed for England with these collections. He immediately dispatched a vessel to the Sound, to intercept it, but was too late. The Herbarium books, MSS., &c., arrived safely in London in 1784, packed in twenty-six cases, and cost the purchaser £1,083 5s. In the following year Smith was elected a Fellow of the Royal Society, and devoted himself more to botanical studies than to his profession as a physician. In 1792 he had the honour of being engaged to teach botany to Queen Charlotte and the princesses, and he was knighted by the Prince Regent in 1814. At his death, in 1829, the celebrated collection, with Sir J. E. Smith's additions, was purchased by the Linnean Society.—From Caswell's "Old and New London" for April.

MR. J. R. E.—The case was a most unusual one, and beset with difficulties; we do not see how you could have acted otherwise under the circumstances.

CONSAQUINITY.—Our correspondent shall be answered in our next, or by private note.

VACANCIES.

St. Luke's Hospital for Lunatics. Resident Medical Superintendent. Appointment limited to single men. Salary, £100, with board and furnished apartments. (See Advt.)

Abbeyleix Union. Medical Officer to the Abbeyleix Dispensary District. Salary, £100 as Medical Officer, and £20 as Sanitary Officer. (See Advt.)

Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 65 Market Street, Bradford.

Wolverhampton Hospital. House Surgeon. Salary, £100 per annum, with board and residence. Address the Chairman of the Medical Committee.

Adminster Union. Medical Officer. Salary, £23 per annum, exclusive of midwifery and other fees. Address the Clerk to the Union.

Liverpool Royal Infirmary. Resident Medical Officer. Salary, £100 per annum, with board, &c. Address the Chairman of Committee.

Bristol Royal Infirmary. Dispenser. Salary, £100 per annum. Non-resident. Applications to the Secretary.

Dundee Royal Infirmary. Resident Medical Superintendent. Salary £200, with board. Applicants should address Mr. Stewart, Solicitor, Dundee.

Consumption Hospital, Brompton. Two Physicians. Honorary.

APPOINTMENTS.

BOLTON, J. A., L.R.C.S.I., L.M., Medical Officer for the Coniston District of the Ulverston Union.

BRAYLEY, W. R., M.A., M.D., Lecturer on Comparative Anatomy at St. George's Hospital Medical School.

CARTER, C. H., M.D., M.R.C.P.L., a Physician to the Hospital for Women, Soho Square, London.

COLLINS, W. C. G., M.B., C.M., M.R.C.S.E., Assistant House Surgeon to the Swansea Hospital.

COVENTON, C. J., L.R.C.P., Medical Officer of Health for the Bequilly and Llanbister Sub-district of the Knighton Rural Sanitary District.

CRIMINO, H. G., F.R.C.S.E., House Surgeon to the Exeter Hospital.

HEARN, R. T., M.B., House Surgeon to the Dorset County Hospital, Dorchester.

HENWOOD, J. D., Resident Medical Officer to the Charing Cross Hospital.

HOLLAND, E., M.D., F.R.C.S.E., an Assistant Physician to the Hospital for Women, Soho Square, London.

LEDGER, H. A., M.B., M.R.C.S.E., Medical Officer to the Central London Sick Asylum District in new Asylum in Cleveland Street.

ODUM, Dr., Assistant Medical Officer to the Durham County Lunatic Asylum, Feggsfield.

REID, W., M.B., C.M., Resident Medical Officer and Secretary to the West Norfolk and Lynn Hospital.

SINCLAIR, J., M.D., M.R.C.S.F., Medical Officer for No. 10 District of the Parish of Liverpool.

SMITH, R. T., M.D., an Assistant Physician to the Hospital for Women, Soho Square, London.

THOMAS, J., L.R.C.P. Ed., a Surgeon to the Swansea Hospital.

THOMAS, J. W., F.C.S., Public Analyst for Cardiff.

THOMPSON, E. C., M.B., L.R.C.S.I., L.M., Surgeon to the County Tyrone Infirmary, Omagh.

THORNLEY, J. G., M.D., L.R.C.S. Ed., Physician's Assistant at the General Hospital, Bristol.

TONGE-SMITH, WINCKWORTH, M.R.C.S.E., House Surgeon to the Clinical Hospital and Dispensary for Children, Manchester.

Marriages.

CLARKE—ATKINSON.—On the 30th ult., at the Congregational Chapel, Lancaster, T. E. Clarke, M.R.C.S., of Dalton-in-Furness, to Maggie, eldest daughter of Mr. William Atkinson, of Kirby-Lonsdale.

HOPKINS—KIRKMAN.—On the 31st ult., at St. Peter's, Catherington, Henry Culliford Hopkins, Surgeon, of Bath, to Georgina Mary, youngest daughter of J. T. Kirkman, F.R.C.S., of Hordean, Hants.

RAVESHILL—BROOKFIELD.—On the 30th ult., at St. George's Church, Oxford, Edmund Burton Ravenhill, M.R.C.S., of Wolverhampton, to Ellen Mary, daughter of John Brookfield, of Midhurst, Sussex.

RIGDEN—FENTON.—On the 31st ult., at the Parish Church of St. George, Duncester, Walter Rigden, Surgeon, of Montpellier Square, London, to Cecelia Frances, third daughter of C. D. Fenton, M.D., of Duncester.

Deaths.

BEST.—On the 25th March, at Hyères, France, Alexander Vans Best, M.D., F.R.C.S.E., of Aberdeen.

CARDELL.—On the 14th March, J. M. Cardell, F.R.C.S.E., of St. Columb, Cornwall, formerly of Salisbury, aged 43.

CUMMING.—On the 23rd March, James Cameron Cumming, M.D., of Exmouth, aged 72.

DAVIDSON.—On the 22nd March, Samuel Davidson, M.D., of King Street, Aberdeen, aged 33.

EDMOND.—On the 22nd March, James Williams on Edmond, M.D., C.M., of Inveresk.

PALMER.—On the 24th March, Silas Palmer, M.D., of Newbury.

STEWART.—On the 26th March, at Tunbridge Wells, Duncan Stewart, M.D., late Surgeon-Major H.E.I.Co.'s Service, aged 70.

YOUNG.—On the 23rd March, James Young, M.D., of Kirkcaldy.

Advertisements.

EXTENSIVE APOTHECARY BUSINESS, Established over a Century, at No. 82 Grand Parade, Cork, to be DISPOSED OF, privately or by auction.—Apply to A. P. and G. FOOTT, Solicitors, 39 South Mail, Cork.

ABBEYLEIX UNION.

ABBEYLEIX DISPENSARY DISTRICT.

MEDICAL OFFICER WANTED.—The Committee of Management of the above Dispensary District will, at their Meeting on SATURDAY, the 10th APRIL, next, at 12 o'clock noon, proceed to elect a qualified MEDICAL OFFICER for the District, at a Salary of One Hundred Pounds per annum, with Vaccination Fees, and Twenty Pounds per annum as Sanitary Officer.

Applications, with testimonials, to be forwarded to Colonel Bull, J.P., Honorary Secretary, Abbeyleix.

By order,

Clerk's Office, Workhouse,
30th March, 1875.

JAMES FINNEGAN,

Clerk of Union.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.

The SUMMER SESSION commences on MONDAY, MAY 2nd. The Hospital contains 300 beds. Clinical Lectures are delivered by the Physicians and Surgeons every week. The usual Courses of Lectures are also given by the appointed Teachers. Dr. Robert Barnes has this year been chosen Lecturer on Midwifery, and Dr. Brailey Lecturer on Comparative Anatomy. Further information may be obtained from the Treasurer or Dean of the School, at the Hospital.

OWENS COLLEGE (MANCHESTER ROYAL) SCHOOL OF MEDICINE.

SUMMER SESSION.

Midwifery and Diseases of Women and Children—Dr. Thorburn.

Materia Medica and Therapeutics—Mr. Somers.

Forensic Medicine—Mr. G. Morley Harrison.

Ophthalmology—Mr. Windsor.

Practical Chemistry—Prof. H. E. Roscoe, F.R.S.

Botany—Prof. W. C. Williamson, F.R.S.

Hygiene and Public Health—Dr. Arthur Ransome.

In addition to the above, Classes will be held for Practical Operative Surgery in connection with that of Practical Anatomy, conducted by Mr. J. B. Perrin, and for Morbid Histology, by Dr. Dreschfeld. The Session will commence on the 1st May next. Prospectuses will be forwarded on application.

J. HOLME NICHOLSON, Registrar.

THE LUMLEIAN LECTURES.

ON LIFE, AND ON VITAL ACTION IN HEALTH AND DISEASE. (a)

By LIONEL S. BEALE, M.B., F.R.S.,
Physician to King's College Hospital.

LECTURE II. (continued).

Absolute Distinction between the Living and the Non-living.—The conclusion which is impressed upon my mind, with ever-increasing force, is, that the distinction between the living and the non-living is not of a gradational kind; but, on the contrary, that it is absolute. Whatever may be the difference between plant and animal, however deep and wide may be the gulf which intervenes between the lowest and the highest living, it will, as I believe, be shown to be as nothing compared with the chasm by which the lowest living is separated from every form of the non-living.

It has been contended that because the line, supposed by our predecessors to mark off the vegetable from the animal kingdom, has proved to be fallacious, the distinction held by some to exist between the living and the non-living will, some day, be broken down. But what analogy is there between the two cases? It would be as logical to insist that, as it can be shown that certain changes in a dog, in some particulars, somewhat resemble certain changes in an oak, it necessarily follows that at some future time it will be proved that dogs and oaks are not to be distinguished from crystals. It ought not to be necessary to point out that the demonstration that a distinction formerly believed to exist between different kinds of life could not be established, did not ensure the fur-

ther demonstration, at some future time, of an alliance between any life and no life. We may be, in some respects, like plants, without men and plants being like stones.

In this lecture I have adverted to many facts and arguments which seem to me to justify the conclusion that there are certain phenomena characteristic of all living matter, and which are included under the terms *nutrition, growth, formation, multiplication*,—which are not physical, and which cannot be in any degree explained by physical law. I propose, therefore, to call these *purely vital actions*, and I consider that they ought to be placed by themselves in a class or category distinct from that of physical phenomena.

I have never been able to discover in any non-living bodies whatever any phenomena which can be fairly said to correspond to, or to be comparable with, the above. Nor can I discern the faintest analogy between the marvellous changes which affect every kind of living matter in nature, and any changes which have been proved to occur under any circumstances in matter which does not live. And if we believe with Grove that "man will never know the ultimate structure of matter or the minutiae of molecular actions," must we not conclude, *à fortiori*, that man will never know the ultimate structure and arrangement of the atoms of living matter, and the minutiae of those marvellous phenomena which proceed in the centre of every living particle?

Until the ultimate structure of non-living matter and the minutiae of molecular actions, and the ultimate arrangement of the atoms, and the minutiae of the actions of living matter shall have been made known, there can be no valid objection to our being influenced by facts that are actually known at this time, which justify the arrangement of phenomena in two distinct classes:—

1. Vital phenomena.
2. Physical phenomena.

The vital actions of living beings are exclusively confined to the bioplasm or living matter. When this becomes converted into any kind of formed material, or when it suddenly dies, physical and chemical changes ensue which we are able to investigate. The purely vital

(a) Delivered at the Royal College of Physicians on Friday, March 12th.

phenomena of the bioplasm continue only as long as this remains in its living state. If we endeavour to investigate the nature of vital actions, and attempt, in the first place, to ascertain the constitution of living matter, the first thing we do is to destroy its life. The substances we submit to examination are not really the actual materials that were alive, but only chemical compounds that were formed at and after death.

There is yet another consideration to be advanced in favour of the doctrine of the absolute difference between living and non-living matter. In the non-living world every change is dependent upon, or is a consequence of anterior change; and must, in its turn, lead to consequential changes. Each antecedent has its consequent. A real cause is not conceivable in the physical world, but I do not know upon what data the same could be affirmed with respect to the living world.

Consider how the simplest vital action is to be accounted for. Such movement, for example, as may be seen to take place in the living matter of a common amoeba. Let us inquire what was the condition of the moving matter at a given spot just before the visible movement occurred. Who shall prove the nature of the antecedent to which the movement of the particles is a consequent? And who will demonstrate that the movement immediately following was a direct consequence of that which had been observed? It will, I know, be again most confidently asserted by physical authority that the movement in question, as well as other phenomena which puzzle us at this time, will, to a certainty, be proved to be due to physical change in the time that is to come. "To-morrow, and to-morrow, and to-morrow," has always been the refuge of the philosophers who have faith in the dogma that matter alone is competent to develop every form of life. But the "to-morrow" of Lucretius has not yet dawned, and how many thousand years, I would ask, may be expected to pass away before the prophecies of those who would now go along with Lucretius shall be fulfilled?

Let us now revert to the changes occurring during the nutrition and growth of the simplest living organism, such as the yeast corpuscle. May we not conceive physico-chemical forces to be at work there to any extent imaginable, and yet fail to gain anything approaching to an adequate explanation of the facts discerned? Let it be admitted that in nutrition electro-chemical changes play an important, if you please, an absolutely essential, part. The internal surface of the cell-wall, in contact with the bioplasm, and the external in contact with water will, no doubt, be in opposite electrical states, and electrical currents will be constantly manifested. But will these or any other physical conditions account for the formation of the matter of the "cell-wall," or the increase of the bioplasm within?

As it were, behind all the physical and chemical actions in living beings are prior changes which are as essential as is the arrangement of the metals and solutions of a voltaic cell to the establishment of the current. Behind the osmose and the currents in the living cell are the changes in the bioplasm, by which alone the physical actions are rendered possible, and the continuance of these provided for. The phenomena of the bioplasm is their antecedent or cause. These phenomena have already been briefly adverted to under another head, but it is desirable I should recur to them here.

Observation has accompanied us throughout a long line of investigation which has been passed by, almost without notice, by physical philosophers. Let us now, however, proceed beyond this point and stretch onwards in imagination, and see whether our notion concerning the absolute difference between the living and non-living is supported or contradicted, neither swerving to the right nor to the left from that straight path which was pointed out from the first. We must again try to conceive the changes proceeding in those minute centres of living matter to which I have already adverted. Within every centre of every one of the thousands of minute molecules of which I con-

ceive every particle of living matter is constituted, is a more central centre in which the matter is a degree nearer the point where it began to live, and where new powers were first communicated to it. To bring the mind, as it were, face to face, with the actual change that occurs, seems, at this time, hardly possible. But surely one is justified in concluding that the *cause* must be, so to say, very central, and that in living matter the direction of the action of the forces is from, and not towards, centres. All that goes on in the environment is necessary—essential if you please—but it is to the power acting from the centre within, and welling up, as it were, from a yet more central source of power which seems inexhaustible, that vital phenomena must be attributed. Having been carried so far, how am I to resist the conclusion that the power that influences must be more central than the matter that is influenced; and that, therefore, the central life-communicating power plays a far more important part in the phenomena of life than anything in the environment acting from without. That forces in the environment react upon the force or power acting from the centre may be fully admitted, but that these are the *cause* of central activity, is clearly an untenable proposition. The central action is absolutely essential, and the difference between the matter in the centre, and the matter in the environment, is absolute. Neither can the conditions, under which action occurs, be regarded as the true cause of the action, since the conditions are conceivable without the action; and the action, in question, clearly must exist ere it can be influenced by conditions. It would surely be as unreasonable to regard the *power* by which the atoms of a mass of living matter are arranged and their forces guided as the same in nature as the atoms and forces themselves, as it would be to suggest that the mind of the artist is but another form or mode of the properties of the matter of the paints he blends, and disposes as he may determine upon his canvas.

The phenomena which I have described as characteristic of every kind of living matter in nature, and which are known only in connection with living matter, I must ask you to regard as purely *vital actions* due to the operation of a force or power capable of controlling matter and its forces, but neither originating in them, nor formed by or from them, nor capable of being converted into them—a power which we cannot isolate or physically examine, but the effects of the action of which we may study. Thus we may learn much—and even, I think, form some dim conception of this wonderful power which, stirring in every living particle, establishes between it and every non-living atom, or collection of atoms, a difference which is absolute.

The Construction of the Body by Bioplasm.—All development of structure, all the structural peculiarities of living beings, are due to changes which have taken place in bioplasm, all those characters upon which we depend for distinguishing one living form from another, are the result of changes occurring in bioplasm, changes which took place long before any differential characteristics had manifested themselves. In the formation of every tissue, in the construction of every organ, and of every form of mechanism existing in a living being, bioplasm is the sole essential and active agent. And if, as I have endeavoured to show, the ordinary phenomena, characteristic of all living matter, cannot be adequately explained except by the operation of an agency of an order or kind distinct from, and without direct dependence upon, or causal connection with any mode of physical force yet discovered, how is it likely that the yet more remarkable results of formative or constructive power should be accounted for, unless we admit the operation of such peculiar agency? Whether we examine the marvellous details of the most minute structures entering into the formation of the tissues, or study their chemical composition, whether we take note of the simplicity of the conditions under which they are produced, or consider their wonderful, and in many instances, inexplicable properties, we shall be forced to conclude that no ordinary physical actions will, alone, account for the result. The

more minutely the details are investigated, the more firmly, I feel sure, will the conviction become established, that the agency by which each one of a long series of successive, but not necessarily consequential changes cannot possibly be of the nature of ordinary force, seeing that no forces known, except those operating in living matter, have been found competent to effect special structural arrangements. But the case is still stronger than I have stated it, for many of the special arrangements in living animals, wonderful and elaborate as they are, serve only a temporary purpose. While these are in active function, more permanent, and perhaps still more highly endowed, organs are slowly undergoing formation.

Every attempt to explain the formation of any definite organ by what is called evolution and the operation of physical causation, independently of intelligence, and of guiding governing power, has signally failed. Even with the aid of that wonderful "nature" with a capacity for differentiating herself, which the evolutionists have been obliged to call to their aid, we get only a very confused and inadequate notion of the formation of any single tissue of any one organ—the eye for example. Let it be fully explained, in full detail, according to evolutionary law how the formation, not of the eye as a whole, but of one only of the tissues of the eye is carried out. Such an explanation would have far more weight than the assurance that the eye may be compared with a telescope, or that it exhibits an indelible stamp of its lowly origin. By vague suggestions of this sort, nothing whatever is proved, or even rendered probable. An interpretation of facts is authoritatively given, favourable to certain preconceived views, and that is all. Other interpretations might be given, but for the time all others are excluded, by authority which rules as if it were infallible.

No one has yet been able to account for the arrangement even of the nerve fibres of a nerve plexus of the eye or of any other organ. The little papillæ of the frog's tongue are, as I have remarked, organs admirably adapted for investigation, and I wonder that these have not been selected to illustrate the theory of evolution. They can be easily obtained for study, and are far less complex, and more easy of investigation, at every stage of development, than the eye. (a) A discussion concerning their formation, and the laws by which it is governed, would be extremely interesting. It is not very likely that evolutionists will accept this or any other challenge for the purpose of testing the application of their doctrine to the details of anatomical structure. They prefer generalities; and as long as they are able to make people believe that their doctrines are true, and that their prophecies will be verified, they are wise. If they are encouraged to persist in calling attention to general characters, to the exclusion of details, and to select, out of nature's storehouse, just those facts which support their own theories, taking no account whatever of facts which cannot be explained by them, they will be able to hold their own, but whenever they are forced to go into detail, and study the minutæ of the development of an individual organ, the difficulty of the application of the doctrine will be apparent enough to every one, and the farther the investigation is pushed, the more will the difficulties to be surmounted by the evolutionists increase, as regards degree and number.

Let me now consider, but only in the merest outline, the changes which occur when bioplasm, manifesting its wonderful developmental powers, at last gives rise to the formation of tissue.

The earliest state of matter, in every kind of development, is that of bioplasm, which was derived from pre-existing bioplasm. The masses of living matter absorb nutriment, and the whole increases in bulk. So far, the only indication of formed material is afforded by the presence of a little soft transparent mucus-like matter without any indications of any definite structure. This material is formed, and accumulates around each mass of bioplasm. During the development of tissue, bioplasm masses, em-

bedded in their soft matter, continue to divide and subdivide. As development advances, there may be discerned, amongst the bioplasts here and there, one which undergoes more active change than the rest. This, in fact, becomes a new centre, from which growth proceeds, while the neighbouring bioplasts remain passive for a time, and some gradually waste. Soon, by division and subdivision, a collection, composed of a new series of bioplasts, results. Many such collections are formed, being separated from one another by the altered bioplasm particles of the previous generation, and their imperfectly developed formed material. Thus results the first indications of the different structures and organs which appear in the embryo of man and the higher animals at a very early period of development. The process above indicated is repeated many times probably ere the first traces of actual structure with capacity to act are to be detected. Nay, the tissue which is at last formed, and which acts, exhibits structure, but this first tissue only serves a temporary purpose, and differs in its characters from the permanent texture which is at length formed. Thus the first muscular tissue, for example, which is produced in the mammalian embryo, only lasts but for a short time, and it is entirely replaced by a form of contractile tissue which differs materially from it in structural arrangement and in mode of growth. The formation of cartilage, bone, nerve tissue, glandular, and other organs, illustrates the same fact.

But formed material—whether its structural character be simple or complex, its function be low or exalted, and exerted only temporarily or throughout life—results from changes in bioplasm. I propose, therefore, now to consider the actual change from bioplasm to formed matter, and then I shall advert to the powers and properties of the particles of the bioplasm which succeed one another, series after series, or generation after generation, as long as the development of tissue continues.

The production of formed material may be studied in the early development of any of the tissues and, in many of them, at any period of life. Epithelium, muscle, nerve, certain forms of fibrous tissue, are being produced from bioplasm at every period of life, and changes of the same order as those by which the first formation of tissue is provided for may be observed. In all cases the newest formed material is that which is nearest to the living matter. This formed material is pushed out, and a more recent formation occupies the space between it and the bioplasm. Gradually the formed material loses water, becomes firmer, and slowly undergoes other alterations, until it assumes its characteristic form and begins to fulfil its proper function. In some cases, as I have already remarked, the bioplasm actually moves onwards, leaving the formed material which it has produced, behind it. I have described this phenomenon as it occurs in certain forms of yellow elastic tissue and muscle, in which tissues the thickening of the fibre can be clearly seen to be due to the formation of new material by the bioplasm as it moves over the surface of the fibre already formed. The new matter is soft and does not at first exhibit the peculiar characteristics of the tissue.

But however long a period may elapse before the formed matter assumes its characteristic peculiarities, and becomes functionally active, its characters, its properties, and its chemical composition mainly depend upon the changes which occurred just at the moment it ceased to be bioplasm. The elements entering into its composition must have been arranged in a definite way, while they were yet bioplasm, so that they were certain to combine in the manner required at the time when they assumed the condition of formed material. If, then, we desire to discover the true cause of the formation of tissue, we must search for it in the bioplasm ere formation occurs. Some of the elements of the living matter combine to produce the formed material, while others combine to form gaseous or solid substances which escape or are carried away dissolved in fluid. That which determines the combination—that which causes the elements to unite so as to produce the definite matter or the tissue is the *cause* of its formation.

(a) "Protoplasm," 3rd edition, p. 349.

According to my idea, which however may be considered by some very unphilosophical, there is something operating in each kind of bioplasm which in fact determines the kind, by virtue of which the living matter *must* grow and *must* produce formed material of a certain character, if only it be supplied with pabulum, and be placed under certain conditions. This something is, I believe, a power or force which the bioplasm has derived from pre-existing bioplasm—a force or power which has been transmitted onward, perhaps for ages, with or without variation. Conditions may indeed modify the action of this power within certain limits, or may prevent its action altogether, but that the action results from the power, and ought not to be attributed to the conditions, is obvious from the fact that one form of bioplasm exposed to the conditions favourable to the developmental phenomena belonging to another kind will not be so influenced as to exhibit these.

The characters of previous generations are indelibly stamped upon every individual belonging to each generation, and these inherited characters can be transmitted by the bioplasm only. In fact, is not the "nature or constitution of the organism" the nature or constitution of the bioplasm out of which the organism is formed? It may still be asked, whether all generations were potentially included in the first, and whether the germs of all were included one within the other from the first creation as Leibnitz thought—each being containing the germs of its successors one within the other, which were thrown off one after the other, as envelope might be removed from envelope? Such questions must now be regarded from a point of view different from that from which they have been considered hitherto. The study of the characters and properties of the bioplasm will open out new lines of inquiry, more particularly with reference to the powers by virtue of which all formation takes place.

Those peculiarities of external form, and of external and internal structure and action, in which one species differs from all others, must also be attributed to the vital phenomena of the bioplasm. In like manner the power of origination, and handing down of newly acquired properties and characters, is limited to bioplasm. Bioplasm is the agent concerned in the transmission of all hereditary structural peculiarities. Nay, this living matter alone can inherit, and whatever it inherits comes from bioplasm. There is nothing in the non-living world, it need scarcely be remarked, that presents any analogy with this marvellous power of inheriting from predecessors definite characters, and transmitting them to those that succeed. All will accept Mr. Darwin's conclusion, that whenever variation occurs, the cause of variation must be attributed to something in the "nature or constitution of the organism,"—or, as I venture to think, we may say with still greater accuracy, to something in the nature or constitution of the bioplasm from which the organism is developed. This cause of variation must, as it seems to me, be very closely related to the cause of the formation of tissue by bioplasm, and is in its nature *vital*—not *physical*.

(To be continued.)

SUCCESSFUL REMOVAL OF A FOREIGN BODY IMPACTED IN THE PHARYNX BY THE OPERATION OF PHARYNGOTOMY, BEING THE FIRST CASE OF THE KIND IN IRELAND. (a)

By W. I. WHEELER, F.R.C.S.I.,

M.D. Univ. Dub.; Licentiate of the King and Queen's College of Physicians; Demonstrator of Descriptive and Surgical Anatomy, Royal College of Surgeons; Surgeon to the City of Dublin Hospital, and Lecturer on Clinical Surgery.

THE treatment of foreign bodies in the œsophagus and pharynx being of great interest to all practical surgeons

(a) Read before the Surgical Society of Ireland, March 19. The discussion will be found at page 320.

has induced me to bring before this Society a brief outline of the treatment recommended in such cases, and a short history of the nature and result of a case of the kind which has lately been under my care in the City of Dublin Hospital, in which I performed the operation of pharyngotomy, being the first time in this country. To all surgeons bodies impacted in the pharynx are a source of anxiety, calling, as they do in almost every case, for prompt assistance perchance to relieve the sufferer from impending suffocation. When bulky and solid they are generally arrested behind the cricoid cartilage, but when pointed and sharp are more usually found in the soft parts at the base of the tongue, the discomfort caused being most distressing, and vomiting and pain and difficulty in swallowing and breathing being the common symptoms. Cough and laryngeal irritation may be produced, depending on the situation; small bodies occasionally set up inflammation, causing suppuration, and abscess in the neck resulting, and cases are stated where the cervical vertebrae have become diseased; coins have been impacted for months, and finally coughed up. (Dr. O. Ward, "Path. Trans.," 1848-9.)

False teeth are not unusually found impacted in the gullet and œsophagus; such cases are indeed comparatively common.

Sir James Paget relates a case where a gentleman, in a fit, got a set into his pharynx, where they remained for four months. (*Med. Times*, 1862.)

Mr. Bryant, in his valuable work on "The Practice of Surgery," relates the case of a half-set of teeth falling into the pharynx during an operation for ovariotomy, the patient being under the influence of chloroform.

I assisted myself the late Professor Geoghegan in the removal of several teeth from the pharynx of a gentleman, and great caution and dexterity was required, from the danger of wounding the arteries bounding the tonsil by a sharp hook attached to the plate in which they were set.

Sir William Fergusson relates the case of a female who swallowed four false teeth with gold setting, which became fixed at the lower end of the gullet; he pushed them into the stomach. In four days the patient appeared proudly displaying the teeth again in her mouth. In the meantime they had travelled the length of the intestines, and when found were replaced to perform their ornamental duties. He thought the patient might relinquish them for a new set; but she preferred them, as lost and found cherished friends. (*Lancet*, 1869.)

Mr. Pollock and others relate numerous cases of this kind, which it would be tedious to record. Such foreign bodies as punch-ladles, forks, and gold watches have also been found impacted in the gullet, and some difficulty has been experienced in detecting even such large substances when embedded for some time in its walls. Fabulous stories have been told of the passage of these bodies, but recently I have been informed of a reliable case by Mr. Robert McDonnell, of a lunatic in America who swallowed a pair of scissors, which ulcerated through the epigastrium. But although in nearly all the surgical works there is mention of the manner to explore for foreign bodies situated in the pharynx, and the various methods at the command of the surgeon for extraction by the mouth, or pushing them into the stomach, or opening the trachea or larynx, yet the majority of surgical writers say little or nothing on the subject of pharyngotomy, and appear to mix this operation and œsophagotomy indiscriminately. The latter has but seldom been performed, and in but few cases out of the many requiring it has the operation been attempted, and thus many lives have been lost through the dread of operating. On looking over the works of some of the most recent surgical writers I find Mr. Bryant never performed the operation. Sir W. Fergusson relates how the operation may be performed in the dissecting-room, but considers it attended with the greatest danger on the living subject. Pirrie merely relates there is an operation of the kind. Gross never performed œsophagotomy, and makes no mention of pharyngotomy. Miller states when the operation of œsophagotomy was first proposed. Gant-

gives a few lines on the subject. In several well-written works there is no notice at all of the operation. In the "Mémoires de l'Académie de Chirurgie" will be found a most exhaustive account of fatal cases where the foreign bodies remained in the gullet, or had been swallowed, and it appears to me that the case recorded by Mr. Kirby in the "Dublin Hospital Reports" as dying from spasmodic constriction of the muscles of the glottis might have been saved had he performed the operation of pharyngotomy and removed the foreign body.

Foreign substances, when extracted otherwise than by the mouth, have almost in every case been removed by the operation of œsophagotomy, which appears to have been proposed by Verdue, but to have been first performed by M. Goursaud, who extracted from the œsophagus a portion of bone; the patient recovered. M. Begin performed the next operation of the kind; recovery followed. Mr. Amott performed the third operation of œsophagotomy on a child 2½ years old ("Medico-Chirurg. Trans.," 1838). The operation was not performed till five weeks after impaction. The incision was made on the right side of the neck; the spinous process of one of the dorsal vertebrae of a sheep was removed; the child died of pneumonia. In the year 1832 M. Begin performed the operation of œsophagotomy twice successfully (*Journal Hebdomadaire*, 1838). Dr. Martini has the next case on record. He made an incision on the foreign body, a portion of bone, but it was swallowed by the patient before it could be extracted. The bone passed to the rectum. The treatment stated to be adopted in this case was frequent bleedings. Sixty attempts with various forceps and instruments, endeavouring to remove the impacted substance, were made. Belladonna was administered by the rectum; tartar emetic injected into the veins; enemata of opium were given to check its effects. During this period the patient could not swallow even a drop of water. Need I add the case was fatal. In 1845 M. Delarocherie, Professor of Clinical Surgery at Liege, extracted a large piece of bone from the gullet of a man by œsophagotomy (*Journal de Chirurgie*, 1845). Efforts were made to remove the foreign body which caused hæmorrhage and injury to the gullet; the incision was made on the left side. The patient had recovered on the twenty-fifth day. The wound both suppurated and sloughed.

Now all the cases I have just related are cases of œsophagotomy, and no account is given of the operation of pharyngotomy being performed till those graphically described by Mr. Cock in "Guy's Hospital Reports." Although the steps of the operation are different, the same structures are not engaged, the parts to be avoided are not similarly situated, and there is not the same readiness in getting at the pharynx as there is at the œsophagus on the left side of the neck. Although there are other difficulties to counterbalance this—namely, the extreme proximity of the left common carotid to the œsophagus compared with the pharynx, there is danger of wounding the thyroid gland in the one case, not in the other; the almost absolute necessity of dividing the insertion of the omohyoid muscle in pharyngotomy, not in œsophagotomy; the danger of the inferior thyroid artery being wounded in œsophagotomy, not in pharyngotomy. These are all differences and distinctions which do not appear to me to have been weighed by surgical writers, and evidently for the reason that the operation has not been contemplated or performed. And thus the two operations, œsophagotomy and pharyngotomy, have not been separately described, and the description of the former ideal and theoretical, while the latter is ignored by most surgical writers. The history of the case and the operation I was called on to perform some months ago, is as follows. The notes have been accurately taken by Mr. Arthur Benson, now a member of this College, at that time resident in the hospital.

John O'Brien, æt. 45, married, a large man, in robust health, by occupation a farmer, residing in the County Leitrim, was admitted into the City of Dublin Hospital on Tuesday, November 10th, 1874, under my care, having

been sent to me by my friend and former fellow-student, Dr. Palmer. At the time of his admission his face was full and flushed, with slightly injected conjunctiva, and there was a huskiness of voice not unlike that of acute laryngitis. From one corner of his mouth hung a strong black thread, which was fastened round the left ear. He states that on the Sunday previous, that is two days before his admission, he had been sewing a button on his trousers, and having put the needle into his mouth, eye foremost, it slipped down. He endeavoured to withdraw it by the thread, but it seemed to him to fasten it tighter, for the obvious reason that he was embedding the point more firmly. On examining his throat with the laryngoscope I was able to detect the exact position of the needle, being somewhat obliquely situated, the eye-end being buried in the left palato-pharyngeus muscle, the point in the left arytenoid cartilage. At a subsequent period this diagnosis was confirmed by Dr. R. McDonnell, who kindly examined the patient with the laryngoscope for me.

Intense anxiety was depicted on the countenance of the man; he could not swallow anything but fluids. Before his admission Dr. Palmer had tried to extract the needle, and also Dr. Little, of the Sligo Infirmary. I endeavoured on the night of his admission to extract the needle, but without success, and although I believe on one occasion I caught it with the forceps, it slipped through the blades. I ordered him ice to suck, and made slight traction on the thread by fastening it to the cheek by means of adhesive plaister. On the following day, the 11th November, I called a consultation of my colleagues, and with the assistance of Mr. Tufnell (President of the Royal College of Surgeons) and Mr. Arthur Barker, both of whom attended, I tried again to remove the needle, but without success. I had procured different kinds of forceps for the purpose, and have to thank Mr. Butcher for lending me an instrument whose blades opened antero-posteriorly, which I thought might have been useful. After some attempts to withdraw the needle the patient suffered considerable laryngeal distress, and I determined not to again try its removal for some days, until the symptoms ascribable to the endeavours at removing it had subsided. Ordered ice to suck, and to inhale the steam of warm water.

12th November.—The great laryngeal distress he suffered from in the night had considerably subsided. Ice continued; diet, milk and beef-tea.

On the 15th I again endeavoured to withdraw the needle, and had an eye or loop put on the external surface of one of the blades of the forceps, in order that the thread, to which I had added a portion of hempen ligature, to make it longer, might run through the eye, and thus direct the forceps to the needle. The needle had, however, become so completely and firmly embedded that it was impossible to catch it. I next tried the thread through a catheter with the eye in the end (kindly lent to me by Mr. Tufnell), hoping by this means to depress and dislodge one side or end of the needle. This was likewise unsuccessful. I contemplated dividing the needle, and to try the effect of magnetism, but I abandoned these ideas for reasons obvious.

17th November.—Up to this date the patient had not swallowed any solid food from the day of the accident, and had got considerably thinner, and pale and haggard looking. Occasionally he suffered from considerable pain, which caused him sleepless nights, being not only where the foreign body was situated, but even up the side of his head, and in his ear; the patient did not suffer so much laryngeal irritation after this trial at removal, and it was wonderful to witness the great toleration of the patient to these trials to relieve him.

Having tried every means possible for the extraction of the needle without operating and opening the gullet, I felt from the condition of the patient, his increasing weakness, the anxiety he was suffering, the occasional intense pain, added to his numerous and constant importunities to relieve him and cut it out, there was not any other means at my command but to perform pharyngotomy. After due

deliberation with my colleagues, Mr. Tufnell and Mr. Barker, who on every occasion I required most kindly attended and assisted me, I determined to operate, and on Monday, the 23rd of November, I proceeded in the following manner, before a large class of students and several distinguished surgeons of Dublin.

The man being placed on the operating table in the theatre, was put under the influence of chloroform. I made my incision on the left side of the neck, commencing from the body of the os hyoides to the superior margin of the cricoid cartilage; through the integument and fascia a small vessel sprung, most probably the sterno-mastoid branch of the superior thyroid artery, which I quickly ligatured. Each layer of fascia I took up on a director, and cautiously divided; the common external and internal carotid arteries now came into view, also the superior thyroid artery and superior laryngeal nerve, with a few descending filaments from the ninth nerve. I now separated the attachment of the omo-hyoid muscle. The chloroform, which was administered by Mr. Gardiner, the senior resident, was now discontinued. The vessels Mr. Butcher was good enough to retract for me, and kept them to the outside. I now passed a staff, as originally recommended by Vaceca-Berlinghieri, into the mouth and pharynx. Mr. Tufnell, to whom I handed it, caused it to bulge, the pharynx to the left side, and at this prominent point I made a small incision sufficient to allow in the top of my index finger. The staff was now withdrawn, and I enlarged with my fingers the opening already made in a direction upwards and downwards. I now passed my finger behind the ala of the thyroid cartilage, and endeavoured to feel for the needle, which I was unable to find. I next passed in a small forceps on the palmar aspect of my left index finger to the situation I knew the needle was, but could not get it. Failing this, I passed my left fore-finger upwards towards the mouth and brought the thread attached to the needle from the mouth through the wound. I followed the course of the thread, but the needle was entirely embedded in the soft structures. I now scraped through the tissues with my nail, and came on the needle by slight traction on the thread, and grasping the needle with the forceps before mentioned, I withdrew the needle, to my great gratification and relief of the patient. During the period I was abstracting the needle the patient suffered great dyspnoea, his face was congested, eyes protruding, the perspiration was pouring off of his face, and to the uninitiated it would appear as if dissolution was near at hand. I put no sutures in the gullet, but the edges of the wound I brought towards one another with a few points of carbolic suture. The man was speedily conveyed to bed, a piece of lint soaked in carbolic oil was laid over the wound, a poultice of bread and milk placed over the abdomen, to be renewed in four hours. Nutritive enemata to be administered during the day, ice to suck, &c., and a sponge soaked in iced milk was occasionally squeezed on his lips.

I saw him in four hours after the operation: the expression of anxiety had left his countenance; he expressed himself relieved; some of the milk given by means of the sponge and in teaspoonfuls came out through the wound, but the greater part followed the natural course to the stomach.

On the 24th he was doing well; had some sleep.

25th November.—Had a rigor; temperature 100°; the edges of the wound slightly inflamed; an abscess formed in the vicinity of the incision, which discharged itself through it, as I had taken the precaution not to draw the edges together, as such was likely to follow.

On the 6th of December the fluid ceased to come through the wound, and he was discharged from hospital perfectly recovered on the 19th of December, 1874.

The points of practical interest appear to me as follows:

1. To arrest hæmorrhage from the small vessels necessarily severed immediately, so as not to obscure any of the parts to be divided, which should be well examined before being cut.

2. To have the vessels well retracted.

3. To have a staff put into the pharynx from the mouth to make it bulge.

4. Not to pass a knife into the pharynx to enlarge the opening up and down, as recommended by Mr. Cock, as to my mind this was the cause of the hoarseness in his case, and it was thus he wounded the filaments of the nerve.

5. The patient need not of necessity be fed with a tube.

6. Should the thyroid gland appear, not to mistake it for the gullet.

7. To operate on the left side of the neck, being more convenient to the surgeon, unless the foreign body is bulky and bulges on the right.

In conclusion, I agree with Mr. Cock, who believes the operation, if dexterously performed, not to be a fatal one; and I have thus, as faithfully as I can remember, described each step of my operation, in hopes that it may be of use to others if called on to perform pharyngotomy.

ON SOME PECULIAR SYMPTOMS CONNECTED WITH OBSTRUCTIONS OF THE LACRYMAL PUNCTA, CANALICULI, AND NASAL CANALS. (a)

By C. E. FITZGERALD, M.D., Ch.M. Dub.,

Ophthalmic Surgeon to the Richmond Hospital; Assistant Surgeon to the National Eye and Ear Infirmary; Lecturer on Ophthalmic Surgery, Carmichael School of Medicine.

THE subject I propose bringing under the notice of the Society this evening appears to me to be possessed of some importance, and especially as it is one which, so far as I am aware, is not treated of in any of the standard English works on ophthalmology, and I believe the only foreign text-book which contains any account of it is Dr. Galezowski's "Treatise on Diseases of the Eye." (b) Both as a clinical teacher and writer, Dr. Galezowski has always strongly insisted on the importance of examining the condition of the lacrymal passages in the various forms of ophthalmia, and he is clearly the first who has directed attention to and described the peculiar train of symptoms which form the subject of the present paper. He has written two papers on affections of the lacrymal passages. The first was published in the *Gazette des Hôpitaux*, (c) a translation of which appeared somewhat later in the *Dublin Quarterly Journal of Medical Science*. (d) The second was contributed to the *Recueil d'Ophthalmologie*, (e) a quarterly journal edited by Dr. Galezowski.

I thoroughly recognised the importance Dr. Galezowski attaches to the careful examination of the lacrymal passages when attending his clinique at Paris, and since I commenced practise in this city I have had ample opportunity of verifying, and in most particulars confirming, the truth of his views regarding this subject.

If we take up any one of the standard works on diseases of the eye and refer to the part which deals with the subject of obstruction of the lacrymal passages, we find that only one prominent symptom is mentioned as present in this condition—namely, lacrymation. Of course I am not now speaking of cases of abscess, or inflammation of the lacrymal sac (dacryo-cystitis), but merely of cases of simple obstruction to the passage of the tears. Now, Galezowski maintains, and I can corroborate the statement, that even slight obstructions of the lacrymal passages are very frequently accompanied by

(a) Read before the Surgical Society of Ireland, March 19. The discussion will be found at page 321.

(b) "Traité des Maladies des Yeux." Par X. Galezowski. Paris. 1872.

(c) "Essai sur la Conjonctivite Lacrymale et son Influence sur la Vue." (*Gazette des Hôpitaux*, 1868.)

(d) "Lacrymal Conjunctivitis and its Influence on the Sight." (*Dublin Quarterly Journal of Medical Science*, Nov., 1869.)

(e) "Etude sur les Affections des Voies Lacrymales." (*Recueil d'Ophthalmologie*, 1873.)

symptoms which may and often do assume a grave aspect—at all events, causing the patient considerable uneasiness, alarm, and anxiety. I am convinced that these symptoms have hitherto been invariably ascribed either to the special affections, whose presence they simulate, or to some general constitutional disturbance, or possibly the patient has been looked upon as a hypochondriac, and his complaints regarded as mere fancies. In the one instance the treatment will either be directed to the special malady supposed to be present, or to the constitution; in the other, according to the code of a very dubious morality, the patient will probably be furnished with a placebo. Both lines of treatment fail, but still there remains the comforting assurance that "time cures all."

Let us now inquire what are the consequences which may follow obstructions of the lacrymal passages. According to Galezowski these obstructions are capable of producing a special form of conjunctivitis, which he terms lacrymal conjunctivitis, which is characterised by the gradual and insidious manner of its invasion, and by a peculiar vesicular eruption (if I may so term it) on the palpebral conjunctiva. As further consequences he has noticed both suppurative keratitis and blepharitis. The latter had also been observed by Desmarres the elder, and the occurrence of the former is confirmed by a statement in a recent report by Dr. Nieden (*a*), surgeon to the Ophthalmic Institute at Bonn, on the treatment of that form of ulcer of the cornea described by Prof. Samiech under the title of "ulcus cornea serpens." The statement is "that dacryo-cysto-bleorrhœa and stenosis of the lacrymal duct establish a predisposition to the formation of suppurative corneal ulcers."

The most remarkable consequence, however, which may follow obstruction of the lacrymal passages—and one which, in my experience, occurs very frequently—is the appearance of a train of symptoms exactly resembling those which mark the presence of the affection termed asthenopia. The patient complains of inability to use the eyes for any close work, such as reading, or needlework, without very soon experiencing a feeling of intense uneasiness in and around the eyes. This feeling is variously described as heat or weight in the eyes, as a tightness, a dizziness, &c.—in fact, it seems to be indescribable. In the more aggravated cases it amounts to pain in the eyes and across the brows. If the reading or work be persevered in the sight becomes confused and clouded, the words run into one another, and, to use a common and very expressive term, the sight becomes "spread." All these symptoms are greatly aggravated by artificial light, so much so, indeed, that eventually the patient is obliged to relinquish reading or working in the evening. Added to all this there is frequently photophobia. In one case which I had under observation this was so intense that the patient was obliged to have her chair placed in a corner of the room with the back to the light, in addition to which she found it necessary to use an eye-shade.

A point Galezowski lays stress on, and it is an important one, is, that in these cases there is frequently no lacrymation complained of; and, indeed, in the most aggravated cases I have met with this symptom was not present—in fact, I am inclined to think it is the exception to find it so, at all events to any great extent.

The obstruction may occur either in the puncta, canaliculi, or nasal canals. It is not at all uncommon to find the former greatly narrowed (atresia, or stenosis of the puncta and ducts)—indeed, the puncta are sometimes so small that it is a matter of some difficulty to introduce the small director which Mr. Bowman employs for his operation, or even the very fine silver probe with which the case for Anel's syringe is furnished, and which is not much thicker than the ordinary silver suture wire. When the obstruction is situated in the nasal canal, it is pro-

bably owing to a thickening of the mucous membrane, the result, it may be, of a catarrh of the nasal cavity. How these obstructions of the lacrymal passages produce the symptoms already described is a question which I honestly confess I am as yet unable satisfactorily to solve. Galezowski says it is due to the irritative action of the tears lodging in the conjunctival *cul-de-sac*. He asserts that the quality of the tears changes. From being neutral they become distinctly alkaline. This may possibly account for the occurrence of blepharitis, conjunctivitis, and keratitis already alluded to; but it does not appear to me to account, at least in a satisfactory manner, for the peculiar affection we are now considering.

As regards the treatment in these cases, of course, the first object must be to get rid of the obstruction. The plan I generally adopt is to inject some water through the lower canaliculus by means of Anel's syringe. If there be an obstruction in the nasal canal the water will return through the upper punctum and fill the conjunctival *cul-de-sac*. Thus the syringe serves as an aid towards making a diagnosis. But it possesses a further advantage—namely, that with it alone we are often able to overcome the obstructions in mild cases. On the whole, however, it may be better, if the patient will consent, to slit up the canaliculi, for then if the symptoms still persist, owing to an obstruction in the nasal canal, this can easily be dealt with by catheterisation. The most convenient instrument for performing the operation of slitting up the canaliculus is the small probe-pointed knife devised by Dr. Weber. If there be any conjunctival irritation a mild astringent lotion should be prescribed. In conclusion I shall very briefly narrate three cases which have come under my own observation, and which illustrate this peculiar affection.

CASE 1.—Mr. H. came to consult me in May last. Four years ago he first noticed "a weakness in his eyes." This increased so much that for the last two years he had been quite unable to read in the evening. This gentleman was connected with an extensive business in one of our principal provincial towns; but his office work was not heavy, and he did not suffer from his eyes when engaged at it. As soon, however, as he commenced to read in the evenings he experienced most intense uneasiness in and around the eyes. His wife being similarly affected, and both being very fond of literature, they were eventually compelled to hire a person to come in the evenings to read to them. I syringed his lacrymal passages, and as this proved of some benefit to him, I recommended him to have the canaliculi slit up, which he consented to have done. There was an obstruction in both nasal canals, for the treatment of which he remained in Dublin for some time. Eventually he returned to the country, and I received a letter from him in December. He states that though his eyes have not yet regained their old power, he has had "to give them a good deal of work both by gas and lamplight," and that he is "quite surprised at the improvement."

CASE 2.—Miss A. consulted me in February, 1874. About a year previously she first experienced pain and uneasiness in the eyes and across the brow when attempting to read. She had consulted an oculist, who correctly diagnosed the presence of hypermetropia of about 1-20, and prescribed the proper correcting glasses. These appeared to afford her some relief for a time, but gradually the symptoms returned with the same severity. I syringed the lacrymal passages regularly for some time, and she so far improved that she was soon able to give up the spectacles, and she can now read with ease and comfort.

This case was specially interesting, because taking the symptoms in conjunction with existence of hypermetropia spoke strongly in favour of its being a case of accommodative asthenopia.

CASE 3.—Miss G. was brought to me last December. She complained of not being able to read or work without experiencing pain and fatigue in both eyes. She had hypermetropia of about 1-36th, which was entirely latent. Syringing the lacrymal passages gave little or no relief, so

(a) "Archives of Ophthalmology and Otolgy," vol. iii., No. 1, 1874, p. 242.

I prescribed the proper correcting glasses for the hypermetropia, and desired them to be always worn when the patient was reading or writing. The patient, who was at a boarding school in the suburbs, now returned home to spend the Christmas holidays, during which time she wore the spectacles. For a time the latter appeared to give her some ease, but soon the symptoms returned. She visited me again last month. The eyes were very painful whenever she tried to use them, and she complained greatly of photophobia. I saw the case in consultation with Mr. Swanzy, who suggested that the canaliculi should be slit up. This was accordingly done, and the result has been so far most satisfactory.

This case is to me very interesting, for it proves that syringing alone is not, as I supposed, a sufficient test in all cases.

Hospital Reports.

ADELAIDE HOSPITAL.

ON RETROVERSION OF THE GRAVID UTERUS :

BEING THE ABSTRACT OF A CLINICAL LECTURE
DELIVERED BY

LOMBE ATTHILL, M.D.,

Obstetric Physician to the Hospital.

RETROVERSION of the uterus is not, at least in its complete form, a displacement of frequent occurrence; doubtless partial retroversion, by which is to be understood that condition in which the fundus inclines more or less backwards, the whole organ lying in a sloping direction across the pelvis, the os being still, however, its lowest point, is not very rare; but this partial version of the womb seldom gives rise to distressing symptoms, and consequently, as a rule, escapes notice. But true, complete retroversion is of infrequent occurrence. But although this displacement is comparatively rare, still it is an affection of great importance, not only from the gravity of the symptoms it gives rise to, and the serious and even fatal consequences which may result from its occurrence, but also because of the frequent errors of diagnosis made in relation to it.

In retroversion the uterus, as the name indicates, is turned completely backwards, the os uteri looking upwards and forwards, the fundus lying in the hollow of the sacrum, and sometimes almost on the perineum.

It is of importance that you should clearly understand the difference between retroversion and retroflexion of the uterus. In the former the whole organ is, as I have explained, turned over; in the latter it is flexed, or bent at a point usually corresponding to the os internum. The annexed diagrams will convey to you a tolerably correct idea of these two very distinct affections, which, however, are frequently spoken of as identical, or at most as differing only in degree.

Retroversion, at all times a rare affection, is still more rarely met with unconnected with pregnancy. It generally occurs about the end of the third month of pregnancy, and the first symptom it gives rise to, almost invariably, is retention of urine. You will be asked to see a woman in the third or fourth month of pregnancy, who will tell you that she is unable to pass water, and on examination you will find the bladder to be distended with urine. On emptying it, you will on a further examination find that a globular body occupies the hollow of the sacrum and that the os uteri is high up behind the pubes, possibly altogether beyond your reach; at the same time, a bimanual examination will prove the uterus to be absent from its normal position. But possibly the patient may tell you, as in the case at present under our observation, that she is able to pass water, nay more, "that it is

always coming." This is a statement which constantly misleads inexperienced practitioners; the dribbling of

Retroflexion of the Unimpregnated Uterus.

Retroversion of the Gravid Uterus.

urine is under such circumstances but the overflow of a too greatly distended bladder, and if you fail to recognise this, and promptly to empty the bladder, your patient's life will be endangered, possibly lost. She may die of peritonitis, or of uræmic poisoning, or the mucous membrane of the bladder may become softened and subsequently gangrenous, and death ensue.

The causes producing retroversion of the uterus are various. Frequently the displacement appears to take place suddenly. A pregnant woman makes an effort such as that requisite to lift a heavy weight, and immediately experiences some pelvic distress. By-and-by she finds that micturition is impossible, and on examination retroversion is found to exist. The conclusion is that the displacement took place on the moment. I doubt if this explanation is ever perfectly correct. Most probably the uterus had been, ever since, probably before the occurrence of pregnancy, lying in an abnormal position—namely, more or less across the pelvis, and that the sudden muscular effort, the bladder being at the time distended, merely completed the displacement which had previously been in gradual progress. The subsequent retention of urine is the result of two causes—one, that the posterior wall of the bladder is drawn down by the uterus, to which it is attached; the other, that the neck of the uterus presses upon the urethra, and thus obstructs the flow of urine. But in some cases the patient cannot assign any cause for the production of the distressing symptoms from which she suffers. There may have been a gradually increasing difficulty in evacuating the contents of the bladder, till finally that cannot be effected at all, or at most, but partially, only a very small quantity of urine being voided

at a time. What has occurred under such circumstances probably is this: the patient, previous to her becoming pregnant, may have been the subject of retroflexion of the uterus; pregnancy occurring, the fundus of the uterus, as it enlarges, instead of rising, sinks gradually lower, drawing down with it the posterior wall of the bladder, the flexion in time being thus converted into a version. This, however, is, I believe, of very rare occurrence. I have, on the contrary, frequently known patients, the subjects of retroflexion of the uterus, to become pregnant, and have observed that as utero-gestation advanced, the fundus gradually rose, and finally assumed its normal shape and position. Dr. Barnes believes that this is effected by the gradual enlargement of the fundus upwards, there being no obstacle to its growth in that direction, and that thus, in time, the pelvic portion is partially "drawn out of its lodgment."

Cases of retroversion of the gravid uterus usually terminate in one of three ways:

1. The uterus may be raised above the promontory of the sacrum and utero-gestation proceed normally;
2. Abortion may occur; or,
3. Death may ensue.

I shall here detail for you the particulars of the case of the patient at present in hospital, as she is likely to afford an example of the first and most favourable termination of this displacement, and it will also, I think, impress on you deeply, the importance of being able to recognise the affection, for this woman had been under treatment for some time before she came under my care, without the true nature of her case being suspected.

A. M., a married woman and the mother of five children, was admitted into hospital a fortnight ago, evidently suffering great pain. She stated that she had a "tumour" in the abdomen, which had existed ten or twelve days, during the whole of which period she had been in constant pain. For some time previous to the formation of this "tumour" she had, she said, experienced a good deal of discomfort, or rather distress, which was greatly increased by a constant desire to pass water, her efforts to do so being but partially successful, only a very small quantity of urine being voided at a time. Latterly, however, her condition had undergone a great change: there was now incontinence of urine, or, to use her own words, "it was constantly coming from her;" nevertheless, her sufferings were, if possible, more intense than ever. On passing the hand over the abdomen, a well-defined tumour could be felt above the pubes, pressure on which caused great pain. A vaginal examination detected another tumour lying in the hollow of the sacrum, and almost resting on the perineum. The os uteri was absent from its normal situation, lay high up behind the pubes, and could not be reached without the greatest difficulty. On questioning her, she stated that, though a married woman, she did not think she was pregnant, but on being pressed on this point, admitted that she had not menstruated for at least ten or twelve weeks. On proceeding to pass a catheter, she objected, stating that this had been done the day before, and that she was told that there was no water in the bladder. However, being satisfied that this statement must be incorrect, I persisted, using for the purpose an ordinary No. 9 gum-elastic catheter, and drew off about two quarts of turbid, highly ammoniacal urine. The diagnosis was now clear, and a careful examination verified my previous impression, that I had to deal with a case of complete retroversion of the gravid uterus.

The thorough emptying of the bladder was followed by much pain, and fearing that peritonitis might supervene, I desisted for a time, after one ineffectual attempt, from any further effort at replacing the uterus in its normal position, and with the view of allaying the pain which this woman suffered, administered half a grain of morphia, in the form of a suppository.

After the lapse of eight hours, I found her in a comparatively satisfactory condition. She had slept, and the pain had nearly altogether subsided. The bladder was now again emptied, and the patient being placed in the

ordinary obstetric posture, on her left side, I proceeded to endeavour to raise the uterus. For this purpose I introduced two fingers of the right hand into the vagina, and made steady pressure on the fundus, directing it upwards and rather to one side. Such of you as were present will remember the stress I laid on the apparently trifling point of making the pressure laterally, instead of directly upwards: by so doing the promontory of the sacrum, which often opposes a serious obstacle to the ascent of the fundus, is avoided. In the present instance the effort I made, as described, was attended with complete success; the fundus yielding to the steady pressure, slipped above the brim, and remained there; the patient experienced great relief, and has since progressed favourably. The catheter was, however, used regularly night and morning for some days subsequently, for though the patient could pass water, she was unable to empty the bladder, and it was very desirable that no accumulation should be permitted to occur. This precaution—namely, that the catheter be passed twice a day, in all cases in which retention has continued for a considerable time, should never be omitted, otherwise the bladder may not recover its tone. The subsequent history of this patient presents no point of interest; pregnancy is proceeding normally, and there is no reason to suppose that she will not go to her full time.

This fortunate termination is not, however, to be frequently expected, in the great majority of cases in which retroversion of the gravid uterus takes place, abortion occurs either as a direct consequence of the accident or as a result of the treatment necessary to effect reposition; therefore, be always careful to give a guarded prognosis. Thus, not long since I was urgently requested to visit a lady who, in the twelfth week of pregnancy, suddenly discovered that she was unable to pass water. I found her in great agony, having for some hours endeavoured ineffectually to relieve herself. She stated that she had always enjoyed the most perfect health; that on the morning of the day on which I saw her she had been engaged superintending some domestic arrangements, during the progress of which she had assisted in raising a heavy box to a considerable height; that at the moment of making this effort she became conscious of "something giving way inside" her; but, as at the time she did not experience any discomfort, she thought no more about it, till after the lapse of some hours, being desirous to pass water, she discovered that she was unable to do so. By-and-by her sufferings from this cause became severe, and she sent for me. I at once recognised the nature of the case, emptied the bladder, and endeavoured to raise the uterus, which I found to be retroverted, above the brim, but my efforts were ineffectual. In this case I passed the catheter morning and evening, on each occasion of doing so, endeavouring by pressure on the fundus to replace the uterus in its normal position, and on the sixth attempt, that is, at the end of three days, succeeded in doing so. This patient seemed to go on well for a time, but after the lapse of ten days, a sharp dash of hæmorrhage occurred, and she aborted. My belief is that in this case the force necessarily exerted to replace the fundus, and not the accident itself, was the cause of the abortion.

But abortion is not the result most to be dreaded—death may possibly follow. One fatal case occurred in my own practice. This patient was further advanced in pregnancy than either of those just alluded to, before her sufferings induced her to seek relief. It was her first pregnancy, and she was unable in any way to account for the displacement. The symptoms appeared to have developed themselves very gradually, and the difficulty of micturition to have been progressive, till finally it became impossible. As well as could be ascertained, she was, when I saw her, in the sixteenth week of pregnancy; the whole of the abdomen was very tender to the touch, and the retroflected uterus nearly filled up the true pelvis; the greatest difficulty was experienced in raising the fundus. This was mainly due to the size of the uterus; but I am also of opinion that the uterus was bound down by adhesions. Abortion occurred within twenty-four hours after the

reposition of the fundus had been effected, and she died in a few days. I am of opinion that this may have been a case of congenital retroflexion, which, under the influence of pregnancy, was, as previously explained, converted into one of retroversion. The adhesions were of recent origin; probably local subacute peritonitis existed previous to the raising of the fundus, and that this subsequently spread over the whole abdomen and proved rapidly fatal.

In the treatment of retroversion of the gravid uterus, two indications are plainly indicated, one being to keep the bladder empty, the other to restore the uterus to its normal position. The former should always be effected by means of a long gum-elastic catheter, for an ordinary silver female catheter will often in these cases fail to reach the bladder, so greatly is the urethra elongated and displaced. The bladder being emptied, it is generally advisable to attempt reposition at once, unless, as in the case first narrated, great pain is caused by doing so, under which circumstances it is wiser to allow some hours first to elapse, care being taken to pass the catheter at short intervals.

In the majority of cases, especially if pregnancy has not advanced beyond the twelfth or thirteenth week, steady pressure, exerted by means of two fingers introduced into the vagina, will be successful in raising the fundus, care being taken to make the pressure rather to one side, so as to avoid the promontory of the sacrum. Occasionally, however, you will fail to effect reposition by this means. When this is so you will sometimes succeed by introducing one of Dr. Barnes' india-rubber bags into the rectum, (a) distending it with water, while pressure is still exerted by the fingers in the vagina. If these efforts fail in raising the fundus above the brim, no resource remains but to bring on abortion. This under the circumstances is best effected by introducing a catheter or sound into the uterus, and if possible rupturing the membranes, but sometimes, in consequence of the os uteri having been forced up behind the pubes, the introduction of a catheter or sound is impossible, and then, as a last resource, an effort should be made to lessen the size of the uterus by tapping it through the rectum by means of a fine trocar or aspirator. This has been done several times successfully; the liquor amnii having been evacuated through the trocar, abortion followed, the patient subsequently recovering; but in all cases of retroversion the tendency to abortion is great, and occasionally peritonitis supervenes. Bear in mind that, in addition to abortion, the possible occurrence of peritonitis is to be dreaded, and death may ensue from this cause. Retroversion, therefore, of the gravid uterus is always to be looked on as an accident of a very serious nature.

But supposing you have succeeded in raising the fundus, the patient will still, under the most favourable circumstances, need care for a considerable time. It is essential to attend to the state of the bladder, and to pass the catheter at stated intervals till satisfied that the organ has regained its tone, and you must watch lest the fundus of the uterus fall down again into the pelvis. To lessen the risk of this occurring, and also with a view of counteracting the tendency to abortion, you should for some time confine the patient strictly to the recumbent posture. As the uterus enlarges, the risk of a relapse lessens, and after a time becomes impossible, but the tendency to abortion for a long time continues, and in a comparatively small percentage of cases does the patient reach the full time of pregnancy.

Before concluding my remarks on this subject, I must say a few words on the question of diagnosis. In all the cases which have come under my observation in which an error in diagnosis had been made, no sufficient examination appeared to have been instituted; thus, with respect to the patient whose case I am specially alluding to, the fact that she was suffering from retention of urine was not recognised, although the enormously distended bladder could be easily

(a) This method was, I believe, first suggested by the late Dr. Halpin, of Cavan.

felt above the pubes. This negligence is quite inexcusable. But it is just possible that an ovarian or other tumour occupying Douglas' space might be mistaken for a retroverted uterus, even though an examination had been instituted, especially if it were large enough to press against the urethra and thus obstruct the flow of urine; but in such a case the symptoms of pregnancy will probably be wanting, and, moreover, a careful examination will detect the uterus, which, under such circumstances, would probably have been forced up above the pubes, lying anterior to the tumour. Any other tumour, such as that caused by the sudden escape of blood into the recto-vaginal *cul-de-sac*, may, in like manner, cause some perplexity. All doubts, however, will be dispelled if, on emptying the bladder, the uterus is found lying anterior to the tumour. Excusable errors in diagnosis, then, in cases of retroversion of the gravid uterus, are possible, but with ordinary care such should rarely, if ever, occur.

Transactions of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, MARCH 23RD, 1875.

Sir JAMES PAGET, Bart., F.R.S., D.C.L., LL.D., in the Chair.

MR. WALTER RIVINGTON, M.S. Lond., F.R.C.S.E., related a case of

PULSATING TUMOUR OF THE LEFT ORBIT, CONSEQUENT UPON A FRACTURE OF THE BASE OF THE SKULL, CURED BY LIGATION OF THE LEFT COMMON CAROTID ARTERY, SUBSEQUENTLY TO INJECTION OF PERCHLORIDE OF IRON, AFTER DIGITAL COMPRESSION AND OTHER MEANS OF TREATMENT HAD FAILED; WITH REMARKS AND AN APPENDIX CONTAINING A CHRONOLOGICAL TABLE, AND A RESUME OF THE RECORDED CASES OF INTRAORBITAL ANEURISM.

THE author prefaced the narrative of the case with an historical *résumé* of the views and observations placed on record by previous writers. The first known case was described by Mr. Travers, in 1809, as a case of aneurism by anastomosis, and the second by Mr. Dalrymple in 1812, under the same designation. Notwithstanding the observation of Guthrie, in 1823, of a case in which similar symptoms existing on both sides were shown by post-mortem evidence to have resulted from an aneurism of each ophthalmic artery within the orbit, the views of Travers were generally adopted for many years, as explanatory at least of the idiopathic cases of intra-orbital aneurism. Mr. Busk, in 1835, met with a case which arose gradually after a fracture of the base of the skull, and was able to cite the prior case of a boy, under the care of Mr. Scott, in 1834, at the London Hospital, in which protrusion and pulsation of the eyeball supervened after an injury to the head, occasioned by a fall into a ship's hold, and in which the subsequent occurrence of violent arterial hæmorrhage from the nose rendered it necessary for Mr. Scott to ligature the carotid; a cure resulting. Mr. Busk combated the views of Travers, and advocated the view that his own case and previous ones had been cases of ordinary aneurism affecting the ophthalmic artery within the orbit. His paper had a marked influence on subsequent observers, as might be judged from the fact that M. Pétrequin, Mr. Curling, M. Bourguet, M. Legouest, Mr. Zachariah Lawrence, M. Gioppi, Dr. Morton, and Dr. Schmid of Odessa, all diagnosed their cases as examples of aneurism of the ophthalmic artery; whilst M. Démarquay, Mr. Nunneley, Mr. Jos. Bell, Mr. Ernest Hart, Dr. Delens, Mr. Holmes, and others who had ably and successfully opposed the view of Travers, had repeated, with reinforcements of their own, Mr. Busk's arguments. To Mr. Nunneley was due the chief credit of first directing forcibly the attention of pathologists in England away from the orbit to the vessels lying behind it; and he showed from post-mortem observations in two out of six cases which he had met with, that the symptoms might be due to an aneurismal affection of the internal caro-

tid artery in the cavernous sinus, or an aneurism of the ophthalmic artery within the skull. The record of Mr. Bowman's well-known case, by Mr. Hulke, in which no change was found in the arteries, but in which the cavernous, transverse, and petrosal sinuses were obstructed by clot; and M. Aubry's case of obliterated inferior petrosal sinus; and MM. Wecker and Richet's fatal case, were all so many indications that aneurisms within the orbit were only exceptional conditions. A brilliant light had been thrown on the pathology of the traumatic cases, by the publication of two cases under M. Nélaton, in which all the symptoms had resulted from a direct communication between the internal carotid artery and the cavernous sinus produced by the fracture of the base of the skull; and a similar case observed by M. Hirschfeld. These cases, and cases of spontaneous rupture of an aneurismal carotid, related by M. Baron, in 1835, and M. Gendrin in 1841, were little known in this country until the publication of Dr. Delens' monograph, and Mr. Holmes's lectures at the College of Surgeons. The author's own case was briefly this. W. C., aged 24, was admitted into the London Hospital in July, 1873, with a fracture of the skull. Six weeks later the patient heard a noise in his head, like wind blowing; the eye gradually became prominent, pulsation of the eyeball was seen for a day or two, followed by the formation of a pulsating and thrilling tumour between the eye and the margin of the orbit. There was a *bruit*, continuous, with reinforcements, and the *bruit de plement* could be heard at intervals. At the time of the commencement of the aneurismal symptoms, Mr. Reeves was in charge of Mr. Rivington's wards, and carried out very thoroughly digital compression, without making any impression on the disease. Ligation of the carotid was discussed, but negatived at a consultation. A further trial of compression, digital, instrumental, and direct, having been made without effect, combined with veratrum, and the affection at the end of a year being decidedly aggravated, threatening extinction of vision and preventing work, an injection of five drops of a neutral watery solution of the perchloride was made; but this proving to be insufficient in quantity to cause sufficient coagulation in the dilated ophthalmic vein, and a second injection being impracticable, on account of subsequent swelling, the carotid artery was tied by Mr. Rivington, and effected a cure of the disease; a slight *bruit* only remained, but superficial ulceration of the cornea occurred a few days after ligation, and resulted in opacity. The author then discussed at length the causation, symptoms, pathology, differential diagnosis, and treatment of the affection, the following being a few of his conclusions. 1. Of 62 recorded cases, 29 were idiopathic, and 33 traumatic; of the 29 idiopathic cases, 11 were affected on the left side, and 13 on the right; whilst of 33 traumatic cases, 22 were affected on the left side, and nine on the right, the side affected not being mentioned in the others. Thus, the preponderance of cases in which the affection had existed on the right side was entirely maintained by the traumatic cases. 2. Pulsation of the eyeball and a pulsating tumour might be absent, but no case should be regarded as one of so called intraorbital aneurism unless, in addition to exophthalmos and chemosis, a *bruit* were present. 3. The only true basis for the pathology of intraorbital aneurism was the record of post-mortem examinations, to which allusion had been already made. By this the doctrine of aneurism by anastomosis had been negatived, and a variety of morbid conditions had been disclosed (*vide supra*). 4. It was of great importance to recollect that, in eight out of twelve cases examined after death, the ophthalmic vein had been found varicose and enlarged, and in four certainly had formed the pulsating tumour observed during life at the orbital margin. The distension of veins might reach to the bridge of the nose and the forehead. After specifying the distinctive features of erectile tumours of the orbit, pulsating encephaloid cancer, speno-orbital meningocele, and rejecting as efficient causes of the affection arterio-venous aneurism of the orbit, circoid aneurism, and aneurism by anastomosis within the orbit, and morbid conditions of the sympathetic nerves and ganglia, the author pointed out the necessity of studying the mode of occurrence of the symptoms, the nature of the paralytic symptoms of orbital muscles (if present), the character of the *bruit* and pulsating tumour, and other points, for the purpose of forming an opinion as to the pathological causes of the affection in any given case. Having discussed the means of treatment, and given the statistical results, the author showed that the symptoms might return in three

different ways; that loss of vision might occur in cases treated by any method, or not treated at all, the result depending chiefly on the degree of interference with the circulation by the formation of coagula before anastomosing channels could be established. The conclusions as to treatment were the following:—1. Belladonna, digitalis, veratrum, and ice were worthy of a trial; 2. Digital compression should always be essayed; 3. Instrumental compression was more difficult, and more likely to injure important nerves; 4. Galvano-puncture was not well suited for application to a thin-walled vein; 5. Coagulating fluids were adapted only for cases of arterio-venous aneurisms; 6. Ligation of the carotid was the remedy most generally applicable, but should not be hastily employed. The author expressed his obligations to Mr. Holmes for his interest in the case and supply of valuable information.

Mr. HENRY POWER said the affection was a rare one. He did not remember to have seen a case; and the late Sir William Lawrence, in his work on the eye, did not mention that he had seen one. He doubted whether the forms described could be distinguished accurately from each other. He thought the injection of perchloride of iron dangerous, and would prefer the ligation.

Mr. HULKE said that Mr. Rivington had spoken of aneurism by anastomosis. This term had been used in different senses. William Hunter applied it to arterio-venous aneurism. As to the question of the formation of erectile nœvus in the orbit, he would call Mr. Rivington's attention to a case described by Von Grafe some years ago, in which an encapsuled cavernous tumour was found in the orbit; also to a similar case recorded by Mr. Critchett. He doubted whether the tone of the *bruit* was of any value; but it was important to observe whether it was continuous or interrupted. He regarded injection of perchloride of iron as a risky proceeding, unless the communications with vessels around could be cut off. He had heard of a case in which the injection of a few drops of solution of perchloride of iron into a nœvus was followed by death; and of two other cases in which extensive sloughing took place.

Mr. CURLING agreed with Mr. Power that the malady was very rare. The author had collected his materials from very various sources, extending over a long period of time, and had found only sixty-two cases. Still it was important that surgeons should know something of the subject, lest they might meet with cases. In traumatic cases he regarded the early application of the ligation as of importance where vision was seriously threatened. He would not wait to see the effects of digital compression. In idiopathic cases, where there was no indication of injury, digital compression and other measures might be tried before resorting to ligation.

Mr. C. J. B. WILLIAMS wished to call attention to the medical aspect of the subject. The disease described in many instances closely resembled exophthalmic goitre. He believed that in all such cases there was an enlargement of the carotid arteries, extending to the arteries at the back of the eye, and sometimes accompanied by a murmur. Usually there was also enlargement of the thyroid, from enlargement of its vessels. The cases seemed to belong to a diseased condition that had scarcely received sufficient attention—viz., partial enlargement of arteries. There was often an anæmic state of the system. He thought that in such cases medical treatment, applied early, was quite as successful as surgical, and said that cases of the kind were readily amenable to the internal use of perchloride of iron, with strychnia, digitalis, good living, &c. His remarks, of course, were not applicable to traumatic aneurisms of the orbit.

Mr. W. ADAMS called attention to Pravaz's experiments on the injection of perchloride of iron; he found one drop sufficient to coagulate a drachm of blood. The solution of perchloride of iron contained free hydrochloric acid; and this, if it escaped into the cellular tissue, would produce serious destruction of the parts. He related a case in which he had injected perchloride of iron into the tibial artery.

Mr. HULKE said that some years ago he had injected two drops of solution of perchloride of iron into the vein over the tendo Achillis in dogs, by Pravaz's plan; the result was instantaneous death. Extensive coagula were found in the veins.

Mr. C. HEATH had seen a case where a *bruit* was heard, and a ligation applied to the common carotid artery; after

death no aneurismal state of the arteries was found. Another case of the same kind had been referred to by Mr. Rivington; and if two cases had occurred, could it be inferred that there had been aneurism in all the successful cases?

The PRESIDENT had never seen a case of pulsating tumour in the orbit; but he would point out that any tumour deeply set in bone would commonly pulsate, even though it had no blood-vessels, receiving an impulse from the vessels, however small, in the neighbourhood. This might be noticed in tumours of the antrum. Pulsation, perceptible to the eye, was also communicated to the pus in cases of necrosis. In the same way he considered increased pulsation of the ophthalmic artery from any cause would be followed by a communication of the pulsatile movements to the eye.

THE SURGICAL SOCIETY OF IRELAND.

THE usual fortnightly meeting of this Society was held on Friday evening, 19th March, 1875,

The President of the College of Surgeons, Mr. JOLIFFE TUFNELL, in the chair.

PENDULOUS TUMOUR IN THE LEFT LABIUM.

Dr. BARKER exhibited a specimen presented to the Society and College by Dr. L'Estrange, of Wicklow. It was one of six years' growth, and it was removed by him in the infirmary on account of intense hæmorrhage. In looking over the museum he (Dr. Barker) found one smaller specimen, but of a similar character, given to the College by the late Mr. Kirby. The specimen now presented was of a fibrous nature, and also impregnated with a quantity of watery fluid. It was by no means malignant, and the woman made a very rapid recovery after it was removed. It appeared that the growth, which was about six years in forming, when it first appeared was the size of a pigeon's egg. It stopped in growth during lactation, but during pregnancy increased rather rapidly. It ulcerated at the lower part, and must have caused a great deal of suffering from its pendulous nature. He did not think there was anything further to notice with regard to it except that tumours in that part of the system were, as far as he could judge, of two distinct kinds. These tumours were very common, and sometimes grew to the size of a child's head. He might mention that Dr. L'Estrange was anxious to know whether the tumour was atheromatous. He (Dr. Barker) had never seen atheroma in these cases.

Mr. RICHARDSON: Where was the hæmorrhage?

Dr. BARKER: In the lower part at the fundus.

Mr. WHEELER then read a communication on

THE SUCCESSFUL REMOVAL OF A FOREIGN BODY IMPACTED IN THE PHARYNX BY THE OPERATION OF PHARYNGOTOMY, BEING THE FIRST CASE OF THE KIND IN IRELAND, which will be found at page 312.

In the succeeding debate,

The PRESIDENT said they had had several consultations in reference to this case, and at first he was under the impression that it could have been removed by passing down one of Arnold's tubes on the throat; by gently drawing they could then get the eye of the needle drawn into the catheter and in that way they could dislodge it. That, however, failed. Then he thought it might be removed by a double curved forceps—a regular pharyngeal forceps—by having an eye fastened to the side of the blade of the forceps, and by passing the thread through the eye so that the forceps thereby would be brought down on the needle to a certainty, and in that way they could get hold of it and withdraw it. This, however, was not possible, inasmuch as the eye and point, being firmly imbedded, left only a small central portion of the needle exposed. One thing they considered, too, was the amount of traction they might safely make on the thread which protruded from the mouth. The man stated that at the time of the mishap he was using the strong thread that country people used, and that it was in four doubles, or two plies. The man showed him a needle similar to that which he said he had swallowed, and on looking at it he (Mr. Tufnell) felt satisfied that the man could not have been using two plies of thread. It turned out afterwards that it was only ordinary thread put through the needle once. They therefore could not have relied on the man's statement, and could

not have judged of the amount of traction, because the difference between two and four folds of thread would have been considerable. It was a case that might occur to anyone at any moment, and he was sure it was most interesting. Foreign bodies of different kinds were frequently found under such circumstances, but a needle was certainly one that was rarely impacted in the way that had been described by Mr. Wheeler. Pins and needles had often been swallowed. If the thread had not been held by the man's mouth it was most likely that the needle would have taken the downward course. He recollected a case in which a lady's child had swallowed a wooden screw, the worm of which was deeply cut. About forty-eight hours afterwards it passed from the child, and no human being could have told what the screw was when he saw it. It looked like a piece of white chamois leather, so completely had it, when thrown out, been changed in appearance, and mucus filled in the cuttings of the screw. Now he recollected a case which came under his own observation a few years ago where a very small portion of a feather caused death. An individual was eating part of a turkey at Christmas time, and a very small portion of one of the legs had not been well plucked. A little piece about the size of a pin perforated the intestine, and death followed. They were aware, however, that metallic bodies, when swallowed, had generally come out without doing much harm to the individual.

Dr. DARBY had never seen a case requiring pharyngotomy. The case related by Mr. Wheeler was a very novel one. He (Dr. Darby) had seen needles and pins passed through the inside of the body in various places and come out through the skin. He thought the Society was greatly indebted to Mr. Wheeler for bringing forward so novel and singular a case. Were he (Dr. Darby) to draw upon his own experience—which he thought was the proper course for gentlemen to adopt at meetings of the Society, and not quote authorities or books—he must say he never saw a case in which he was not able to remove a foreign body from the pharynx or that it did not pass down the canal. On one occasion there was a large-sized brass pin, which he removed with the forceps, and he might mention a very remarkable case that occurred a very few years ago of a child, an infant of eight or nine months, who, while playing with a coral staff and bells swallowed the entire coral and the metallic top of it. The mother came to him in a state of great alarm, and he told her that as the thing was down, it must have arrived at the stomach, and not to give the child any medicine. She had previously been recommended by another medical man to give the child an emetic; but he (Dr. Darby) advised her not to do so. He met Dr. Sims, who knew the family very well, and on being told the circumstance, he gave it as his opinion that the child must die. The child, however, was not in the least sick, and in two days afterwards passed the foreign body by the rectum, and it never seemed to suffer in health at all from it. That was the only case of the kind of interest that he knew of.

The PRESIDENT remarked that it was extraordinary how the body had passed on.

Dr. WARD said that about five years ago he was summoned to a lady in Rathmines who had swallowed a fish-bone. When he arrived he found the lady suffering from intense dyspnoea, and on examining the pharynx he saw a piece of fish-bone sticking into the posterior half-arch of the palate. He took it out with a forceps without any trouble, whatever. It was situated in the palato-pharyngeus muscle. It gave a good deal of distress for the time, but immediately after it was removed the patient got perfectly well.

Dr. FLEMING said the paper read by Mr. Wheeler possessed a considerable amount of interest. He (the speaker) could not say that he had absolutely met with a case identical with this, but he had seen not a few cases where pins, not needles, had been lodged in the back of the pharynx; and he recollected one case in which a surgeon of some considerable eminence endeavoured in vain to remove a pin from the pharynx. He (Dr. Fleming) happened to look into the throat by mere accident, and thereupon saw a pin impacted in the transverse portion and under the side of the hard palate. They must recollect that in these cases it very often happened that foreign bodies, even such things as pins, would pass along the whole track of the intestine and would escape or be removed by the rectum. Yesterday he saw the case of a gentleman who had swallowed a piece of bone, though not a very large piece. Still it produced an enormous amount of uneasiness when it reached the rectum, and in the rectum it could be felt by the finger passing up and down. In other cases he had seen artificial teeth, and, as Mr. Wheeler had observed in

his paper, these were by no means uncommon, lodged in the pharynx, and they had been felt by some surgeons, but not interfered with further, the laceration being fortunately little in extent. He had two or three specimens of artificial teeth which had been passed by the rectum. In these latter cases the teeth remained for a lengthened period delayed in their transit, some months occasionally, but ultimately escaping by the rectum, and all uneasiness thus completely removed. He might mention another occurrence which was familiar to many members of the Society, and which certainly should put them on their guard in some cases. He would like to know whether any member of the Society had met with cases of epilepsy in persons who wore artificial teeth, either in sets or separately? He had, in cases of these fits or partial paralysis, been enabled to remove the teeth without any difficulty by passing a finger into the mouth; but it was quite intelligible to the members of the Society that some of these teeth may possibly have become embedded in the pharynx, or swallowed altogether. It was well known that a man of considerable rank had fallen a victim to such an accident. The people about him were not aware that he wore false teeth. Well, he died in a sort of semi-epileptic fit, but afterwards a set of false teeth was found impacted in the back of the pharynx. He mentioned that in order to put the members of the Society upon their guard, and as showing that they should attend to the possible contingency of obstructions where set up in the locality to which Mr. Wheeler had so graphically and so satisfactorily directed their attention.

Dr. BENNETT thought the members who had spoken had in great measure departed from the subject before the meeting. He did not think that the subject to occupy their attention was the form of foreign body or where it lodged in the pharynx: it was the actual operation which had been performed in this instance, and he did not think it should pass the notice of the Society merely with criticism as to the varieties of the foreign bodies and the mode of their lodgment. He thought the question before the Society was the operation, and he thought none of the members had much experience in that matter, and Mr. Wheeler had exhausted the literature of the subject pretty fully. There might be a point to which they would perhaps take exception; but that was not his (Dr. Bennett's) object in speaking: it was, however, to express, so far as his own opinion went—and he had no doubt he also conveyed the opinion of the other members present—an extreme sense of respect for the operation and for the skill and courage with which it was done. He thought the Society should express their approval of the spirit and courage of the operator.

The PRESIDENT observed that there was one difficulty in speaking of the operation, in this way, that they had only had this one single case.

Dr. BENNETT said the operation of pharyngotomy had been performed sufficiently often, but not in Dublin; hence he thought the greater honour was due to Mr. Wheeler.

The PRESIDENT said he had seen this case from the beginning to the end of it, and he knew of no other line of treatment that could have been adopted than that which was resorted to. Of course, there was a good deal of risk and danger, more or less, in the operation, and in inflammatory action which might follow. No one would resort to operative treatment if they could remove the needle by forceps or other manipulation.

Dr. F. T. PORTER said that, presuming the operation necessary, would it not be better in other cases of the kind to perform the operation at an earlier period, because he thought that a good deal of the difficulty experienced in removing objects of the kind was increased by the time they were allowed to remain in the tissues?

Mr. WHEELER, in reply, had very little to say, save that he was glad to hear gentlemen of the experience of Dr. Darby and Dr. Bennett express their gratification and satisfaction at the operation. With regard to the other foreign bodies—pins and needles—that passed down, no later than three days ago he was present at a post-mortem examination made by Dr. Finny in the City of Dublin Hospital of a woman who had swallowed a pin, and who was brought to the hospital in a state of peritonitis, which terminated fatally. The post-mortem examination showed that the pin had ulcerated through the vermiform process, and the woman evidently died from swallowing the pin. He remembered himself being fortunate enough to take out a pin on the 28th of December, 1864, in Beckett Street Hospital. It had been swallowed by a young man while eating turkey on Christmas day. Billroth stated a

case where a needle ulcerated in the same place—in the cæcum. With regard to Dr. Porter's question, it was laid down by Messrs. Cock, Arnott, and Bryant in his "Practice of Surgery;" these writers all stated that the earlier the operation was performed the better, and the greater the chance of recovery. He (Mr. Wheeler) did not think that in this case there was any undue delay, as a great deal of the time that elapsed was occupied in waiting for the instrument-makers to complete the necessary and special instruments for use in the case. The man was admitted on the 10th, and the operation took place on the 23rd. He quite coincided with Dr. Porter that the earlier these operations were performed the better. He found that, taking seven cases of the operation of œsophagotomy, two of the patients died; five recovered. One of the fatal cases was Dr. Martin's, and the result appeared to be caused by the treatment. The other case was one in which the dorsal vertebra of a sheep was stuck in the gullet, and the result was that the child died from pneumonia. With regard to the operation of pharyngotomy, he could only find that it had been twice performed. Mr. Denham had elaborately put forward statistics of œsophagotomy, but he (Mr. Wheeler) did not think them quite correct, inasmuch as he quoted 21 cases, including Mr. Cock's, two of which were purely pharyngotomy. As far as he could find out, the only two cases of pharyngotomy were those in which Mr. Cock operated.

Mr. FITZGERALD then read a communication on

SOME PECULIAR SYMPTOMS CONNECTED WITH OBSTRUCTIONS OF THE LACRYMAL PUNCTA, CANALICULI, AND NASAL CANALS, which will be found at page 314.

Mr. SWANZY said the subject was a most important one. In most of the half-dozen or so cases of the kind, that had come under his observation no doubt the syringing of the lacrymal passages had been sufficient. It was not, however, always sufficient. In many cases it would be necessary to slit up the canthus where symptoms of asthenopia were present, and where obstructions of the lacrymal ducts were established with chronic conjunctivitis. Very often those cases seemed incurable until it struck someone to examine the lacrymal passages. Prof. Becker, of Heidelberg, in his "Records of Ophthalmology," had related such cases. He (Mr. Swanzy) had a lady under his care who suffered from lacrymal conjunctivitis. She was under his treatment for some years, and eventually he performed Bowman's operation. In connection with asthenopia and conjunctivitis, he thought the examination of the passages most important. There was no doubt that until the lacrymal passages were opened the irritation was kept up.

Dr. MAPOTHER asked by what method were the tears discharged when the canaliculi were divided?

Dr. STOKES said that obstructions of the lacrymal passages were most important in diseases of the eye. He wished to know the method of treating the partial closing of the lacrymal ducts by means of dilatation. Formerly, when he was in the habit of treating cases of the kind, he used to resort to dilatation, which, to his mind, was the best mode of treatment, the instrument he used being one devised by an ophthalmic surgeon in Paris, M. Galezowski, whose name had been already mentioned. The instrument was no doubt like the one alluded to by Mr. Fitzgerald. He (Dr. Stokes) would be glad to learn what was Mr. Fitzgerald's experience of that instrument in treating partial closure. He (Dr. Stokes) had treated many cases of the kind with that instrument with very good effect. It had the advantage of avoiding any cutting operation, which persons, especially in private practice, had a great dread of.

Dr. F. T. PORTER thought that Mr. Fitzgerald was scarcely accurate in thinking that no Irish author had been distinguished in treating this subject, for the records of Mr. Pott showed a great deal of ability and spirit. He (Dr. Porter) wished to ask Mr. Fitzgerald what was his constitutional treatment in these cases, because he (Dr. Porter) was sure that many of them were connected with constitutional causes.

Dr. HENRY KENNEDY said that, if he understood Mr. Fitzgerald rightly, he said many of these cases occurred where there was no stoppage of the tears. He (Dr. Kennedy) wished also to mention that sometimes, in reference to these patients, dislike for artificial light and suffering from pain and weakness frequently existed without any stoppage of tears, and were treated freely by constitutional, without any reference whatever to local treatment. On one occasion he took a case to Sir Philip Crampton, and his treatment was entirely constitutional. He (Dr. Kennedy) would like to know if these

cases occurred without stoppage of tears, because he thought that was an important consideration.

Dr. PURSER thought the question of the stoppage of tears a most interesting one. He considered the question one of deep interest to ophthalmic surgeons as to how far the obstruction of the lacrymal passages could reduce the flow of tears. The fact of there being no flow of tears over the lids in these cases was no proof that there was no obstruction of the lacrymal passages.

Mr. WHEELER wished merely to mention that he had seen Mr. Fitzgerald use the syringe exhibited with the greatest benefit and with advantage. He (Mr. Wheeler) was very much struck with the neatness of the instrument.

Dr. WARD said that when demonstrating in the Ledwich School of Medicine some days since he was struck with the thickness and enlargement of the valve at the termination of the nasal duct. Between the termination of the nasal duct and the lacrymal sac, three valves, commonly called the valves of Hassner, Huysehe, and Foltz, existed. He would like to ask Mr. Fitzgerald, did he think those valves having become thickened caused the obstruction in the nasal duct to which he had referred?

Mr. FITZGERALD said, with regard to what had fallen from Dr. Mapother, the question of how the tears were carried off from the eye was still, he (Mr. Fitzgerald) believed, a disputed point. In none of these cases, while the operation was being performed, had he ever seen any tears from the eye at all. The tears seemed to be carried off perfectly, and he believed the explanation which was held in most favour was that it was produced by a process of exhaustion of the air in the lacrymal sac. Of course, if that be the case, the canaliculi could not interfere with it. As regarded Dr. Henry Kennedy's observations, he (Mr. Fitzgerald) never meant to say in his paper that there were no cases which might not depend on constitutional disturbance, a rather vague, but useful term. In cases after childbirth they not unfrequently saw intense photophobia, evidently due to exhaustion. The instrument alluded to by Dr. Stokes he was well acquainted with, and had used it, but had never employed it solely without the other forms of treatment as well. He (Mr. Fitzgerald) thought it almost useless in these cases where there was great stenosis of the lacrymal passages. With regard to what Dr. Porter had stated, he (Mr. Fitzgerald) regretted he had not read Mr. Pott's works, and as to the rest of Dr. Porter's question, the same answer as that given to Dr. Henry Kennedy applied. The question of the valves, mentioned by Dr. Ward, was rather a disputed point, because a great number held that they were merely folds in the mucous membrane, that they were not true valves, and, undoubtedly, in a great number of cases, they did not prevent the passage of an instrument through the nasal duct. He did not think that any amount of thickening could ever produce sufficient obstruction.

The Society then adjourned.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, APRIL 14, 1875.

THE ETIOLOGY OF TYPHOID FEVER.

NOTWITHSTANDING the many excellent monographs we possess upon the subject of typhoid fever, it must be said

that much remains to be done before the medical world shall become unanimous upon all points in the history of that very important disease. A discussion has recently taken place in the Société de Médecine Pratique of Paris which throws some light on the etiology, a point always very obscure. Dr. Flamarion mentioned that he had observed seventy-eight cases of this affection at the end of 1873 and the commencement of 1874 in two villages in Haute-Marne, twenty-seven of them being in Louvières and fifty-one in Donnemarie. Only two of these patients died, one of them during the disease, and the other in the period of convalescence, in consequence of imprudence.

The author, without going into any generalities about the etiology of typhoid fever, limited himself to seek out what was the origin of the two epidemics he had witnessed. He insisted particularly upon the evil influence which the water seemed to maintain, considered either as causing exhalations, or as an article of consumption. It seems that at Louvières twenty-one patients out of twenty-seven lodged in houses the doors and windows of which looked out upon a watercourse, which was pretty clear, but along which, for some years past, each house had established a sort of washing establishment, which became the receptacle of the kitchen refuse, and sometimes of filth.

Dr. Flamarion, with Pettenkofer, makes the level of the underground water play an important part in the production of typhoid fever. The lowering of this level, after a long drought, must, he thinks, contribute to provoke a putrid fermentation in the bed of such underground streams. For some years past the inhabitants of Louvières, it seems, had given up getting their supplies of water from springs which arose above the ravine, and had drawn them from a new spring in the middle of a little hill. Now, it was impossible not to be struck with the very regular succession, after the dryness, of the appearance of new cases of typhoid fever in July and September, 1873, in this village.

At Donnemarie there was no watercourse, except a little river, which ran at the foot of a hill, at the top of which the village was situated. When rain falls, the streets are furrowed in all directions by currents of water which may sometimes change into little torrents. These unite in a double stream, which merges into one in the middle of the hill, where the public fountain is situated. These streams, thus contaminated, become infiltrated by the waters which wash the dunghills and carry with them the straw, so that, when it rains, there issues from the pipe of the public fountain a dirty, muddy water, which the cattle sometimes refuse to drink. A remarkable fact is that the epidemic in this village commenced at the beginning of December, after abundant rains, and that the recrudescence of the disease has always coincided with an elevation of the layer of water in the pluviometer. The chemical analysis of the fountain-water, in December, showed a great quantity of organic matter in it.

With regard to the treatment of typhoid fever, the author mentions some of the so-called special treatments of the disease; and he more particularly insists on the treatment of Brand, which he could not try in the country on account of the prejudice of the country people. He does not see that this method, which at first promised so much success, now gives results more favourable than those ob-

tained by Valleix, Bouillaud, Andral, and Louis. The best statistics vary from 6·6 to 9·7 per cent.

Dr. Flamarion, for his part, said that he had employed a treatment apparently very complicated, but which was based on the general principle of watching indications, which he divided into general indications, directed to the whole of the symptoms and to the form of the disease, and special, which were directed to each separate symptom. Thanks to this treatment, the author had lost only 1·33 per cent. of his patients, for he eliminated the case of death due to imprudence at a time during convalescence, when cure might be considered as certain.

Dr. Flamarion then passes in review the different methods of treatment which have been suggested to him by the general indications, in the forms of ambulatory, mucous, and ataxo-dynamic fever. He then refers to the methods of treatment suggested by the special symptoms of each case, such as headache, delirium, pain in the spine, fever and heat, fuliginosities, diarrhoea, vomiting, constipation, meteorism, piles, bronchitis, hypostatic congestion, pneumonia, and gangrene.

It will be seen by this *résumé* of Dr. Flamarion's paper, that in France, as in this country, it is now beginning to be almost universally admitted that the prominent cause of typhoid fever is the impurity of drinking-water. Instances have of late years been so multiplied of the evil effects of the communication of sewage with drinking-water that there are probably but few physicians who now refuse to admit that this is the chief cause of the occurrence of epidemics of typhoid fever. Dr. Flamarion says but little about the contagious nature of the disease.

With respect to the treatment of Brand by cold water affusions, one very great difficulty in carrying this out has been mentioned; and that consists in the great prejudices against such a treatment, which exist even in London and in the best conducted hospitals in this country. It is doubtful, on this account, whether the cold-bath treatment of typhoid fever has ever been fairly tried in this country as yet. Whether Dr. Flamarion's wonderfully excellent statistics could be verified in London is a matter of grave doubt, and we suspect that, under all treatments, the mortality from typhoid fever will occasionally prove very high in such large cities. But there seems to be some prospect of almost entirely getting rid of typhoid fever from our better-drained towns. Meanwhile, the last word has by no means been spoken about typhoid fever and its etiology and treatment.

A ROYAL MEDICAL STAFF CORPS.

THE suggestion that the various atoms of which the present Medical Department is composed should be incorporated into a Royal Corps, and that all officers should be executive as far as the command of the Army Hospital Corps is concerned, both as regards officers and men, has our entire approval. We believe such a suggestion is only in accordance with the spirit of true progress, and would, we firmly believe, if adopted, do much towards establishing that *esprit de corps* and union of professional feeling among medical officers, without which they can never hope to rise above the prejudices and jealousies which beset them on every side—prejudices which have

marred their usefulness, and kept them in leading strings for more than 200 years.

Coeval with the formation of the English army military surgeons have been ever bound to it by the most intimate ties of humanity and honour. Having from the nature of their duties and profession only the interest and efficiency of the soldier to promote, they can never do otherwise than take a warm interest in its welfare. Yet, although a sharer with that army in all the vicissitudes of war, they have reaped hitherto only *barren honours* at those moments when gratitude and loyalty demanded that they should have had their due share of the public rewards. His Royal Highness the Prince of Wales told us not so very long since that "he could not help saying that we owed a deep debt of gratitude to those distinguished medical men who served in our navy and in our army." Yet, beyond the mere general expression of such opinions, military surgeons have little to look back upon or to bind them to the service with which they cast their fortunes. The greatest of all military commanders, Emperor and General, knew how to appreciate and reward the difficult and dangerous services of the military surgeon. He acted upon the principle that, as "the medical staff shares the fatigues and dangers of war, in just reason it is entitled to a share of advantages." He bestowed the highest grade of the Legion of Honour on Barons Larrey, Desgenettes, and Percy. The commanders of the French army considered that the Legion of Honour derived lustre and renown from the enrolment of such names in its ranks. The President of the National Assembly, when unveiling the statue of the first of these great men, said to the military surgeons in attendance: "I tell you, if anyone were bold enough still to dispute your right to proportionate rank in the army, proudly answer by pointing to this statue, and by citing the life of the man it represents." As yet such sentiments as these are unknown in the English army. The opportunity has now arisen when services rendered during so many centuries may be recognised by a mark of Royal favour. It appears to us that upon many grounds a change of designation is desirable. When the regimental system was practically abolished in April, 1873, and with it the old title of "Medical Staff," there was no name round which the best spirits of the service could rally. The term *department* has never been in favour, and has been silently ignored. More than one branch of the service has been wrecked upon the unpopularity of a name, and if the Government wish to gain recruits for the Medical Department of the Army, they must, in addition to substantial advantages, do away with all sentimental grievances. Already medical officers are Royal surgeons in virtue of the ancient charters of the colleges to which they belong. It only remains to embody them into a united Royal Corps. We see nothing Utopian in the idea, but a very practical and necessary change for the better, and one which has become absolutely essential to ultimate medical success should we again take the field in any serious military operations. The present Army Hospital Corps was originally raised as the "Medical Staff Corps," and in our opinion should wear the traditional scarlet uniform and black velvet facings of the officers under whose orders the men serve in station and general hos-

pitals. Being now on the staff of the army, our medical officers should wear the same distinctive staff dress without any marks which would render it offensively distinctive, or hurt their *amour propre*. If we would compete with the Indian and naval services for recruits, we must attend to these small grievances, as well as others. A compulsory retirement at sixty years for administrative officers, a better twenty years' voluntary retirement, a guaranteed promotion after fifteen years' service or before, a general roster for all officers, whether staff or regimental, forage according to rank, and a liberal scale of retirement for officers incapacitated by ill-health have become imperatively necessary if we would keep pace with the times.

THE WATER SUPPLY OF LONDON.

In these days, when it is almost universally acknowledged that the main cause of typhoid fever is to be found in the contamination of drinking water, it is a matter of universal interest to all dwellers in large cities to ascertain that they are supplied with the best and purest water attainable. Some years ago a gigantic scheme was set on foot by some of our able engineers to bring water to London all the way from the Cumberland lakes, giving off in the way supplies to the cities and towns lying near the aqueduct. Such a splendid scheme lies in the possibilities of the future, and we doubt not that far greater difficulties than even this would appear at first sight to be will be easily enough surmounted by our descendants in this favoured island.

In the meantime, London is more or less creditably supplied with water by the agency of eight large monopolies in the shape of water companies, most of which give handsome returns to their shareholders in the shape of dividends. The names of these companies are the West Middlesex, Southwark, Lambeth, Grand Junction. All of these derive their supplies from the river Thames. Next comes the East London, which derives its supplies from the river Lea. The New River is now supplied from springs in the vicinity of Amwell, Herts, and also from the river Lea. Lastly, we have to mention the Kent Waterworks, supplied from deep wells in the chalk. These companies supply the great metropolis daily with some 110 millions of gallons. About one-half of this supply is derived from the Thames, and a great proportion of the remaining supply is derived from the river Lea.

Dividing the daily supply furnished by the population of London, we find that somewhere like 30 gallons a head are furnished daily to the inhabitants of London. When we compare this supply with that of Glasgow, which is somewhere like 55 gallons per head daily to each inhabitant, of the purest possible water, we can see that the London supply still errs both in quantity and quality. And, what is worse, the tendency is to lessen both the amount per head furnished by the London water companies and the quality just as London increases in size; for the capacities of the Thames and Lea do not, of course, increase *pari passu* with that of the births in London.

We hence may look with some confidence towards a revival of the project of erecting an aqueduct through the heart of England, commencing in the lake districts, and

there can be little doubt that such a scheme could not fail eventually amply to repay the cost of construction and yield a handsome dividend to shareholders, because it would economise so much in the cookery of food and in soap, &c.

It must be admitted, we think, that, notwithstanding all allowances for the power which rivers possess of becoming free from the pollutions arising from the matters poured into them from the towns and villages through which they flow, a consummation devoutly to be desired, and which is contended for strenuously by Dr. Letheby and other able chemists, still there would be no small advantage to the inhabitants of large cities could their water supply be as pure and unsuspected as that of Glasgow or of ancient Rome. It is not a pleasant idea to contemplate, that a certain amount of sewage must necessarily be mingled with the water supply which Londoners derive from the Thames or river Lea. And that there must be a certain amount of fecal matter in the water supplied by the above-named water companies is a fact we think incapable of being denied, even by the greatest optimist, when we consider the great and increasing population which is situated on the banks of these rivers, at, or a very short way above the spots whence the supplies are derived.

It has been remarked that one method of procuring a plentiful supply of water might be found in the construction of large lakes or reservoirs in the upper valleys of our watersheds. Thus, if an artificial lake of large extent were constructed high up in the Thames valley, the superabundant flow of water, the origin of these periodical floods, which have lately caused such injury to the quality of the water supplied to Londoners, might be prevented, and a vast system of tubes or an aqueduct might be constructed to bring the pure water to London. Probably iron tubes might prove quite adequate to the supply of London and the riverside towns and villages on the Thames.

It is to be hoped that with the revival of the desire for cleanliness and good water which distinguishes the 19th century, as compared with the monkish ages, when filth and coarse living were held as a part of true piety, we may before long have as true an appreciation of the value of plenty of good water as the Romans of the days of the Empire possessed.

Notes on Current Topics.

Dr. Demarquay on Intestinal Obstructions.

In a meeting of the Académie des Sciences (*La France Méd.*, No. 24) Dr. Demarquay made recently a communication about the treatment of intestinal obstruction at the outset by means of the aspiration of gas. He remarked that intestinal obstruction is a rather common disease, and both physicians and surgeons are frequently powerless in treating it. Nélaton had recourse in a certain number of cases to gastro-enterotomy; but this operation is of itself a very severe one, and not suited to all surgeons—let us add that it was often followed by mishaps. The aim of Nélaton in making use of it early was to put an end to the tympanitis and to re-establish

the passage of the fæces. When the peristaltic movement of the bowels was once re-established, the intestinal obstruction has been seen to cease, and the patient has been cured.

Dr. Démarquay asked of himself whether he could not get the same result by an operative process more easy in execution and within the power of any physician. What happens when an obstacle suddenly is offered to the flow of the fæces? Gases accumulate in the upper part of the intestine, tympanitis appears, and at the same time nausea and vomiting supervene, and the intestinal loops become paralysed by excessive distension. If then, at the commencement of the disease, when no local or general peritonitis has as yet arisen, we can make the tympanitis disappear by removing the gases, and sometimes the peristaltic motions of the intestines re-established, with them there disappears the obstacle. Thrice in the course of some years he has had recourse to this practice, and the patients recovered.

In relating the last case which he has operated on in hospital, he indicates the operative procedure. A young man, aged 20, entered his hospital on the 23rd February with all the signs of an intestinal obstruction, which dated from the 23rd: he had nausea, mucous vomiting, considerable tympanitis, insomnia, and suffocation from throwing upwards of the diaphragm. On the 26th, at the morning visit, the condition of the patient was still aggravated. Without any hesitation Dr. Démarquay made, with the capillary trocar of Dr. Potain's apparatus, four intestinal punctures, two on the right and two on the left, and, making aspiration of the gases of the intestines by means of a vacuum in a great jar, a large quantity of gas was removed. The belly immediately sank, and the patient was relieved. At once after the operation the movements of gases were heard in the intestines, thanks to the peristaltic motions of the bowel. The patient was better during the day; he could not support the application of ice to the abdomen, but took, without vomiting, a little beef-tea and calomel in small doses. The nights of the 26th and 27th were less troubled than the two preceding ones. On the 27th, in the morning, tympanitis persisted, and the loops of intestines were visible through the walls of the abdomen. Dr. Démarquay again made four new punctures, and removed, as in the former case, a great quantity of gas and liquid matters from the intestines. About two in the afternoon all accidents had ceased. There is no physician who could not have recourse to this operation at the commencement, and thus might arrest the progress of a disease which is often fatal.

Polypus of the Uterus.

DR. HEYDENREICH (*Le Progrès Méd.*, No. 13) read the details of a case in the Société Anatomique of Paris where a woman, aged 49, married, came to the Hôtel-Dieu with menorrhagia, which was soon cured. She remained two months in hospital, and had merely symptoms of metritis, with feverishness. The cervix uteri was found large and red; and on the 6th November it was cauterised with the actual cautery. On the 17th November peritonitis ensued, and she succumbed next evening.

At the post-mortem examination there was found suppurative peritonitis in the lower half of the abdomen. The Fallopian tubes were filled with pus, and this, on pressure, flowed into the uterine cavity. At the external extremity of the right tube there was a cyst, filled with pus, communicating with the tube. The left ovary was small and atrophied; the right, on the contrary, presented all the symptoms of recent menstruation. As to the uterus, it had, at the upper extremity of the right side, a little fibrous body, the size of a hazel-nut, projecting exteriorly. The walls of the uterus had their normal thickness; the mucous membrane was red, and covered with a muco-purulent layer. Lastly, at the bottom of the uterine cavity there was, at the right side, a polypus, which descended until about a centimetre distant from the inferior orifice of the neck. This polypus was lengthened, blackish, soft, and very vascular: it was a mucous polypus, of the celluloso-vascular variety.

Disease of the Mammary Areola preceding Cancer of the Breast.

SIR JAMES PAGET ("St. Bart. Hosp. Rep.," 1874) mentions cases of women, ages from 40 to 60, who had found their disease of the breast commence by eruption of the nipple or the areola. In most of the cases the lesion consisted, first of all, in a very red efflorescence, strewed with fine granulations, as if almost the whole thickness of the epidermis were desquamated. This resembled a case of very acute eczema, or intense balanitis. The base of the ulceration constantly secreted an abundant limpid or yellowish liquid. The patients experienced feelings of stinging, itching, and burning, but the general health was not at all affected. We never see this eruption go beyond the areola; only in one case was there a deep ulceration, which occupied the thickness of the skin of the areola. Sometimes the lesion had the appearance of a chronic eczema, and allowed a viscous serosity to escape; at other times it was dry, like the scales of psoriasis; and sometimes there was observed beyond the areola on the breast a plate of psoriasis. In several cases he has seen these skin affections resist all local or general treatment, and in a year, or two at most, he has seen the appearance of a schirrous tumour in the thickness of the mammary gland. The schirrus has never commenced by a cutaneous disease; the latter, on the contrary, persisted until it was attacked by the neoplasm. The cancer, in this case, presented nothing special: it sometimes had an acute progress, sometimes a chronic one; it attacked the lymphatic glands, and was in no way distinguishable from the ordinary descriptions of cancer of the breast. He has also seen cancers of the penis, of the lower lip, and even of the tongue preceded by analogous skin eruptions.

Dr. Valette on Cauterisation.

DR. VALETTE, of Lyons (*Le Progrès Méd.*, No. 13), explains the application of cauterisation in several important surgical operations, such as in piles and prolapse of the rectum, extirpation of the uterus, removal of uterine polypi, in varicocele, in vaginal hematocele, cystic goitre, and in the opening of cold abscesses and ovarian cysts. He generally uses a porte-caustique, con-

sisting of two grooves wherein caustic of zinc can be placed, and which can be screwed up as tightly as is requisite. In the operation for the radical cure of hydrocele, which he has practised forty times, success has almost been constant. He perforates the integuments with one of the branches of the caustic holder, which has a sharp point, and thrusts it into the venous bundle, whilst the other branch is placed behind the veins: the two grooves having been first of all filled with caustic, are brought together by means of a screw. This instrument remains *in situ* for forty-eight hours, and in a fortnight the cure is completed. In vaginal hæmatocele he traverses the pouch filled with blood with a seton dipped in caustic, and withdraws it next day; there arises after this a moderate, progressive inflammation, which gradually determines the resorption of the effused blood and modifies the walls of the sac. By means of these same forceps M. Valette has obtained a remarkable cure of a very large cystic goitre. In other circumstances he has removed successfully an enormous enchondroma of the neck. Lastly, in a case of complete inversion of the uterus he does not hesitate to extirpate the organ, and he has been able by the caustic method to obtain a complete cure after this grave operation.

More about the Jews.

We have already spoken of the question of circumcision among the Jews, and our remarks have called forth an interesting series of letters. Moreover, we are indebted to the editor of the *Jewish Chronicle* for the following information, contained in his issue of March 12. Baron Larrey says that—

“The convolutions of the brain, whose mass is in proportion to the cavity of the cranium, are more numerous, and the furrows which separate them are deeper, among the Jews than in other races, and the matter which forms the organ is more dense or firmer. The nervous system appears to be composed of nerves more dense in structure than those of Europeans in general, whilst the heart and arterial system display the most remarkable regularity and very perfect development. Fourthly, that the external senses of the Jews are very acute and perfect. One race among all others seems to have resolved the problem of acclimatisation, and that is the Jewish. The Jew occupies at this day every part of the world: he is found in Europe, from Gibraltar even to Norway; in Africa, from Algeria to the Cape; in Asia, from Cochín China to the Caucasus, and from Jaffa as far as Pekin; in America, from Montevideo to Quebec. Fifty years ago he invaded Australia. Not only is he acclimatised under the tropics, but he has also lived during a long series of centuries in the only country in the globe situated 400 metres below the valley of the sea—in the valley of the Jordan. It is worthy of remark that in many countries where the Jew may be studied and compared with other people amongst whom he lives, a difference more or less pronounced is always discovered in the proportion of births and deaths, in that of the sex of the births, and finally, in the degree of predisposition for different maladies, of which some constitute the almost exclusive property of the Jewish race, while others seem to spare it. In Prussia, during a period of nineteen years from 1822 to 1840, the proportion of deaths was found to be, amongst 100,000 inhabitants—in the Prussian population, 2,961 deaths; in the Jewish, 2,161.”

M. Mayer, in his treatise relative to the duration of life in the Jewish population compared with that of the Christian, found the following facts connected with the statistics of Furth for a period of ten years:—Mean aver-

age of Jews, 37 years; Christians, 26 years. Excess in favour of Jews, 11 years. Amongst Christians, one-half die before the age of 30.

In France Dr. Neufville has found analogous results. In Prussia the Jewish population increased 34½ per cent. from 1822-4, whilst in the same time the Christians augmented only 28 per cent., increase by immigration being the same. There was 1 birth to every 28 Jews, 1 to 25 Christians; 1 marriage to 139 Jews, 1 in 112 Christians; 1 death among 40 Jews, 1 in 34 Christians. Legoyt says the Jews have fewer still-births than Christians; and it must be remembered that circumcision is said by Hutchinson to prevent the contagion of syphilis. Glätter gives 1 still-birth in 19 Christians, and 1 in 34 Jews.

In these days of positive science it is most important to hear of such results. The days for dogmatic theologies are at an end, and the era of science is fast dawning. To live a long and painless existence is the recognised aim of all religion worthy of the name; and, in future, we must judge of faiths by their results in attaining happiness and longevity for the race.

Alleged Death from Ether.

A DEATH from the inhalation of ether has been reported from Manchester, which we find reported in the *Students' Journal and Hospital Gazette* in the following terms:—

On Monday an inquest was held at Manchester on the body of a boy, aged 16 years, who died at the Manchester Workhouse Hospital whilst under the influence of ether, which had been administered previous to removing some dead bone from his hand. Deceased had been operated on two former occasions, when chloroform was administered, but as he did not tolerate it well, it was thought safer to administer ether. Only a very small quantity was given, but in three or four minutes the patient suddenly fainted, and died without recovering consciousness, notwithstanding the employment of galvanism and every other means likely to be of any avail.

In the absence of any circumstantial report of the case, we can express no opinion upon the matter, and it is quite probable that on investigation it may turn out, as it did in a similar case in America, that the ether had nothing to say to the death. Although we have very strongly advocated the substitution of ether for chloroform, we have never suggested that its use is absolutely free from danger, or that it is not possible to kill a patient by the careless or bungling use of it; but we maintain that the chances of mortality are reduced to a minimum from its use, and that no surgeon is justified in subjecting his patient to a risk of death for the sake of convenience or prejudice.

The *Students' Journal* says:—

We have always maintained that there is but little, if any, difference as regards safety, between ether and chloroform, and that were ether used so extensively as chloroform is, deaths from the former agent would be almost as numerous as they are at present from chloroform.

We read with surprise a statement that, “were ether used so extensively as chloroform” deaths would occur as frequently. Is our contemporary aware that ether is used much more largely than chloroform, being almost the only anæsthetic employed in America, and that the statistics of mortality prove it to be eight times less dangerous than chloroform?

The Contagious Diseases Acts and the Committee of Supply.

In a Committee of the whole House of Commons, on Thursday last, when the vote of £73,330 for medicines and medical stores came under consideration, Mr. Gourley asked for an explanation of the item of £15,500 in the vote for the expenses of carrying out the Contagious Diseases Acts. Mr. A. Egerton said the money had been expended in carrying out the details connected with the Acts. Mr. Whalley said he had spent some time at Portsmouth and Davenport Hospitals in making inquiries relative to the working of this Act, and he was convinced that no public money was better expended and for better purposes. The Act had worked well in the social interests of those districts where it was in operation. Mr. Gourley said he objected to public money being expended for the encouragement of vice. The vote was agreed to.

The late Sir John Gray, M.D., M.P.

In our last we announced that our esteemed *confrère*, and one of the few representatives of our profession in the House of Commons, was lying hopelessly ill at Bath. The intelligence was, unfortunately, only too true, as on Saturday morning we received a telegram announcing that he had passed away during the night. Of the medical career of the deceased but little can be said, as early in life he turned his attention to the field of politics, into which he entered with all the force of his ardent and energetic nature. Still the interests of the profession were not forgotten, and whenever he considered them at stake, or matters directly concerning them were before the legislative assembly of the country, Dr. John Gray was always to the front. Deceased was born at Claremorris, in Mayo, in 1815; he was therefore 60 years of age. He entered Trinity College, intended for the Church, but, altering his views to the medical profession, he obtained his degree in due course. For several years he was connected with one of the Dublin hospitals, and was a diligent student, devoting himself to his profession with that enthusiasm which he displayed in all his subsequent pursuits during life. Residence in Dublin, and association with literary and political men, influenced the feelings of Dr. Gray, and gave a cast and complexion to his life which decided his future. In 1842, with Dr. Atkinson, and his brother, Wilson Gray, a barrister, the interest in the *Freeman's Journal* was purchased. From this event may be truly dated his public life. He has also contributed to our columns.

For very many years past Sir John Gray held the position of Town Councillor to the City of Dublin, which he held to the hour of his death; but though often tendered the Mayoralty he always declined the distinction. His labours in the Municipal Council were productive of the highest benefits, and the Vartry Waterworks alone are an abiding and noble monument to his memory. For the direction and accomplishment of this beneficent public work, the Viceroy, Lord Carlisle, in 1863, conferred on him the honour of knighthood, an honour eminently merited.

In 1865 Sir John was returned M.P. for Kilkenny city, for which he sat for the last ten years.

Thus Death has robbed us of another representative in Parliament, one whom we can ill spare, for although many differed from him politically, it can truly be said to his memory that he had few personal enemies.

CATTLE disease is again, unfortunately, very prevalent in the county of Devon. During the last week the number of animals affected with foot-and-mouth disease and scab was 2,022.

THE Medical Society of the College of Physicians will meet this evening at 8 o'clock, at the College Hall, Kildare Street, when the following communications are set down for reading:—Dr. W. G. Smith "Notes on some Diseases of the Skin—(1) Favus, (2) Erythema Multiforme;" Drs. Grimshaw and J. W. Moore, "On Pythogenic Pneumonia," Dr. Grimshaw to exhibit an improved aspirator.

A SPECIAL meeting of the Council of the Queen's College, Belfast, was held last week, for the purpose of considering the charge brought against a number of medical students of participating in the disturbances which took place in the common hall during the recent visitation. A petition on behalf of the students so summoned, expressing regret at the disturbance, was handed in to the Council. After a deliberation of some five hours, the Council mulcted three of the students in a fine of £10 each, and a fourth in a penalty of £18. The remainder were reprimanded.

THE appointment of a Mr. R. T. Hearn as House-Surgeon to the Dorset County Hospital is noticed in all the Dublin papers as being a signal honour which the press may delight to record. In addition to the emoluments of the office, Mr. Hearn will be permitted to enjoy the privilege of taking his meals with the matron, two other surgeons having refused the appointment in consequence of this requirement being insisted on.

THE Ulster Medical Society will meet this evening at 8 o'clock at the Belfast General Hospital, when the following communications are set down for reading:—Dr. J. J. Charles will exhibit a Dissection of the Parts of an Old Dislocation of the Elbow. Dr. John Moore will give an account of two cases—the first, of Traumatic Emphysema, and the second, of Inguinal Hernia complicated with an Undescended Testis.

ON Saturday morning Captain Boyton started from Dover, for the purpose of demonstrating, by a trip in his newly-invented life-saving dress across the English Channel, the value of his apparatus to shipwrecked mariners. Although he was not successful in reaching France without assistance, the trial nevertheless proved that a man could remain in the water in his dress almost as long as he could find sustenance to keep him alive. He started with his body at the normal temperature of 97.7°, and after fifteen hours' immersion, so little variation had it undergone, that the thermometer recorded only the fraction of a degree.

THE sixth meeting of the Dublin Obstetrical Society was held in the College of Physicians on Saturday, the

10th April, 1875. The following communications were read:—1. Dr. M'Swinye, "Report of a Case in Midwifery Practice;" 2. Dr. T. More Madden, "On Monstrous Births, and the influence of Maternal Impressions on the Fœtus in Utero;" 3. Mr. H. G. Croly, "Case of Ovariectomy."

Correspondence.

"FUNGUS EAR DISEASE."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I write to thank you for the favourable notice which you took of my little *brochure* on the above form of ear disease; also to say that I am pleased to learn that a case of true ear fungus had been recorded so long ago as 1857. But my paper may, as you observe, call attention to what seems to have been a hitherto overlooked cause of disease of the ear; in this respect it will not be without its use. I may, however, so far as I know at present, lay claim to be the first aural surgeon in Great Britain who recognised and recorded such a case. A Mr. Pennefather, in your issue of the 31st of March, in relation to this disease, refers to his "work" to show, among other things, that it is not an uncommon form of ear disease, &c. In reply, I have to say that it is a matter for regret that that gentleman did not make himself acquainted with the subject of my paper before he wrote the letter referred to.

I am, Sir, your obedient servant,

JAMES PATTERSON CASSELLS.

2 Newton Terrace, Glasgow.

Medical News.

The International Medical Congress.—The following resolutions as to the conduct of the International Medical Congress for 1875 have been adopted:—

1. The International Medical Congress of 1875 will open at Brussels on the 19th of September, under the auspices of the Government, in the large hall of the Government at the Museum.

2. This Congress will be exclusively scientific, and will last one week.

3. The Congress will consist of members of the medical profession, both native and foreign, who have sent in their names to the Committee. They alone will have the right to take part in the discussions. The members of the Congress will not be subjected to any contribution except that they will have to pay 12fr. 50c. (10s.), in return for which they will receive a copy of the Proceedings. This sum must be paid by members when they send in their application; by visitors when they present their cards. Applications may be made after July 1. The inscription and distribution of the tickets will be made as follows:—On September 18, from 12 o'clock in the day till 5 in the afternoon, and on the 19th inst., from 9 a.m. till noon, in the rooms of the Academy at the Museum.

4. The business of the Congress will be divided between eight sections.

5. At the time of receiving their ticket, the members will put their names down in the section to which they wish to belong. The same member can put his name down in several sections. The Committee will appoint the provisional officers of the sections—viz., a president and two secretaries to each. The sections will elect their own permanent officers (a president, two vice-presidents, and two secretaries).

6. The Congress will meet twice a day—in the morning for the business of the sections, in the afternoon for that of the general meeting.

7. Reporters, appointed beforehand by the Committee, will make reports to the sections of the subjects that have been assigned to them. The reports will end with provisional conclusions which the sections will consider in the order adopted in the report. When this business is at an end, the sections will employ their time in receiving different communications special to each, and not relating to the general programme.

The conclusions arrived at by the sections will be communicated to the general assembly through the delegates appointed by them.

8. The sittings of the general assembly will be devoted—1stly, to discussions upon subjects of general interest to the medical world, and not mentioned in the programme; 2ndly, to reading and discussing the reports of the sections.

9. Members who wish to make a communication upon a subject foreign to the programme should give notice to the Committee at least a month before the opening of the Congress. The Committee will decide as to the suitability of the communications, and the order in which they will be brought forward. The time allotted to each speaker will be limited to twenty minutes. This arrangement will not apply to those who have prepared reports.

10. At the first meeting the Congress will appoint its permanent executive, which will consist of a president, two acting vice-presidents, and an indefinite number of honorary vice-presidents, a general secretary, and two secretaries of meetings.

11. All the papers read at the Congress, whether in the sections or the general meetings, shall be deposited on the table, and the Committee, which will resume its duties after the meeting, in order to proceed to the publication of the proceedings of the Congress, shall decide as to the insertion (partial or entire) of the papers in the Proceedings.

12. Whilst the French language will be that in which the sections will be conducted, the members will be also allowed to express themselves in other languages. In this case, if it is wished, their meaning will be briefly explained by one of the members present.

13. The president will conduct the meetings and debates according to the manner usually adopted in deliberative assemblies.

14. Students of medicine will receive tickets of admission, but will not be permitted to take part in the proceedings.

The sections are as follows:—Medicine (pathology, pathological anatomy, and therapeutics), Surgery (including military surgery and syphilography), Obstetrics (including diseases of women and children), Biology, Public Health (hygiene, forensic medicine, statistics), Ophthalmology, Otolgy, Pharmacy.

All communications respecting the Congress must be addressed to Dr. Warlomont, Brussels.

The Hampstead Hospital Agitation.—At a full and rather excited meeting of the Metropolitan Board of Works, on Saturday last, the offer of a third alternative site and the proposal by the inhabitants of Hampstead to purchase for £28,000 the ground on which the temporary Hospital for Contagious Diseases at present stands were rejected by majorities of 18 to 13 and 19 to 14 respectively.

NOTICES TO CORRESPONDENTS.

HOMOEOPATHY IN ASIA.—A new Chinese remedy for worms, syphilis, vomiting, and skin diseases, and possibly for any other kindred malady for which the patient may take it, is prepared as follows: Maggots are taken from privies and washed, then dried in the sun, fried, pulverized, and either made into pills or eaten in powder. We think it would be better for the Chinamen not to get these diseases.—*New York Medical Record.*

MEDICAL SUPERINTENDENT.—There is a fairly remunerative appointment in Canada now being advertised as Medical Superintendent of the Toronto Asylum. Emoluments, £411 per annum, with furnished residence, fuel, light, and furnished table for self and family. Candidates must have had experience in the management of asylums. Applications to be addressed to Mr. McKellar, Office of Provincial Secretary, Toronto.

DR. W. E.—The gentleman who gets up the "Dummy Notices" for our contemporary has the library of the College of Surgeons of England at his back; hence their antiquity.

DOGGON'S CARRIAGES.—A venerable physician of Philadelphia, still living, Dr. Condie, the author of a book on "Diseases of Children," would never keep a carriage, says an American contemporary, notwithstanding his large practice, and is made responsible for this *bon mot*: "If a doctor drive one horse, it indicates physical weakness; if he drive two, mental weakness."

DR. CAREY.—The work referred to is by an American physician, and would sell at about 12s. in English currency. You will doubtless be able to obtain it through one of the foreign houses in London—Messrs. Baillière, Tindall, and Cox, or Trübner's.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I should feel much obliged if you kindly inform me in your "Answers to Correspondents," in your next publication, in what way a surgeon anxious for an appointment in the Peninsular and Oriental Company's Service should proceed in order to obtain it.

Your obedient servant,

SUCROSB.

[These appointments are almost uniformly in the gift of directors and secretaries of companies, and of the owners themselves, with whom,

as may be believed, personal influences are a better recommendation than any professional qualification. The appointment is made by the directors, and the surgeon is bound for three years' service. He is placed always at first on some of the lines at the other side of the Isthmus of Suez, and is drafted into the "home" service between England and Alexandria as vacancies occur. The pay is at first twelve guineas per month, which is afterwards increased; and he is permitted to receive such fees as may be offered for attendance on passengers, whom, however, he is bound to attend without charge if required to do so. Occasionally large fees are paid by grateful patients; but usually the income from this source is not large, and less in the home service than elsewhere. The surgeon can resign on giving a month's notice when on leave, i.e., when his ship is laid up.]

MR. KNOWLEY THORNTON wishes us to correct an error which occurs in our notice of an "Ovarian Cyst," showed by him at a recent meeting of the Pathological Society of London. He believed the "papillomatous growths" referred to to be less common than Dr. Wilson Fox stated them to be, as he had only seen them a very few times, though he had examined more than 100 tumours. In the same report the cyst referred to by Mr. Spencer Wells is spoken of as "a parovarian one," whereas it was taken by Mr. Thornton to the Society as a further illustration of the occurrence of truly ovarian unilocular cysts. In these comparatively rare cases of cysts arising from droopy of an ovarian follicle in which this papillomatous growth is found they must be treated as if they were malignant, and hence early removal by ovariectomy was indicated.

DR. JAMES COLLARD.—See reply to Dr. Carey.

DR. JOHN LOWE is thanked.

MR. H. A. L.—Proofs will be sent you in due course, but we cannot possibly promise any particular week, having already so many papers in hand.

MEETINGS OF THE LONDON SOCIETIES.

- WEDNESDAY, April 14th.—Hunterian, 7½ p.m. Meeting of Council. 8 p.m. Dr. Pyle-Smith, "On Leucæmia."
- THURSDAY, April 15th.—Harveian, 8 p.m. Mr. Field: "Some Cases in Aural Surgery."
- FRIDAY, April 16th.—Medical Microscopical, 8 p.m.
- MONDAY, April 19th.—The Medical, 8 p.m. Ordinary.
- TUESDAY, April 20th.—Pathological, 8 p.m. Ordinary.
- ROYAL INSTITUTION, 8 p.m. Prof. P. M. Duncan, "On the Grandeur Phenomena of Physical Geography."

APPOINTMENTS.

- BINGHAM, J. J., L.R.C.P. Ed., M.R.C.S.E., Medical Officer and Public Vaccinator for the No. 5 District of the Mansfield Union.
- BOYD, H. W. B., L.R.C.S.I., L.K.Q.C.P.I., L.M., House Surgeon to the Queen Adelaide Dispensary, Bethnal Green.
- BRAMWELL, B., M.B., L.R.C.S. Ed., Pathologist to the Newcastle-upon-Tyne Infirmary.
- DAWSON, Mr. C., an Assistant Resident Medical Officer to the General Infirmary, Leeds.
- EGGAR, R. T. S., M.B., M.R.C.S.E., House Surgeon to the Coventry and Warwickshire Hospital.
- FAIRWEATHER, A. F. A., M.B., Medical Officer for the Pocklington No. 7 District and the Workhouse of the Pocklington Union, Yorkshire.
- FOULIS, Dr. D., Pathologist and Curator of the Museum at the Royal Infirmary, Glasgow.
- GOWLAND, Mr. G. R., Resident Assistant Medical Officer at the Crumpsall Workhouse, Manchester.
- GRANDISON, A., M.B., L.R.C.S.I., L.M., Medical Officer for the Workhouse and St. Mary's District of the Dover Union.
- HANDYSIDE, P. D., M.D., F.R.C.S. Ed., Examiner in Anatomy and Physiology at the University of St. Andrews during the illness of Professor Bell.
- HAY, F., M.D., M.S., Visiting Surgeon to the Hull Dispensary.
- LEE, E., M.R.C.S.E., an Assistant Resident Medical Officer to the General Infirmary, Leeds.
- LYALL, W. L., M.D., C.M. Glas., Parochial Medical Officer and Public Vaccinator for the Parish of Campsie, Stirlingshire.
- MISTER, J. M., M.D., (additional) Hon. Physician to Her Majesty the Queen.
- MORRELL, R. B., L.R.C.P. Ed., M.R.C.S.E., Medical Officer and Public Vaccinator for No. 5 District of the Bradfield Union.
- POPHAM, T., L.K.Q.C.P.I., L.M., L.R.C.S.I., Medical Officer, &c., for the Bantry Dispensary District, and Medical Officer to the Workhouse of the Bantry Union, co. Cork.
- SANDERSON, C., L.R.C.P. Ed., Medical Officer, for the Districts of Drymen and Aberfoyle, Stirlingshire and Perthshire.
- SMYTH, HATTON, M.B., C.M., T.C.D., L.M.K.Q.C.P.I., Medical Officer of Health for the Cranford and Kinson Sub-district of the Poole Rural Sanitary District.
- WELSH, J., F.F.P. & S. Glas., Medical Officer for the Brampton-Brian District of the Knighton Union, Radnorshire; Medical Officer of Health for the Knighton and Brampton-Brian Sub-district of the Knighton Rural Sanitary District.
- VERDOY, W., M.R.C.S.E., a District Surgeon to the Royal South London Dispensary.

Marriages.

- GOWERS-BAINES.—On the 6th inst., at Leeds, W. R. Gowers, M.D., of Queen Anne Street, London, to Mary, second daughter of Fredk. Baines, of Westwood Lodge, Leeds.
- WELSH-JUPP.—On the 7th inst., at Christ Church, South Hackney, Edward Welsh, M.R.C.S.E., of Hackney Road and Victoria Park Road, to Julia Sophia, daughter of John Jupp, of Victoria Park Road.

UNIVERSITY OF EDINBURGH. SUMMER SESSION, 1875.

The CLASSES for the different Branches of STUDY will be Opened as follows, and will meet daily (Saturdays excepted), unless otherwise stated:—

Classes.	Days of Opening and Hours of Attendance.	Professors.
Natural Philosophy (Short Course for Medical Students)...	Mon., May 10, 11 A.M.	Prof. TAIT.
Botany	Mon., May 8, 8 A.M.	Prof. BALFOUR.
Botanical Demonstrations (Mon. Wed. and Frid.)	Mon., May 10, 9 A.M.	
Vegetable Histology (Tues. and Thurs.)	Tues., May 11, 9 A.M.	Prof. CAUM. BROWN.
Chemistry, Advanced Class (Mon. Wed. and Frid.)	Mon., May 8, 1 P.M.	
Practical Chemistry	Mon., May 8, 10 and 11 A.M.	Prof. TURNER.
Practical Chemistry, Advanced Class	Wed., May 5,	
Anatomical demonstrations	Wed., May 5, 11 A.M.	Prof. LISTER.
Practical Anatomy	Mon., May 3,	
Clinical Surgery (Mon. and Thurs.)	Mon., May 8, 12 NOON.	Prof. SIMPSON, on Diseases of Women.
Clinical Medicine (Tues. and Frid.)	Tues., May 4, 12 to 2 P.M.	
Medical Jurisprudence	Mon., May 3, 11 A.M.	Prof. MACLAGAN.
Obstetrical and Gynecological Operations (Tues. and Frid.)	Tues., May 4, 10 A.M.	
Natural History	Mon., May 3, 2 P.M.	Prof. HUXLEY, for Prof. WYVILLE THOMSON.
Practical Natural History (Mon. Wed. and Frid.)	Mon., May 3, 3 P.M.	
Practical Physiology, including histology	Mon., May 3, 3 P.M.	Prof. RUTHERFORD.
Medical Psychology and Mental Diseases (Mon. Wed. and Thurs.)	Wed. May 5, 3 P.M.	
Do. with Practical Instruction at an Asylum (Tues. and Frid.)	Frid., May 7, 3 P.M.	Prof. LAYCOCK.
Operative Surgery, (Mon. Tues. Thurs. and Frid.)	Mon., May 3, 4 P.M.	
Morbid Anatomy and Practical Pathology	Tues., May 4, 11 A.M.	Prof. SANDERS.
Royal Infirmary	Daily at NOON.	

The following means are afforded for Practical Instruction:—
The Dissecting Rooms are open daily, under the superintendence of the Professor, assisted by J. A. Russell, M.A., M.B., C.M., and D. J. Cunningham, M.B., C.M.

The Royal Edinburgh Asylum is open to Members of the Class of Medical Psychology exclusively for Practical Instruction in Mental Diseases by Professor Laycock, and the Physician Superintendent, Dr. Coultson.

Chemical Laboratories.—The Laboratory for instruction in Analytical Chemistry and for Chemical Investigation, under the superintendence of the Professor, assisted by E. A. Letts, Ph.D., is open from ten to four. The Laboratory for instruction in Practical Chemistry, under the superintendence of the Professor, assisted by A. P. Aitken, M.A., D.Sc.

The Physiological Laboratory is open daily for Physiological Investigation, under the superintendence of the Professor, assisted by William Stirling, M.B., C.M., D.Sc.

The Physical Laboratory, is open daily from Ten to Three, under the superintendence of Professor Tait.

The Medical Jurisprudence Laboratory is also open daily from Ten to Three, under the superintendence of the Professor, assisted by J. O. Aitken, M.D.

The Practice of Obstetrical and Gynecological Operations is carried out in the Obstetrical Museum, under the superintendence of the Professor, assisted by J. Halliday Croom, M.B.

The Natural History Laboratory is open daily, under the superintendence of Professor Huxley, assisted by Isaac Bayley Balfour, D.Sc.

The Natural History Museum in the Museum of Science and Art, Chambers Street, is accessible to the Students attending the Natural History Class.

The Royal Botanic Garden, Herbarium, and Museum are open daily. April, 1875. JOHN WILSON, Sec. Sen. Acad.

LECTURES ON HOMŒOPATHY, instituted by the British Homœopathic Society.—Dr. RICHARD HUGHES will continue his course of HOMŒOPATHIC MATERIA MEDICA every Thursday, at 6 p.m., at the London Homœopathic Hospital, Great Ormond Street, Russell Square, W.C. Subject (Thursday, April 16th) to-morrow: BELLADONNA.

A Course of FOUR LECTURES ON CLINICAL MEDICINE has been commenced by Dr. HALL (one of the Physicians to the Hospital). The next Lecture, subject, LARYNGITIS, will be delivered at the London Homœopathic Hospital on Tuesday, April 20th, at 5 p.m.

Members of the Medical Profession admitted on presentation of address card. Medical Students can obtain admission on application to Dr. Bayes (Hon. Sec. Lectures Committee), 68 Brook Street, W.

EXTENSIVE APOTHECARY BUSINESS, Established over a Century, at No. 82 Grand Parade, Cork, to be DISPOSED OF, privately or by auction.—Apply to A. P. and G. FOOT, Solicitors, 89 South Mall, Cork.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.—The SUMMER SESSION commences on MONDAY, MAY 3rd. The Hospital contains 350 beds. Clinical Lectures are delivered by the Physicians and Surgeons every week. The usual Courses of Lectures are also given by the appointed Teachers. Dr. Robert Barnes has this year been chosen Lecturer on Midwifery, and Dr. Brailey Lecturer on Comparative Anatomy. Further information may be obtained from the Treasurer or Dean of the School, at the Hospital.

UNIVERSITY COLLEGE, LONDON.—FACULTY OF MEDICINE.—The SUMMER SESSION will begin on Monday, May 3rd. Prospectuses containing full information respecting the Classes in the College, Clinical Instruction at the Hospital, Scholarships, Exhibitions, &c., may be obtained at the Office of the College, Gower Street, W.C.

H. C. BASTIAN, M.D., F.R.S., Dean of the Faculty.
JOHN ROBSON, B.A., Secretary to the Council.

BRISTOL MEDICAL SCHOOL.—The SUMMER SESSION will commence on MONDAY, MAY 3. Prospectuses may be obtained on application to
GEORGE F. BURDER, M.D., Hon. Sec.
Medical School, Old Park, Bristol,
April, 1875.

RESIDENT MEDICAL SUPERINTENDENT.—ST. LUKE'S HOSPITAL FOR LUNATICS.—There is a VACANCY in this Hospital for a RESIDENT MEDICAL SUPERINTENDENT, and a Committee of Governors will meet at the Hospital on WEDNESDAY, the 21st APRIL, instant, at 12 o'clock at noon, to consider the applications and testimonials.

Candidates for the office must be single, not under 25 years of age, must have both a medical and a surgical qualification, and be duly registered under the Medical Act. The salary will be £200 per annum, with apartments and board in the Hospital. Applications and testimonials must be forwarded on or before the 19th APRIL, to the Secretary, from whom any further information may be obtained on personal application at the Hospital, between the hours of 11 and 2 o'clock.

By order,
GEORGE SEYMOUR,
Secretary.

St. Luke's Hospital,
April 2nd, 1875.

OWENS COLLEGE (MANCHESTER ROYAL) SCHOOL OF MEDICINE.

SUMMER SESSION.

Midwifery and Diseases of Women and Children—Dr. Thorburn.

Materia Medica and Therapeutics—Mr. Somers.

Forensic Medicine—Mr. G. Morley Harrison.

Ophthalmology—Mr. Windsor.

Practical Chemistry—Prof. H. E. Roscoe, F.R.S.

Botany—Prof. W. C. Williamson, F.R.S.

Hygiene and Public Health—Dr. Arthur Ransome.

In addition to the above, Classes will be held for Practical Operative Surgery in connection with that of Practical Anatomy, conducted by Mr. J. B. Ferrin, and for Morbid Histology, by Dr. Dreschfeld.

The Session will commence on the 1st May next.

Prospectuses will be forwarded on application.

J. HOLME NICHOLSON, Registrar.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £25 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote.

Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,

W. O'NEILL, Secretary.

MIR. I. SANDHEIM,

Dentist,

16 SUFFOLK STREET,

DUBLIN.

N.B.—A Vacancy for a Pupil.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE.

50 LINCOLN'S INN FIELDS, W.C.

J. BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.,
&c. (KING'S COLL.), and Author of VIA MEDICA.

Has always upon his books a large number of desirable Investments and available Appointments for negotiation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

PRACTICES AND PARTNERSHIPS NOW OPEN for Negotiation (in addition to those advertised in Dr. Langley's List, which is sent post free on application).

Z 148. LONDON SUBURB. Well-established and improving NUCLEUS in a rapidly-increasing district, with railway facilities, &c. Gross returns for 18 months £570. Cash received during the time £395. Appointment yields £30 a year. Midwifery £1 1s. and upwards. House small but convenient. Rent £45. Expenses small, no horse or carriage being necessary, and no assistant required. Satisfactory reasons for the transfer.

Z 147. LONDON, S.E. DEATH VACANCY. Receipts £400 a year; capable of great increase. Midwifery from 15s. to £2 2s. Cash taken in the surgery about £150 a year. Small house and garden. Rent £24. An efficient introduction can be given. To a young practitioner commencing business this affords an unusual opportunity at a small cost.

Z 146. WESTMORELAND. A well-established PRACTICE in a picturesque district. Receipts £320 a year. Appointments £80. No opposition. No horse required. Convenient house at a low rent. Part of premium payable by instalments.

Z 145. DEATH VACANCY. MIDLAND. Receipts upwards of £300 a year, with immense scope for increase. Appointments £80, the succession to which can be guaranteed to a suitable man. Excellent house at a low rent. Terms easy.

Z 144. In a large and prosperous town, a JUNIOR PARTNERSHIP is OPEN for NEGOTIATION. The practice has been held by the present incumbent, and is capable of immense success. Appointments have been declined, but there is ample opportunity for obtaining them if desired. The incoming partner would reside in the house, hitherto occupied by the vendor, who proposes to add a valuable speciality to the practice. The present connection yields about £1,000 a year. If a third share be taken the incumbent will guarantee £300 a year for the first three years.

Z 143. £550 a year. In a town containing about 15,000 inhabitants, a WELL-ESTABLISHED PRACTICE for TRANSFER. Patients, middle-class. The house is situated in the best part of the town, contains ten rooms, with stabling, &c., held on a lease at a very low rent. The vendor is retiring from practice altogether, and will give an introduction as long as desired. Direct rail to London.

Z 141. YORKSHIRE. Near a fashionable watering-place, a WELL-ESTABLISHED PRACTICE, realising £650 a year. Appointments £100. The residence contains thirteen rooms, with stabling, coachhouse, garden, &c. Rent £22. Part of the premium may be paid by instalments properly secured.

Dr. LANGLEY'S QUARTERLY LIST of SELECTED PRACTICES and PARTNERSHIPS for APRIL is now ready, post free, on application.

The Medical Press & Circular.

THE LUMLEIAN LECTURES.

ON LIFE, AND ON VITAL ACTION IN HEALTH AND DISEASE. (a)

By LIONEL S. BEALE, M.B., F.R.S.,
Physician to King's College Hospital.

LECTURE III.

MR. PRESIDENT AND GENTLEMEN,—One of the most remarkable examples of inherited constructive power, and one which, as it seems to me, is especially worthy of our consideration with reference to many abstruse questions relating to the transmission of vast power through the agency of infinitesimal particles, is the bioplasm of the spermatic particle. The powers derived from the organism which produced it, are by this tiny speck of living matter transferred to bioplasm through which its influence is brought to bear upon vast quantities of living matter.

The bioplasm of a human spermatozoon, which, perhaps, hardly weighs as much as the one-hundredth part of a single red blood-corpuscle, may stamp with unmistakable individual characteristics several tissues and organs which, in their fully developed state, weigh many pounds. Moreover, the influence of the power thus conveyed extends over many years, and is as distinctly manifest in the action as in the structure of tissues. This influence may not be clearly evident until many years have passed since the minute particle of bioplasm left the organism that produced it. But how are we to explain the association of such far-reaching constructive power with molecules of such minute size? With what properties of ordinary matter can these powers be placed in comparison?

The special particles of matter endowed with the

powers under consideration are produced in one particular organ which does not attain its power of production until many years have passed since its development commenced. Surely no one would consider it reasonable to attribute the powers manifested by the spermatozoon to the properties of the elements of which its minute speck of bioplasm is composed. No properties of any elements that have been discovered, are, in any way, comparable with those manifested by this wonderful particle. Mr. Darwin has therefore endeavoured to explain the marvellous properties in another way. But let us consider what insuperable objections immediately present themselves to the acceptance of his hypothesis of pangenesis.

Here is one of the very smallest living particles, carrying the most extensive powers—powers which may reach to every tissue in the being that is to be formed. It is nevertheless suggested that the spermatozoon may be composed of millions of particles, one or more having been detached from every component element of the tissues of the parental organism. But this is not all, for every one of millions of spermatozoa must be considered as having been formed in the same way.

Now, concerning the manner in which the supposed particles meet together to form the spermatozoon. We are asked to conceive that particles are being continually detached from each anatomical element of each tissue, and that they pass from every part of the body where they were formed, and move with unerring precision towards the gland tubes, where they collect together in sets without confusion, thus to form the spermatic particle. If several particles from the same locality come together, they must separate again, and find their way to the collections which were deficient in these particular particles. By what means all these millions of particles find their way to the precise spot which is their proper destination—how they sort themselves, or by what means they are sorted, how at last they arrange themselves in proper order in the minute particle of bioplasm which they are supposed to constitute, has not even been suggested. But this is not all. The hypothesis assumes that particles are detached from each anatomical element. But from what part of the cells they are supposed to come, is not stated.

(a) Delivered at the Royal College of Physicians on Friday, March 13th.

Now these anatomical elements are complex in structure, and many are composed of several kinds of matter. Many are growing, and the matter of which they consist is in very different states in different parts at different periods. As I have shown, the outer parts of the cells and certain of their contents are, in many cases, non-living. Now, if non-living particles were to collect in the manner assumed, the resulting collection would not be anything like a spermatozoon, and it is not conceivable that such a collection of non-living particles could, in any way, have vital powers communicated to them after they had collected together. On the other hand, if we assume that the minute particles from the different anatomical elements are detached from the bioplasm, our difficulties will still be found to be insuperable, for the bioplasm is surrounded by the formed material, and we should have to assume that minute particles of bioplasm passed through even the thickest and hardest formed material in a direction the opposite of that in which nutrient fluid was flowing. We must further conceive such living particles as making their way into the intercellular spaces, and directing themselves, or being drawn, into the blood-vessels or lymphatics, or working their way through the tissues in the most direct course towards the seat of their development. By what means they find their way, why they do not take up nutrient material and grow so large as to be stopped in their course, how it is that many are not lost and impacted in growing parts, it is impossible to conjecture. Upon the whole, I think it will be difficult for any one to accept this doctrine if he tries to realise the occurrence of the phenomena implied by the terms of the hypothesis.

Lastly, I have to consider whether it is probable that in living things, especially in those having an organism of complex structure, there is any agency which exerts a *directive influence* over the whole, as some have supposed. It has been suggested that a general directing agency might be influential in regulating and governing the phenomena contemporaneously proceeding in all parts of a living body which result in the formation of very different structures, somewhat as a number of workmen are controlled and directed by a central authority placed over them. And, certainly, the facts of the case do seem to demand some such postulate; for, as each part grows and undergoes development, changes occur in other parts not anatomically connected with the first, but otherwise related, though separated, perhaps, by a considerable distance. But the more carefully we consider the question the less shall we feel inclined to accept any hypothesis which involves the idea of supervision on the part of any central power acting in the organism. There is, in fact, no centre from which such power could act, and there are no means by which it could be conceived to operate upon tissues at a distance. I cannot even admit that any facts known to us justify the belief that one cell is capable of acting upon adjacent cells. I do not believe that any particle of living matter is capable of influencing the phenomena of any other particle except, perhaps, by taking up more than its own share of pabulum, in consequence of an unequal distribution. I have, elsewhere, adduced reasons for rejecting Virchow's views upon this matter. It is difficult to conceive how one living particle can "excite" increased or diminished action upon the part of adjacent living particles; and I cannot think that under any circumstances do particles of living matter act in sympathy or in antagonism with neighbouring particles.

It will be asked how, then, are the facts to be explained? If the development of any particular tissue be carefully studied, as may be done by comparing specimens taken at different stages of growth, the observer will be able to form a conception of the phenomena which succeed one another in an orderly manner, until, in place of the bioplasm-particles of the embryo, he finds a highly elaborate arrangement of parts performing a definite office; but I fear I shall fail in my attempt adequately to represent the series of pictures which would be formed

and combined into a moving panorama in the mind of one who had thus studied.

At first, all that is to be seen is a number of masses of bioplasm which divide and subdivide. Each bioplast, by virtue of its inherent vitality, continues to produce successors in regular series, and, at a certain rate, a limited range of change, in external circumstances, being, as it were, allowed for, does not affect the result.

After the process of multiplication has continued for a certain period of time, each portion of bioplasm undergoes change upon the surface, and produces formed material. The arrangement and shape assumed by each particle will in some measure be determined by the growth of neighbouring masses, and the pressure that may be exerted, as well as by a number of other circumstances. Indeed, the general form of the organ or tissue is determined chiefly by the inherent vital powers of each individual portion of bioplasm out of which it is formed, but in part by the growth of contiguous organs or structures. Whether the elementary part shall be drawn out like tendon, muscle, or nerve, flattened, many sided or oval, like certain forms of epithelium, will depend upon its connections which were determined at a very early period, and whether it be subjected to stretching or pressure. If free to grow equally in all directions, as in fluid, the mass will certainly be spherical. Many questions that might be asked with reference to many of the matters to which I have very briefly adverted cannot, in the present state of our knowledge, be answered, and are likely to remain unanswered for a long period of time. But I venture to think that if scientific men substitute conjectures for answers, and confidently recommend to the public their own speculations as if they were scientific conclusions based upon evidence, it is the duty of other scientific men to examine the propositions, and to carefully criticise them. From what has lately fallen from some of those attached to the doctrine of evolution, it would almost seem as if they considered that their views were to be accepted by us without even the slightest examination. Against this idea one cannot too strongly protest, and especially when one finds the most far-fetched hypotheses advanced and pressed upon the people as worthy of being accepted and believed as actual truths. No objection ought to be made to the free discussion of whether, for instance, certain instincts constitute the foundation of the moral faculties, but it would be monstrous to assert that such had actually been proved to be the case. In the same way, attempts might be made to force people who have not the knowledge to enable them to form a judgment upon such a question, to believe in the truth of the hypothesis that man has resulted by direct descent from lower forms. Now one can conceive that if but one clear case could be made out in which it had been clearly proved that two distinct species of any kind of animals had descended from a common progenitor, the evolution hypothesis would be received almost without opposition, but at present no evidence advanced is perfectly conclusive, and people ought to be allowed to discuss the matter freely without condemnation. *Aut Darwin aut nullus* is a method of argument that seems to me by no means more convincing than the assurance on the part of a philosopher that he would prefer to have descended from an amiable beast than from a savage man.

Bioplasm in Disease, and the Degradation of Bioplasm.—Having considered the changes taking place in simple living matter, and those wonderful phenomena which succeed one another with perfect regularity and in perfect order, until the formation of the organisms, with its complex tissues and organs, is accomplished, let me ask your attention to vital phenomena of a different kind which result in degradation as regards formative power, although there is *increase*, not diminution of those changes to which I would restrict the term *vital*. We can trace the formation of the living disease particle from normal living matter, and may see exactly how it results from an alteration of the conditions under which the life of normal

bioplasm is carried on. Not only so, but if I have interpreted the observations aright, I shall be able to show how the disease-carrying germ is produced in the living body as a consequence of abnormal changes going on in successive generations of bioplasm particles; these morbid living particles having invariably originated, as I believe, in normal bioplasm.

If the bioplasm of man or one of the higher animals grows more rapidly than in the normal state, its power of forming tissue and of developing structure is impaired. If any structure whatever is produced it is soft, incapable of discharging its function properly, it is weak, and it does not last. It has been produced too quickly to attain power of resistance. But if the rapidity of the growth of bioplasm is very considerably increased, no tissue at all results. Bioplasm produced by descent from that which grows and multiplies quickly, does not regain formative power. Rapid increase is associated with loss in constructive power, but, as I have remarked, *vital activity* is increased, if by the phrase we mean to imply that more pabulum undergoes conversion into bioplasm, within a given time, than in the normal state; and I know no other meaning applicable to the words.

If the bioplasm of any tissue in a state of inflammation or fever be compared with that of the same tissue in health, it will be found that the bioplasm masses have considerably increased in size. In every kind of inflammation and in all ordinary fever, bioplasm grows. It is, in fact, the increase of the bioplasm that constitutes the malady and gives rise to the characteristic phenomena of the disease. I shall not describe the changes as they may be observed in the tissues, for I have already considered this part of the subject in my Report on the Cattle Plague, in "Disease Germs," and a brief account has been given in one or two other works. The essential change, both in inflammation and fever, seems to be increased nutrition of bioplasm. An inflammation, as I have remarked, may be regarded as a local or circumscribed fever, and a fever as a general inflammation. The growth of the bioplasm in ordinary fevers does not proceed far enough to end in pus-formation, because the general changes in the blood, in the nervous system and in other parts of the body, cut short life long before the whole organism could pass into a state of general suppuration; but how often do we find a sufficiently marked tendency to such a state in the extensive and too often wide-spread suppurations occurring in tissues and organs of persons who just escape death from severe attacks.

Now, what is the cause of the increased nutrition and growth of the bioplasm? In fevers and in every form of inflammation the normal phenomena in the bioplasm undergo a striking change. The bioplasm of healthy tissues, which is living very slowly, taking up little nutrient matter, and slowly being converted into formed material, perhaps gradually diminishing, but never increasing in size—suddenly, quickly, that is perhaps within a few hours, increases greatly in amount. It may divide and subdivide into several masses, all of which grow rapidly and take up a large quantity of nutrient matter. So far from the production of formed material of tissues going on under these circumstances, not only is this change for the time suspended, but much of the formed material last produced, and still in a soft and imperfectly developed condition, is taken up by the bioplasm which produced it, and the latter, in fact, grows at the expense of the structure of the body. Much tissue may in this way be destroyed, and portions of organs completely removed, never to be replaced. The body is thus permanently damaged, for the parts destroyed could not be replaced, unless they were developed anew, and this in man and the higher organisms is impossible. The power of new formation, however, does exist, and to a wonderful extent, in many of the lower animals, the fully formed lobster being able to develop a new claw, the salamander and axolotl, new limbs, and the lizard a new tail. The muscles, nerve fibres, vessels, and all the complex tissues entering into the formation of these organs,

be it observed, are developed from formless bioplasm, in the same manner as they are formed during the embryonic period of existence. Man cannot develop a new finger—not even a nail or a tooth—if these structures, with the matrix from which they grow, be removed after their development is completed. Not even a bone will be replaced if, with the bone itself, all the soft tissue which takes part in bone formation be removed. But new vessels, new nerves, new epithelium, new fibrous and some other tissues may be developed even in man long after he has reached maturity. Vessels and nerve fibres are, however, formed in continuity with and from the bioplasm of already existing tissues of the same kind. A low form of epithelium and connective tissue, with the exception of certain textures found occasionally in the ovary, are probably the only tissues which are formed in the adult from bioplasm, which we can be sure has not been derived from that belonging to the tissues. The above may be, I believe, developed from bioplasm which has been produced by the white corpuscles of the blood.

I must, however, leave this interesting question, and revert to the consideration of the cause of the enlargement of the masses of bioplasm in tissues in fever and inflammation, but we may first inquire what would happen if the living matter did *not* increase—if pus were *not* formed, and perhaps much tissue destroyed? Although the inflammatory process in question is undoubtedly destructive, the tissue destroyed is as nothing compared with the amount of texture that would be totally destroyed by decomposition if the phenomena of inflammation did not occur. The bioplasm particles would die, and that regular flow of fluid to and fro in the very substance of all the tissues, being deranged, the bioplasts near the part affected would also die, and the organic matter of these, with that of the tissue, and organic matter present would undergo decomposition. The resulting products would diffuse into the neighbourhood, and extensive mortification would ensue. The blood would stagnate in the neighbouring vessels, its bioplasm would die and undergo decomposition. In such cases it too often happens that the death of the organism very soon follows. If, however, a part of the body mortifies, and inflammation occurs around the dead tissue, life may be saved and the dead mass detached. But in this case there must be rapid growth and multiplication of bioplasm between the part that is dead and the healthy tissues.

If the bioplasm of any tissue be supplied with more nutrient material than it receives in the normal condition, it will grow more rapidly than usual. This increased growth, owing to an increased access of nutrient pabulum, is the first change that occurs in inflammation, and it is essential to the inflammatory process.

The more ready access of nutriment may be due to an opening in the formed material and exposure of the bioplasm at one point, as may occur in mechanical injury; or it may depend upon a softened state of the formed material, which is thereby rendered more permeable to the fluids, or lastly, the character of the nutrient fluid may be so altered as to permeate the formed material much more readily than the nutrient fluid which transudes through the walls of the vessels from healthy blood,—a condition which is met with in some forms of inflammation, and in all the more severe forms of fever. In the latter state changes in the blood often proceed to such an extent as to materially modify its chemical composition. (a)

If we are to ascertain the true cause of the enlargement of masses of bioplasm in inflammation and fever, it is clear we must carry our inquiry beyond the fact of the increased access of pabulum, for it is obvious that the access of pabulum could not determine increased growth unless there was an active tendency on the part of the bioplasm itself to appropriate the pabulum and to grow—in fact, a tendency on the part of the bioplasm to move towards the pabulum, take it into itself and convert it into living matter. Bioplasm *always* tends to grow. It *must* in fact grow if it be supplied with nutriment.

(a) "Disease Germs," p. 340.

Bioplasm has within itself no power of regulating or controlling the rate of its growth. As already stated, the conditions under which it grows exert an important influence in the results of growth and development of bioplasm, and these "conditions" vary as regards every kind of bioplasm, and not only so, but different forms of bioplasm differ greatly in their power of bearing a change in the conditions without suffering deterioration. Some forms will live under external circumstances of the most varied kind, and are, therefore, found over a very wide area. Others suffer or are destroyed if the external conditions are altered only so slightly as to be imperceptible to many living creatures, and in this case the distribution of the life-forms, resulting from the development of the bioplasm, will be confined to a very limited area. The same observations may be made with respect to the several different forms of bioplasm in one living organism; some, like that of epithelium, bearing very great changes in temperature, &c., without being much affected, while other forms, like those of some glands, and those of some parts of the nervous system, suffer under comparatively slight alterations of the ordinary conditions under which they live. (a) There is no cogent reason for supposing that all forms of bioplasm might be made to bear without suffering similar great alterations in external conditions, than for believing that we might domesticate the wolf and the lion, as we have domesticated the dog and the cat, or make the swallow flourish in our little home prisons like the canary bird.

(To be continued.)

SNAKE POISON.

SINCE our communication on this subject of the 24th ult., we have received two more cases from Australia of the cure of snake-bites by Dr. Halford's intra-venous injection of ammonia—the first in the *Argus*, Melbourne, 30th December, 1874.

"INJECTION OF AMMONIA FOR SNAKE-BITE.

"The following remarkable case of cure of snake-bite by Dr. Halford's remedy—the intra-venous injection of ammonia—reported by the *Warrnambool Standard*, is the one referred to in the leading article on the subject published in this issue:—

"A severe case of snake-bite occurred at Allansford on Sunday, December 6, to a young woman named Mary Ann Dowling, aged 22 years, a servant in the employ of Mr. E. Griffin, of the Junction Hotel. It appears that at about half-past twelve she went out to the wood-heap to get some fuel to replenish the fire. She had gathered a few pieces, and was sitting on a low log with it in her arms, watching the children playing. Suddenly she felt a sharp twinge of pain in the calf of her left leg, and jumping sharply up, at the same time giving her clothing a shake, a large snake fell from her clothes, and disappeared in the wood-heap. She went into the house and told Mr Griffin that she had been bitten, but he at first could not realise the fact. In the course of two or three minutes, however, the girl began to vomit and get drowsy. Mr. Griffin then lost no time in getting a vehicle ready, and in less than an hour he reached Warrnambool, much difficulty being experienced in keeping the girl awake on the journey. When brought to Dr. Bradford's residence she was in a comatose state. The doctor gave her several doses of ammonia and brandy, but the tendency to sleep continued despite these remedies, and it was determined to inject ammonia on Professor Halford's principle. At the young woman's

(a) The "conditions" under which bioplasm grows in the higher animals are, it must be borne in mind, very complex and determined, partly by the results of growth of pre-existing bioplasm and in part only by external conditions. The same remark applies to the "environment" of any cell or elementary part of the body.

request Father Meade was sent for, and also Mr. Hugh Murray, the solicitor, as she wished to make some provision for the disposal of her money, but on their arrival she could not be got to speak or make any sign. Dr. Bradford then opened a vein in the left arm and injected liquid ammonia, the effect being watched with intense interest by those present. Almost immediately favourable symptoms appeared, and in a few minutes, from a death-like stupor, the patient returned to perfect consciousness, and spoke to those around her. Her recovery was very rapid, but she complained of violent headache. Doses of ammonia were continued throughout the day, and at about seven in the evening she had recovered sufficiently to be removed to Tattersall's Hotel. The inclination to sleep still remained, but the patient was kept awake until about eleven o'clock, when she retired, being wakened every four hours to take her medicine. Yesterday morning she still complained of violent headache and lassitude, with numbness in her left hand and leg. She has now quite recovered."

The second case occurs in the *Argus*, 5th January, 1875.

"PROFESSOR HALFORD'S REMEDY FOR SNAKE-BITE.

"To the Editor of the *Argus*."

"SIR,—Permit me through the *Argus* to add my testimony to the efficacy of Professor Halford's treatment by the injection of ammonia. I lately had a young man brought to me who was bitten on the hand by a large black snake. The punctures were quite apparent, and the patient on arrival was incoherent and intensely sleepy. My treatment consisted, firstly, in incising chiefly above the bitten part, followed by severe application of nitrate of silver. Powerful stimulants, including the aromatic spirit of ammonia, were then administered, immediately afterwards galvanic shocks, and after persevering in these appliances for a lengthened period without the slightest effect, I determined to inject ammonia into a vein of the arm, the man at this time being insensible, pulseless, and cold at the extremities.

"The effect of the injection was marvellous; pulse, heat, and consciousness rapidly returned, and the man went to his family the following day, and is now at his usual occupation. I have never failed in any of the many cases I have had after applying the Halford remedy.—I am, &c.,

"ED. GOVETT, M.R.C.S Lond., &c.

"Melbourne, Jan. 4."

The *Argus* of 2nd January, 1875, contains the report of the annual general meeting of the Medical Society of Victoria. The address of the President affords a skilful and lucid *résumé* of the improvements and discoveries of the medico-chirurgical world. In speaking of discoveries he says:—

"As a rule, any novel proceeding in surgery, or treatment in medicine, is at once freely tried, more especially when it comes accredited with a large amount of success. In striking contrast to the usual avidity with which such recommendations are adopted is the manner in which Professor Halford's treatment of snake-bite by the intra-venous injection of ammonia has been received *outside* Australia. The powerful influence which it has in rousing the collapsed sufferer has been too frequently proved by trustworthy practitioners in this country to leave any doubt of its great efficacy in counteracting the poison of the Australian snakes. The only point of doubt is as to whether its value will be equally great in combating the venom of the larger-fanged and more deadly snakes of other countries. It seems, therefore, simply marvellous that a treatment, not merely proposed for trial, but of already proved efficacy here, should not have been eagerly seized upon by the surgeons of India, where, unfortunately, the opportunities of experimenting on the human subject are abundantly frequent. As a fact, however, I believe that ammonia has not as yet been properly injected into the veins of any snake-

poisoned human being out of Australia. It is quite beside the question to experiment with imported Australian snakes on dogs and other lower animals. The efficacy of the intra-venous injection of ammonia in extreme cases has been attested by men as capable of judging as any surgeons anywhere else, and Professor Halford is certainly entitled to demand, in the interest of mankind, that it should be fairly tried in the case of human beings bitten by the cobra or other equally venomous snakes of India."

TREATMENT OF NECROSIS. (a)

By ANTHONY H. CORLEY, M.D., F.R.C.S.I.

IN submitting the following remarks on a more advanced method of treating necrosis to the notice of the Surgical Society, I am anxious to have a free discussion and to benefit by the experience of others, whilst endeavouring to secure a trial for my suggestions. There is perhaps no disease in the domain of surgery in which improved treatment is so strikingly manifested as necrosis. More advance has been made in this department tending towards the preservation of life and limb within the last thirty or forty years than in almost any other. Limbs used to be ruthlessly sacrificed on the one hand, or patients allowed to perish of hectic exhaustion whilst waiting the ineffective exertions of the *vis medicatrix nature* on the other. These cases are not frequent now. The judicious surgeon, with his armamentarium of modern necrosis instruments, usually knows when to step in and assist Nature, and by the skilful removal of sequestra at once preserve a useful limb and remove the cause of hectic. There are, however, occasions (and they are not very unfrequent) when the exact time at which interference is at once necessary and justifiable is a most vital question, and one that gives the surgeon many an anxious thought. To afford some practical assistance under these circumstances is the object of this paper.

If there is one precept more than another on which surgical writers are unanimous it is that no operative interference is justifiable until the sequestrum is completely detached, and there is no doubt that when such has taken place the cure is more satisfactory; but there are two conditions under which the precept is of little use as a guide—1. There may be complete separation, and yet the sequestrum so fixed from the extension into its inequalities of granulations from the surrounding new bone that there may be no evidence sufficient to show the detachment; 2. There may be present symptoms of wasting and hectic so urgent that surgical interference of some kind may be rendered imperative to save the patient's life. Besides, even though there may exist no very urgent constitutional symptoms, still we now thoroughly understand that long continued and profuse suppuration, especially from diseased bone, is extremely likely to produce that serious form of visceral degeneration called amyloid, a condition not amenable to treatment, and one which may tend to a fatal result even when its cause had long since been removed. It is therefore very desirable to know if operative measures may be attempted before any certainty exists as to the complete separation, and also when a continuance of the symptoms indicates a probably fatal termination, even though the surgeon may have reason to think that detachment is only in progress. The following cases, briefly told, illustrate my meaning and my treatment:—

T. L., an attorney's clerk, was admitted into Jervis Street Hospital in the beginning of October, 1873, presenting the symptoms of tibial necrosis to a most exaggerated extent. The limb was nearly twice the size of the opposite one, and had seven or eight openings through which the dead bone could be felt, and which were constantly pouring out quantities of pus. The disease was

of nearly a year's duration, and had, confessedly, a syphilitic origin. His general health was simply deplorable: want of appetite, night sweats, and diarrhoea had brought on extreme emaciation, and attempts to use the leg in walking produced much pain and exacerbation of local symptoms. There was no evidence of motion in the sequestrum, but in some places the probe could be passed for a little distance between the new shell and the sequestrum. I kept him in bed for about six weeks, in the hope that rest and attention to general hygiene might raise his health to such a standard that he could afford to wait until Nature's effort should separate the sequestrum and afford an evidence that the process was complete. Although the inflammatory condition of the limb was ameliorated, his general health did not improve, and the symptoms of exhaustion became so urgent that in December, 1873, I determined to interfere, operating for necrosis first, and holding myself free to amputate if necessary. I used Esmarch's method to obviate hæmorrhage, and I am bound to say that I do not think the operation, or any one like it, could have been successful unless done bloodlessly. When I mention that the patient was one hour and forty-eight minutes under chloroform, and exhibit the amount of bone removed, the gravity of the case can be readily understood. I found, as the size of the limb led me to expect, a very thick new shell, and on cutting away a portion of this between adjacent cloacæ with mallet and chisel, I found a sequestrum which included the entire diaphysis of the tibia. Along the surface complete separation had taken place, although in some points the dead and living tissues were in actual contact; but at the two ends no line of separation was to be found, for dead bone, fixed and firm, could be felt as far upwards and downwards as I thought it prudent to lay open the new shell. Partly with the forceps and partly with the chisel I managed to get away the great mass of the sequestrum, but was obliged to leave a small portion at the upper and lower ends. Having packed the cavity well with lint and bandaged over all I sent the patient to bed. I may say that practically the operation, though I thought it at the time unsatisfactory, was a great success. Although in the second week he had a sharp attack of surgical fever, the great cavity filled up and cicatrised over most satisfactorily, except at the upper and lower ends, where small sinuses leading to undetached dead bone still exist. All the constitutional symptoms passed away. The patient is now in excellent health, and the remaining bone is gradually coming away in small fragments. I should mention that shortly after he left the hospital he thought himself so well that he walked a considerable distance and took too much exercise. The consequence was that a rapid and unhealthy kind of inflammation ran up from one of the lower sinuses through the cicatrix and laid bare a small portion of the edge of the new bone—a superficial exfoliation of this took place; and rest in the horizontal position, with some iron lotion, restored matters to their previous condition. This patient can now walk to his work, do it, and is in excellent health.

CASE II.—M. A., a young woman of about 22, was admitted into hospital, January, 1874, with necrosis of femur. In her case the dead bone could be very clearly felt through a sinus on the postero-lateral aspect of the limb, about its middle. The disease was of a couple of years' duration, and I dare say many here present know the case, as the patient was in several hospitals, and had the opportunity of testing the treatment as well as the patience of several surgeons. Her constitutional state, although not so bad as that of the last patient, was one of great gravity, and she was most anxious to submit to any treatment short of amputation. With the experience of the last case before me, as well as some others successfully treated by my colleague Dr. Kelly, I determined to expose the sequestrum and remove it wholly or in part, as might seem expedient. I therefore proceeded as before, but with more difficulty, as I had to cut through a great thickness of soft parts, and as for the new shell, I found it

Read before the Surgical Society of Ireland, April 2. The description will be found at page 340.

over three-quarters of an inch thick in some parts. The sequestrum seemed about five inches long, completely separated on its surface, but fixed at both ends. I took away as much as I could, but left a portion both at the upper and lower ends. This operation, like the last, was perfectly bloodless, lasted for one hour and thirty-five minutes, and, with the exception of some sharp febrile symptoms, the patient made a good recovery. Since then small pieces have come out at intervals, and at one time, about five months ago, I felt a large piece near the orifice, and extracted it under chloroform. There is now a tolerably large granulating cavity, in which I can detect no dead bone, and the patient is in very good health. She walks without the least lameness, and only complains of the discharge being an annoyance.

Now, Sir, when it used to be laid down that no operative interference was justifiable until complete separation had taken place, it was said that neglect of that rule led to extension of the disease and other graver results. I fancy that the loss of blood had more to do with subsequent misfortunes than the premature interference with the sequestrum. Any of us who have operated for necrosis on the old plan must remember with horror the amount of blood necessarily lost; and I have myself more than once seen an operation stopped and postponed for the same cause. The condition of the patient after such hæmorrhage is about the most unpromising when it is remembered how much he has to go through, and no doubt many sequelæ very embarrassing to the surgeon have their origin in the anæmia which the old operation caused.

I think, Sir, I have shown in these two cases what I know from others, that operative interference may be attempted in necrosis much earlier than high names authorize without extra risk to the patient, and in so doing I think I have shown that the number of cases in which amputation is necessary is still smaller, and should my conclusions be borne out it will add another obligation to those which we owe to that Columbus of present-day surgery, Professor Esmarch.

INDIAN MEDICAL NOTES.—No. XXXIV.

(FROM OUR SPECIAL CORRESPONDENT.)

MEERUT, *March*, 1875.

THE STUDY OF THE COUNTRY.

UNEXPECTEDLY a case of idiopathic tetanus has recovered, thanks to chloral hydrate, iodide of potassium, quinine, good living, avoidance of cold, heat, and glare, the bowels relieved by enemata, the body kept warm, the spine rubbed with anodyne liniments. Tetanus, attributed to scholastic hand-caning, was treated by Dr. Hunter with tincture of cannabis Indica, 10, bromide of potassium, 5 grains, every three hours, besides 12 grains of chloral thrice a day, the spasms controlled by chloroform, the allowance of wine 20 ounces in twenty-four hours; the patient, a half-caste boy, ill from October 21st to December 15th, 1874, recovered. So did a Hindoo, aged 40, who required nearly 6 ounces of chloral during fifty-six days' treatment for tetanus caused by cold. *The Indian Medical Gazette* also points out the expensive health-risking folly of hurried trips home, impresses on all the expediency of avoiding the delusive alluring rock of hasty general conclusions, by special study of each place and community—likewise publishes a letter by Surgeon-Major Skeen on enteric fever. He states that, at Mean Meer, in February, 1870, the 85th Regiment and the 5th Lancers suffered from this disease, which never touched the 39th Foot, four months from Ireland, or the 92nd Highlanders, three years in India. Certain wells contained organic matter traced to old cesspools, sixty feet deep, formerly nearly full of excrement, the distance between about 180 feet—when the troops drank canal-water the fever ceased. That enteric fever is a hot-weather disease affecting young weakly new comers did

not prove the rule at Mean Meer, but other practitioners think differently, and the invaluable researches of Dr. Bryden almost grasp India.

In every medical school library or society the *Indian Medical Gazette* should be taken in, so should the *Indian Annals of Medical Science*, both containing, as a rule, a mint of matter. The celebrated Dr. Joseph Ewart, well known by his pen, is the able editor of the *Annals* now commended. "What we can do against Cholera," by Pettenkofer, commences the last number, *quod vide*. Surgeon-Major Cayley, who has succeeded in five cases out of ten, praises Wood's operation for radical cure of hernia, besides narrating interesting surgical experiences. Papers on "Pneumothorax," by Dr. Nicholson, on "Syphilis," by Dr. Curran, on "Unreduced Dislocations," by Dr. Joshua Duke, I should like to quote, and also make long extracts from the "Report of the Indian and Australian Snake Committee," but it is a shame to pick out too many plums, so a few notes must suffice.

Dr. Duke relieved two cases of strangulated inguinal hernia with Dieulafoy's aspirator; Dr. McNally fancies the inhalation of atropine diluted and atomized by Siegle's instrument might be useful in cholera; Dr. Birch treats infantile diarrhoea with 3 grains of gallic acid after each motion, also 5 of bromide of potassium in solution, taking care to give alkalies with the food. Dr. Staples has "Notes on Surgery," and Dr. Francis supplies the "Biography of Dr. J. A. P. Colles," a hard-working, religious, young surgeon, who died of remittent fever in this abode of the alligator, mosquito, and malaria: evidently friends, relations, the Bengal Medical Service, the Royal College of Surgeons of Ireland, each had every reason to be proud of, as well as deplore the untimely loss of Dr. John Armstrong Purefoy Colles, F.R.C.S.I. Ireland turns out very fine doctors; and although my acquaintance with the Emerald Isle, the gem of the ocean, only includes Kinsale, Cork, Ballincollig, then on to Curragh, from the fact of doing duty in these places, still the recollections are pleasant. Does Dr. Parker still catch 18-pound salmon in Hell Hole? Does Dr. Rountree remember our craniotomy case in an isolated cottage? Is Cork College flourishing? Professor Corbett very kindly, very patiently, went through a course of operative surgery with a very stupid pupil. But the jabber of my parrots, the curious yelping of the dogs, the tiger claw of the cat, and the chatter of the monkeys recall attention to India.

Concerning Meerut, every road now familiar, what with riding, driving, walking, marching, encamping, besides railway trips, there are many links in the chain of description still untold. The close cultivation in the district will not permit much choice of camping-grounds. They say that tobacco, poppy, caraway-seed, safflower, garden stuff, indicate good land, 30s. an acre, compared to 5s. where cereals, sugar-cane, indigo, cotton grow: all require irrigation, and the Ganges canal, which has a small navigable traffic to carry grains, rice, maize, cotton, oil, seeds, salt, firewood, metals, irrigates 27,000 acres for instance—wheat and sugar cane in December. Last year the heavy fever prostrated men and cattle, until the ground became too hard to plough dry, and indigo did badly. This year there was no rain until Valentine's day, when two inches fell, when fever increased, and cases of rheumatism or secondary syphilis relapsed. The Ganges canal is one of the few sights of India elsewhere described. From the main artery run any number of minute branches for irrigation, and as the subsoil water is annually rising the country about may remain moist, at certain places filthy, the tripod of disease constituted by moisture, heat and filth. Formerly, snipe were rare, yet now abundant. Formerly, the fever described as ardent, requiring depletion, seldom degenerated into intermittent. Dysentery was generally intractable, and fatal to drunkards. As a rule, servants excepted, the natives here are sober, quiet, industrious. A respectable man will keep a family on 17s. a month, indulging in rice, split peas, vegetables, salt, turmeric, spices, betel-nut, and tobacco. A house may cost 30, furniture 20, clothes 4 shillings. Next to his

son and his honour does he love his land, which is ploughed by scratching the surface, as in the days of Job, who probably objected to machinery and manure, and some say was afflicted with syphilis. The native application of hot taurarind-water, hand friction, followed by a smearing of the joint with mud and turmeric will soon cure sprains, or a bandage covered with mud will heal cuts. Out of mud the native makes houses, sugar refineries, forges, bread ovens, and a jeweller will ply his trade very cunningly with common pincers or blow-pipe, turning out gold or silver filagree like a spider's web; with the roughest tools the potter works; the Dacca weaver supplies muslins soft as silk, and the embroidered slippers, carpets, tapestries, enamels glowing with colour, carvings in wood or ivory, all testify that manual skill still lives, although the designs never change, and inferior goods are imported or manufactured in prisons. The wonderful tombs and temples, always located in picturesque positions, the tiniest trifling elevation or shady nook made the most of; the marvellous harmony of colours, red, green, gold, and purple, so noticeable at the Mohurum this afternoon, creates astonishment. A cook will turn out on a wet, windy day in a ploughed field, on the line of march, a dinner as good, if not better than an expensive, elaborate affair in Harley Street, which has driven the hostess to distraction. As for clerical work, the natives have a positive mania for unravelling returns, picking out errors, checking statistics; they gloat over figures, indents, circulars, memos., references, with fiendish malignity. In certain occupations the Europeans are nowhere in the race; even supposing a splendid situation given to one, he may, after a time, prove physically unfit, may ill-treat natives, connive at speculation, or become the slave of drink. About 5000 soldiers are total abstainers, many women and children also, and the providing of resources dissociated from drink, the comfort of temperance canteens are gradually beginning to tell. In a medical point of view the water-drinker unfortunately appears in youth susceptible to all the hidden dangers which neither the microscope or test-tube can discover, nor the filter prevent. If a man would only keep to his beer and rum, in many instances he would do well; but as the flesh is very weak, especially in company, it is far better to take the pledge; the only objection is that the teetotallers are sometimes puffed up as being the salt of the earth, or else cannot resist the badinage of the thirsty foxes who are losing their tails. Having watched and studied for many years this great question, my sympathies with total abstinence only grow stronger, at the same time fully convinced that the "least drop in the world" is here dietetically useful to many persons. Cider, only objectionable on the supposition of leada adulteration, or unsuitable for the gouty, is very refreshing in the hot weather, and it is said that in cholera epidemics in Europe the cider-drinkers have escaped.

Concerning native crime here, no interesting facts have as yet come under notice. There are restrictions on the sale of aconite, cocculus, datura, henbane, Calabar bean, white, yellow, red, and green arsenic, and corrosive sublimate; still a fair amount of poisoning goes on by all accounts. This morning a man gave me a queen of white ants, about the same size and much resembling an enormous snail. It is marvellous that a bug should be a great grandfather in twenty-four hours; so it is to hear that a queen of white ants lays fifty eggs a minute for two years. The destructive decay wrought by climate and insects urges on all the financial necessity of considering the cost of barracks, fixtures, furniture, repairs, the price of food, clothing, medicines, stimulants—so that when sanitary suggestions are required the least expensive propositions can be entertained. When we know more about Indian herbs and remedies, about hypodermic injections, notably quinine, thousands of pounds will be saved. The resources, advantages, objections of each district are gradually being understood; but with the exception of "Thornton's Gazetteer," published in 1854 and 1862, very little printed information about Meerut appears available. Very few snakes or scorpions personally

noticed; very little hydrophobia, plenty of variola, no special ulcers. Dengue in 1872 spared no one. Several persons have been treated for a rash marvellously resembling scarlet fever. The sport in the district is very good—plenty of antelopes, black buck, pea fowl, duck, hares, partridges, snipe in abundance. The soldier cares not for snipe and shooting for the pot—prefers something substantial, for instance, a man shot a pig twenty-four stone weight the other day. So long as men keep out of water and have their heads well protected, they do very well; but the careless are stricken down by jungle fever, ushered in by cramps, semi-collapse, violent headache, distressing vomiting.

ADDRESS AT THE CLOSE OF THE SESSION OF THE SURGICAL SOCIETY OF IRELAND.

By JOLIFFE T. TUFNELL, F.R.C.S.I., M.R.C.S.E.,
President of the Royal College of Surgeons, Ireland.

I HAVE now, gentlemen, in accordance with annual custom, to say a few words in reference to the session just ended, and to the work performed.

We have held nine meetings, each one characterised by a generosity of feeling and good temper in debate that could not be surpassed. This is one, I think, of the leading objects to be aimed at in a society such as ours, where free discussion is allowed, and upon which its success so greatly depends. On one or two occasions I was myself obliged to be absent; but when presiding I had not once even to interpose, nor do I believe had the Vice-President, who so worthily filled this chair when I was away.

With reference to the subjects brought under the notice of the Society during the session, I may remark that almost every branch of our profession has been ably represented.

In Medicine we have had most valuable communications, as well as papers upon the action of therapeutic remedies.

In Surgery, contributions upon the lesions of the major portion of the human frame—tumours in the parotid region, cancers of the male and female breast, strangulated hernia, excision of the hip, excision of the knee, and supra-condyloid amputation of the thigh, the treatment of the contraction from burns, and of the ulcer of Marjolin, with elephantiasis of the leg, the removal of foreign bodies either intentionally or accidentally introduced—such as hair-pins from the female bladder, and a sewing-needle extracted by pharyngotomy from its seat of impaction in the throat.

In Ophthalmology, amaurosis, and obstruction of the lachrymal puncta, the canaliculi, and nasal canals.

In Pathology, the nature of tumours, with their consequent bearing upon the question of operative interference.

Necrosis and the diseases of bone have also engaged the attention of the Society, as well as aneurism, internal and external; and in addition to these, papers upon the relative strength of muscular tissue.

So wide a range of subjects introduced in all their practical bearing within a single session truly prove the title of the Society to be that of Medico-Chirurgical in the fullest sense of the word; and I think we may flatter ourselves in the belief that for practical utility our Society will bear favourable comparison with that of any other kind in the sister kingdom. Upon only one point have I to express a regret, which is that our country brethren have not come forward and given to us the results of their great or practical experience, for I can most fully endorse the words of a former president, Dr. Macnamara, when I say that no records are received with more cordial respect and thanks than those emanating from our country brethren; and I am sure that I only express your opinion, gentlemen, also, when I say that it is the earnest wish of the Society that our country members would communicate for the benefit of the profession the results of their great experience and observation.

And now I have to say a few words of those who cannot be with us to-night to speak for themselves—not indeed for themselves—I am wrong in saying this, for their

remarks, when present, were ever made, not for their own benefit, but for the benefit and welfare of others.

Death during the last year has been busy amongst the members of our profession. At our opening meeting I spoke to you of two familiar faces whom we missed—those of Arthur Jacob and William Hargrave, men who were constantly at our meetings when able to do so, but who had been recently called away. To-night I have with deep regret to mention three others whose names henceforth will cease to be on the roll—Robert Adams, William Jameson, and Frank L'Estrange. They have gone; but, before departing, have well done their duty by the Society. This we personally know, and the records will in future time testify to the value of their work and their intrinsic worth. Were I to attempt to say what I ought to speak in justice to either, the closing hour of our meeting would indeed be long exceeded. There is, however, one duty that I must perform, and that is, to resign my trusteeship of the valuable case of instruments now before you, confided to me (as President) by the late Francis L'Estrange, and by him desired to be handed over to you this night. They are the originals of the several valuable instruments he invented. He has bequeathed them to the College of Surgeons in Ireland, the College that I may truly say he loved.

A mere passing notice, such as I could only make now, would, I feel, not be respectful to his memory; you will therefore perhaps kindly permit me in the session ensuing to bring the history of these several instruments specially before you, for they are deserving of special notice.

And now, gentlemen, before I quit this chair, I must ask you to give what I know you will do by acclamation, and that is, your cordial thanks to the Honorary Secretaries, those officers who have so ably conducted the business of the session which I now hereby declare closed.

Transactions of Societies.

THE SURGICAL SOCIETY OF IRELAND.

THE final meeting of the Society was held on Friday evening, 2nd April, at the Royal College of Surgeons, the President of the College in the chair.

Mr. BARTON said that in the early part of the present session he read a paper upon the excision of the hip-joint, and in the course of that paper he mentioned three cases. One, he stated, had been operated on in the year 1871, and at the time he read the paper the boy was in perfectly good health, and able to walk two miles with a stick. This boy had at the time of the operation albumen in the urine, and about a year ago he had an attack of dropsy, from which he recovered. About a month ago, during the prevalent easterly wind and severe weather, the boy was brought into hospital again with another attack of albuminuria and dropsy, and in spite of the treatment adopted he died on the 23rd March. He therefore had now an opportunity of exhibiting the hip-joint, which presented some features of very great interest. The operation was performed on the 28th July, 1871, and the boy died on the 23rd March, 1875, so that there was an interval of two years and nine months between the two events. The bone was united to the acetabulum by a very firm fibrous union, admitting, however, of very free motion. There was no evidence of diseased bone in that part; but he might mention that in making a section of the bone he found the internal part of the ala of the ilium coated with lymph. The old disease had been protected from the cavity of the abdomen by a wall of lymph, so that it was removed without exposing the viscera of the abdomen. The case might be said to be a successful one so far as operation went, inasmuch as life was saved and reparation went on in a healthy manner, and it also taught the lesson that in such cases the operation should not be long deferred. The kidneys were extensively diseased, the cortical substance being entirely occupied by amyloid deposit. The liver was very large, and of the same form of degeneration. The portion of bone which he had removed he had

exhibited at the Pathological Society. The head of the bone was entirely removed, and the appearance it presented was such that the members of the Society to whom he showed the specimen thought it was an os calcis until he explained to them that it was the head and neck of the femur.

CASE OF POPLITEAL ANEURISM TREATED BY DIGITAL AND INSTRUMENTAL PRESSURE.

Mr. H. GRAY CROLY: I need hardly say that I could not have selected a better opportunity for bringing under the notice of the Society the treatment of popliteal aneurism than during the session in which you, Mr. President, so worthily fill that chair. It would be out of place to do more than allude to the fact, for your labours in this branch of surgery are known everywhere, and I shall therefore proceed to detail the particulars of the case which I desire to bring under your notice. J. L., aged 46 years, married, and by occupation a car owner and driver, sent for me on the 28th January, 1875, and was visited by my brother, Dr. Albert Croly, who diagnosed the case as one of popliteal aneurism. I visited the patient on the following day, and took the following notes of the case. He had enjoyed good health, and stated that he never had syphilis; but he had been intemperate, and his wife stated that for the past six or eight months he came home drunk night after night. About the 28th October he felt for the first time a stiffness in his left ham and a slight swelling, and at the same time he observed that his left leg and foot from the knee down were swollen. He kept on at his usual occupation, and was much exposed to cold and hardship, until the 15th December, about a fortnight before I saw him. He says the swelling then gradually left his leg and foot, and he remained in bed from the 15th December until the 29th January, the date at which I saw him. During that time his appetite failed, and he slept badly. He felt the left leg and foot hotter than the sound limb. The man was of slight build, dark complexion, but not unhealthy-looking. His pulse was 72, full, and regular, there was a murmur at the orifice and in the aorta, the lungs and kidneys were sound, and the urine was free from albumen. On looking at the left knee and popliteal space in profile a tumour was observed occupying the latter region, and also a swelling on the external side of the joint, with the biceps tendon indenting it, and giving the appearance of a double tumour. On placing the patient in the prone position the popliteal space was observed to be very full compared with the opposite side. The swelling was oval in the long axis of the limb, and the following are the measurements then taken:—Long axis of the tumour, 8 inches; transverse axis, 2½ inches; circumference of knee-joint across the centre of the tumour, 15 inches; circumference of the calf of the leg, 13 inches; circumference of the ankle, 8½ inches. The circumference of the other knee-joint was 12½ inches; of the calf, 11; and of the ankle, 7 inches. When the leg was fully extended the tumour felt hard, and there was very little, if any, pulsation felt in it. On flexing the leg on the thigh a distinct pulsation could be felt. Three pieces of paper placed transversely on the tumour and viewed in profile were observed to be raised together at each pulsation. On applying the stethoscope over the tumour a soft bruit de soufflet was heard, and a similar murmur was audible over the swelling at the external side of the joint. No other aneurismal tumour could be discovered. The patient was next placed in the supine position, and the fingers of the left hand were put on the aneurism and the pulsation distinctly felt. The femoral artery (which pulsated very strongly and felt harder than natural) being compressed with the finger of the right hand, the pulsation could be completely controlled in the aneurism, but it required firm compression to do so; and I noticed that the popliteal tumour was not diminished by such pressure on the main artery. I explained to the patient and his wife the serious nature of the case, and advised his removal to the City of Dublin Hospital, in order to carry out the treatment more efficiently, and also with the object of allowing the pupils to see the case and watch its progress. The patient seemed willing to accept my offer of admission to hospital, but his wife persistently refused, giving as her chief reason that she understood her husband would be handed over to another surgeon, the prevalent notion of rotatory duty in the mind of the public having on other occasions, to my own knowledge, deprived our hospital of valuable and instructive cases for our clinique. Treatment commenced on the 29th December, at 2 o'clock. The thigh was carefully shaved and dusted with French chalk, the foot and leg were wrapped in wadding and bandaged with flannel. A pillow was placed

under the leg, and a second under the thigh, so as to support the limb. The line of the femoral artery was marked with ink, and Signoroni's clamp—the pads lined with pieces of flannel to prevent irritation of the integuments—was placed on the femoral artery, a little above Scarpa's angle. When the screw (previously well oiled to make it work freely) was tightened the pulsation in the ham was found to be fully controlled. A cradle was placed over the limb to keep off the bed-clothes. Diet, drink, and medicines were prescribed as follows:—Cocoa, bread, and fresh egg for breakfast, chicken-jelly and toast for luncheon, small chop for dinner and small quantity of brandy-and-water, bread-and-milk or beef-tea for supper. I taught the patient how to compress the femoral artery against the pubis when he desired to be relieved from the instrument, and I fully explained to him and his wife—a most active and intelligent woman—the necessity for digital and instrumental pressure. Tincture of perchloride of iron was prescribed, 30 drops to be taken three times a day in half a wine-glassful of brandy and cold water. I may here observe that the addition of brandy or whisky prevents the iron causing nausea or vomiting, which, without the spirit, it is apt to produce. I shall not trouble the Society by reading all the notes of the case, but briefly allude to the treatment adopted. The patient bore Signoroni's clamp for an hour at a time, and controlled the artery himself with his finger and thumb, and from the 29th December to the 20th February he was under digital and instrumental pressure combined. The tumour appeared to resist all treatment for the first month. The man's foot and leg became enormously swollen; the tumour filled the entire ham, and the pain suffered by the patient was almost beyond bearing. I gave him large doses of opium during night and day, and begged him to allow the pressure to be kept on. The tumour in the ham then assumed a very remarkable appearance: it became perfectly red and oedematous in the centre, and had all the appearance of a huge popliteal abscess—in fact, so like it, that you could scarcely blame anyone for falling into the trap of laying open this tumour as an abscess. The redness gradually disappeared, and the pulsation ceased in the tumour. In a week afterwards it returned, and then matters looked as badly as ever. We thus had a huge tumour apparently converted into matter, then absorption taking place, and afterwards pulsation recurring again. We then consulted as to the propriety of amputating the thigh; but the man had a hard atheromatous artery, and we thought there was a risk of secondary hæmorrhage, and that his chance of life after operation would be but small. It was therefore determined to persevere with the digital pressure, and on the 20th February, very suddenly, with acute pain in the tumour, all pulsation ceased. At that time collateral circulation had become established in the limb, and the oedematous condition left the leg and foot. The pulsation in the artery ceased on the 20th February, and it had not since returned. When the tumour was at its worst condition there was considerable effusion into the knee-joint. The chief points of interest in the case are the tumour having become so extremely like an abscess, threatening at one time gangrene of the limb, and the fact of its being a case unfitted for any other treatment except digital pressure. I think the case is one that should impress on us the importance of not giving up pressure, but of keeping it up as long as possible with the hope of a favourable termination.

The PRESIDENT said Mr. Croly had given him an opportunity of seeing the case while under treatment, and he had visited the patient that afternoon. The description Mr. Croly had given of the resemblance of the tumour to an abscess was correct. There was an oedematous point of dusky, livid appearance, apparently in a suppurative condition. There was no pulsation or bruit in the tumour, and anyone who had not seen it before would have imagined that it was an abscess in the popliteal space. There was one point, however, that ought to be noticed: the man had never suffered from rigors. When he saw him that evening the limb below the tumour was as fine as the opposite one. There was considerable effusion into the knee-joint, but an absence of boring pain; and it was clearly an effusion of synovia, and not the result of direct pressure forward. The contents of the sac were absorbing slowly, and it might be some months before the mass of blood was absorbed; but when that was effected he had no doubt there would be perfect recovery, and the man would have perfect use of the limb. It was a case that showed the reparative power of nature, and what could be done by waiting and watching.

Mr. WILKINSON asked whether, in consequence of the pain

suffered, pressure was removed during the night. He had had one or two cases of this kind, and he always made it a rule to remove pressure at night, so as to give the patient the benefit of a quiet night. He had not found that the temporary relief of the patient thus given militated against the success of compression. He should also like to know whether the effusion into the knee-joint was into the joint itself or the parts external to it. Mr. Croly mentioned having given large doses of opium; but from his (Mr. Wharton's) own experience he was not in favour of giving opium largely in these cases.

Mr. B. WILLS RICHARDSON said: I wish to supplement the case detailed by Mr. Croly with a very interesting case which was admitted to the Adelaide Hospital on the 24th November, 1873. The patient was a boy, only 19 years of age, and was admitted with an aneurism, which we considered to be of the right posterior tibial artery, probably implicating the bifurcation of the popliteal. He had a very well-marked double murmur and permanent patency of the aortic valve. There was visible pulsation of all the arteries which were enlarged. In this case digital compression of the femoral artery was kept up continuously for 154 hours, and pressure, instrumental and otherwise, extended over a space of 115 days. Carte's, Read's, and Signoroni's tourniquets were used, but chiefly the first. Carte's instrument having got broken on two occasions, pressure was kept up by means of weights. Sixty-three hours after digital compression first began pulsation ceased for about six hours. On the 18th March, after returning from a drive, a sudden diminution in the pulsation was noticed. At 2 p.m. the next day pulsation had stopped completely. On the 2nd December, 1874, the patient was readmitted with aneurism of the left ulnar artery. At 10.45 a.m. digital compression of the brachial artery began. At 7 p.m. on the following day pulsation had ceased entirely. The man ultimately died of the diseased heart; but we had not an opportunity of making a post-mortem examination. The case was under the care of Dr. Walsh at first, and I had the care of it myself for a month or two. It was an unfavourable case for ligature, owing to the condition of the artery. The deposition of fibrin gradually went on, we had a slow increase in the firmness of the sac, and eventually the pulsation ceased.

Mr. BARTON might mention a case that contrasted with Mr. Richardson's case. It occurred two years ago, and was a well-marked case of popliteal aneurism. The pressure was carried out for twenty-eight hours continuously. The pulsation was so much diminished that he removed the pressure at night, but not the first night, when it was kept on. It acted most satisfactorily, and after compression amounting in all to thirty-six hours the consolidation was perfect, and the same phenomenon that existed in Mr. Croly's case was presented in this—namely, a sudden pain being experienced at the time of the consolidation of the blood. This was an instance of diseased arteries. A short time afterwards the young man appeared again at the hospital with an aneurism of the arch of the aorta.

The PRESIDENT said he was an advocate for continuous pressure, provided it could be borne without uneasiness by the patient, but the moment it gave uneasiness it should be removed. One of the most important cases of this kind occurred in Jervis Street Hospital, under the late Mr. Barron. The compression was about being given up in consequence of the pain which the individual suffered, and which prevented him from taking rest. Mr. Barron ordered the man to receive an opiate and the pressure to be taken off. The man immediately fell into a sound sleep, and the patient in attendance brought down the screw of the instrument, and when the man awoke the aneurism was cured.

Mr. STAPLETON said the instrument used on the occasion referred to was what was called a carpenter's clamp for glue, one being placed above, and the other four or five inches lower down on the artery. Afterwards, in some cases in Jervis Street Hospital, they used shot, with very great advantage.

The PRESIDENT observed that Hoey, the patient referred to, was a carpenter, and himself suggested the instrument that was used. The first instrument used in Ireland for compressing an artery in cases of aneurism was the modification of the femoral truss brought forward by Mr. Todd, which instrument was in his possession; the second one was a ring, which was used by Mr. Hutton as a lever; and the third was an instrument made at the suggestion of Sir Philip Crampton, and used by him in the treatment of secondary hæmorrhage. It was lent to Mr. Cusack, and it was with that instrument the

third case was cured, and by it also the fourth case was cured by Mr. Bellingham.

Mr. CROLY, in reply to Mr. Wharton, said that he did not keep up the pressure at night; and with regard to pressure producing oedema, there was a great deal of oedema before the man was treated for aneurism, which showed that pressure had not much to do with it. With regard to the effusion, he was justified in saying that it was into the knee-joint. It had all the characters of synovial fluid. One point of great interest was that before the aneurism got well there was a distinct double murmur where the femoral artery pierces the adductor magnus, and a single murmur over the rest of the tumour. The greater part of the pressure was effected with Signoroni's clamp, and it caused no irritation of the integuments, and the patient bore the instrumental better than the digital pressure. The femoral artery, which felt as large as a man's finger, was now reduced to its normal size, and was much feebler in its circulation than in the sound limb, though the collateral circulation was increased. He considered that Mr. C. Hawthorn Todd was the originator of the system of curing aneurism by pressure, for in his work he states that pressure may cure aneurism. With regard to digital compression, in Holmes's "Surgery" Greatrex's case was stated to have been the first, the President's case coming second. There was an interesting case under the late Mr. Maurice Collis, where the patient, finding he could relieve himself from pain by pressing on the femoral, did so, and when Mr. Collis came to put on the instrument he found the aneurism cured.

Mr. A. H. CORLEY read a communication on

THE TREATMENT OF NECROSIS,

which will be found at page 335.

The PRESIDENT said that in the Devon and Exeter Hospital, in which he was educated, there was not a day that he did not see cases of this kind, owing to wrestling being the custom of that county. They wrestled in very heavy boots, and kicking was allowed, so that every young fellow's shins were completely battered, and periosteal inflammation set in, and the hospital was full of such cases. In the adjoining county of Cornwall, where they wrestled in their stocking feet, they hardly saw any of these cases, nor was the proportion of them so great in Ireland.

Dr. BENSON said they were common enough in some parts of this country.

Dr. BARKER bore testimony to the efficacy of Esmarch's bandage. He had an opportunity of testing it in an operation for necrosis of the tibia, extracting a large sequestrum. Not more than two or three drops of blood escaped; the knife was not wet with it, and there was not a teaspoonful of blood on the dressing.

The PRESIDENT said that in the case alluded to by Dr. Barker there was great hyperæmia afterwards, the limb being of a purple colour, and presenting a remarkable contrast with the other limb, in which normal circulation was going on.

Dr. BARKER did not remark any hyperæmia when he returned to see the patient in bed. It had then wholly subsided, and the limb was the same as before operation.

Mr. H. GRAY CROLY: The question which Mr. Corley has brought before us is that of early operation for necrosis, and not Esmarch's operation. I have been in the habit of dealing with cases of necrosis earlier than I was taught to do when a student. Of course we are all aware that interfering with a fixed sequestrum is not safe surgery; at the same time, we often find that while we cannot move the sequestrum, yet when we cut down on the bone we find many pieces of bone to be got away. I can call many cases to mind where the patients improved in health and got fat on the removal of a piece of bone that could not be said to have been loose. I therefore thoroughly agree with Mr. Corley in the views he has expressed.

Mr. CORLEY said he had looked into all the books dealing with this subject, and they were all particular in saying "you must wait until the bone separates," and in many cases he feared they waited until the patients were in their graves.

The PRESIDENT then read his Valedictory Address, which will be found at page 337.

The meeting then separated.

THERE is an excellent leading article in praise of the medical charity system of Ireland in the *Medical Record* of New York, March 20th.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, APRIL 21, 1875.

THE CORONERS (IRELAND) BILL, 1875.

THIS Bill, which will be brought before Parliament early next month, proposes to deal chiefly with the office and duty of coroners only; but as many grievances are inflicted on our profession in carrying out the working of the Coroners' Jury system, we think an opportunity now occurs which should not be lost in having alterations and improvements made in the medical arrangements which would render the working of the Act more complete, and, at the same time, more satisfactory and just to the medical witnesses.

The Council of the College of Surgeons, Ireland, and of the Irish Medical Association have both given their consideration to this matter, and, we are sure, will not relax in their efforts to have the Bill rendered as smoothly-working and efficient as possible.

Some alterations in the present system of procuring medical evidence are at once suggested on reading over the present Act. It is the present law that in case the medical officer of a public institution or hospital be called on to give medical evidence as to the cause of death of any patient dying at such institution, he shall not be entitled to any fee, and, still further, that should he find it necessary to perform a post-mortem examination, or he be desired to do so by the coroner or jury, he shall not be entitled to any fee for so doing.

Now, however inconvenient and irksome it may be to give oral medical evidence under such circumstances, without fee or reward, our readers will surely sympathise with the medical officer who has to perform the tedious, unpleasant, and even dangerous process of an efficient post-mortem examination without suitable payment. We can hardly conceive that such a practical injustice was contemplated when this clause was originally introduced. Nor can we see why this disagreeable and dangerous task should be imposed on officers of public institutions as an *extra official* duty without a liberal and suitable payment being provided. Nay, more: we believe it has occurred more than once that in case of a person dying in an infirmary, for instance, and subsequently being removed to an adjoining county burial-ground, where exhumation and a post-mortem examination were subsequently considered necessary, the surgeon under whose care the patient originally happened to be placed had to

travel many miles, spend his time, and undergo the *désagrément*s of an exhumation, and be then incapable of receiving any fee, because he held a position which was in itself a guarantee of his being a valuable public officer.

Can anything be more unjust?

Again, it not unfrequently happens that persons are brought to hospital in *extremis*, or are found absolutely to be dead on being brought there. The surgeon at the hospital examines, and has the opportunity of observing the body immediately on the death of the patient; yet, if he gives evidence, or performs a post-mortem examination, he can get no payment; while if the body be removed elsewhere, a friend of the coroner's, possibly a mere tyro, or one selected for his political or religious proclivities, or who may have private opportunities of obliging the coroner, or who may happen to reside "at or near the place," yet be possibly inferior in experience, status, or qualification, may perform a post-mortem, give evidence, and be paid the fees which obviously would have of right belonged to the medical officer of the institution to which the patient was brought originally. We hold that the medical officer of a public institution is entitled to be paid for giving his testimony as an expert, and also for filling the very disagreeable duty of performing post-mortem examinations, and we must believe that such an injustice was never contemplated.

The clause in the Act directing that in case medical evidence is sought, the medical practitioner "at or near the place" of holding the inquest is to be chosen by the coroner, has led to much dissatisfaction. "At or near the place" is variously construed. Sometimes the medical witness is brought on the side car with the coroner from a distance, but being so happily situated, is certainly "at or near the place," his fee, however, we have heard it hinted, being liable to diminution by paying the whole or half the coroner's car hire. Sometimes it may be the "mountain is brought to Mahomet" in the shape of the dead body, which, being found, say, by the road side, is directed to be removed to "at or near the place" where the medical friend, social or political, or co-religionist, or possibly coadjutor of the medical coroner, is resident, and who will be enabled to give evidence with the minimum of inconvenience and the maximum of facility of affording suitable "entertainment for man and beast" when the court is dismissed. It is now sought that in the first instance, where it is practicable, the medical practitioner who had seen the patient when alive, and who had a knowledge of his disease, should be called in to give evidence, as thus public time and money would be economised, and should this evidence not be available, then, that the practitioner residing *nearest* to the place, and more particularly the dispensary officer in whose district the death occurred, should be summoned. Of course, it is always in the power of the coroner and jury to call in other medical evidence in dubious or difficult cases.

It is proposed that in future the fee for performing a post-mortem examination shall be two guineas, but that in difficult and protracted cases it may, at the option of the coroner and jury, be increased to £5. 5s.

It is also sought that in future travelling expenses at the same rate as the coroner shall be allowed to medical witnesses, as it is specially unreasonable that no provision

for travelling expenses should be made to medical men in the country.

There are other suggestions made as to details; the more important we have thought it well to remark on, and to draw the attention of our readers to what is doing. Complaints are constant and loud as to unfairness and partiality, both medical and political, which should not be concerned in such inquiries; we therefore commend to the medical practitioners throughout the country the action taken in this matter, and would urge the desirability of union and of energetically appealing to those in power for the redress of grievances so obvious and practically too well known to, we believe, not a few.

RULES OF HEALTH IN CONTAGIOUS DISEASES.

THE suggestions made by the Society of Medical Officers of Health for the guidance of persons in cases of fever or other infectious diseases, although not new, are of obvious utility. They first of all urge separation of the sick from the other members of the family as soon as illness appears, and advise that the sick person be placed, if possible, in an upper room, where all carpets, curtains, and unnecessary furniture must be removed. Fresh air is to be admitted to the room by opening the upper window-sash. The fire-place to be kept open, and a fire lighted if the weather be not too hot; whilst fresh air is to be freely admitted through the whole house by means of open windows and doors, with the object, of course, of diluting the contagion.

The advice is then given to hang up a sheet outside the door of the sick room, and keep it wet with a mixture made either with a quarter of a pint of carbolic acid (No. 4) or a pound of chloride of lime and a gallon of water. The floor to be frequently sprinkled with similar disinfectants, and cloths wetted with them should be hung up in the room. Everything that passes from the sick person should be received into vessels containing half a pint of solution of green copperas, made by dissolving one pound in a gallon of water. Every sink, closet, or privy should have a quantity of one of these disinfectants poured in daily, and the greatest care should be taken to prevent the contamination of wells or drinking water by any discharges from the sick. All cups, glasses, &c., used by the sick should, it is advised, be first washed in the above solutions of carbolic acid, and then in hot water, before being used by other persons, and no article of food should remain in the sick-room or be given to anyone else after being in the sick-room. The linen of the bed and that worn by the patient should as soon as it is removed be put into the carbolic acid solution, and remain in it at least half an hour, afterwards being boiled in water. Instead of handkerchiefs small pieces of rag are recommended, which can be burnt when soiled.

It is advised that all persons attending on persons with infectious diseases should abstain from the use of woollen garments, as they are apt to retain infection; they should wear cotton or linen dresses, which can be washed. The nurses, too, are directed always to wash immediately after attending to the sick person, and to use carbolic acid soap. It is further well urged that no visitors should be allowed to the sick, save those absolutely necessary, as the clothing

of visitors is so apt to carry away infection. This may well remind us of the arguments often so strenuously urged as to the necessity of all practitioners who attend many labours entirely abstaining from attendance on cases of scarlatina or other infectious fevers so long as attending obstetric practice.

With regard to scarlet fever, it is advised that the scales and dusty powder which peel from the skin in this disease, and the crusts in small-pox, as they are highly infectious, may be prevented from escaping by smearing the body of the patient over every day with camphorated oil. This practice, conjoined with the use of warm baths and carbolic acid soap, is most essential. With regard to the date of convalescence, it is well remarked that the sick person must not be allowed to mix with the rest of the family until peeling off has quite ceased and the skin is quite smooth again, and all clothes used during the time of illness, or in any way exposed to infection, must not be worn again until they are properly disinfected.

When the illness is over comes the disinfecting and cleansing of the sick-room. This should be done in the following way:—All articles of clothing and bedding should be spread out and hung upon lines. The fire-place, windows, and other openings are to be closed, and half a pound of sulphur is to be put in an iron dish over a pail of water, and there burnt so as to let the fumes of the sulphur attack every part of the room, &c., for twenty-four hours. After this the room is to be thoroughly ventilated by opening the doors and windows widely; the ceilings are to be whitewashed, and the paper stripped off the walls and burnt; whilst the furniture, and all wood and painted work is to be thoroughly washed with soap and water with a little chloride of lime mingled with it. In addition to this, beds, mattresses, and articles which cannot well be washed should, if possible, be submitted to the action of heat in a disinfecting chamber, provided, if possible, by the local authorities. Until all this is done, the room should not be occupied.

Some excellent advice is given about the danger of children attending school. No child from a house where there is infectious disease should be allowed to attend school, even although the child be itself well, as it may carry infection, and thus spread the disease to many. And no child should be allowed to re-enter school without a certificate from the medical attendant allowing it to do so without danger to the rest.

Finally, in case the patient die, it is recommended that the body should not be removed from the room unless to carry it to a public mortuary. The body should be put into a coffin as soon as possible, with a pound or two of carbolic acid, and the coffin should be fastened down and burial take place without any delay.

THE National Health Society has organised a series of lectures on ventilation and cleanliness in the East-end of London, and the first of the series was lately delivered by Miss M'Cormick. This lecture was attended by some 150 women, and was illustrated by a few experiments showing the poisonous nature of carbonic acid gas prevalent in all crowded and ill-ventilated apartments. The audience was very attentive, and evidently took away many interesting facts for home use.

Notes on Current Topics.

Mortality of Infants.

THE mortality of infants is still very high, when compared with what it might be. In Sunderland, in 1874, the deaths of children under five years amounted to nearly one-half of the total mortality. Dr. Yeld found that of 102 cases attributed to the commonest of children's diseases, 71 or 66 per cent. had been fed by the bottle. That this method requires the most scrupulous care is well known, and we fear that among the poorer classes this care is often wanting.

Dr. Haviland on the Causes of Consumption.

DR. HAVILAND, Medical Officer of Health, showed, at a meeting held in Northamptonshire lately, that consumption in his district could not be attributed to the usually-assumed causes, viz., the cold climate of the valley of the Nene and the damp and clay soil of the district, for, out of a population of 10,908, only 3,654 were exposed to that peculiar climate, while three only of the twenty villages of the area lay upon the objectionable soil. Looking out for other causes—over-crowding and dilapidated houses—Dr. Haviland asserted these were the two evils that destroyed the mothers and rendered their offspring weakly, so that their premature mortality went to increase the general death-rate. He urged upon them the necessity of at once prohibiting grown-up sons and daughters earning their own living from encumbering the narrow chambers of their parents, where the younger members of the family are obliged to remain. If they could not build better and more commodious cottages, they could at least thin out those now pestiferously over-crowded.

Dr. Bouchut on Cerebroscopy.

AT one of the recent clinical lectures at the *Hôpital des Enfants-Malades* (*La France Méd.*, No. 25) Dr. Bouchut invited a certain number of medical men of Paris to demonstrate to them the result of his labours on the ophthalmoscope in medicine, and his opinions on cerebroscopy. He firstly pointed out the anatomical and physiological relations of the eye with the brain and spinal cord, in order to explain the influence of cerebro-spinal lesions upon the optic nerve, the retina, and choroid. He then indicated the laws of the formation of intra-ocular lesion dependent on diseases of the brain, the cord, or the meninges. These laws are four in number. Whenever the circulation is disturbed in the cranium or in the meningeal veins and sinuses by the compression of the ventricles distended by serosity or by any other cause, there takes place an arrest of the venous circulation, which produces in the eye swelling, hyperæmia, and œdema of the papilla, with varicosity of the veins, and sometimes hæmorrhages. When a tumour with encephalitis, or when a partial encephalitis exists, there ensues a descending inflammation, which brings about sclerosis of the optic nerve, and exudations which surround the papilla, and finally cause its atrophy.

If the cord be diseased by anterior or posterior hardening, as this organ, because of its relations with the great

sympathetic, never acts on the eye, there results a hyperæmia of the disc, which in time produces atrophy. This is seen in cases of locomotor ataxia.

In all diatheses and poisonings when the organism suffers the eye suffers with the rest of the body, and there result certain forms of neuritis or of choroiditis.

Malignant Stricture of the Oesophagus— Adenoma of Breast.

DR. ERSKINE MASON lately presented to the New York Pathological Society a specimen of cancerous growth of the oesophagus, with the following history:—

A man, aged fifty-three, was admitted to the Coloured Home in October, 1874. He had always enjoyed perfect health until two months previous to his entering the home, when he began to lose strength. Two weeks before admission he began to experience a difficulty in swallowing, especially solid food, which, when taken, would meet with an obstruction at a point opposite the upper portion of the sternum, and he would immediately eject it. Liquids he could swallow, but with great difficulty. A bougie of the size of No. 18 of the urethral scale was introduced, and became arrested in its course by an obstruction situated at a distance of eight inches from the teeth; it then deviated to the right and passed through. Frothy blood and mucus were ejected after the operation. A diet of milk and beef tea was ordered. At the end of a week Nos. 5 and 6 oesophageal bougies were introduced, after which raw oysters were swallowed, but with great difficulty.

His strength gradually failed, and he died shortly afterward. Some aphonia was present. He felt no pain at any period of the disease, but on the day previous to his death he complained of pains all over his body.

Autopsy.—Three inches above the pylorus a mass was seen involving the anterior portion of the oesophagus, measuring five and a quarter inches in circumference, and four inches in length. It was nodulated, of a white colour, moderately vascular, and traversed longitudinally by a channel. The tumour was given to Dr. Arnold for microscopical examination.

The other specimen presented by Dr. Mason was one half of the right breast, which was removed from a patient in Roosevelt Hospital. An unmarried woman, aged thirty-two, had always enjoyed good health. She never received any injury of the breast. Eight years ago she had noticed a circumscribed hardness of the right breast, which gave no further trouble until four years after, when it began to grow rapidly. On examination the tumour was found to be movable. The nipple was not retracted and the skin of the breast not discoloured. There never was any lymphatic enlargement. She experienced no pain until a few months ago, when she would occasionally feel a slight twinge at the seat of the tumour. The patient applied to the hospital on account of the weight of her right breast. Dr. Mason regarded the tumour as an adenoma. He replied in the negative when asked by Dr. Sayre if the patient who suffered from the oesophageal stricture had ever injured the parts by swallowing fish bones. Dr. Mason said that when stricture of the oesophagus was caused by injury, the stricture was annular, and did not involve a large amount of tissue. The president stated

that in these cancers ulceration generally occurred, but that process had not taken place in the present case.

With respect to the adenoma of the breast, he said it belonged to a class of tumours which consist almost entirely of fibrous tissue. In the normal tissue a few acini and cysts are buried, the whole mass being separable from the skin. On account of their structure they are not malignant.

Gosselin on Tumours of the Testicle.

DR. GOSSELIN (*France Méd.*, No. 24) says that for a long time in France no one believed in the existence of chronic simple orchitis. Everyone willingly admitted that there were tubercular or syphilitic cases; but as to chronic simple orchitis, no one said a word. Nélaton made the first step, and has clearly established the difference. If in France practitioners were silent about chronic simple orchitis, in England, where it was described, all was confusion. It suffices, indeed, to read the treatise on diseases of the testes by Curling in order to see that in his description of chronic orchitis there was a little of everything. Curling speaks of softening of the tubercular matter, of fistulous sinuses, of adhesions, and describes the symptoms of the tertiary accidents of syphilis and of the syphilitic testes. He even adds the characters of fungus of the testes. In this way it becomes impossible to understand anything in the midst of this chaos, where there are found the symptoms of three diseases grouped together pell-mell, out of the *ensemble* of which the English author has wished to form a special affection.

Dr. Gosselin says that in his eye there is a great analogy between the characters assigned by Nélaton to simple chronic orchitis and the symptoms in the case before him. These were slight augmentation of volume, slow, progressive enlargement, slight increase of sensibility, a slight effusion into the tunica vaginalis. Masturbation is one cause which might be mentioned; but the boy says the disease commenced when he was 8 years old. And besides, these chronic cases of orchitis from masturbation have characters similar to those caused by metastasis from mumps—that is, they often cause atrophy. Boisson and Boyer have described chronic orchitis of rheumatismal origin. As to tubercular orchitis, most generally the epididymis becomes infiltrated with tubercle, and in a short time the tubercles soften, and cause fistulas to appear. The syphilitic testis augments very slowly in volume, and is almost indolent. The testis alone is attacked, as in the case before us. Dr. Gosselin therefore considered this to be a case of hereditary syphilitic sarcocele occurring in a young man of 16. He ordered iodide of potassium and mercurial ointment.

Epistaxis cured by Pressure on the Facial Arteries.

DR. BEVERLEY ROBINSON (*Med. Record*, New York, March 20) mentions a case where compression of the facial arteries proved successful in arresting epistaxis when styptics had proved ineffectual. These arteries were compressed upon the superior maxillary bones, just before they reach the ala of the nose, by means of two small pads of lint. These pads were sewed to a piece of

tape at the proper distance from one another, and the ends of the tape were passed across the cheeks and above the ears and tied securely behind the occipital bone.

The Germ Theory of Disease.

THE expected debate in the Pathological Society of London brought together a large gathering of the fellows of that society last week. Dr. Charlton Bastian opened the debate by mentioning the analogy between zymotic processes and ferments, for in each case particles set up processes resulting in the reproduction of others resembling them. He preferred Liebig's theory to that of Pasteur. Contagion multiplies within the body in a manner comparable to organic growth and multiplication. Bacteria, which are not present in the blood of healthy persons, are met with in a few hours after death in abundance. He contended that these had a relation of cause and effect with infection, and were not mere carriers of infection. They were pathological products produced within the body, just as there is fatty degeneration.

Dr. Burdon Sanderson said that bacteria identical with those found in diseased tissues might be introduced into the body without injury; and, in destructive inflammation bacteria are found only in the outer zone of the disease, where it was spread, and not in the central parts. In relapsing fever spirallæ were only found during the febrile paroxysms, and not subsequently. In erysipelas and sheep-pock bacteria are not found in the vesicles, but in the skin lymphatics. The discussion was then adjourned.

Singular Injury to a Fœtus.

THE *Live Stock Journal* of April 9th mentions the following curious case, which may lead to theories of various shapes, but which is, at all events, a singular phenomenon:—

‘A curious case of injury to an unborn calf was brought to light during a recent stay in Surrey. That a fœtus does not breathe during the time of its “pre-historic” captivity, but if inspiration is prevented by any obstacle for a minute or so after birth, the consequence will be immediate death, is known to every inquirer; but that the body of the mother is a sufficient protection to the vital organs, and that their development goes on in the absence of a large portion of the natural envelope, is not so patent; yet in this case it is clearly proved, as is the fact that a position which no contortionist can approach does not prevent growth and action. The calf was brought forth by a Jersey cow, in the night, and unattended. The spine was doubled back at the loins, the hind quarters being turned over until the hips rested upon the shoulders. The four legs lay all together, and from pressure the knees were in the same position as, and had taken the form of the hocks, the joint working backwards when the foot was lifted. The abdomen was torn quite across and up to the loins, so that the intestines and viscera were exposed. The cow was addicted to jumping over fences, which amusement is supposed to have brought about the injury; and that it was done at an early period of gestation is demonstrated by the fact that no hair had grown where the skin of the back and

shoulders were in contact, and that the two portions of skin had partially united. Nevertheless, the young animal, which was half-bred Shorthorn, had grown to the usual size of a Jersey calf at birth; the head was well-formed and quite healthy-looking, and the roan hair was long and abundant. It had unquestionably been alive within a few hours, but if living when calved, it would probably die in a few seconds from the shock of exposure to the atmosphere.”

The Great American Doctor.

It is now somewhere near eighteen years since Montreal was distinguished by having among its residents, for the greater part of one year, a man of whom the *Canada Medical Journal* gives a biography, and who, under the name of “Tumblety,” the great Indian Doctor, made something of a stir, not alone among the uneducated, but among many whose position should have prevented so barefaced an imposition. He filled columns of our daily papers with cheaply purchased certificates, drove a fast horse and a flashy-looking carriage, and for half a season was a clever adroit at humbugging not a few out of considerable sums of money. Suddenly as he appeared on the Montreal stage, he about as suddenly departed, and during the long interval which has elapsed from that time to this we have not till a few days ago heard of him, or even seen his name mentioned. Under the title of the *Great American Doctor*, Tumblety has again come to the front at Liverpool, and that, too, in not the most enviable light. A man consulted him, and was given a variety of medicines, among the rest, a mixture, of which he took a dose, one tablespoonful, and died the same night. A certificate of death being requested from Tumblety, he refused to give it, and returned the fee (thirty shillings) which had been paid to him. Although a post-mortem was held, no evidence of poisoning could be made out, and the verdict was death from natural causes. The *Canada Medical Journal* notes this case to show, firstly, that our brethren across the Atlantic are as easily imposed on as thousands are with us, by the veriest quacks; and, secondly, that these quacks obtain from the working classes fees for single consultations which they would grudgingly pay to a regular practitioner for a month's work.

“Pygmalion and Galatea” in a Lunatic Asylum.

THE Easter holidays at the West Riding Asylum, Wakefield, were marked by the performance of “Pygmalion and Galatea” by a party of amiable amateurs, superintended by Mr. Gilbert, the author of the play, who also played his part.

An Aquarium in Edinburgh.

MR. RALPH RICHARDSON writes to *Nature* that a large aquarium is likely soon to be erected in Edinburgh. A company named the “Edinburgh Winter-Garden, Theatre, and Aquarium Company,” proposes to provide at the West-end of Edinburgh a large and well-stocked aquarium on a scale not inferior to that of Brighton or the Crystal Palace.

Ether Drunkenness.

OUR readers will remember the notorious cases of drunkenness reported as existing in the north of Ireland. It would seem that Ireland is not the only country where ether is preferred as an intoxicant, for Dr. Ewald, of Berlin (*London Medical Record*), mentions the case of a man aged 32, lately a patient of Frerich's at the Charité Hospital, who was well known as practising ether-drinking to a great extent. He was admitted for general debility and muscular tremors. Originally temperate, he had been a student at the University, and passed his examinations with

credit, but was of a mystical turn of mind, and meeting with a popular book upon medicine, he remarked in it a description of the powers of ether in quickening the mental powers. He accordingly inhaled some of the vapour by means of pouring the drug upon a handkerchief. He did this even as he went along the streets. He was turned out of his lodgings on account of the smell of his breath, and took to wandering without a home. He had not lost his memory, nor was his mind affected. An attempt was made to anæsthetise him, but it required seven ounces to do so, and the moment the inhalation ceased he awoke. His susceptibility to the action of cannabis indica was not impaired.

The late Mr. J. D. Hill.

THE early death of Mr. John D. Hill, F.R.C.S., illustrates the perils to which we are exposed in our profession. In fulfilling with ardour his duties as Surgeon to the Royal Free Hospital, he contracted the disease which last week carried him off. Those who knew his excellent qualities will deeply regret that he has so soon been removed from his sphere of usefulness. We knew him well enough to warrant our saying thus much. More it is scarcely worth while to add.

The Fatal Balloon Experiment.

WITH respect to the cause of death of the bold French experimenters, MM. Sivel and Croce-Spinelli, it seems evidently, we think, to have been asphyxia; and it may be as well to state clearly what are the necessary conditions of asphyxia. When any mechanical cause hinders the free entrance of air into the lungs, or when the gaseous medium which surrounds the animal does not contain oxygen, or contains it in insufficient quantity, the exit of carbonic acid from the blood becomes diminished. The blood does not get free, or becomes so incompletely, from this gas, in its passage through the lungs; then, as it receives little or no oxygen, and keeps always receiving more carbonic acid, from the incessant combustion resulting from nutrition, it quickly assumes the properties of venous blood. In this condition it becomes unfit to keep up the functions of the nerves. Hence arise disturbances of the organs of sense, and these are the preludes of the phenomena of asphyxia. This effect is very rapid. The non-vivifying action of the blood on the nervous system, again, acts by the agency of this system on the pulsations of the heart, which, although they persist, become altered in energy and rhythm. It is also complicated by the embarrassing of the capillary system, especially that in the lungs.

It is this last-named phenomenon, indeed (an immediate consequence of the disturbance of the nerve influence on the circulation), which explains the rapidity of death, rather than the non-oxygenation of the blood itself. The absence of oxygen, by modifying the composition of the blood, constitutes, it is true, the commencing fact, and even the existence of asphyxia; but the arrest of the circulation of the blood in the lungs precipitates the result.

It seems to us highly probable that the cause of the asphyxia in this melancholy case was the over-rarefied condition of the atmosphere, which did not afford sufficient

oxygen to carry on the functions of the nerves or the circulation of the blood through the lungs. We know of no facts to contradict this supposition, and much that we do not would lead us to entertain it.

We understand that Mr. John Hamilton, who was recently appointed Surgeon-in-Ordinary to Her Majesty the Queen in Ireland, in the room of Dr. Robert Adams, has resigned his office of Surgeon to the Richmond Hospital, which he has held for many years. The vacancy is not yet actually declared.

THE mortality of London during the first week in April reached the rate of 29 per 1,000 annually.

ST. MARY'S HOSPITAL, Paddington, is to be closed for a period of two or three months to be cleansed and for other sanitary purposes.

MR. FREDERICK PEEK, one of the most distinguished students of St. Thomas's Hospital, has died of typhoid fever within the hospital.

DR. THEODORE WILLIAMS has been appointed Lettsomian Lecturer for next session of the Medical Society.

CONVERSAZIONE AT THE ROYAL COLLEGE OF SURGEONS, DUBLIN.

THE College of Surgeons, Dublin, has had the honour of entertaining His Grace the Duke of Abercorn at a scientific evening and *conversazione* on Thursday evening last.

The entire suite of rooms were thrown open, and many objects of interest and novelty were exhibited.

His Grace arrived at half-past nine o'clock, accompanied by members of his household, and was received by the President and the Members of Council, the Examiners and Professors, in their robes, and was conducted through the museum, board-room, and libraries of the College. The following objects were exhibited:—

Professor C. A. CAMERON—An apparatus showing the influence of magnetism on light. A beam of electric light revolving round an electro-magnet. Giesler's Electric Tubes. Experiments illustrative of the Dissociation of Ammonium Salts, and of the Detection of Adulteration by Fluorescence.

Mr. GEORGE PORTE—By means of the Lime-light Microscope, Magnified Views of the Compound Eyes of the Gnat, Fly, and Beetle; the latter showing the crystalline lenses. Typical Antennæ—the moniliform antennæ, the plumose antennæ, the bipectinate antennæ, and laminate antennæ. Four typical Tongues of Insects—the soft, fleshy tongue of the Cricket, the haustellate tongues of Fly and Butterfly, and the tongue of the Bee. The Foot of Spider and Common Fly. The Foot of Dytiscus. Stings of Wasp. Ovipositor of Ichneumon, and the Saws of the Saw-fly.

In the board-room the following objects were exhibited:—

Dr. FRAZER—Wax Models of Medals made by the Mosops, and a Collection of Medals in various Metals. Cibotium Barometz, or Tartarian Lamb, from Pekin. Bones of the Fossil Elk. Bronze Mortar of 1654. Prepared Ferruginous Cotton, &c.

Mr. ARTHUR ANDREWS—Microscopic Preparations: A Specimen of an exceedingly rare Entomostracan.

Dr. JOHN BARKER—Some Glass Models of Hydrozoa. A Nest of Carpenter Bee.

Professor M'NAB—Microscopic Preparations: Embryos of Shepherd's Purse (*Capsella Bursa-pastoris*) in different stages of development.

Dr. DAVID MOORE—A collection of Rare Flowers.
Mr. EDWARD CROWE—Microscopic Preparations: Specimens of *Gonium pectorale*, *Pandorina*, and *Euglena viridis*.
The Rev. EUGENE O'MEARA—Microscopic Preparations: Undescribed Diatomaceæ, from Demerara, gathered from the river silt.

Professor MACALISTER—Pigmy Hippopotamus from Liberia. Nest of the Oven Bird, *Geobates Brasiliensis*. Edible Swallow's Nest, *Collocalia esculenta*, from Button Island. Magpie with Amputated Limb, and an Ancient Irish Skull, from the silt beds beneath peat, Co. Armagh.

Mr. WILLIAM ARCHER—Microscopic Preparations: *Hydra viridis*. *Dinocharis pocillum*. *Anurea squamata* (Rotatoria). Fructification in the Fresh Water Alga, *Vaucheria sessilis*. Some Zygospores of Desmidiæ. "Spermatie" Condition of *Volvox globator*, and incipient in similar condition in *Pandorina*. *Mougeotia glyptosperma* with Zygospores. One of the prettiest of "Conjugate," a group of Fresh Water Alga. A remarkable and novel View of "Secondary Deposit" in the Cells of the Marine Germs of Rhodospematous Alga, *Ballia*, consisting of a Hemispherical Lid or Cover placed immediately over certain "Pits" in the Laminated Wall of the Cells.

Mr. JAMES ROBINSON—Microscopic Preparations: *Cyclois* in *Vallisneria*. Bouquets of Flowers composed of the Scales of Beetles and Butterflies. Whole Diamond Beetle; and Polariscope, with Selenite Designs; also a Stereoscope, and a Kaleidoscope.

Mr. FRANCIS ROBERT DAVIS—"Heraldic Illumination—Appliqué Work." (This is a very rare book, and has been valued at £150.)

Mr. JOSEPH WOODWORTH—Apparatus for Taking Photographs of Microscopic Objects, with Specimens.

Alderman PURDON—A Specimen of the Colorado Beetle.

Mr. T. H. SANGER—*Limnoria terebrans*, the Crustacean which destroyed the Telegraph Cable between Howth and Holyhead, with Portions of the injured Cable.

Dr. TICHBORNE, Ph.D.—Recent Contributions to Organic Chemistry and Materia Medica.

Dr. BIGGER—Picture, supposed to be by Rubens. Original copy of the Koran. Pen and Ink Sketch of Yeh, the Chinese Mandarin. Chinese Work on Medicine. Nest of the "Trap-door" Spider. An Andrea Ferrara Sword.

Dr. BOOKEY—An Articulated Human Cranium. Model of Human Face. A Butterfly formed of Phosphorescent Salts.

The Vice-President, Mr. E. HAMILTON—Stuffed Specimen of *Apteryx Owenii*.

Professor BARRETT, F.R.S.E.—Tisley's Compound Pendulum for exhibiting the Curves produced by the Combination of Rectangular Vibrations. Barrett's Tonophant, a simple arrangement for the same object. New Form of Magnetometer and Torsion Balance combined. Apparatus for exhibiting Mr. Gore's Discovery of the Anomalous Expansion of Iron Wire at a Red Heat. Apparatus for showing Professor Barrett's discovery of the "After-Glow" in Cooling Iron Wire.

Professor HULL—Photographs of Eozoon Canadense.

Professor MINCHIN—Cutting from a Pane of Glass.

Mr. DRAPER—Specimens of *Eucalyptus globulus*.

His Grace left at eleven o'clock, having expressed his gratification at the reception given him and the interest afforded by the various specimens exhibited.

Over 700 guests received invitations, and together with a large number of the Fellows filled even the spacious rooms of the College.

It is hoped that the next *conversazione* will be held at the inauguration of the new library and pathological museum, of which plans are already accepted, and which will very shortly be in process of erection.

The Origin of Scirrhus.

S. WOLFFBERG, of Erlangen, has satisfied himself that scirrhus of the breast originates in the epithelium, either of the alveoli of the gland or of the excretory ducts; the former epithelium presenting the glandular, the latter the columnar form. The connective tissue of the gland participates under very various forms in the growth of the tumour, but the endothelium of the lymphatics is not implicated.—*Virchow's Archiv.*, and *American Practitioner*.

Literature.

THERAPEUTIC MEANS FOR THE RELIEF OF PAIN. (a)

THERE are probably few single subjects connected with medicine of greater moment than the means of relieving pain; and it is worthy of remark that Nature seems to have afforded a great variety of means for so doing. The very number of drugs which exist, all of which have in turn been useful, is remarkable. With one and all of these the medical man cannot be too familiar. Many a doctor's fame has turned on the point of his being able to relieve pain, and more particularly after others had failed. Nor need we wonder at this; for pain is in itself such a trial, even to the strongest, that all rush instinctively somewhere for relief, and the man who is fortunately able to relieve it must be looked on with respect and confidence. Pain, too, is of a very widespread character, and few are the diseases in which it is not a leading symptom. Besides, too, it is often the sole symptom from which the patient suffers; so that whether it be but a portion of another disease, if we may so speak of it, or one *per se*, it is the most important symptom with which the practitioner has to deal. It is not our business here to enter into the several varieties of pain; they are well known to most of us. But we are not sure the author of the work before us has entered into them in such a way as it seems to us a work of the kind might be expected to do. Much, very much, depends on recognising the character of the pain which we have to conquer; still more on the causes which give rise to it, and which we consider a very important, if not the most important, part of the subject. We have known a number of cases of suffering, in one form or other, which entirely baffled the practitioner, and this simply because the source of the pain was undetected. The moment, however, the cause was made out, the pain then ceased like a charm. It is quite true that in many instances the cause cannot be made out. But this should not prevent us from using our best efforts to ascertain it, and so far rendering medicine more worthy the name of a science.

The work before us has resulted from the "Medical Society of London"—a very ancient and well-known institution—having offered its yearly prize for the best essay on the "Relief of Pain," and having awarded it to this essay. Taken as a whole, it seems to us a valuable contribution on the subject of which it treats, and it will have been observed from the title-page that the author is a resident of Bath, and therefore the more entitled to praise. That the question should or could have been exhausted scarcely comes within the limits of possibility; for it is one of great extent, and no little difficulty, and besides, it is a subject on which everyone must, in a degree at least, build up an experience for themselves, just as with other points in medicine, which no books can teach nor lectures convey. We have already noticed the fact that the author might have given us more definite descriptions of the several kinds of pain; and this leads us to state further, that in the chapter on the nature of pain he quotes largely the views of the late Dr. Anstie on the subject. We must say it has ever seemed to us that this lamented physician had taken up too narrow a view of the matter, and always spoke as if pain were owing to a lowered state of the system only, and was necessarily to be treated by tonics and good diet. We do not accept this view, for we know as a matter of experience that the very opposite plan will often prove successful. There are, it has always appeared to us, two states of the nervous system which give rise to pain—the one in which the tone of the system

is lowered, and the individual, speaking generally, is known to be out of health; the other the very opposite of this, that is, the nervous influence, whatever it be, is in excess; just as occurs with the blood, which we know may be too rich in its component parts, or in too great quantity for the purposes of health. That something analogous to this occurs in the nervous system we take to be certain. We would instance gout as an example in point, and also the neuralgia we meet in the middle and upper classes. Now the treatment of these cases is essentially different from those where the tone of the system is too low, and if they be treated as such the treatment will surely fail. In place of tonics and nourishing food, purgatives and a strictly regulated diet, as regards both food and drink, are required. But we are not called on here to enter farther into the subject.

In the chapter on the relief of pain, which indeed constitutes the greater part of the volume, the reader will find very ample directions, and a great variety of remedies for same. We think, however, that for some affections the author confines himself too exclusively to local applications; thus, we might take as an example, diseases of the female genital organs, in which we do not find a single remark on the value of constitutional treatment. Now we would not underrate local treatment in these cases, but we can state positively that very many of such cases will not get well till constitutional remedies are used; and if we were tied to one class of remedies we believe more advantage would arise from the latter than the former. Long before the means for diagnosing these affections had reached their present state of perfection these cases were cured by general treatment. Hence the rule, as it appears to us, ought to be to use both, and we would suggest to the author that in the next edition he would add the constitutional treatment. Neither does this point apply to one class of diseases alone, but to all, and especially where pain constitutes an important element in the case. This subject, and viewed in the aspect we are now considering, is, we repeat, of paramount importance, and, were it necessary, we could illustrate it by a great number of cases. But enough has been said to direct the author's attention to the matter.

The remarks just made lead us on to the most important point which may be said to belong to the local relief of pain—we mean its treatment by the subcutaneous injection of some anodyne, but chiefly morphia. Of the immense power which medicine used in this way possesses we need not here speak, except to add to the author's caution on the matter. We believe that if we do not know the patient and his constitution, even a quarter of a grain of morphia is too much to begin with. But it is in another aspect we allude to the subject here. We believe that by trusting too much to this mode of treatment we are often foiled; for though very few cases resist the effects of morphia so used, and pain is allayed at the time, it by no means follows that the disease is cured; and when we read at page 191 that the plan was specially useful for cases of dyspepsia marked by "foul breath, thirst, and loaded tongue," we at once conclude that the remedy is here used in the wrong place, and must necessarily fail; at least, it has done so in our hands: for we know, as a matter of experience, that the secretions ought to be set right first, and then the morphia, and not till then, may be used with the happiest effects; in truth, the plan has been carried too far, and so often fails: and we would add that, for so far, we have seen no cases of real disease, whether acute or chronic, which have been cured by subcutaneous injection alone. The pains of neuralgia, sciatica, &c., are no doubt allayed, but the patient is not cured; and on the whole, we think the best physician will be the man who, whilst not neglecting the use of morphia under the skin, will at the same time pay every attention to correcting the secretions, as we believe that in the vast majority of instances these will be found more or less deranged. But the subject is too extensive to pursue further here. We shall only make one other remark now, in reference to the use of morphia in any way when the heart is at all weakened.

(a) "Therapeutic Means for the Relief of Pain." Being the Prize Essay for which the Medical Society of London awarded the Fothergillian Gold Medal in 1874. By John Kent Spender, M.D. London; Associate of King's College, London; Surgeon to the Mineral Waters Hospital, Bath. London: Macmillan and Co. 1874. Pp. 230.

Cautious as we should ever be, our caution should be doubled now, for ordinary doses may prove fatal, even when given by the mouth: how much more need if used subcutaneously we need not say.

We conclude our notice of this work by strongly recommending it to our readers. They will find in it a great deal of valuable information bearing on one of the most practical points in all medicine.

Correspondence.

BELLADONNA AS A PROPHYLACTIC IN SCARLATINA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—There appeared in your valuable journal of the 31st ult. an article headed "Belladonna as a Prophylactic of Scarletina," from the pen of Dr. William Carleton, on which, with your kind permission, I will make a few observations.

The supposed prophylactic properties of belladonna is no new discovery to British physicians. It has been advocated by German physicians many years ago that it was an undoubted prophylactic of scarlatina—an advocacy which Dr. Carleton apparently attempts to confirm, or at least strengthen. Dr. Neligan has said that experience has fully confirmed its powers in preventing the spread of scarlatina, where many young persons are congregated together, and in support of this he cites the investigations of M. Lecointe, of Paris, in which 2,227 children and adults had been preserved from scarlatina by its use; those at Langendorf, in Prussia, where, in the Orphan Hospital, out of 160 inmates to whom the drug was administered immediately on the breaking out of an epidemic, but 2 contracted the disease; and those of Dr. Newbigging, in Watson's Institution in Edinburgh, where, 69 children exposed to the contagion, but 3 took the disease. The foregoing will, no doubt, at first sight appear very conclusive evidence of the drug's prophylactic properties; and my reason for referring to the opinion of Neligan with the investigations of others is simply to strengthen the argument against myself, as my opponents hereafter might probably make use of said opinion and investigations in support of their opinions, and I am anxious to save them all the trouble in my power. A physician should always, in my opinion, endeavour to confirm his statements by some means, and not finish a contribution to medical literature by a thinking conclusion. The apparent efficacy of belladonna in one family as a prophylactic of scarlatina is no proof of its universal efficacy as a prophylactic of the same disease of an epidemic type. There was, as most Irish physicians know, an epidemic of scarlatina in Newry last summer. I was then assisting Dr. A. McBride, of that town—a gentleman not only second to none as a provincial physician, but also a profound therapist. I had, therefore, unusual opportunities of testing the supposed prophylactic virtues of belladonna. When the disease made its appearance in families by attacking individual members, I alternately prescribed belladonna to the unattacked members, and alternately trusted to nature. I kept a memorandum of all the cases at the time, with the intention of publishing the result of my experience, but I was unfortunately prevented from doing so, and precipitately destroyed my notes of the cases. I was, however, too much interested in the experiment to forget the result. I was at first partially convinced of the prophylactic powers of the drug, but experience of many cases proved to me that such was not the case. When I summed up all the cases and compared the results, I found the difference between nature and belladonna as prophylactic of scarlatina to be *nil*. I remember the disease visiting one house in which were four children, all of whom contracted the disease in its most virulent form. The houses at either side were occupied by large families, composed chiefly of children under fifteen years. I prescribed belladonna as a preventive remedy to the members of one family, and the others I directed to use chloride of lime as a disinfectant. The former family contracted the disease, which proved fatal to one of the children; the latter, remarkable to say, escaped. I have also tested the preventive properties of chloride of lime as a disinfectant, and am favourably impressed of its efficacy in preventing the spread of epidemics. I have witnessed two children out of eight in the same house contract malignant

scarlatina, whilst the others escaped—an occurrence which is too universally acknowledged by physicians to be doubted. In this case would Dr. Carleton, if he prescribed belladonna for those who escaped, be justified in attributing their escaping the disease to the fact of their having taken belladonna? A solitary instance of the effect of a certain medicine for a certain purpose is not proof of the virtue of that medicine for the same purpose. If a certain medicine prove repeatedly effectual when prescribed with the same object, then the prescriber will have something to write about, that is, if original, or in confirming the previously expressed but doubted opinions of others.

If Dr. Carleton or any of your readers feel inclined to discuss fairly the foregoing subject by way of correspondence in your valuable journal, I shall endeavour to throw as much light on the argument as in my power.

I am, Sir, your obedient servant,

JOHN LOWE,
Assistant-Surgeon Cyfarthfa Iron Works.

Merthyr Tydfil, 5th April, 1875.

Gleanings.

Removal of the Uterus.

By E. M. BARTLETT.

MRS. J. J. M., aged 18 years, was delivered, after a natural labour, of her first child, by a midwife, who, in her haste to remove the placenta, inverted the uterus and immediately left to attend another case of labour.

Mrs. M. passed four weeks in this condition without any marked untoward symptoms. At the end of a month, however, when she attempted to sit up, uterine hæmorrhage began. A physician was called, who, on examination, ascertained the abnormal condition of the uterus, and sent for a second physician. Together they made several fruitless attempts to replace the uterus. Patient then lay four years under the treatment of different physicians, one of whom treated her for prolapsus uteri by introducing a pessary.

Each catamenial period was attended with profuse and alarming hæmorrhage. Whenever the patient arose to her feet, uterine hæmorrhage came on. She was therefore confined constantly to her bed for four years, until she had become completely bed-ridden.

Dropsical effusion in her lower limbs had resulted from profuse and repeated hæmorrhage. Occasionally at her menstrual periods her physician was unable to detect the pulsation of an artery for twenty-four hours.

I was called to her in 1842, four years after the accident happened. She was then 22 years of age. On examination I discovered in the vagina a large tumour of a pyriform shape, larger at its base than at its superior extremity, but not attached by a very narrow pedicle and surrounded at its apex by the cervix uteri, between which and the tumour I could readily pass my finger. I found that I had a case of almost complete inversion of the uterus. I could find no evidence of scirrhus or carcinoma about the uterus. I decided to operate by removing the tumour as soon as cold weather returned. I had seen the report of the ligation and removal of the uterus by Newtham, of England, but no report of the operation having been performed in this country. I thought, however, that if European surgeons had the boldness to perform the operation, American surgeons ought to be bold enough to try it. I had no means of knowing what effect the cessation of her menses would have upon her general health. This was before the invention and introduction of the *écraseur*, else I should have used that instrument.

I commenced the operation Dec. 2, 1842, using a double cannula, so constructed that the ligature could be tightened by turning a screw. I applied the ligature, made of very strong silk, as high as possible, taking care to avoid including any part of the cervix uteri, by carrying the silk within the orifice. I strangulated the tumour effectually.

When I applied the ligature, it produced nausea, and fainting; I then loosened the screw, until the patient became perfectly easy. I gave her a dose of morphia immediately after applying the ligature; this was the only anodyne administered during the progress of the operation. I gave the screw one turn daily until the tumour was removed, which occurred 24 days after the ligature was applied. After the operation, the os uteri resumed its normal position. The ovaria were

not removed. She still lives in Pike county, Mo., and enjoys good health. She has not suffered from the suppression of her menses. She has a more masculine appearance than before. I afterwards presented the specimen to the St. Louis Medical College Museum, and am informed that Prof. M. M. Pallen exhibited it annually to his classes.—*St. Louis Medical and Surgical Journal*.

On Ligature of Ruptured Tendons.

THE dread of serious accidents after the introduction of sutures in tendons has long prevented surgeons from employing this treatment. Prof. König published a case of successful suture in tendon with catgut ligature, and hence Dr. Rochelt (*Wcin. Med. Presse*) has published his experiments on rabbits. He divided the tendo-Achillis in five rabbits, sewed the cut ends together with carbolised catgut, and then applied an immovable dressing. It appeared that the ligatures were all absorbed; and the operation was not followed by any dangerous reaction, and the animals regained complete use of the extremities.—*Med. Chir. Centralblatt*, and *N. Y. Med. Journal*.

Cure for Warts.

LISFRANC immerses the parts on which the warts are developed in a strong solution of black soap. This causes a slight cauterization of the surface of the wart. The loosened tissue is to be removed and the application repeated every day till the cure is complete. Oil of vitriol should never be used for this purpose; it is very irritating, and inflames the warts instead of curing them.—*Trib. Méd.*, No. 316, 1874. and *N. Y. Med. Journal*.

Cure of Intussusception by Enemata.

DR. B. C. SMITH (*Atlanta Med. J.*) thinks that most cases of invaginated intestine, and many of hernia, are curable by the distension method, if it is pushed sufficiently. He pumps water into the bowels to the extreme endurance of the patient, then desists for a few minutes, preventing its escape in the mean time, and then resumes the pumping, and so on until the obstruction yields. The effect of the distension in an upward direction, he says, is illustrated by the effect on hæmorrhoidal tumours, which, though in a state of protrusion and congestion, will be readily drawn in by distending the colon with water.—*Pacific Med. and Surg. J.*

Propylamine in Rheumatism.

LOWE, in the *Deutschen Militärärztlichen Zeitschrift*, reports excellent results from the exhibition of propylamine in the acute varieties of articular rheumatism. Its influence is shown by the rapid lowering of the temperature and the pulse rate (the latter at times to 48 beats), and also by the diminution of the pain and swelling. Profuse perspiration occurs in a few hours after its administration, and a marked improvement is observed after the second day at farthest. The duration of the disease is shortened from four to eight days, according to the intensity of the several cases. Lower finally claims that an accompanying heart affection forms no contra-indication for the administration of this medicine.

A Hairy Tumour in the Rectum.

DANZEL (*Archiv. für klin. Chirurg.*) reports the case of a tailoress, aged 25, on the anterior wall of whose rectum, two inches within the anus, he discovered a firm tumour with large bunches of hair, which latter extended outside the anus. The tumour was extirpated, but the patient succumbed at the end of three months after the perforation of the peritoneum. Microscopic examination showed the surface of the tumour to be covered with common epidermis. The tumour itself contained a tooth, rudiments of bone, fatty tissue, nerves, and finally, portions of brain tissue. The tumour is therefore to be considered as a true dermoid, which variety has, we believe, never before been found in this location.—*Centralblatt f. d. med. Wissenschaften*, Feb. 6, '75, and *The Clinic*.

Removal of Foreign Bodies from the Ear.

Let the surgeon take six inches, or as much as he pleases—it is always handy, and plenty of it—of horse-hair, double it into a loop; then having the patient placed on his side, pass the loop into the ear as far as it will go; turn it gently, and at first or second withdrawal the foreign body will come out in the loop. It gives no pain and cannot do damage.—*Atlanta Med. and Surg. Journal*.

Medical News.

Royal College of Surgeons of England.—The following gentlemen passed the primary examination in Anatomy and Physiology at meetings of the Court of Examiners on April 6th, 7th, and 8th:—W. J. Pycock, S. J. Wood, O. Tottie, and H. Lighton, Cambridge; H. J. D. Innes, G. R. Turner, and T. E. Worgan, St. George's Hospital; W. J. Cant, W. Leah, C. L. Williams, C. Bradford, and A. Pratt, Birmingham; B. J. Newmarch, W. T. Milles, and E. Thurston, King's College; W. S. O. Williams, Glasgow; P. A. Steedman, T. H. Gillam, A. R. Anderson, E. W. Walter, W. J. Haines, R. H. Schofield, St. Bartholomew's Hospital; R. Walker, C. F. Hawkins, M. Greenwood, E. Berdoe, and J. G. Clark, London Hospital; H. Davy, T. H. Berry, J. C. Uthoff, J. W. Meek, and P. Horrocks, Guy's Hospital; J. Wigglesworth, J. Rose, R. H. Jones, W. Gillibrand, and W. Barber, Liverpool; W. M. Hope, W. J. Frankish, E. Hughes, and E. S. Morgan, University College; C. K. Morris, F. W. Giles, and J. H. Battye, St. Thomas's Hospital; R. N. Hartley, Leeds; G. S. Griffiths, T. James, and F. Bellaby, Middlesex Hospital; A. Hemsted, Belfast; H. Whitehead and F. S. Boreham, Charing Cross Hospital; G. B. Fraser and W. S. Cox, St. Mary's Hospital; C. Henderson, Bristol; F. T. Willie, G. W. Sidebotham, J. Fergusson, and Albert Andrew, Manchester; Frederick L. Benham, University College; Arthur Bennett, London Hospital; Arthur G. Blomfield, King's College; James W. Browne, University College; William B. Clarke, St. Bartholomew's Hospital; Samuel A. Clinton, M.D., New York, Middlesex Hospital; Edward C. Cripps, St. Bartholomew's Hospital; Arthur R. Davis, Middlesex Hospital; Frederick De Caux, King's College; William Dunstan, Guy's Hospital; Francis Goodchild, St. George's Hospital; Edward C. Greene, Guy's Hospital; Joseph Hammersley, Guy's Hospital; Edmund H. Howlett, King's College; Robert E. Inman, London Hospital; James T. Jones, University College; Percy Kidd, B.A. Oxon., St. Bartholomew's Hospital; William Lane, Guy's Hospital; Hardwick Le Cronier, St. George's Hospital; Charles A. S. Ling, London Hospital; William E. Luscombe, St. Mary's Hospital; Thomas E. F. MacGeagh, University College; Robert J. Mills, St. Thomas's Hospital; John Morgan, Guy's Hospital; Charles J. R. Owen, St. Mary's Hospital; George W. Robinson, St. Thomas's Hospital; Charles E. Sheppard, St. Thomas's Hospital; Harold G. Taylor, King's College; Henry L. Webb, St. Mary's Hospital; Francis H. Weekes, St. Thomas's Hospital; Thomas Wilmot, St. Bartholomew's Hospital.

King's College Hospital.—The anniversary festival in aid of the funds of King's College Hospital was held recently, in the College, under the presidency of his Royal Highness the Duke of Cambridge. There was a numerous attendance. His Royal Highness, in proposing the toast of the evening, "Prosperity to King's College Hospital," made an earnest appeal on behalf of the charity, which he truly said was doing an immense amount of good. The hospital contained 172 beds, but the committee were desirous of increasing the number, being prevented from doing so in consequence of want of funds. During the year ending the 31st of December, 1874, no less than 1,754 in-patients had been admitted, while the establishment had treated upwards of 31,297 out-patients during the same period. During the evening subscriptions were announced amounting to over £1,300.

City of London Hospital for Diseases of the Chest, Victoria Park.—The 27th anniversary festival of this hospital was held recently at the London Tavern, under the presidency of the Right Hon. the Lord Mayor. Nearly 200 friends of the institution sat down to dinner. The secretary's report showed that since the opening of the hospital in 1848, 240,000 out-patients had been relieved, and 10,400 in-patients had been under treatment since 1855. The number of out-patients during 1874 was 13,938; in-patients, 781. The Lord Mayor, in proposing "Prosperity to the City of London Hospital for Diseases of the Chest," spoke of his long connection with the hospital. He said 100 more patients had been received this year than last, but the committee had spent more than its income in the good work. His lordship adverted to the large proportion of deaths from consumption, particularly among the poorer classes, the disease being accelerated by the victims breathing bad air in unwholesome and ill-ventilated dwellings. He concluded by an earnest appeal for support, particularly in

the way of annual subscriptions, which he described as the "back-bone" of all institutions of the kind.

National Life Assurance Society.—The directors' report shows that the business of the society continues in every respect in a thoroughly sound and satisfactory position. The net amount of new assurances issued in 1874 exhibits an increase of 10 per cent. on that issued in 1873. The claims admitted in the past year were £47,538 including bonus; this is nearly £6,000 less than in 1873, and about £6,500 less than the expected amount as indicated by the society's tables. Those members who were entitled to participate in profits have had a reduction of premiums amounting in the aggregate to £16,821 in 1874. The amount similarly allotted in 1873 was £15,770, which was referred to in the last report as being the largest sum that the society had ever divided. In addition to this cash bonus, reversionary sums were added to policies the holders of which had agreed to have their share of profit appropriated in that method.

Briton Medical Life Association.—The twenty-first annual report of this Association has just been presented to the shareholders, and we are glad to see that in spite of the adverse criticisms of which it has been the subject in certain quarters during the past year, the balance-sheet shows that the affairs of the Association have been conducted upon a sound footing, which each annual report only the more firmly consolidates. Thus we observe that during the past year proposals for insurance to the amount of nearly £536,000 were made, but accepted only to about the extent of two-thirds. The funds account has also increased, notwithstanding adverse circumstances during the past year, which is an additional safeguard to insurers. On the whole, the report is most satisfactory, and we have pleasure in congratulating the directors, and the secretary, Mr. Messent, in particular, for having brought the Association through so trying an epoch in its history, and for giving fair grounds for hope that its future will be none the less successful than the past.

Testimonial to the Inventor of the Laryngoscope.—A Committee, consisting of several members of the profession and others, of which Mr. Critchett is treasurer, and Dr. Mo ell Mackenzie is the hon. sec., has been formed with a view of presenting a testimonial to Senor Manuel Garcia. The following resolutions were passed at the meeting held at Mr. Critchett's house:—"That the invention of the laryngoscope by Senor Manuel Garcia, whilst it has greatly advanced physiological science, and has conferred incalculable benefits upon humanity, has never received any fitting recognition." "That a subscription be raised with a view of publicly presenting Senor Manuel Garcia with a testimonial, in special recognition of his claims as the inventor of the laryngoscope, and also as a mark of the high estimation in which he is held by all classes."

Execution of a Quack.—Thomas Heap, the man who was convicted of causing death by attempting abortion upon a patient, he at the same time being illegally practising as a surgeon, was hanged on Monday at Liverpool.

NOTICES TO CORRESPONDENTS.

* * In our leader of this day we draw attention to the Coroners Bill, and remark on the improvements suggested by the Irish Medical Association, as representing the feeling of the Poor-law and medical practitioners throughout the country. We understand the Council of the Association has issued circulars to our professional brethren throughout the country embodying the suggestions and alterations proposed. We would ask, how can improvements and alterations in Acts of Parliament be made without combined action and unanimity in making suggestions, and without subscriptions to bear some necessary expenses? A powerful organisation could be established did the medical men throughout the country take a more lively interest in their own advancement, and throwing aside minor differences, aid the Council of the Association by putting forward hints for the redress of grievances together with authentic and detailed records of injustices done by coroners. Sanitation or other Acts, it is most important that the Council should be able to supply Parliamentary supporters with authentic information.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£1 2s. 6d., at the offices in London, Dublin, or Edinburgh.

MR. T. B. COUCHMAN, Henley-in-Arden.—As we were going to press a strongly-worded letter reached our office from this gentleman, upon whose conduct, in his capacity of coroner at a recent trial, we considered it our duty to comment. We shall return to the subject in our next.

DR. SMOGOWICK SAUNDERS.—A testimonial, consisting of an elaborate and extensive service of plate, was presented to this gentleman on Monday, at the Mansion House, by the Lord Mayor, in recognition of his eminent public services in the foundation of the new Guildhall Library. We wish Dr Saunders health and long life for the enjoyment of his well-earned laurels.

CORRESPONDENT.—In our next.
NEW SANITARY JOURNAL.—We have received the first number of a little eight-page monthly journal entitled the *Sanitary Review*, which professes to be under the authority of the Model Houses Association, whatever that may mean. We are always glad to welcome any attempt, however humble, which can assist in the promotion of sanitation, especially amongst the poor; but we fail to see that the little venture before us has in it the elements of success. It contains but little, and what there is might have been read in other journals many times over. Perhaps the first number is not a fair specimen of the intentions of its promoters.

MOSES AND CIRCUMCISION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me to quote from a recent speech of Mr. Disraeli, namely—"As a general rule, it would be useful not to avail ourselves of the use of epithets," and to express a hope that your correspondent "A Surgical Observer of Experience" will in future act upon the Premier's advice when speaking even of individuals, but especially of a whole race, and avoid such expressions as "a notoriously unclean lot," and "enough to nauseate even a doctor," particularly when such expressions are founded on misconception. Your correspondent should have known that it was not Moses who made "a religious rite of circumcision," but a far higher personage, before the Hebrew people, as such, had begun to exist; consequently, it could not have been owing to their "uncleanness" that the rite was instituted. The fact is that Moses was undoubtedly opposed to the operation, for he neglected to circumcise his own sons; and the Jews who were born in the forty years of wandering in the Desert under his guidance were all uncircumcised, as your correspondent can ascertain for himself by a perusal of the Pentateuch and Book of Joshua. Apologising for troubling you, I am, &c.,
Old Kent Road, S.E.

W. T. GREENE, M.A., M.B., &c.

CLINICAL SOCIETY OF LONDON.—On Friday next, at 8½ p.m., Dr. Tilbury Fox, on behalf of Dr. Gustavus Fritsche, of Poland, "On a Case of Fibroma, weighing 35 lb., successfully removed." Mr. T. Smith, "On a Disordered Nerve Function in an Infant." Mr. R. W. Parkes, "On a Case of Scald of the Glottis, with Deposit of False Membranes in the Pharynx, Larynx, and Bronchi." Dr. T. Henry Green, "On Acute Fatty Degeneration of the Heart."
POOR HAMPSHIRE.—Dr. Brewer, Chairman of the Metropolitan Asylums Board, presided at a meeting of the Board on Saturday last. When innocently asked by Sir James Hamilton what had been done about the third alternative site for the Hampshire Fever Hospital, he replied that "the third alternative site remained precisely where it was;" after which the meeting is reported to have broken up with a great deal of confusion. Who can be surprised!

DR. E. A. S.—Either *La France Médicale* or *Le Progrès Médical* would serve your purpose; they are representative French journals.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Kraus, Vienna. Dr. Althaus, London. Dr. Burder, Bristol. Dr. Viney, Southwark. Dr. Dobell, London. Dr. Will, Edinburgh. Dr. Myrtle, Harrogate. Dr. Cornelius Fox, Burnham. Dr. Morgan, Dublin. Mr. Lunn, Edgbaston. Mr. E. Alex. London. Dr. Handal Griffiths, Dublin. Dr. Richardson, London. Dr. Cassells, Glasgow. VACANCIES.

Central London Sick Asylum District. Assistant Medical Officer for the new Cleveland Street Asylum. Salary, £110, and partial board. Printed forms to be had at the Highgate Infirmary.

Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 66 Market Street, Bradford.

Wolverhampton Hospital. House Surgeon. Salary, £100 per annum, with board and residence. Address the Chairman of the Medical Committee.

Dundee Royal Infirmary. Resident Medical Superintendent. Salary £200, with board. Applicants should address Mr. Stewart, Solicitor Dundee.

Kent and Canterbury Hospital. Assistant House Surgeon. Salary, £50, with board and lodging. Testimonials, &c., to the Secretary, the Hospital, Canterbury.

Salford Hospital. District Surgeon to visit home patients. Salary, £50, with board and lodging. Applications to the Secretary.

Liverpool Dispensaries. House Surgeon. Commencing salary at £108. Applications to the Secretary.

Penistone Union, Cornwall. Medical Officer for the Union and for the District. Combined salary, £51, with extra fees. Applications to Mr. W. Dransfield, Penistone.

Barnstaple Union. Medical Officer. Salary, £36, with extra fees. Applications to Mr. W. H. Toller, Barnstaple.

Hull-Borough Asylum. Resident Medical Superintendent. Salary, £350, with residence, &c. Applicants must apply to the Committee of Visitors, under cover, to the Clerk.

Droitwich Union. Medical Officer of Health. Inclusive Salary, £150. Applications, endorsed "Medical Officer of Health," to the Clerk of the Committee.

APPOINTMENTS.

BASHAM, W. R., M.R.C.S.E., House Physician to the Westminster Hospital.

BLAKENEY, E. T., L.K.Q.C.P.I., L.M., L.R.C.S.I., Medical Officer, &c., for the Ballinacree Dispensary District of the Boyle Union, co. Roscommon.

CREAGA, J., L.R.C.S.I., Medical Officer to the Fernoy Railway.

GARDEN, R. J., M.D., a Medical Officer to the Aberdeen Dispensary.

HASTINGS, G., M.R.C.S., House Physician to St. Bartholomew's Hospital.

M'EVOR, Dr. J., Medical Officer, &c., for the Nobber Dispensary District of the Kells Union, co. Meath.

OSBALDESTON, L. F., M.R.C.S.E., Medical Officer for No. 4 District of the Hatfield Union.

PAGE, E. S., L.F.P. & S. Glas., L.M., Medical Officer for the Solihull District of the Solihull Union, Birmingham.

PALMER, T. D., L.R.C.P.Ed., Medical Officer for the Boyle No 1 Dispensary District of the Boyle Union, co. Roscommon.

PAUL, R. W., M.R.C.S.E., L.K.Q.C.P.I., Medical Officer for the Calne Union, Wilts.

SMYTH, H., M.B., C.M., L.M.K.Q.C.P.I., Medical Officer to the Town and County Gaol, Foles, the Dorset County Reformatory, and the Canford Dispensary, Admiralty Surgeon and Agent, and Medical Officer of Health for the Canford and Kinson Sub-district of the Poole Rural Sanitary District.

STEPHENS, A. E. R., L.R.C.P.I., M.R.C.S.E., House Surgeon and Secretary to the Kidderminster Infirmary.

THOMPSON, K. C., M.B., L.R.C.S.I., L.M., Consulting and Visiting Physician to the Tyrone and Fermanagh Lunatic Asylum, and Medical Officer to the County Gaol, Omagh.

Births.

CAMERON.—At 15 Pembroke Road, Dublin, the wife of Chas. A. Cameron, M.D., of a son.

NORRIS-CANE.—On the 8th inst., at Mullinavat, the wife of Dr. J. B. Norris-Cane, of a son prematurely.

Marriage.

BLUSDEN-ARMSTRONG.—At St. Mathias Church, Dublin, Maurice Robert Blunden, M.B., son of Sir John Blunden, Castle Blunden, co. Kilkenny, to Nellie Louisa, daughter of E. J. Armstrong, D.L., co. Clare.

Deaths.

ARCHER.—On the 5th April, Francis Archer, M.R.C.S.E., of Crosby, Liverpool, aged 71.

BARKWAY.—On the 2nd April, at Lavenham, R. E. E. Barkway, M.R.C.S.E., of Bungay, aged 42.

BEST.—On the 25th March, at Hyeres, France, Alexander Vans Best, F.R.C.S.E., late Surgeon Bengal Army.

BROWN.—On the 5th April, at Weston, Joel Brown, M.R.C.S.E., L.S.A., of Stourport, Worcestershire, aged 64.

DICKEN.—On the 12th April, at Ashby-de-la-Zouch (after a short illness), Perry Dicken, M.D., in his 84th year.

DICKSON.—On the 30th March, Thos. Dickson, F.R.C.S.E., F.R.C.S.Ed., of Buxton, aged 70.

FRYER.—On the 27th March, Thos. Fryer, M.R.C.S.E., of Trowbridge, aged 73.

GRAY.—On the 8th April, at Bath, Sir John Gray, M.D., M.P., aged 60.

HORN.—On the 15th April, at Dalton-in-Furness, Wm. Horn, L.F.P. & S. Glas., L.S.A.L., aged 87.

HUMPHREY.—On the 10th April, Alex. M. Humphrey, M.B., of Balmoral Place, Aberdeen.

KIRKMAN.—On the 18th March, at Chicago, Dr. John Kirkman, formerly of Bolton, Lancashire, aged 64.

McSWINEY.—On the 1st April, at Shop Street, Galway, James McSwiney, L.A.H.D., aged 64.

NORRIS-CANE.—On the 10th April, at Mullinavat, the infant son of Dr. J. B. Norris-Cane.

PARKES.—On the 7th April, at Abingdon, Henry M. Parkes, M.R.C.S.E., aged 52.

POWELL.—On the 30th March, at Trinity Square, Southwark, W. E. Powell, L.F.P.S.

POWER.—On the 10th April, Robert Francis Power, M.D., of Montagu Street, Montague Square, London.

PROVIS.—On the 12th April, Wilton Provis, L.R.C.P.Ed., of Mere, Wilts, aged 28.

SAWYER.—On the 12th April, at Albert Lodge, Stillorgan Road, Donnybrook, James Hewett Sawyer, M.D., late Professor of Midwifery, Royal College of Surgeons, Ireland, and one of the Masters of the Coombe Hospital.

SCULLY.—On the 5th April, at Main Street, Clonmel, co. Tipperary, Matthew Scully, L.A.H.D.

SOUTHAM.—On the 1st April, G. T. M. Southam, M.B., of Peterborough, aged 35.

STEWART.—On the 6th April, at the Belfast District Hospital for the Insane, Robert Stewart, M.D., Resident Physician, aged 71.

Advertisements.

EXTENSIVE APOTHECARY BUSINESS, Established over a Century, at No. 82 Grand Parade, Cork, to be DISPOSED OF, privately or by auction.—Apply to A. P. and G. FOOT, Solicitors 89 South Mall, Cork.

MEDICAL ASSISTANT WANTED ABROAD.—A fully-qualified doctor of unexceptionable character.—A salary of £500 a year will be secured for three years, at the end of which term he will be admitted a partner on terms to be agreed upon. Passage money will be paid out. The climate excellent, duties not severe, and European society numerous and friendly. Apply by letter to T. C. D., at Messrs. Fannin's, Grafton Street, Dublin.

CHARING-CROSS HOSPITAL MEDICAL SCHOOL.

SUMMER SESSION, 1875.

The LECTURES for the Summer Session will commence on Monday, May 8th.

Materia Medica and Therapeutics—R. D. Powell, M.D., F.R.C.P.
Midwifery and Diseases of Women and Children—J. Watt Black, M.A., M.D.

Forensic Medicine—G. V. Poore, M.D.
Botany—J. P. Irvine, M.D., B.Sc.
Pathology and Morbid Anatomy—T. Henry Green, M.D., F.R.C.P.
Practical Chemistry—C. W. Heaton, F.R.C.S.
Zoology and Comparative Anatomy—J. F. Blake, M.A.
Public Health—C. W. Heaton, F.R.C.S., G. V. Poore, M.D., and Wm. Essie, C.E.

Psychological Medicine—W. T. Hunt, M.D.
Diseases of the Skin—E. Sparks, M.A., M.D.
Operative Surgery—E. Bellamy, F.R.C.S.
Practical Instruction in Bandaging—W. Fairlie Clarke, M.A., M.B., F.R.C.S.

Practical Pathology—J. Astley Bloxam, F.R.C.S.
Morbid Histology—J. Mitchell Bruce, M.D.
Dental Surgery—John Fairbank, M.R.C.S.
Clinical Medicine—Alexander Silver, M.D.
Clinical Surgery—H. Hancock, F.R.C.S.
Practical Instruction in Auscultation—J. P. Irvine, M.D., B.A., B.Sc.
Instruction and Supervision in Case-taking—R. D. Powell, M.D., F.R.C.P.

Hospital Practice daily, with Clinical Instruction by the Medical and Surgical officers.

Matriculated Students of the Charing-cross Hospital are admitted without additional fee to the Practice and Clinical Instruction and Demonstrations at the adjoining Royal Westminster Ophthalmic Hospital (under the guidance of Henry Power, F.R.C.S., and James Hogg, M.R.C.S.)

A Special Class of Demonstrations on the Bones and Ligaments, adapted for Students commencing their medical education, will be held during the Summer Session by Dr. Cantlie, the Demonstrator of Anatomy. This Class is intended to prepare Students commencing their Anatomical studies in the Winter Session.

The following Appointments are open to Students of the School:— Medical Registrar, Surgical Registrar, House-Physician, Assistant House-Physician, House-Surgeon, Assistant House-Surgeon, Resident Accoucheur, Clinical Clerkships, Dresserships, and Pathological Assistant.

The Assistant Demonstrators of Anatomy are usually selected from among the senior Students who have distinguished themselves in their Anatomical studies.

SCHOLARSHIPS, MEDALS, AND PRIZES.

Two Entrance Scholarships of the value of £30 and £20 respectively are awarded annually in October.

THE GOLDING SCHOLARSHIP of £15 is awarded annually to Students who have completed their first year.

THE LLEWELLYN SCHOLARSHIP of £25 is awarded to Students who have completed their second year.

THE GOVERNOR'S GOLD MEDAL for Clinical Medicine and Surgery is awarded to senior Students. Silver and Bronze Medals and Certificates of Honours are awarded in the various classes.

Fee of Matriculated Students for the entire course of study required by the Examining Boards, £75 5s. Composition fee for Dental Surgery, £42 2s.

Further information may be had of the Librarian or the Dean, at the office of the School, between 10 A.M. and 4 P.M.

FRANCIS HIRD, Dean.

CLINICAL ASSISTANTS and OPHTHALMIC DRESSERSHIPS.—1875-6.—Notice.—Gentlemen who have entered to the Practice of the ROYAL LONDON OPHTHALMIC HOSPITAL, and who are desirous of undertaking the duties of Clinical Assistant for one year from the 1st of May next, are requested to forward their names in writing to the Honorary Secretary of the Medical Council, or to the Secretary of the Hospital, previous to the 27th of April next. The appointment is held for one year, but the officer is re-eligible on the recommendation of the Medical Council. Those gentlemen who, on the expiration of their term of office on the 30th of April next, desire to be re-appointed, will be good enough likewise to signify their intention as above. Anyone applying must undertake, if appointed, to perform the duties for one year certain. Ophthalmic Dresserships have also been instituted, for the performance, chiefly, of the minor duties of the Out-patient department. Anyone applying for these appointments must undertake, if appointed, to hold them for six months.—Apply as above.

April 13th, 1878.

ROBERT J. NEWSTEAD, Secretary.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.—The SUMMER SESSION commences on MONDAY, MAY 3rd. The Hospital contains 350 beds. Clinical Lectures are delivered by the Physicians and Surgeons every week. The usual Courses of Lectures are also given by the appointed Teachers. Dr. Robert Barnes has this year been chosen Lecturer on Midwifery, and Dr. Brailey Lecturer on Comparative Anatomy. Further information may be obtained from the Treasurer or Dean of the School, at the Hospital.

KING'S COLLEGE, LONDON.—SUMMER SESSION.—The LECTURES will commence on Monday, May 3rd.

- Botany—Professor Robert Bentley, F.L.S.
- Materia Medica and Therapeutics—Professor Baxter, M.D.
- Obstetric Medicine—Professor W. Playfair, M.D.
- Forensic Medicine—Professor Ferrer, M.A., M.D.
- Practical Chemistry—Professor C. L. Bloxam, F.C.S., W. N. Hartley, F.C.S., and J. M. Thompson, F.C.S.
- Comparative Anatomy—Professor A. H. Garrod, B.A.
- Practical Zoology—Professor A. H. Garrod, B.A.
- Pathological Anatomy—Professor L. E. Beale, M.B., F.R.S.
- Dental Surgery—Professor Samuel Cartwright, F.R.C.S.
- Ophthalmology—Professor J. Soelberg Wells, M.D., F.R.C.S.
- Psychological Medicine—Professor E. Shepherd, M.D.
- Dean—Professor Bentley.
- Medical Tutor—Dr. J. H. Philpot.

KING'S COLLEGE HOSPITAL.

CLINICAL LECTURES are given four times a week by the Physicians and surgeons. Clinical instruction is also given in diseases of the throat and in skin diseases.

- Physicians—Dr. Johnson, Dr. Beale, Dr. Duffin.
- Assistant Physicians—Dr. Yeo, Dr. Ferrer, Dr. Curnow, Dr. Baxter.
- Physician for Diseases of Women and Children—Dr. W. Playfair.
- Assistant Physician for Diseases of Women and Children—Dr. T. C. Hayes, B.A.
- Surgeons—Sir W. Ferguson, Bart., J. Wood, Esq., H. Smith, Esq.
- Assistant Surgeon—H. Royes Bell, Esq.
- Dental Surgeon—S. Carwright, F.R.C.S.
- Assistant Dental Surgeon—S. H. Cartwright, M.R.C.S.
- Ophthalmic Surgeon—J. Soelberg Wells, F.R.C.S.
- The Physicians' Assistant, Physician-Accoucheurs' Assistant, House-Surgeon, their Assistants, Clinical Clerks, and Dressers are selected by examination from among the students, without extra fees.

SCHOLARSHIPS, REGISTRARSHIPS, and PRIZES.

Warnford Scholarships.—Students entering the Medical Department of this College in May or October, 1878, will have the exclusive privilege of contending for two Scholarships of £25 each for three years. The subjects for these scholarships are given in the prospectus.

Six Medical Scholarships are annually awarded for proficiency in professional subjects, viz.:—One for £40, for two years; one of £30, for one year; and one of £25, for two years; and three of £20, for one year.

Sandbrooke Registrarships.—Two of £50, tenable for two years, are annually awarded to students of this Department.

The Daniell Scholarship of £20, for two years, given for proficiency in Chemistry, is open to Students of the Medical Department.

Endowed Prizes of the value of £25, £15, £10 10s., and £4 4s. each, and College Prizes of the value of £50, are annually awarded.

For further information apply personally, or by letter, marked outside "Prospectus," to J. W. Cunningham, Esq., Secretary.

ST. MARY'S HOSPITAL MEDICAL SCHOOL, PAD-DINGTON.—The SUMMER SESSION will commence MAY 1.

The Prospectus and full information may be obtained on application to the Dean at the Hospital, Cambridge Place, Paddington.

The Medical Tutor receives into his house to board and lodge a certain number of Students, whom, in addition, he prepares for their Examinations, &c.

A. B. SHEPHERD, M.B., Dean of the School.

OWENS COLLEGE (MANCHESTER ROYAL) SCHOOL OF MEDICINE.

The SUMMER SESSION will commence on the 1st MAY next. Prospectuses will be forwarded on application.

J. HOLME NICHOLSON, Registrar.

BRISTOL MEDICAL SCHOOL.—The SUMMER SESSION will commence on MONDAY, MAY 3.

Prospectuses may be obtained on application to

GEORGE F. BURDER, M.D., Hon. Sec.

Medical School, Old Park, Bristol, April, 1878.

MALVERN COLLEGE.

This COLLEGE contains TWO DEPARTMENTS—the CLASSICAL and the MODERN. There is also a Preparatory LOWER SCHOOL. There are Boarding Houses within the College Grounds, held by the Head Master and others of his Staff; a Gymnasium, &c. Board and Tuition under 14, £30; over 14, £30. Non-shareholders pay an extra fee of £6. Special advantages for Sons of Clergymen and Home Boarders.

For further information apply to the Rev. ARTHUR FABER, M.A., Head Master, late Fellow and Tutor of New College, Oxford. The next Term commences on Monday, the 3rd of May next.

SCHOOL OF MEDICINE, EDINBURGH.—SUMMER SESSION, 1878.

On MONDAY, 3rd MAY, CLASSES will commence in Practical Anatomy and Demonstrations, Practical and Analytical Chemistry, Materia Medica and Therapeutics, Midwifery and Diseases of Women and Children, Medical Jurisprudence and Public Health, Clinical Surgery, Clinical Medicine, Vaccination, Diseases of the Eye, Diseases of Children, Practical Physiology, Insanity, Surgical Appliances, and Operative and Practical Surgery.

These Classes qualify for Graduation in the University of Edinburgh, and other Universities, the Royal Colleges of Physicians and Surgeons, and the other Medical and Public Boards.

STEVENSON MACADAM,

Secretary to the School of Medicine.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

Notice is hereby given that on TUESDAY, the 4th of May next, at the hour of Three o'Clock p.m., the President, Vice-President, and Council will proceed, according to the provision of the Supplement Charter, to Elect from among the Fellows of the College—

Seven Examiners to examine Candidates for Fellowships, and Letters Testimonial;

Three Examiners to examine Candidates for the Diploma of Midwifery; and

Three Examiners to examine Students as to their proficiency in General Education.

Candidates are requested to lodge their applications with the Registrar, at the College, on or before WEDNESDAY, the 26th April.

By Order,

JOHN BRENNEN, Registrar.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £35 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote.

Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN.

W. O'NEILL, Secretary.

DUBLIN INFIRMARY for DISEASES OF the EYE and EAR, Ely Place.

Ophthalmic and Aural Surgeon: ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S., Ex-Ophthalmic and Aural Surgeon to the City of Dublin Hospital.

Consulting Physician: EVORY KENNEDY, M.D. (Hon. Caus.) T.C.D. and Edin., Fellow and Ex-President King and Queen's College of Physicians.

Consulting Surgeon: GEORGE H. PORTER, F.R.C.S.I.; M.Ch. T.C.D. (Hon. Caus.), Surgeon in Ordinary to Her Majesty the Queen in Ireland; Fellow and Ex-President, R.C.S.I.; Senior Surgeon to the Meath Hospital.

Obstetric Physician: JOHN CRONYN, M.D., F.R.C.S., Professor of Midwifery, Roy. Col. Surgeons; Ex-Assistant Physician Rotunda Hospital.

Work, Income, and Expenditure for Twelve Months

Annual number of Dispensary patients	5,847
Number of visits paid by such patients	124
Number of patients within the Infirmary	165
Number of operations performed	£37 15 0
Total gross expenditure per bed per annum	1 10 6
Average expenditure per intern patient	

The Infirmary is wholly dependent on private benefactions, and is in debt to the Medical Officer. SUBSCRIPTIONS ARE EARNESTLY SOLICITED

ON THE SCIENTIFIC AND EMPIRICAL INVESTIGATION OF EPILEPSIES.

By J. HUGHLINGS JACKSON, M.D., F.R.C.P.,
Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

CHAPTER IV.

GENERAL REMARKS ON THE CAUSES OF EPILEPSIES.

EPILEPSY, or rather Epilepsies, have been defined as depending on abnormal conditions of nerve tissue. Such permanent alterations occur in the nutrition of areas of grey matter in the cerebral hemispheres that it becomes highly unstable. The sign of this instability is an occasional excessive discharge. In short, there is a permanent "discharging lesion" in each Epilepsy.

That there is a "discharging lesion" in those cases of epilepsy where there is convulsion is evident, for there does occur now and then a paroxysm which gives proof of there being an internal, sudden, excessive and rapid discharge of nerve tissue. In cases of *petit mal*, in which loss or trouble of consciousness is the chief and almost sole observable thing, there is in the pallor of the face evidence of strong discharge; for there is great arterial contraction.

The reader will bear in mind that I believe that in cases of *petit mal*, as well as in cases of convulsion (*grand mal*), the discharging lesion is of some part of the cerebral hemisphere. The accepted view is that in both cases the discharge begins in the medulla oblongata. Indeed, what is essential to my definition of an Epilepsy is that there be a sudden excessive and violent discharge of nervous tissue. Affection of Consciousness is not essential. I have repeatedly spoken of loss or trouble of consciousness in epilepsies. It is a matter of such vast importance that I must speak of it again and again. The absolute distinction into cases with and cases without loss of consciousness is only to be

justified on the score of practical convenience. It is an empirical and not a scientific distinction. It is not a distinction analogous to that made by a botanist, but analogous to one made by a gardener. It has no anatomical or physiological warrant. It is a distinction of psychological parentage. Consciousness is often spoken of as if it were an entity. It is also spoken of as if it were a "function" of the nervous system or of some part of it. Suppose it is a "function" of the nervous system, we have, at any rate, to distinguish this function from that other function—viz., energising of nervous arrangements representing impressions and movements. It is with the latter only that we have to do as medical men; it is on an anatomical basis only that we can trace relations betwixt cases in which consciousness is lost and cases of convulsion, paralysis, &c.

In whatever way an epileptic seizure may begin (in the thumb, in the great toe, by what is subjectively coloured vision, sensation of smell, &c.), consciousness will be lost if the discharge be strong enough. The stronger it is the further it will spread in the brain. (a) In the cases mentioned (where the earliest signs of the discharge are spasm of the hand, or of the foot, &c.) the discharge begins in some subordinate centre. Seizures beginning with loss of consciousness (cases without "a warning") are those in which the discharge begins in the highest of all nervous processes of the cerebral hemisphere—that is to say, in nervous processes evolved out of all lower subordinate centres.

Even the empirical distinction should really be into cases in which consciousness is lost first, very early, late, or not at all. Those cases in which it is not lost at all are cases in which the discharge, beginning in

(a) As I have several times suggested, I think there is a two-fold spreading. The part which is morbid (unstable) discharges, and this discharge, if strong, (1) unrlocks lower and subordinate centres (discharges them), (2) and also discharges associated and, so to speak, collateral centres. I believe the second process is by the intermediation of arteries; the suddenly induced contraction of the artery discharges the cells of grey matter it supplies. There are two kinds of Co-ordination: there is Melody of Movement as well as Harmony of Movement. The arteries, I think, regulate the former, which is Time Co-ordination.

a subordinate centre, is slight, as shown either (1) by the fact that the part of the body affected is limited, or (2) by the fact that although a considerable part is affected, it is slowly affected. Much depends on the rapidity of the discharge. How arbitrary the distinction is must force itself on the notice of the most superficial observer; for of any case in which there are convulsions without loss of consciousness we should mostly be right in saying that some day or other the patient would have one with loss of consciousness—i.e., there would occur a discharge a little stronger, which would therefore spread more widely in the brain.

The one thing common in the many superficially different seizures which I (*MEDICAL PRESS AND CIRCULAR*, November 4, 1874, page 392) call epilepsies is the unstable condition of grey matter; in other terms, there is a "discharging lesion" in every epilepsy. This is the *Functional* affection in epilepsy. The next point is as to the Seat of this Functional Affection. Grey matter may be unstable in many different parts of the cerebral hemisphere (Organ Damaged); hence many differences in the symptoms from cerebral discharges. There is a third inquiry. The pathological processes (Alterations of Nutrition) by which grey matter can be rendered unstable are no doubt numerous.

Let me again remind the reader that for epilepsy, as I define it, loss or trouble of consciousness is not essential. What is essential is a sudden, abrupt, and paroxysmal discharge. What I am now about to urge of a case in which there is loss of consciousness applies in principle to other epilepsies in which there is none. Without intending to make an abrupt limit, we may, for simplicity of illustration, say that in some paroxysms of *petit mal* there is loss of consciousness only. In such a case we have just as much as in any other variety of epilepsy (in one, for example, in which the symptom is convulsion of the arm) to (1) search for the seat of the lesion, the substrata of consciousness; we have to discuss (2) the abnormality in the Function of these substrata (strong discharge of these substrata during which consciousness is lost); and (3) to consider evidence bearing on the disorder of the nutritive process by which cells and fibres of these substrata get into such a state of instability that they occasionally discharge strongly.

That loss of consciousness, a negative symptom, should be ascribed to an active process (discharge) seems, at first glance, unlikely. We see, however, that patients lose the use of an arm during the stage of tonic spasm of it as much as they do in paralysis of it. I think, then, that consciousness may be lost during the *excessive discharge* of the anatomical substrata of consciousness.

Besides other reasons for ascribing loss of consciousness from an epileptic discharge, the discharge is rapid. Time is required for consciousness. On this matter I will quote Spence, "Psychology," vol. i., p. 107:—

"A subjective state becomes recognisable as such, only when it has an appreciable duration: it must fill some space in the series of states, otherwise it is not known as present. This general truth harmonises with a general truth before pointed out respecting nervous action, as well as with the above interpretation.

"The observed fact that time is taken in the transit of a nerve-wave, is not to the point; for this transit has no concomitant subjective state. But the inferred fact that the change set up in a nerve centre must take time, and a more considerable time (§ 35), is relevant; for what is objectively a change in a superior nerve centre is subjectively a feeling, and the duration of it under the one aspect measures the duration of it under the other."

During the *excessive and rapid discharge* of the anatomical substrata of consciousness we could not expect that conscious states would appear; on the contrary, we should, *a priori*, expect loss of consciousness.

To speak of the anatomy, physiology, and pathology of the symptom loss of consciousness may seem strange; but we have already explained that the anatomical substrata of consciousness are only highly compound sensori-

motor processes fundamentally like those of lower centres, differing in being the most special and complex of all. They have, then, their anatomy, their physiology, and their pathology. (a)

Recapitulating, but putting the facts in slightly differing order, we have to study the Anatomy, the Physiology, (b) and the Pathology of Epilepsies, or rather of each epilepsy; or, stating the facts in a more abstract form, and in the reverse order, we have to study the abnormalities in the Absorption, in the Expenditure, and in the Transfer of force in cases of Epilepsy. It is an anatomical inquiry to search for the seat of lesions. It is a physiological inquiry to note how the function of nervous matter is affected. It is a pathological inquiry to trace the morbid nutritive processes by which local changes of instability are brought about.

The above shows in chief part how we use the word Cause. We must use it, however, not in a threefold, but in a fourfold sense. The fourth group of so-called causes is for the conditions which determine individual paroxysms, but more particularly the first paroxysm in a case. We shall have a separate chapter for these so-called causes. But for the present we speak only of Causes with reference to the three lines of investigation—Organ, Function, Nutrition. The word cause is frequently used by medical men for any one of the three. It is used for the seat of the lesion (organ). Thus hemiplegia is said to be "caused by" disease of the corpus striatum. It is used for the functional nature of the lesion, as when it is said that epilepsy is "caused by" increased excitability of the medulla oblongata. It is used for the pathological process (Alteration of Nutrition), as when it is said that loss of speech is "caused by" "softening," the result of embolism. But properly we have, in each case of nervous disease, before our conception of it is anything like complete, to find the seat of the lesion (Anatomy), the functional nature of the change (Physiology), and the derangement of the nutritive process (Pathology). In other words, our classification aims to be threefold, as our method of investigation should be. The principles apply to all cases of nervous disease. I will now, therefore, on the principle of studying first the simplest problems, give the order of the three lines of investigation of a case of hemiplegia of the common form—we will suppose of the left side. Such a case is far simpler than is a case of convulsion. Indeed, our knowledge of the "causes" of the latter is much too imperfect for clear illustration. As illustration only is intended, a mere sketch will suffice.

Anatomical Investigation (Organ Damaged—Seat of Lesion—Localization, &c.).—We find that the face, tongue, arm, and leg are affected on one side. This points to the Organ damaged, which is the corpus striatum.

This kind of evidence points to nothing more. It tells us only that the corpus striatum is damaged, but tells us nothing as to the functional nature of the lesion, nor as to the pathological process by which it is brought about.

Physiological Investigation (Affection of Function—"Destroying" or "Discharging" Lesion).—We find that the parts affected are paralysed. We can now say that the functional affection of the corpus striatum is loss of function—that nerve fibres are destroyed.

It will, I fear, seem mere affectation to give this separately, as when we saw that the patient's face, arm, and leg were *affected* we saw that they were *paralysed*. But from this very simple case I wish to illustrate a method; I wish to show that it is the Regional affection in epi-

(a) Moreover, the anatomico-physiological statement is not loss of consciousness, but, as previously explained, loss of the correspondence of the organism as a whole, with its environment. When we come to anatomy we shall point out that there is not one seat of this correspondence, for consciousness is a varying quantity—that is, we are from moment to moment differently conscious, we are continually changing correspondence with our environment.

(b) Of course we mean by Physiology in this application abnormal function, and correspondingly for the other terms.

lepsies, chorea, &c., which localises, regardless of the state of the muscles in that region.

Pathological Investigation (Alteration of Nutrition).—On inquiry we discover that the palsy came on suddenly, and that there was deep coma. Further, we examine the patient and conclude that he has chronic renal disease, atheromatous arteries, and hypertrophy of the left ventricle of the heart. We now say that the loss of function was the result of breaking up of fibres and cells by irruption of blood.

Here, again, it may seem simply tiresome to separate the functional affection from the pathology. It may be needless for practical purposes in cases like that furnishing the simple illustration now before us; but I think there are few things in Neuro-pathology more unfortunate than the confusion of the physiology of epilepsies with their pathology. For example, the statement that the medulla oblongata is over-excitable is a physiological statement. By what pathological process did that excitability result? is a question in pathology. This is a *very distinct* question.

In so simple a case our investigation and classification are complete. Such a case is indeed so simple that it seems, as we have said, mere pedantry to write out three stages in diagnosis. But in methodical investigation we must do it; we must separately consider the two things, muscular region affected and the condition of the muscles affected. Again, we must not mix our physiology and pathology.

When we pass from palsies to mobile affections resulting from nervous discharges, and particularly to the effects of the paroxysmal discharges in epilepsies, we cannot accomplish this threefold classification. We can often only be certain of the second—the nature of the Functional affection. If we take cases with convulsions, we can be certain of that—we are sure that nerve tissue is Unstable. The fact that certain parts of the body are occasionally put in excessive action is as certain a warrant for the conclusion that a certain area of nerve tissue is unstable as paralysis is for the conclusion that the function of some area of nerve tissue is destroyed. But as to the organ damaged, we can, in most cases, say nothing with certainty. It is only a speculation to say that the organ or part affected in the Epilepsy of Authorities is the medulla oblongata. I hold the counter-speculation that the cerebral hemisphere is the part in which the discharging lesion lies, in the epilepsy of Authorities (which is one epilepsy in my classification). But assuming that there is a localised state of instability in the medulla oblongata, we cannot in most cases trace, except roughly, any links in the pathological process by which that localised discharging lesion resulted.

The method is of great value in keeping up expectation. The causes of epilepsy are wide of the mark unless they bear on one of the three (Organ, Function, Nutrition). If we are told that a patient's epilepsy has been "caused" by anxiety or fright, we gladly accept the important fact that the first epileptic paroxysm was preceded by fright. But the paroxysms continuing to occur, we still ask—Where is the discharging lesion in this case? If it be replied, "In the medulla oblongata," we may, for the sake of putting a further necessary question, provisionally accept this, and next ask—"By what pathological process does Fright lead to such instability of nerve tissue in the medulla oblongata, that it occasionally discharges excessively? Of course I do not expect that those who declare the medulla oblongata to be the unstable part which discharges in epilepsy should have answers to such questions. I simply wish to point out what the questions really are.

(To be continued.)

Royal Hospital for Incurables.—The anniversary festival of this charity was celebrated on Wednesday last by a dinner at the London Tavern, under the presidency of Sir Thomas Chambers, M.P. The guests numbered about 150, who subscribed in the room, after a telling appeal from the chairman, the munificent sum of £2,500.

THE LUMLEIAN LECTURES.

ON LIFE, AND ON VITAL ACTION IN HEALTH AND DISEASE. (a)

By LIONEL S. BEALE, M.B., F.R.S.,
Physician to King's College Hospital.

LECTURE III (continued).

As it were between the two extremes, are forms of bioplasm that grow and deteriorate, but still live for years under adverse circumstances, the structures formed never attaining a state of vigour, but still being formed and acting in an imperfect way, and perhaps for a long period of time. The weak succulent too quickly developed vegetation of our fern cases is an example, and the soft ricketty tissues of our weak, flabby, over-fed, town-bred, highly-precocious children, supply a very painful instance of too quick formation and growth. In such cases the bioplasm has grown too fast, and tissue has been formed too quickly. Time has not been allowed for its condensation and strength, and for the acquisition of resisting and lasting properties. But is it not a mistake to point to such cases as examples of diminished *vital action*? It seems to me that life has been carried on too fast and not too slowly. Too much pabulum has been taken up—not too little. Too much heat, too much food, favour a quick rank succulent spongy sort of development, inducing the formation of soft bones and weak imperfectly acting tissues which are likely soon to deteriorate.

In connection with the question of the nature of *vital* actions, the loss of formative power as the rate of growth and multiplication of the bioplasm increases, must be regarded as a fact of great interest. Bioplasm may form tissue and give origin to multitudes of bioplasts, from which tissue may also be developed. But the very particle of bioplasm which might have taken part in tissue-formation will, if it grows and multiplies too fast, not only lose its power of forming tissue, but the particles that may be produced from it by descent will never regain the wonderful capacity that has been lost. No pus-corpuscle or any of its descendants, then, ever take part in tissue formation. It has deteriorated, and the deterioration in formative power remains a characteristic of all its descendants. But although formative power is lost, new powers or properties may be nevertheless acquired. These are, however, remarkable for destruction—for pulling down and destroying that which has been formed—never for construction. Some forms of pus acquire during their production the most wonderful capacity for rapidly growing and multiplying, as well as for living, and resisting the influence of external conditions. The little off-sets or particles that are detached from them may rise in the air, live for a time in water or milk, or other fluids containing organic matter, adhere to a sponge or a probe or other substance, or be carried in a living state on the foot of a fly or some other insect, and thus transported to an organism at a distance from the one which was the seat of their production. The minute germs being in contact with material adapted for their nourishment, rapidly grow and multiply in their new situation. As we know but too well such forms of *virus* have been produced *ad instig.*, fostered, and propagated to the destruction of hundreds of human beings.

In some cases we are almost able to watch the series of phenomena which result in the development of a contagious animal poison. I have shown that the active agent is a minute particle of living bioplasm, which I have good reason to believe may have been produced by descent from the normal bioplasm of the body. This particle of deteriorated bioplasm, which in some cases may be seen, is a "disease-germ," and of this "contagium"

(a) Delivered at the Royal College of Physicians on Friday, March 12th.

consists. The word *contagion* was used by Hippocrates, by whom, as well as by Harvey, and indeed by authors who lived since Harvey's day, it was employed to signify something immaterial—something intangible, that was supposed to emanate somehow from the affected organism. Now, however, we use this word in a very different sense, for by it we mean actual matter of some kind. This matter, as far as I have been able to ascertain, is composed of minute particles of bioplasm, which resemble in their general characters bioplasm which exists in some situations in the healthy body. The contagious bioplasm results from normal bioplasm, the life of which has been carried on for some time under unusual conditions. It has been already shown that an ordinary form of morbid bioplasm, pus, often originates in the bioplasm of epithelium and in that of connective tissue, and that certain forms of pus have specific virulent properties and are in fact animal poisons, which may be inoculated.

I do not, however, entertain the opinion that all contagious disease germs spring from the bioplasm of epithelium or connective tissue. Some may come from white blood-corpuscles, or from lymph-corpuscles. But I do consider that many facts favour the doctrine that the contagious particles concerned in propagating many of our most serious specific fevers have been derived from the living matter of man's body, and that they are not germs of fungi, or bacteria of any kind whatever. Indeed, in certain instances, they may be seen in far greater multitudes in the tissues of the diseased organism than bacteria, which latter, as is well known, are found often enough in countless multitudes in cases in which there is no specific disease of any kind.

When I was studying the changes in the tissues of animals destroyed by cattle plague I found a quantity of rapidly growing bioplasm in almost all the tissues, but in the skin the manner in which the contagious particles grew and spread could be very satisfactorily demonstrated. The minute particles having gained access to the interstices between the bundles of fibrous tissues of the corium, divided and subdivided, spreading amongst the bundles and separating them from one another. In some places the particles had made their way into the interstices of the epithelial cells of the cuticle, where they formed little collections, and had invaded the tissue itself of the cuticle cell. Similar bioplasm particles were found in the obstructed capillary vessels, and in not a few instances could the course pursued by these be traced from the interior of the capillary to the surrounding tissue by a narrow line of well defined bioplasm particles. Although it is true bacteria were to be seen in some situations, no difficulty was experienced in finding collections of the bioplasm quite free from bacteroid bodies or their germs—a fact which I think conclusively proves that there is no necessary connection between the specific bioplasm particles and bacteria.

I have for years past, in fact ever since 1861, directed attention to what I cannot but characterise as the many insuperable objections to the acceptance of the bacterium and fungus germ hypothesis of contagious fevers. In these days there is nothing more striking than the pertinacity displayed in forcing upon our attention extravagant conjectures which seem to be almost unsupported by facts. One great scientific authority tries to persuade us to go along with Lucretius, another seems to think that it is our bounden duty to believe and confess that we are machines. We are expected to acknowledge that there are forms of life the physical actions of which are not far removed from those of an oil globule—that between a piece of lifeless white of egg and living bioplasm there is only a slight difference—and that omnipresent bacteria, which it is gravely asserted may be made out of non-living matter in a glass flask, or allied forms, are the active agents, or at least the essential concomitants, of almost every form of contagious disease which can be imparted by an infected to an uninfected organism. Indeed there is no end to the suggestions advanced to gratify our love of the improbable, which are made to appear plausible by

the selection and ingenious application of a few arguments, while the numerous facts opposed to them are altogether ignored.

Some writers have committed themselves to the fungus germ theory of disease, and have so clearly stated their views that it is scarcely possible to misinterpret their meaning. Others have expressed themselves against this doctrine with equal clearness and equal force. But there is a third class of persons who seem to think that fungi may or may not be the active *materies morbi*. If, say they, contagium does not consist of actual bacteria it is caused by bacteria, or bacteria constitute an essential condition of propagation, or they prepare the body for the reception of the contagium, or they make the pabulum upon which the contagium lives, or they are a stage in the development of contagium, or they are constant and necessary accompaniments of contagious particles. All this in spite of the broad fact staring us in the face that at the time when certain contagious matter is most virulent, no bacteria, or few or doubtful bacteria, are to be discerned, while as the bacteria multiply the specific properties of the poison become weaker, and when the bacteria are growing rapidly and freely multiplying its specific properties have disappeared. Again it is assumed that there is a necessary connection between the development of bacteria and the formation of pus, although anyone can satisfy himself by observation that the living moving pus-corpuscle is destitute of bacteria germs, while the dead inactive pus-corpuscle or more strictly the matter resulting from the death of the pus-corpuscle is being devoured by them.

The very last conclusion, it seems to me, that would be adopted by anyone who thoroughly thought over the matter would be, that these low organisms were the causes of the changes of the fluids by which their growth was favoured, much less that they were the causes of the diseases which had existed for some time before they began to multiply. One might, I think, with as much show of reason, advocate the doctrine that bacteria were invariably the cause of death, since after every form of death they grow and multiply in the tissues and fluids of the human body.

We have now examined a somewhat extensive range of vital phenomena, and nowhere have we discovered a change or an action peculiar to living matter that could be adequately accounted for by any known facts and laws. The formation of every tissue or organ seems to have been anticipated and prepared for, as it were, beforehand; and, in many cases, changes occur which it is difficult to persuade oneself were not in some sense foreseen, because provision is made for their occurrence long before the changes happen, and the preparation is such that it could only be accounted for upon such an assumption. But, in fact, this is characteristic of every kind of vital action, although it is much more apparent in some instances than in others. It need scarcely be said that physiciats have failed to adduce any explanation of the phenomenon which, like many other facts to which I have adverted, is peculiar to life.

I must apologise for troubling you with so many remarks against any form of physical doctrine of life, but I shall trespass very little more upon your patience. If by physics and chemistry, the phenomena common to all living—even in the case of the very lowest, simplest living—cannot be adequately accounted for, it seems to me it would be an idle waste of time to recount the numberless facts and arguments against the acceptance of a physical doctrine as applied to thought. Nor shall I be greatly moved by the hardest words that may be used, or the intensity of the scorn that may be displayed by those who regard the brain as a machine, and thought as a result of chemical change. They may be well supported in their views, but until they can give a rational account of the changes which occur in a simple living organism, no one who uses his reason aright will believe that they really discern the nature of the difference in the state of the

nervous matter of man's brain when the organ is active and when it is in a state of rest.

Have the supporters of physical doctrines been able to tell us what goes on when a nerve grows, what occurs when it acts, or the difference between the nerve matter of the nerve centres and nerve fibres when they are in a state of the highest activity and most complete rest? Have they shown us how a single nerve fibre is formed in its position, much less accounted for the manner in which that inextricable interlacement of fibres characteristic of all nerve texture is brought about? Have they proved how an odorous or a sapid particle influences the nerve, or the differences between the vibrations of the molecules of the nerves concerned in sight and hearing, or what happens when a nerve centre receives an impression from the periphery, or transmits an impulse outwards—nay, have they advanced a plausible theory to explain how we are able to bring about a definite degree of shortening in muscular fibres, maintain it for a time, and vary it as we will? And yet we are expected to accept the dicta concerning the nature of the highest and most complex actions of man's organism, of authorities who are professedly unable to enlighten us as to the changes which occur when an amoeba or a bacterium moves, or takes up nutrient matter, grows or divides and multiplies.

(To be concluded in our next.)

Transactions of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, APRIL 13TH.

Sir JAMES PAGET in the Chair.

MR. ACTON read a paper on

THE PREVALENCE AND SEVERITY OF SYPHILIS AMONG THE TROOPS QUARTERED IN LONDON AS COMPARED WITH THE RARITY OF THE DISEASE AMONG THE SOLDIERS IN THE GARRISONS OF PARIS AND BRUSSELS, FROM OBSERVATIONS THE RESULT OF A PERSONAL INVESTIGATION MADE DURING THE AUTUMN OF 1874.

There was a very large attendance of Fellows and visitors. Among the latter were observed a number of the army medical officers interested in the carrying out of the Acts, as also Mr. Harris, of the Police Force of London. Mr. Acton's paper commenced by stating that when he returned to England after the completion of his studies in Paris, he was greatly struck with the severity and numbers of cases of syphilis in London as compared with Paris, and as a consequence of this he brought the subject before the notice of the Society in 1846, and again in 1860, showing that the Belgian and French troops were much less attacked by venereal affections than the English. In 1873 he found that in districts in England where the troops were not what he called protected from the women, primary syphilis still existed in the proportion of 123 per 1000 men annually. He maintained that syphilis could be prevented and stamped out by providing ready means of ablation, and destroying the local form of contagion, and warning male patients not to infect other persons. The institution of hospitals, whether free or otherwise, was one remedy, for treatment of prostitutes as out-patients was quite inadequate. They should be segregated as soon as diseased, and not allowed to leave hospital until they are quite cured. By doing this, as at Hong Kong and Dartmouth, the disease had been reduced to a minimum. In his visit to Brussels in 1874 Mr. Acton had visited the Military Hospital, where he found only three cases of syphilis among the private soldiers, and two among the non-commissioned officers, out of a body of 3,500 troops. There were only nine women confined to hospital for venereal disease, showing that in Brussels the police inspection had nearly stamped out the disease. In Paris he visited the military hospitals, and could only discover six cases of primary disease, and eight of secondary syphilis,

among 3,841 men forming the garrison of Paris. Disease among the females was very slight also, and Mr. Acton attributed this decrease to the police regulations. He gave a table showing that in the St. Lazare Hospital he only found 23 cases of primary disease among 202 patients in this prison, which is under the police surveillance. With respect to England, Mr. Acton said that Parisian medical men alleged that British travellers, like sailors, were the cause of much of the disease in Paris, and that the disease would ere now have been stamped out had it not been that England and other similar countries went on continually introducing fresh cases into Paris. In London he found at the hospital of the Foot Guards 24 cases of primary disease among 408 single soldiers in the 2nd battalion of the Coldstream Guards quartered in London. In the 1st battalion of the Scots Fusilier Guards he found 25 cases of severe forms of syphilis among 505 unmarried men. He handed in a table extending over a year, which showed that one-fifth of the whole troops quartered in London in 1874 were affected with primary sores, which would have incapacitated the men from duty for a period of six weeks on an average. Perhaps 164 of these men would have secondary disease, requiring mercury, which would further incapacitate them from duty for a period of two months or so, and this would debilitate them greatly. Comparing the syphilitic affections of the Foot Guards with those among the troops quartered in Paris, he showed that 500 troops in London had more disease than 3,841 quartered in Paris. Mr. Acton considered that one-half of prostitutes in London were diseased; whereas of those in the districts under the Contagious Diseases Acts only about 8 per cent. were found affected at periodical examinations. It appeared that at Woolwich during 1871-2-3, only 1,085 cases of primary sores were treated in hospital, out of a garrison of 18,250 men, or only one man was infected in 17 soldiers, instead of 1 in 6, as in London. He therefore, in conclusion, looked upon the advantages of supervision of prostitutes as no longer a problem, but as an undoubted fact.

Dr. CHARLES R. DRYSDALE passed an eulogium on the labours of Mr. Acton in the great and splendid cause of getting rid of syphilis. No more worthy project could be entertained by any nation than that of stamping out the "great plague of modern times," as it had been called by M. Ricord; and the English nation owed a debt of gratitude to Mr. Acton above all others for having made this question a respectable one, and for having in his papers of 1846 and 1860 brought the matter boldly forward for discussion. Dr. Drysdale would confine his remarks to his experience of the effects of police regulations in foreign countries. The women frequented by soldiers were of the poorest and humblest classes, and comparatively easily grouped together and looked after by the police; but the moment we passed from this class of women the whole police system broke down entirely. He admitted that the troops of Belgium and France were less infected than the troops in this country; but the same could by no means be said of the civil population of Paris as compared with that of London. Formerly he had been of the opinion of Mr. Acton that Paris was less affected by syphilis than London; but in 1867, after examining the question well in London, he proceeded to Paris, and went into it there also. The result of his inquiry was to make him think that there was perhaps more syphilis in Paris than in London. When attending M. Nélaton's clinique in 1860 he saw many cases of old tertiary syphilis, and M. Lecour, head of the Dispensary of Salubrité, had recently calculated that some 50,000 cases of venereal contagion were treated in Paris annually. Dr. Lefort, head at the Congrès Médical International of 1867, agreed with him (Dr. Drysdale) when he stated that there was more venereal contagion and far more prostitution in Paris than in London. Dr. Desprès, surgeon of the Lourcine, said there were some 40,000 prostitutes in Paris, and that the police laws only could get 3,500 of these into their power, so that he alleges that the Paris laws do nothing, or next to nothing, in preventing the spread of the disease, whilst they evidently tend to spread prostitution. Dr. Diday, of Lyons, had lately complained, in a work published in 1874, of the inefficiency of the French laws, and Dr. C. B. Taylor stated that Dr. Jeannel thought that Paris was worse than London. As to Brussels, it was a complete mistake on Mr. Acton's part to say that syphilis was nearly stamped out there, for Dr. Thiry said last year in a lecture that there were constantly many cases of grave disease to be seen in his wards in Brussels. Taking these things into consideration, Dr. Drysdale believed that voluntary examinations and hospital accommodation would

do much more, and he was astonished to find that a system which was such a failure in France should be recommended for adoption in Britain and the United States.

Dr. BIRKBECK NEVINS had entered into the inquiry with the idea that good results must have arisen from the Contagious Diseases Acts; but, on perusing the Royal Commission Reports, he found no evidence of any diminution of disease in 1870 as compared with 1866. Before the Acts came into operation, gonorrhœa in the army had diminished by one-twelfth; but now the amount of this disease was higher than before the Acts were in operation, and the last return stated that it was higher in the protected than in the unprotected districts. Dr. Balfour had admitted that the Acts were a failure as regarded gonorrhœa. In the navy, also, gonorrhœa was much more prevalent in the protected districts. In the home and Mediterranean stations it had more than doubled since 1866. As to venereal disease, he would first speak of constitutional syphilis. Before the Acts, from 1861 to '66, there was a fall of one-fourth of the whole amount of the army, but since the Acts there was an increase of one-twelfth above the previous amount. There had been a fall in the amount of primary cases since the Acts had been in operation, but a comparison of the numbers from various towns would give the following results:—In Devonport and Plymouth the average annual fall per 1000 was, before the Acts, 10·8, after it was 7; in Portsmouth, before 15, after 10; at Chatham and Sheerness, before and since 4; in Woolwich, before 18, since 3½; at Aldershot, before 7, since 3·6; and at the Curragh, before 10, since 11; at Shorncliffe, before 9, since 6; at Dover, before 8, since 11; at Maidstone, before 60, since 21; while in London the fall had been reduced from 96 to 40. The fluctuations in Winchester and Canterbury were so great as to make it impossible to calculate them. Colchester alone showed a remarkable improvement, the average fall per 1,000 having increased from 28 to 35. In the navy there was no station with so little improvement in this respect as the home station. In the Mediterranean, since the Acts came into operation, the number of primary venereal sores had doubled. In the unprotected stations the sores were cured more rapidly. Among the constantly sick from syphilis there was a fall of one-third previous to the Acts; but since the Acts the fall per 1000 had been from 6¼ to 5¼. The number of men invalided from secondary syphilis had risen since 1866 one-twelfth in the army, and one-fifth in the navy. Venereal disease had increased 17 per cent. in the regulated districts since 1866, and the deaths had just doubled.

Inspector-General LAWSON said it was a feature in Dr. Nevins' address that he had compared single years 1866 and '72, and he had not shown that any reduction would have taken place had the Acts not been in force. On examining the cases of disease from 1860, it would be seen that there was a diminution in the frequency of the venereal sore down to 1866, while after that there was an increase, with fluctuations in unprotected stations. No conclusion could be come to as to the course of venereal disease unless studied where there was not any act to interfere. Dr. Nevins had compared a minimum with a maximum year, which was not useful. In particular seasons many remarkable variations at the same stations were seen in contiguous barracks. Dr. Nevins had said that secondary syphilis had become more prevalent since the Acts; but he drew different conclusions from the returns. There had been a change of nomenclature, and before 1869 secondary syphilis was returned under three heads—secondary syphilis, syphilitic iritis, and syphilitic cachexia. In five years before the Acts, among 374,000 men, the rate of secondary disease was 34 per 1000, while in the five years (1866 to 1872) since the Acts passed, the annual rate was 25 per 1000. Secondary syphilis varies from year to year; and in years when the number of cases of primary syphilis is small, that of secondary is also small. With regard to discharges from the army on account of syphilis, up till 1863 these were not recorded separately; but, taking the two periods 1863-67 and 1868 to '72, the discharges per annum were, in the first, 13·4, and in the second, 13 per 1000. In considering the question of the number of men under treatment, Dr. Nevins had compared 1866 with '72 without taking any intermediate year. The average daily number of cases of primary syphilis in hospital in 1866 was 6·35; in 1869 in places not under the Acts it was 9. Of secondary syphilis, in places under the Acts, the average daily number under treatment in 1867 was 6·95 per 1000; in 1873 it was 4·33. From the beginning of April, 1868, medical officers in charge of troops had had to make returns of the cases of venereal disease not originating in the

localities where they were, and at Aldershot it was found that much of the disease originated out of the locality. Before the Acts the amount of gonorrhœa at Aldershot was 95 per 1000, and it had now fallen to 75.

Mr. HOLMES said that, as he had been one of the members of the Commission on the Contagious Diseases Acts, he would remark that it was true that the Commission had reported that there was no evidence that periodical examinations had increased the amount of disease. This he admitted, for there was no sufficient material to work upon at that time. This portion of the report was not approved of by a minority of the Royal Commission, including all the medical men on it, except Dr. Bridges and Mr. Holmes Cooté. There was evidence given that the Act had reduced the frequency of venereal disease, and mitigated its severity. The Act was continued by the advice of the Royal Commission, who recommended that Parliament should show the same vigour with regard to it as it formerly had done as to vaccination.

Mr. BRUDENELL CARTER said that Dr. Nevins had spoken as if Dr. Balfour were opposed to the Acts; but he had lately conversed with that gentleman, who had expressed his high opinion as to the utility of these Acts. The question to be decided surely was whether the Acts diminished disease sufficiently to make them be retained.

Dr. DE CHAUMONT referred to Dr. Nevins' diagrams in the *British Medical Journal* for March 27th, and said it would be seen that after 1866 there was a fall both in syphilis and in gonorrhœa as compared with a period before the Acts. Other diagrams were shown, being curves representing the strength of the Royal Engineers and their diseases during the epoch before the Acts, which showed much more disease than after. In the former period the curve of admission was above the line of strength; in the latter it was below, and fell in a diminishing ratio. As to the severity of the disease, a German surgeon had recently expressed his surprise at the number and severity of the cases at Netley as compared with Berlin.

Mr. BOND gave some statistics from the Westminster Lock Hospital; and

Surgeon-Major HUTTON said he had seen much disease in Portsmouth in 1860; but since the Acts Dover was nearly free.

WEDNESDAY, APRIL 23, 1875.

THE FRAUDULENT TRADING PROTECTION BILL.

THE long-expected debate on Mr. Sclater-Booth's Bill came on on last Tuesday week, and though the interests of the public against the shopkeepers was courageously fought by Dr. Cameron and Dr. Lyon Playfair, it was carried in a form not so bad as at first proposed, but quite sufficiently retrogressive to afford authority to shopkeepers to poison and cheat as much as they like without fear of

the law. In the first place the Act was extended to Scotland and Ireland, which, as it is an intrinsically bad measure, we regret. Dr. Cameron succeeded in removing the word "knowingly" from the clause which deals with manufacturers; but the remonstrants failed to obtain an abandonment of the clauses inserted for the special protection of adulterators. The clauses of the Bill agreed to are as follow, the amendments being in italics:—

Clause 2 [formerly 3]. The term "food" shall include every article *used for food or drink by man, other than drugs or water*:

The term "drug" shall include medicine for internal or external use:

The term "county" shall include every county, riding, and division, as well as every county of a city or town not being a borough:

The term "justices" shall include any police and stipendiary magistrate invested with the powers of a justice of the peace *in England, and any divisional justices in Ireland.*

Description of Offences.

3 [formerly 4]. No person shall mix, colour, stain, or powder, or order, or *permit any other person to mix, colour, stain, or powder, any article of food with any ingredient or material so as to render the article injurious to health, with intent that the same may be sold in that state, and no person shall knowingly sell any such article so mixed, coloured, stained, or powdered, under a penalty in each case not exceeding fifty pounds for the first offence; every offence, after a conviction for a first offence, shall be a misdemeanour, for which the person, on conviction, shall be imprisoned for a period not exceeding six months with hard labour.*

4 [formerly 5]. No person shall, except for the purpose of compounding as hereinafter described, mix, colour, stain, or powder, or order or *permit any other person to mix, colour, stain, or powder, any drug with any ingredient or material so as to affect injuriously the quality or potency of such drug, with intent that the same may be sold in that state, and no person shall knowingly sell any such drug so mixed, coloured, stained, or powdered, under the same penalty in such case respectively as in the preceding section for a first and subsequent offence.*

5 [formerly 6]. No person shall *sell to the prejudice of the purchaser any article of food or any drug which is not of the nature, substance, and quality of the article demanded by such purchaser, under a penalty of twenty pounds, except as herein excepted and provided; that is to say, except—*

Where any harmless matter or ingredient is mixed therewith for the purpose of rendering it portable or palatable, or of preserving it, or of improving its appearance, unless such matter is used to conceal the inferior quality of the article.

Where the article named is a proprietary medicine, or is the subject of a patent in force, and is supplied in the state required by the specification of the patent.

Where a drug is compounded as hereinafter described.

Where the article is unavoidably mixed with some extraneous matter in the process of collection or preparation.

Provided that no article shall be deemed to be within any of the exceptions above set forth if the matter or ingredient mixed therewith shall have been added with intent fraudulently to increase the bulk, weight, or measure of the article.

We may perhaps indulge the hope that the House of Lords will make some effort towards undoing the work of Mr. Selater-Booth; but if this hope proves vain, the public must consider themselves at the mercy of the adulterating manufacturers and shopkeepers until a new agitation forces Parliament to give the victimised consumer some protection for his stomach and his pocket. A more humiliating illustration of the prevalent greed

for money-making, dishonestly or honestly, than is afforded by this Bill never came before Parliament.

THE DEBATE AT THE PATHOLOGICAL SOCIETY OF LONDON.

THERE have been so many debates upon the subject of the germ-theory of disease and on fermentation recently, in the Paris Académie de Médecine, that our readers will welcome the renewal of this important subject on English ground. Dr. Charlton Bastian's paper at the Pathological Society of London is likely to call much attention to the question both in this country and abroad. Of late years the so-called "germ-theory" has been much used to explain the occurrence of fevers, septicæmia, and pyæmia. The relation between bacteria and other minute organisms and the various contagions has often been hinted at; but the Pathological Society's debate has first of all fairly grappled with the subject. It is of course a very wide generalisation which would connect together such very different phenomena as pyæmia and the infection of contagious fevers which so widely differ in their natural history; but this seems to have been done to a certain extent by some of the authors quoted.

Dr. Bastian considers that the germ-theory is merely founded on the faint analogy which exists between contagion and fermentation, which would be quite inadequate even were Pasteur's theory admitted. Bastian prefers Liebig's theory, and considers that germs do not exist, and even if they do, are not essential to contagion. He summed up all the facts and arguments which are opposed to the view that bacteria have any pathogenetic effect, and it is certainly difficult to show clearly that they have any. In absence of clear proof it is, of course, incumbent on all reasoners to look about, or remain in a condition of scepticism. It may be true enough, as Dr. Sanderson remarked, that the parts played by some low organisms in specific diseases are too numerous to be answered by mere sceptical arguments; but it is clear that the time has not yet come for rearing any theory on the basis of the facts before us. With respect to bacteria, it would be necessary to be certain whether their presence constitutes the poisonous character of any fluid, and whether this would become innocuous if they were absent. Lister considers that such organisms come from without. Beale says they originate from germs which penetrate the tissues, and which only come to maturity under certain circumstances; whilst Dr. Bastian thinks that they are produced anew from the degeneration of the protoplasm of the cells.

Dr. Sanderson observed that he had, four years ago, put together what at that time seemed to him the strongest grounds for the germ theory, i. e., the theory that in those processes of disease in which minute organisms are found, the life which interferes in those processes is not only the life of the tissues themselves which are the seat of disease, but another kind of life is introduced. He, therefore, had opposed Dr. Beale's theory, which assumes that in many diseased processes bacteria have to do with the pathological results, but thinks that the life which they enjoy is a life derived from the organisms affected

by the diseased products. He considered that, as regards all kinds of protoplasm, that it was not possible for any small part of it to live when separated from the parent organism; and this seemed to him such an objection to the view of Dr. Beale that it was not even possible to think of such a theory.

Professor Henle had brought forward the germ theory in 1840, in a work called "Pathological Researches," so that if there was to be a discussion of theories, it might have lasted from 1840 up till the present moment. Clinical facts and pathological facts are alone trustworthy in such questions, and Dr. Sanderson considered that no one could come to any conclusion at this moment with regard to the germ theory. Bacteria, which seem on microscopical examination to be identical in their character with those which are present in morbid tissues, can be introduced into the circulation without producing any morbid result.

There is no substance, says Dr. Sanderson, which can produce fever, *i. e.*, first a period of latency, then a shivering fit, and next a rise of temperature accompanied with shivering, going on afterwards and then declining. This we call a paroxysm of fever, and this peculiar physiological fact can only be produced by albuminous liquids in a state of septic decomposition. Such fluids also contain bacteria, and we know that these can be separated from the fluid by boiling them with alcohol, and yet the fluid will still have the property of causing fever. Again, all destructive inflammations, or such as are attended by a destruction of tissue, contain bacteria in the liquids of the destructively inflamed part. These have been called by some persons spheroids, by others micrococci, by others microspora septica; whilst Billroth has named them cocco-bacteria septica. All these forms of inflammation, which are destructive, have an infective character, or spread inflammation.

There have been some observations on this point in cases of diphtheria, in puerperal fever, and in erysipelas. In spreading erysipelas, according to Recklinghausen, bacteria are found in the lymphatic spaces on the affected skin, and the lymphatics at the beginning, or in the progressing zone. This serves, says Dr. Sanderson, to illustrate the intimate relation of the organisms with the process, but proves that we have here nothing to do with septic results; we have to do with a phenomenon connected with the beginning of the process, and which cannot be considered as a result of the destructive changes to which the process has already given rise.

In relapsing fever there was a peculiar spirilla found in the blood discovered by Obermeier in Berlin a few years ago, and these only existed during the paroxysm, disappearing when it passed away. This would be most extraordinary on any theory of spontaneous generation. These organisms are entirely different from any which occur in any septic product, being quite specific in form and characteristic, and entirely different from anything met with in the tissues of either living or dead organisms. A hundred observations of the same kind were lately made in an epidemic of relapsing fever at Breslau. In the case of sheep-pox there is something quite different, for two processes go on side by side and simultaneously. Firstly, there is observed the development of the pustule

from its papule to its ultimate pustular stage in the skin of the sheep, and then a complete series of developmental changes—a development of organisms. These organisms, beginning in a certain form, and in a certain anatomical part of the skin, always in the superficial layer of the corium, gradually extend and find their way into the rete Malpighii. They have a definite anatomical relation to the tissues, and their growth takes place, not in the tissues, but in the lymphatics. Eventually, vesicles become formed, and there is an orderly series of morphological changes taking place in the liquid contents of the vesicles, so that two processes go on side by side each with a development of its own—on the one hand, a development of the pustule, on the other, one of the organism.

Here, again, says Dr. Sanderson, it seems absolutely impossible to admit anything else than that the two processes have some relation to each other. It is not worth while to mention that the organism is the cause of the process, or that the process is the cause of the organism, for in nature we are accustomed to view phenomena in that way. We are accustomed to the notion, with reference to organic beings, that the environment of an organised being has a constant influence on it, but that this influence does not make it impossible to suppose that the organism has an influence on its environment. In this case, therefore, it is not necessary to form any theory as to which is the cause of the other. All we have to do is clearly to understand that the two processes are associated together, and both of them are characteristics of the disease, and then leave it to a later period to determine which is to be regarded as the cause, and which is the effect. The point we have clearly to satisfy ourselves upon is that the organic forms have an inseparable connection with the diseased process. Of course, the whole question is,—Is there a relation between them and the pathological process? In the presence of these facts, it is not desirable to put aside theories, but at any rate the facts should never be forgotten.

THE DISCUSSION ON PUERPERAL FEVER.

DISCUSSIONS are the order of the day, and we are heartily glad to see that they are so. The method of the sciences ought for some years past to have reverted again from the purely empirical to the deductive process. So much material has been collected by the labours of the great observers of the past fifty years, that it becomes absolutely necessary to inaugurate a series of debates in order to give us the interpretation of this mass of experience, which otherwise is but of little value towards human well-being.

There was a well-attended meeting at the Obstetrical Society of London on the 7th inst., to hear Mr. Spencer Wells' opening address on "Puerperal Fever." In the commencement of his remarks, Mr. Wells quoted Dr. Farre's definition of puerperal fever, contained in the work on "Nomenclature," published by the London College of Physicians, and laid great stress on the fact that local lesions generally, but not always, accompany the fever. He remarked that the poison might be so concentrated, or taken in so large a quantity, as to kill before

any local lesions had time to appear, or that the quantity taken in might be so small as to be got rid of before such lesions were caused.

Mr. Wells did not say that puerperal fever is a distinct entity, but propounded this question for discussion, and his remarks were at any rate brief, for he concluded by recalling certain facts, published twelve years ago, on the causes of death after surgical operations, when he had, following the ideas of Pasteur, proposed the use of sulphurous acid and sulphites as a means of preserving the tissues from the action of the supposed virus. Two years after this, Lister commenced the antiseptic treatment of disease, and looking to the great results that surgeon had obtained in ridding hospitals of pyæmia, he thought that by similar precautions lying-in hospitals might be made free of puerperal fever. He pointed out the immense value of sanitary measures in making ovariectomy successful.

Dr. Priestley, the President of the Society, called on Dr. Leishman, of Glasgow, to speak. That gentleman observed that he had come round to the belief that the various forms of fever included under the term puerperal are nearly all of pyæmic or septicæmic character. However different in their origin, whether from scarlatina or local inflammation, the later symptoms in all the forms were of the same septicæmic character. Yet he thought that it was not proved that all kinds of animal poison could engender the fever. A woman entering a lying-in hospital was exposed to as great dangers as if she were exposing herself to typhus fever.

Dr. Newman, of Stamford, said that a large number of cases of puerperal fever owe their origin to the exposure of the patient to some well-marked special fever. In other cases, local inflammations lead to the pyæmic state. Exposure to sewer air, for instance, is such a lowering influence; and the greater activity of the vital processes in a lying-in woman accounts for the readiness with which she is infected by poisons which would not harm her at other times. Mental disturbance, too, he thinks acts as a great predisposing cause. It will be thus seen that this speaker is not in favour of the theory that there is any special disease puerperal fever.

Dr. Braxton Hicks is well known to have some very distinct views as to the causation of puerperal fever. According to Dr. Hicks, a very large proportion of cases of this fever are due to contagion from the specific fevers or from decomposing matters in the uterus, whilst mental influences have a share. So that only about 10 or 12 per cent. of cases remained where the origin of the fever was obscure. In some cases lying-in women may be exposed to scarlet fever and yet escape puerperal fever, where it would be interesting to ascertain whether the patient had suffered from scarlet fever before. Decomposing clots clearly caused fever in some cases, and when the uterus is washed out the fever will disappear. There is not the least doubt that puerperal fever is contagious, however it may be produced, but crowding of puerperal wards was not clearly *per se* a sufficient cause of the disease.

Mr. Jonathan Hutchinson's speech was, as usual, clear and incisive. Erysipelas, he observed, which so often accompanies puerperal fever, is not a specific fever, but merely a local inflammation to which fever is added. This is

shown by the fact that it has no incubation period, that it is local, and that it may be cut short by treatment. It resembled uterine inflammation in these points. Mr. Hutchinson thinks that the term "septicæmia" should be limited to poison introduced into the blood from the patient's own tissues, which may have been first of all inflamed by external irritants, whereas pyæmia was solely derived, he thought, from suppurative phlebitis.

Dr. Benjamin Richardson showed that the condition of the parturient woman was one of great peculiarity, and very prone to the development of febrile conditions. He also did not believe in any special puerperal fever, and thought that the fever might simply be one of reaction or resistance, such as follows after the amputation of limbs. The fever might, he said, be of the bilious remittent type, and it may give rise to cardiac thrombosis. It might also be of a septicæmic nature, from some injury inflicted during the course of the labour, or it might be due to poisons derived from without. Dr. Richardson, speaking of bacteria, and their relation to the pyæmic process in the puerperal state, observed that he had for many years thought that septic processes are purely physical or chemical, and that the association of organic forms was merely a coincidence not causal. Antiseptics, he held, act solely in a chemical way in such processes.

It will be seen from the debate that the idea of there being such a thing as a special disease puerperal fever is not in favour amongst the majority of this day. Mr. Spencer Wells suggests antiseptics and general sanitary care, and there is no doubt that such measures have accomplished much in the case of puerperal women, for no such epidemics are now heard of as Gordon and Armstrong speak of. In the future we may expect to hear of even fewer cases of epidemics of puerperal fever. In this direction the papers of Dr. Leon Lefort and of Mr. Spencer Wells and Dr. Simpson have been of incalculable advantage.

Notes on Current Topics.

A Quarter's Mortality in London.

THE variable temperature and the excessive and continued cold of the past quarter has told a sad tale. Comparing the returns from the Greenwich Royal Observatory with the Registrar-General's returns just issued, we find that from the week ending Saturday, 30th January, to that closing on 6th March the mean temperature of the air was much below the average of the corresponding weeks in the 60 years 1814-73. In the week ending February 6th the temperature was 2.8 degrees below the average; in the next week it was 4.5 below it; the three following weeks did not reach the average by 1.3, 5.9, and 6.5. In the week ending 13th March the temperature in Greenwich was 2.9 degrees above the average, but in the following one it was 4.5 below it. In the two closing weeks of the year there was an excess over the average of 0.5 and 1.9. The effect of these unusual degrees of cold for the season has been most disastrous on the public health. In the four opening weeks of the year the temperature was considerably above the average, and the

deaths sensibly reduced. These, however, were the only exceptions, and during the remaining ten weeks of the quarter an excessive rate of mortality was maintained; no less than 23,367 deaths being recorded in the metropolis in the quarter, and accordingly the annual rate of mortality was as high as 27.2 per 1000 inhabitants, the rate for the March quarter of 1873 being 22.7, and for 1874, 23.7. The death-rate for London for the 10 years 1861-70 is 24.3, and the deaths returned for the past quarter were 3,288 in excess of the corresponding period of 1874.

Extraordinarily Large Child.

At a meeting of the New York Pathological Society, Feb. 24th, Dr. Blake related the measurements of a child, taken 48 hours after its delivery, the dimensions being so large that he wished to place them on record. The head measurements were as follows: Occipito-mental $6\frac{1}{2}$ inches; frontal 6"; perpendicular 5"; transverse $4\frac{1}{2}$ "; temporal $3\frac{1}{2}$ ". The body measurements were: Around the thigh 7"; calf of the leg $4\frac{3}{4}$ "; chest, from under the axilla, $13\frac{1}{2}$ "; biceps $4\frac{1}{2}$ "; middle of forearm $4\frac{1}{4}$ ". Length of child $23\frac{1}{2}$ ". The tallest child at birth recorded before this measured 21". The cranial bones were well ossified, and the head presented the appearance of that of a child of three or four months old. The mother of the child had had an abortion previously, and this was her first-born at term.

Dr. Mary Putnam-Jacobi said that first children were always larger than subsequent ones. The mental and physical capacity was very much taxed in primiparæ. She believed that mothers who led indolent lives bore larger children; she had noticed this in two or three cases coming under her own observation.—*Medical and Surgical Reporter*, April, 1875.

Acute Myelitis.

DR. GUERIN-ROZE (*La France Méd.*) mentioned a case of this disease at the Société Méd. des Hôpitaux, of which the following are the particulars: A man, æt. 46, came into the Beaujon Hospital on July 31, 1874. This man suddenly, without warning, had the evening before felt his legs give way under him, and fell down. At the morning visit paralysis of the lower limbs was observed, but he could move his legs. The arms were intact, and sensibility was normal.

The night of the 31st July was passed by patient without sleep; the arms were affected, and at the morning visit there was paralysis of the muscles, with slight febrile condition. Pulse 88; temperature 37.5° . Dr. Guerin-Roze diagnosed acute generalised myelitis—cause unknown. However, it seemed that the patient had complained some time before of headache, like strokes of a hammer, and three months previously such an attack had got well by means of a purge; another attack was treated unsuccessfully. There was also retention of urine, which was acid, without odour, and sensation was intact.

On the 2nd August and following days the pulse was quicker, palsy persisted, but the intellect was clear; some moist râles were heard in the chest. On the 8th there were symptoms of asphyxia, with cadaveric rigidity, and the patient succumbed on the 18th, after twelve days' illness. At the post-mortem examination congestion of

the brain was noted; the sinuses, filled with blood, presented a sand-like aspect; in the spinal cavity there were seven chalky and irregular plates, three in front and four behind; there was a dirty serosity, with softening of the anterior segment of the dorsal region and of the inferior segment of the lumbar region.

Diarrhœa of Typhoid Fever.

DR. GEORGE JOHNSON (*Practitioner*) says he has lately given up the use of all astringents in the treatment of diarrhœa in typhoid fever. Typhoid fever requires careful nursing and feeding, but no medicine of active nature. He feeds his patients mainly with milk, beef-tea, and two raw eggs in twenty-four hours, and gives wine or brandy in certain cases. He has abandoned the use of mineral acids. When the food disagrees it is better to keep patients to milk alone for several days. Out of fifteen cases of typhoid lately in his wards, all recovered under this treatment.

Circumcision.

DR. DE SAINT-GERMAIN (*France Méd.*, April 10, 1875) has recently delivered a clinical lecture at the Hôpital des Enfants Malades on Circumcision. The lecturer said that dorsal incision of the prepuce could not be considered as a true circumcision. The discovery of the operation is very ancient, and 1,900 years before our epoch we find Abraham practising it. It had from the commencement all the characters of a religious rite, and not of mere hygienic precaution. Herodotus says the Jews borrowed it from the Egyptians, but this is not clear. In general, infants have a long prepuce, and the skin and the mucous membrane are prolonged beyond the gland, forming a sort of little cylinder more or less wrinkled and irregular. This is the ordinary character, and when it disappears the author thought that masturbation existed. Under the influence of this fatal habit the glans is frequently uncovered and exposed to the air and the friction of the clothes; it becomes wrinkled, and the prepuce covers it more exactly. Marjolin attached great importance to this symptom.

The indications for the operation are very numerous. Firstly, we have imperforation of the prepuce, which is a rather frequent malformation; in two or three days the newly-born infant has not passed urine. There is developed at the extremity of the penis a tumour of some size, tense, fluctuating, a true urinary cyst, and we must hasten to incise the prepuce or to practise circumcision to give passage to the urine.

Circumcision may be of some utility as a preventive means or a curative method in masturbation. In this point of view it is of no use after the age of ten; but at the age of five or six we may obtain a cure. As a general rule, masturbation is a moral disease, against which we must most generally employ moral treatment.

Phymosis is a serious obstacle to fecundation. Hutchinson has much insisted on the remarkable immunity from syphilis or soft chancre found among Jews. Perhaps he is right, for the gland, when constantly uncovered, is flattened, retracted, and indurated, and is no longer covered by mucous membrane, but by a kind of skin.

On the contrary, the contraindications are few in number—they are erysipelas, hospital gangrene, &c.

M. Tarnot, in 1865, published a very interesting study on the practice of circumcision in Algeria among the Jews and Arabs. It is practiced among the former eight days after birth. The Rabbin commences by slightly rubbing the gland and prepuce, thus causing a slight erection. He then seizes the end of the prepuce and places it between the two branches of a forceps shaped like a lyre. Then with a special knife he cuts off all that part of the prepuce lying beyond the forceps. To assure the staunching of blood the operator exercises with his lips an energetic suction, and spits the blood into a vessel. Suction is dangerous, for one operator who had mucous plates in the mouth gave syphilis to a series of infants he operated on. Since then suction has been given up, except in Algeria.

The Arabs look on circumcision only as a hygienic practice, and await the age of twelve or thirteen before employing it. The operator ties a ligature on the prepuce in front of the gland and cuts off the part of the prepuce beyond it with a razor.

We may add that MM. Gillet and Grandmont are much in favour of the application of the galvanic cautery to the operation of phimosis.

Reorganisation of the Army Medical Department.

THE following proposals on this subject have been carefully revised and approved by a large number of medical officers. We have reason to believe that their adoption by the War Office would give very general satisfaction:—

1. Department to be styled the "Royal Medical Staff Corps," and all officers to be executive as far as the command of the Army Hospital Corps is concerned, both as regards officers and men.
2. Promotion to the rank of surgeon-major to be fixed at fifteen years' full pay service at *latest*, but to be earlier if possible, e.g., in time of war.
3. All medical officers ranking as field officers to be entitled to forage as laid down in the warrant of 1858.
4. Every officer to be entitled to sixty-one days' leave in the year on full pay and allowances; the arrangements for the performance of his duties to be made by the administration of the "Royal Medical Staff Corps."
5. Officers requiring additional leave on urgent grounds to be granted it on pay only, without allowances.
6. Medical officers to be placed on the same footing as officers of the rest of the army as regards sick leave.
7. Medical officers, no matter how employed, to have a fixed scale of allowances, which shall only bear one interpretation, subject, however, to deductions on a fair scale, when quarters, servants, or forage, &c., are supplied by Government. Servants' allowance to be 1s. 6d. *per diem*.
8. Medical officers attached for any period to regiments, to pay the usual monthly subscriptions to the mess, but not to be liable for the fifty days' pay donation on first joining.
9. All medical officers to be placed on one roster for foreign service, and to go abroad in their turn, irrespective of any appointment they may be holding.
10. Exchanges to be allowed, and to be *bonâ fide*; the officer staying at home to take up the post vacated by the officer going abroad.
11. Medical officers to be relieved of all the duties properly belonging to purveyors; subordinates for that purpose being placed under the orders of the principal medical officer in the station, and being responsible to him for all stores.
12. The Royal Medical Staff Corps to have sole charge of and control in the military hospitals, subject only to the authority of the general commanding officer.
13. Retirement of officers of the administrative ranks to be obligatory at sixty years of age, and on more liberal terms—say 36s. a day for deputy-surgeon-general, and £2 for surgeon-general.
14. Tenure of office for administrative ranks to be limited

to five years in each grade, or ten years in the two: officers so retired to receive the maximum rate of half-pay. All other official appointments (except that of director-general) to be limited to five years.

15. Surgeons-major to be allowed to retire after 20 years' full pay service on 16s. a day, to be increased by yearly increments of 1s. *per diem* for each subsequent year's service, till the maximum pension of 26s. a day is obtainable, e.g., £1 1s. at 25 years' service, and £1 6s. after 30 years, and not to be dependent on medical boards.

16. Officers retiring through ill health, caused in or by the service, to be allowed a higher rate of retirement, according to the recommendation of a medical board.

17. Officers retiring from ill health before the completion of twenty years' service, to be granted seven-tenths of the pay they were drawing, when invalided.

18. Surgeons-major after twenty years' service, to rank as lieutenant-colonels, deputy surgeons-general as colonels, and surgeons-general as major-generals, according to date of commission.

19. Distinctive staff dress: tunic, patrol jacket, mess jacket and waistcoat, full dress trousers, sword and dress belts as at present. Substitute staff forage cap, and staff undress trousers for those now in use. Abolish the black belts, and substitute some other head dress for the cocked hat, except for the administrative ranks.

20. A guarantee be given that whatever terms favourable to the department be now granted, shall not be interfered with or nullified by subsequent circulars.

Dentists' Fees.

MR. PEACOCK, of Scarborough, has been obliged to sue for his fees in a case where he had spent 4½ hours in stopping two teeth for a young lady. He said his uniform charge was one guinea per hour, and proved that the young lady knew this. Several medical men in the town gave evidence that Mr. Peacock was very skilful, and that his fee was well known and moderate. We are glad that judgment was for the plaintiff with costs. One guinea per hour cannot be called extravagant for skilled services, and those who object to pay it should not trouble a dentist whose fee they know to be that. Counsel for defence endeavoured, but without effect, to depreciate Mr. Peacock's service. We doubt if that learned gentleman would like to work for less than a guinea per hour.

International Medical Congress.

THE fourth International Medical Congress is to open at Brussels, under the auspices of the Government, on September 19th, and is to last a week. It will be composed of members of the medical profession, whether native or foreign, who shall have sent in their adhesion to the Committee. No payment will be called for except the sum of 12½ francs, for which a copy will be afterwards given of the Report of the Proceedings of the Congress. The cards of membership will be delivered on Sept. 18th.

The Surgeoncy-General of the Bengal Army.

DR. JOHN CAMPBELL BROWN, C.B., Surgeon-General Bengal Army Medical Department, retires in December next, when his term of office expires, after an active service of nearly forty years. He was with Sir Robert Sale in the Afghan war of 1840-42, took part in the famous defence of Jellalabad, and went through the Sutlej campaign of 1845-46, including the battles of Aliwal and Sohraon. Deputy Surgeon-General Beatson, now on leave in England, and brother to the late principal medical officer of the Indian army, is mentioned as Dr. Brown's successor at the head of the Bengal Medical Department.

Revival of Children in San Francisco.

WE learn from the *New York Medical Reporter* that a "revival" among children has been in process in San Francisco. The little creatures, from four to twelve years of age, are gathered in a large church, and after having been warmed to the work by the singing of hymns stating how full of guilt they are, and the day will come when heaven and earth will pass away, certain "revivalists" begin to stride up and down among them, clapping their hands and crying out as they tell them of the hopeless state of iniquity into which they have fallen, and of the probable early death and certain hell awaiting them. Only the most uneducated or grossly careless parents would subject the brains and nervous systems of their children to a physical strain so unhealthy; and only those profoundly ignorant of the true relation which religion ought to bear to human life would countenance such a false and hurtful phase of it.

The Relation subsisting between Chemical Constitution and Physiological Action.

IN a recent research into the physiological action of the chinoline and pyridine bases, undertaken by Dr. John G. M'Kendrick and Mr. James Dewar, of Edinburgh, these investigators have noticed that on comparing the action of such compounds as C_9H_7N (chinoline) with $C_9H_{13}N$ (parvoline), or $C_8H_{11}N$ (collidine) with $C_8H_{15}N$ (conia from hemlock), or $C_{10}H_{10}N_2$ (dipyridine) with $C_{10}H_{14}N_2$ (nicotine from tobacco), it is to be observed that, apart from differences in chemical structure, the physiological activity of the substance is greater in those bases containing the larger amount of hydrogen. The observation is of great interest as bearing on the question as to the relation between the chemical constitution of a substance and the physiological action exerted by it.

Ophthalmia Neonatorum.

DR. HARKET DERBY (*Boston Med. and Surg. Rep.*, April, 1875), speaking of this frequent complaint and its treatment, quotes Soelberg Wells as saying that if the patient be in hospital, or can be frequently seen by the surgeon, he greatly prefers to apply the nitrate of silver in substance, its strength being diluted by mixing it with one-half or two-thirds nitrate of potash. Sir W. Lawrence says that even the most violent form is easily manageable, and will do well when properly treated. He generally used a simple solution of alum in the proportion of two grains up to six grains to the ounce of water. "Such was the treatment at the London Ophthalmic Hospital, and out of many hundred cases I hardly recollect one where the eye suffered in any respect. When there is any change required, from the eye becoming accustomed to the stimulus of alum, we may advantageously have recourse to the nitrate of silver." Mr. Dixon says that it is sometimes useful to change the local application, and to use a solution of nitrate of silver, two grains to the ounce, dropping a small quantity on the conjunctiva twice or thrice daily. Mr. Lawson thinks that lotion of alum, or of sulphate of zinc and alum, and drops of nitrate of silver, are the most useful astringents in purulent ophthalmia. Dr. Williams, of Boston, seems to have

a great objection to lotions of nitrate of silver in ophthalmia neonatorum. Dr. Derby prefers the *lapis mitigatus* in cases of exceptional severity; but the solution of ten grains to the ounce of nitrate of silver should, he thinks, be applied carefully once in twenty-four hours to the everted lids and washed off with water. This will supersede all other lotions.

Female Abortionists.

THE New York letter of the *Public Ledger*, of recent date, says:—The district attorney, it is understood, was in consultation with the Grand Jury with reference to the ways and means of suppressing the class of female physicians who have figured so prominently in connection with several sad cases that are occupying the attention of the coroners, both in this city and in Brooklyn. There are laws which reach them and their trade, it would appear, but the trouble is the difficulty of putting those laws into force. The result of the conference, of course, is private as yet; but it would not be surprising if it should be a sweeping indictment of the whole tribe, followed by a breaking up of their vile dens. Intimations of this kind from authoritative sources are not wanting.

Curious Epitaph.

IN the Jews' Burial Ground at Bethnal Green is the following:—

MRS.

S earch England or the universe around,
A doctress so compleat cannot be found;
M edicines prepared from herbs remove each ill,
P erfect great cures and proclaim her skill.
S ome hundreds her assistance frequent claim,
O ften recorded by the trump of fame.
N ow, reader, see if you can tell her name.

The Approaching Election at the Irish College of Surgeons.

THE election of Examiners in the Royal College of Surgeons in Ireland will take place, according to charter, on the first Tuesday in May. The Council have applied to the Chief Secretary for permission to amend their present bye-law so as to be empowered to elect eight Examiners instead of seven as heretofore. Mr. Croly and Mr. Stapleton have expressed their intention of seeking admission to the Court, and, we believe, Mr. Thomson, of the Richmond Hospital, also. The candidature of Mr. Croly and Mr. Stapleton will of necessity vacate their seats on the Council, and as Mr. John Hamilton will in all probability be promoted to the Vice-Presidency, there will be three vacancies by retirement from the Council at the next election on the first Monday in June. Mr. Tufnell will, without reasonable doubt, occupy one of these seats on his leaving the Presidential Chair. For the other two vacancies, Dr. Jacob, Dr. Mapother, Mr. McDowel, of Mercer's Hospital, and Dr. Wheeler are already declared candidates. Dr. Jacob and Dr. Mapother have already served upon the Council for several years, the former having succeeded his father on his retirement in 1869. Mr. Fleming has expressed his intention of retiring from the Court of Examiners, and Dr. Peter C. Little is a candidate for a seat in the Court.

Out-Patient Reform.

THIS subject is again being investigated, and this time at Westminster Hospital. The members of the staff of that hospital have been asked for their opinions on the question. The committee of investigation comprehends in its ranks such men as Sir R. Alcock and Mr. Hood, F.R.S.

London Vital Statistics.

IN 1874 the estimated population of London was 3,400,101, of whom 1,591,692 were males, and 1,809,009 were females. In 1871 there were 417,767 inhabited houses, which contained on an average 7.8 persons per house. In 1871 the density of the population was 42 persons per acre. The births registered in London in 1874 were 121,394, of which 61,865 were males, and 59,529 females. Thus the annual births per 1000 living were 35.7. The deaths during 1874 were 76,666, the annual rate of mortality per 1000 persons living being 22.5, or in males 24.6, and females 20.7. The increase of population since the previous year was 44,544 as estimated; and the excess of registered births over deaths in 1874 was 44,788. In 1861 the excess of births over deaths was but 32,000. In 1841 it was but 12,000. In the year 1805 the christenings in London were 6,504, and the burials 6,392. The returns of deaths in 1874 were favourable; in fact, the last three years show a marked reduction in the mortality of London, and imply an improved state of health in the city after drainage. The annual mortality between 1840-49 was 25.2; for the thirty-five years 1840-74 it was 24.2, and for the last three years only 22.2. So that to be a cockney now is, according to the Registrar-General, to have a chance of living a long time.

Sanitary Matters in San Francisco.

IN a review in the *Boston Med. and Surg. Reporter*, 25, 3, 1875, it is remarked that in the city of San Francisco anyone who has seen the filth and crowding of Ward 4 will not be surprised to read that the mortality among the Chinese is more than 50 per cent. greater than among the rest of the population, although they have so few children. As in many other parts of California the mortality from consumption is large (about one-seventh of the total), that in Boston for the past year having been a little more than one-sixth. In San Francisco two-thirds of such deaths were of persons born out of the United States. To explain the low death-rate from infantile cholera (one-fifth as great as Boston) we can think of no conditions except those of climate, which are more or less common to all cities. There were 387 deaths during the year from scarlatina in an estimated population of 200,000. The suicides numbered 3 to 10,000 inhabitants.

Treatment of Throat Diseases.

DR. LEOPOLD SCHRÖTTER (*Fahk. B. d. Kl. für Laryn. u. d. Wien. Uni.*) gives a very interesting account of cases of laryngeal disease occurring in the General Hospital of Vienna. He tried to dilate the glottis in six cases of stricture following on perichondritis, so that the patients might go without the canula. He first tried the common elastic catheter, passed from above, by aid of the mirror,

and drawn through the external opening by means of a small hook, the canula having been removed. It was found impossible to leave the catheter long enough in this position, and it was difficult at times to reintroduce the canula; the operation, too, was very annoying, and the canula was soon destroyed. He then used cylinders of tin about an inch and a half long, which seems to have succeeded in some cases. In the first case, in order to preserve the calibre of the larynx after it was dilated, a catheter-shaped tube of hard rubber, of the size of the normal glottis, was introduced through the glottis into the trachea once or twice daily. One patient swallowed a large-sized bougie, with a string on it a foot and a half long. Both passed by stool on the third day. Schrötter concludes that stricture of the larynx can be thus treated, although it is an unpleasant method of treatment. If dilatation be too rapid, pain in the head and throat, with fever and perichondritis and œdema occur, but the treatment need not be discontinued on this account. The parts regain their normal mobility, and do not lose their sensibility, but it is not certain whether the larynx can in all cases be kept open so that the external opening may be closed.

IN 3,700 cases seen in three years, Schrötter saw seven cysts from the size of a hemp-seed to a cherry-stone. Two were seated on the lingual surface of the epiglottis, three on its edge, and two on the arytenoid cartilage.

THERE were four *simple epithelial* growths and thirty-nine cases of *connective-tissue* growths. In only five out of twenty-one cases operated on was any anæsthetic necessary. There was only one case of recurrence, which he attributes to the cautery of the scar. Türk's crushing forceps were used in all these cases. It is never necessary to open the larynx from without for their removal.

MEDULLARY sarcoma was seen in three cases, and *carcinoma fasciculatum* in one.

TUBERCULOSIS of larynx was observed in very few cases primarily. He found small yellow infiltrations of the size of a pin's head, afterwards ulcerating, very characteristic of laryngeal phthisis. There was always pain in deglutition when the posterior wall of the larynx was ulcerated, but this was only observed in a few cases of simple swelling of the arytenoid cartilages, even when considerable. It was not common even in ulceration of the epiglottis. In one case of dyspnœa, laryngotomy was avoided by passing a hard rubber tube, suitably curved, through the constricted larynx.

THERE were 120 cases of syphilitic affections of the larynx among the 3,700 patients. Of these twenty were cases of perichondritis. In cases of ulceration where tuberculosis or some other disease was not indicated, syphilis was considered to be the cause. Schrötter does not consider the possibility of extensive ulceration from simple catarrh as proved. In symptomatic catarrh, as in typhoid fever, great ulceration may occur. The catarrh was treated by inhalations, the ulcerations by iodoglycerine, or nitrate of silver, and iodide of potassium or mercurial inunction (or both together) internally. Local treatment is advocated without waiting trial by constitutional treatment alone.

THERE was a man with elephantiasis Græcorum in Hebra's Ward, 20 years old, who had had the disease

thirteen years. The circumvillate papillæ of the tongue were very large, the mucous membrane was covered in many places with thick layers of whitish epithelium, especially on several nodes the size of a bean, situated on the base of the tongue. The uvula and arch of palate thickened and covered with greyish-white epithelial layer, and that on posterior wall of pharynx moderately reddened and relaxed. The edge of the epiglottis, the arytenoid epiglottic folds and posterior walls of larynx notably swollen, rigid, irregular in outline, and covered with whitish epithelium, which in places showed slight loss of substance. This was also seen on the vocal cords, which were considerably thickened, with rounded edges of greyish-white colour, and normal mobility. The glottis, even on strongest inspiration, had but a moderate width. He next gives the result of his examination of such patients in Norway and Sweden. He there found small connective-tissue nodes on the epiglottis, the arytenoid epiglottic folds, or symmetrical thickening of these parts. In slight cases the parts seemed merely thickened, in graver cases the entrance to the larynx was narrowed by the rolling in of the sides of the epiglottis, and swelling of the arytenoid epiglottic folds, and sometimes there was ulceration of them.

Orezza Water.

THE use of natural mineral waters is becoming more common in England. On the Continent it is well known that they have long occupied a more prominent place in therapeutics than with us. Chalybeate waters have perhaps been less patronised by British practitioners than have saline and purgative waters. And yet it is well known to those who have fairly tried them that they often do good when all the pharmaceutical preparations of iron fail. Moreover, when these medicines cannot be tolerated, and yet iron is indicated, mineral waters containing the remedy may often be taken with great benefit. One of the best of these is Orezza water, which, though familiar enough to us in France and Italy, has hitherto not been in the English market. We are therefore glad to learn that the valuable Corsican water will henceforth be kept in stock by the Vichy Water Company. Besides being one of the strongest natural chalybeate waters, it is agreeable to the palate in consequence of the large quantity of carbonic acid it contains. Orezza water may be looked upon as a sort of natural ferruginous seltzer water, and as such its numerous uses will at once suggest themselves to our readers.

Scrofula and Tuberculosis.

DR. HUETER (*Volkemann's Samm. Kl. Vor.*, No. 49) states that scrofula is the soil in which tuberculosis is produced, and on this theory bases his practice. Our protection, he observes, from the various sources of inflammatory irritation which surround us, depends on the epidermic and epithelial coats of the skin and mucous membranes. Suppose the case where the protecting coat is not perfect, but presents numerous breaks, the little pores which the microscope has shown to exist between the epidermic and epithelial cells. Such an individual would be especially susceptible to external influences, irritable or vulnerable. Such vulnerability lies at the base of scrofula. We recog-

nise in the inflammations of scrofulous persons a tendency towards extension both in space and in time. We call a person scrofulous when inflammations extend from place to place upon his body, and when they are cured with difficulty and only slowly.

The author thinks that these phenomena are connected with the degree of development of the plasmatic system, to which the pores of the rete Malpighii belong. Thus, the greater development of this system in childhood as compared with adult life, gives the reason why scrofula is so pre-eminently a disease of childhood, and so the expression a "pasty" or "spongy" look, or a "lymphatic" constitution, are warranted by anatomical facts. In the next place, tracing the irritating particles and their inflammatory products into the lymphatic and associated glands, he declares that inflammation of the glands is one, but not the first, expression of scrofula. He looks upon the cheesy metamorphosis of the lymphatic glands as the result of a continuous slight irritation produced by these particles, and agrees with Billroth that the cheesy portions do not, as a rule, result from pre-existing abscesses, but are merely the cells left crowded together, from which the fluids have drained away owing to the incomplete circulation of the lymph in the glands.

He then states that scrofula begins with the local inflammations seated on the peripheral side of the lymphatic glands, which finally ends in the cheesy infiltration of the glands, and this is the first indication of danger involving the life of the patient. The pre-existing inflammations may, of course, have endangered the functions or integrity of the organs in which they have occurred. He feels compelled to say that cheesy infiltrations never resolve; at any rate, such a course is extremely uncommon. After months or years of passive inactivity the cheesy infiltration, as a result of some irritation, becomes the seat of a subacute suppuration occurring in the peripheral layers of the glands. These abscesses are apt to be subcutaneous, and burst externally, thus effecting a cure in some cases.

As to the question how scrofula passes into consumption at some time after the development of the cheesy infiltrations, we are likely to observe hectic fever, and all that group of objective symptoms known to be characteristic of phthisis. Dr. Hueter rests his explanation on the experiments of Fränkel and Cohnheim. It is that the finely granular detritus of the cheesy infiltrations, when the channels of the plasma and of the lymphatics are opened by suppuration, is not free, and finds its way through the blood-vessels into the lungs and thence into the general circulation. These granules ultimately become lodged either in some capillary blood-vessels or lymphatic, and there cause small emboli, around which the whole blood-corpuscles collect, and thus we have miliary tubercles. This process is, in fact, a pyæmia with innumerable inflammatory metastases. Clinical observation shows that the suppuration of the cheesy focus generally precedes the development of the miliary tubercle.

As to treatment, Dr. Hueter insists on the importance of the well-known anti-scrofulous treatment, and upon suitable attention to local inflammations. Moderate enlargements of the lymphatic glands will often yield to

general treatment; but when as large as a pigeon's egg or hen's egg, and obstinate, he protests against delay, and urges extirpation by the knife. The glands most likely to require this are the sub-maxillary group, those on the anterior and posterior borders of the sterno-cleido-mastoid and those under the chin. The operation is free from danger in the hands of a good surgeon; and he believes it most urgently demanded as soon as suppuration occurs in the glands, the seat of cheesy infiltration, and that the least a timid practitioner should do would be to lay open the abscess freely, so as to allow the broken-down cheesy matter to escape. He urges the same principles in scrofula of the testes and epididymis, and also in the bones and joints of the extremities. In the latter he advises resection of the joints, and opening and removal of foci of bone disease.

Urethral Fever.

M. PAULET (*Gaz. Hebd.*, Dec. 18, 1874) read at a recent meeting of the Société de Chirurgie de Paris a report on a memoir of M. Roux on this question. Roux insists on the analogy existing between urethral fever and marsh fever. According to Roux, the determining cause of this fever is as follows: When, after a stricture of the urethra, there is no alteration of the mucous membrane, the sound passes without giving rise to an accident. When, however, the mucous membrane is lacerated or ulcerated, there results an attack of fever of the alkaline, and foetid urine is passed through the canal shortly after the operation. Dr. Paulet thinks that Roux's opinion is too sweeping, all surgeons admitting a previous alteration of the urine. Generally, when the urine is normal, no attack of fever is observed, only when it is altered. The lesion is always seated in the canal when there is an old stricture or alteration of the urethral mucous membrane. But when the urethra is healthy, and the urine is easily passed, may it not be absorbed by a diseased mucous membrane of the bladder? The alkaline state of the urine allows of its dissolving the epithelium. M. Paulet prefers the title urinary or urethro-vesical fever. In affections of the urethra and bladder the kidneys are generally affected. To prevent the access of fever the author advises the treatment of the original affection. Bromide of potassium and sulphate of quinine and ergot may be made use of.

Cirrhotic Liver.

At a recent meeting of the New York Pathological Society, the President, Dr. Delafield, exhibited a remarkable specimen of small cirrhotic liver with a smooth surface, none of the usual irregularities being present. The patient had been an inmate of Roosevelt Hospital, and was about fifty-six years of age. He gave the usual history of a case of cirrhosis, having been a hard drinker for many years. He complained greatly of dyspeptic symptoms, and after a time ascites with jaundice supervened. The liver was small, weighing only two pounds. The surface was perfectly smooth. The capsule was not markedly thickened. There was decided increase of connective tissue. Dr. D. said that the nodulations on the liver were not due to subsequent contraction of the fibrous tissue, as had been formerly supposed, but to the

disappearance of the liver-cells. There were four varieties of cirrhotic livers—the large livers with a rough or smooth surface, and the small livers with a rough or smooth surface.

Radical Treatment of Prostatic Hypertrophy.

PROF. HEINE has cured six cases of prostatic hypertrophy with iodine injections, and now recommends the parenchymatous injection of moderately concentrated solutions of iodide of potassium; he states in *Langenbeck's Archiv.*, quoted in the *New York Medical Journal*, that the operation is not severe, and can be borne by old and weak individuals, because the diminution of the hypertrophied organ takes place without suppuration. When its volume is diminished, the secondary affections of the bladder are also relieved, provided they have not attained a high degree. The operation is performed by placing the patient on his side at the edge of the bed, and introducing the oiled index-finger of the left hand into the rectum to the point where it is intended to make the injection. An exploring trocar is then introduced on the finger, the stilet having been withdrawn into the canula, and the puncture is made. The stilet is then withdrawn from the canula, which is filled with the solution in a syringe. When the canula has been filled, an air-tight syringe is attached to the canula and the injection performed. The median line of the prostate should not be chosen, as a small artery takes its course in this location. The author's solution is: Iodidi potass., ʒij.; tr. iodinii, ʒij.; aq. destil., ʒij.

Remarkable Injury to the Eye.

DR. ADOLPHE BARKAN (in the *Pacific Medical and Surgical Journal*) gives an account of a case of sling-shot injury of the eye of a rather remarkable nature. The patient was struck with a projectile near the outer angle of the eye. The projectile was fired from a sling and was presumably a piece of rock or a small stone. On examination forty-eight hours after the accident, the eye of course presented the appearance of having been injured, but the most remarkable symptom was the entire immovability of the eyeball, which also protruded out of the orbit. The conjunctiva was hyperæmic and swollen; the cornea intact; the aqueous humour slightly clouded; a narrow stripe of blood was at the bottom of the anterior chamber. The pupil was immovable, largely dilated, and not affected by light. The lens appeared to be free from lesion. The vitreous body was much clouded, obscuring the eye to such an extent that ophthalmoscopic examination of the rear of the eye was rendered impossible. From the symptoms, Dr. B. thought that possibly a particle of the projectile had entered the orbit and remained lodged behind the eye, but a careful examination led to a negative result.

Neither a foreign body, nor traces of its having entered the orbit, could be detected. It was therefore concluded that the foreign body had struck the eye with considerable force, causing an effusion of blood into the orbit, more especially into the rear of the eye, and as there were no symptoms of a diffuse traumatic aneurism present, and no foreign body could be detected, the supposition that the protrusion and immovability of the eyeball were caused by

hæmorrhage seemed to be the only satisfactory one. The prognosis was favourable, for it seemed probable that the vision of the injured eye would improve, and its protrusion, as well as its immovability disappear, as the blood extravasated into the eye, more particularly into the vitreous body, and the hæmorrhage into the orbit, were becoming gradually absorbed. Leeches were applied to the temple, and a moderate pressure exerted upon the eyeball by means of a bandage. The patient remained confined to bed and to a darkened room. Under this treatment, the eye made good progress; the swelling and discolouration of the lids considerably decreased; there was a marked diminution in the protrusion of the ball, and a slight movability of the eyeball was perceivable. When a fortnight had passed, however, a foreign body appeared at the side of the eye, near the external canthus. The body in question was a round, large-sized leaden ball, imbedded in a smooth and comfortable conjunctival pocket, in the lower reflected part of the conjunctiva, near the external canthus. The ball could be turned round on its axis in its smooth conjunctival berth, and was easily extracted by forceps. Drawing the lids apart, a blunt probe was introduced into a spacious canal, through which the ball had just made its exit. The canal was situated between the outer wall of the eyeball and the outer osseous wall of the orbit, and on examination with a blunt probe was found to extend through the cellular tissue of the orbit into the rear of the orbital cavity near the optic nerve insertion. The protrusion of the eyeball had entirely subsided; the eye readily moved in every direction; the lids, conjunctiva and eyeball, had assumed an almost normal appearance, but the pupil was still considerably dilated and immovable. Vision had improved in a slight degree. A few weeks afterwards the eye was examined with the ophthalmoscope, and the lens found to be partially luxated, the vitreous body traversed by numerous opacities, and the retina detached in several places. Dr. Barkan says:—

This case of a foreign body in the orbit, is certainly one of the most remarkable on record, for not only is it an astonishing fact that a lead ball $\frac{32}{100}$ th of an inch in diameter, thrown out of a sling, should have found its way into the orbital cavity, passing through between the eyeball and osseous wall of the orbit, yet causing neither a rupture of the tunics of the eye, nor a fracture of the wall of the orbit; and moreover, this is a noteworthy fact, the ball remained lodged in the orbit for more than a fortnight, without causing pain or other troublesome symptoms. That the ball worked itself to the front of the orbit must, in my opinion, be explained by the fact that it and the injury it caused, occasioned considerable hæmorrhage to take place in the rear of the orbit. Thus the wall and the effused blood were the cause of the great protrusion and perfect immovability of the eye, which were observable during the first days after the injury. When the absorption of the effused blood took place, the eye became more and more movable, and undoubtedly these movements, though limited at first, did much towards moving the ball out of its position, and bringing it to the front of the orbit. The fact that I had seen the patient only twice, and almost immediately after the injury had been inflicted, when the conjunctiva was much and universally swelled, and when the foreign body was so deeply imbedded that it could neither be seen nor reached with a probe, accounts for the nondiscovery of the presence of the ball.

We regret to have to announce the death of Mr. Sercombe, which took place on Wednesday last, at 5 p.m. He was a well-known dentist, and was last year President of the Odontological Society of Great Britain.

THE concert which was given recently in the Albert Hall in aid of the Middlesex Hospital has resulted in a cheque for over £225 being handed over to the hospital treasurer.

We understand that Wednesday, June 16th, is the day fixed for the annual meeting of the General Medical Council.

Two dairy proprietors, named Byrne and Rafter, were fined £20 each, on Saturday, at Dublin, for having in their possession cows suffering under pleuro-pneumonia and not giving the required notice to the authorities.

THE Royal Hospital for Consumption at Ventnor has received a bequest of £1000 from the will of the late Mr. Leaf, of Cheapside, London. The York Dispensary has received £500 under the will of the late Mr. Roper.

SIR H. THOMPSON presided at a festival of a Band of Hope Union held on the 17th inst. at the Free Trade Hall, Manchester. The hall was crowded, and Sir Henry spoke strongly in favour of total abstinence from intoxicating drinks.

A MEDICAL SOCIETY for the North of London has just been started, under the presidency of Mr. Kesteven. Dr. Dowse is vice-president, Dr. Harvey Hilliard treasurer, and Mr. W. H. Kesteven hon. sec. The meetings of "The North London Medical Society" will be held on the second Wednesday in each month from October to May. We wish the new venture every success.

IN the House of Commons on Wednesday last the Chancellor of the Exchequer stated that he was aware there was an inequality in the Government grant in aid of medical expenditure to the parochial boards of Scotland as compared with the grant for the same purpose to Poor-law unions in England, but he was not yet prepared to make any change in the existing rule.

IN the House of Commons on Thursday last, in reply to Dr. L. Playfair, as to whether it was the intention of the Government to lay before Parliament reports by the medical officer of the board on the practical efficiency of the act in promoting public health, Mr. Selater-Booth said that the reports referred to had been moved for by his right hon. friend the member for Halifax (Mr. Stansfeld). They had reference to arrangements made under the Public Health Act.

AN absurd charge has been brought against a Liverpool medical man, Mr. Sheldon, for not duly attending a lady whom he attended in confinement. What with medical charities and their abuse by affluent patients, and what with such charges against our brethren when they do the best they can for their patients, it is high time that doctors began to defend themselves *en masse* against the impertinence of the other classes. Cads in the shape of practitioners of medicine who take the side of such prosecutions ought to be sent to Coventry.

At a special Court of Governors of the London Hospital, held on Tuesday, the 20th instant, a vacancy was declared in the office of Senior Obstetric Physician to the hospital. Dr. Palfrey, who has been the Junior Obstetric Physician to the hospital for nearly ten years, and upon whom has devolved the duty of his senior colleague during a protracted illness extending over nearly two years, is a candidate for the appointment.

A COMMISSION which was appointed some time ago to inquire into the best means of getting rid of the sewage of Paris without polluting the Seine proposes that the whole of the sewage shall be distributed by means of machinery over a plain many thousand acres in extent. The value of this land, on which fruit and vegetables are produced for the Paris market, will, it is calculated, be thereby increased tenfold. At the same time no deleterious effect will result, the porous nature of the ground being specially favourable to the operation proposed.

At the last meeting of the Nantwich Board of Guardians with reference to the terrible ravages of puerperal fever in Crewe during the last few days, Mr. Heath stated that no fewer than eleven women in the prime of life had succumbed to the disease quite lately, adding that the contagion had spread by medical officers in the town attending women in their confinement. Mr. Tollemache, a county magistrate, mentioned that three women had died from the same disease in his immediate neighbourhood. The state of affairs has created a great sensation. The Guardians advised the Crewe Local Board to communicate with the Local Government Board at once.

DR. CARPENTER, of Croydon (*Public Health*, April), describes the sewage farm at Croydon, which has occupied his attention for many years past, and is thought by many to be a great success. He showed, in a lecture delivered on the subject, specimens of the crops and other produce of the farm. He laid special stress on the importance of air in assisting filtration, and on the advantage arising by making this process intermittent. In the debate on the paper Dr. Voelcker made some remarks on the influence of sewage on crops. Mr. Smee thought that the Croydon farm was a nuisance and a failure.

THE Board of Governors of the Richmond Hospital, Dublin, met last week for the purpose of electing a surgeon in the room of Mr. John Hamilton, who has been recently appointed Surgeon-in-Ordinary to the Queen in Ireland in place of Mr. Adams, and who resigned his connection with the Richmond Hospital thereupon. The choice of the governors fell upon Mr. Corley, who is one of the surgeons of Jervis Street Hospital. The selection is in all respects a good one. Mr. Corley has established and sustained the repute of being an active and advanced surgeon, and his close relation to the Richmond Hospital for many years as a principal lecturer in the Carmichael School gave him a special claim which could not justly be ignored. Men of higher seniority might have been chosen if they had competed, but amongst the surgeons of his own time Mr. Corley possessed a pre-eminent title to the suffrages of the governors.

THE visitation of the examinations of the Colleges of Surgeons and Physicians of Ireland and of the Irish Apothecaries' Hall was carried out last week by Dr. Risdon Bennett and Dr. Stokes.

At the London College of Surgeons, out of the 180 candidates examined, 35 having failed to acquit themselves to the satisfaction of the Court of Examiners, were referred to their anatomical and physiological studies for three months. The General Medical Council having nominated Dr. Fleming, of Glasgow, and Dr. Barton, of Dublin, to visit and report on the examinations, these gentlemen were in attendance on the 15th inst., and took copious notes.

Literature.

FIVE YEARS' SURGICAL EXPERIENCE IN THE MANCHESTER ROYAL INFIRMARY.

WHEN strangers visit the operating theatre of the Manchester Infirmary it is a common remark of Mr. Southam's to say—"Gentlemen, midway as we are situated between the north and the south, it is natural that we should equally represent the progress the great medical schools there are making."

Bearing in mind this remark of Mr. Southam's, it was with no ordinary interest that we took up Mr. Lund's "Five Years' Surgical Work in the Manchester Royal Infirmary."

In *limine* we may say that Mr. Southam's remark has been clinically and pathologically illustrated in a most satisfactory manner.

As we have had from time to time opportunities of seeing the surgical practice at the Manchester Infirmary, we think we shall best satisfy our readers if we endeavour to show—first, the object Mr. Lund has had in view in republishing from the Manchester and Liverpool Reports his surgical work; secondly, the object and scope of it.

In the preface we learn that the author has had two objects in view in publishing his experience—viz., to show the nature and extent of his practice, but especially the value of reporting surgical cases, points sufficient to indicate that we are dealing with a thoroughly clinical work.

Following the preface there is an index, which, for all practical purposes, is sufficient. We think, however, that here and there it might be altered advantageously; but as classification and medical terminology are subjects almost as arbitrary as the pronunciation of our language, we leave this matter to be discussed by nosologists *et hoc genus omne*.

The index is useful, moreover, as from the method of its arrangement we see at a glance the style of practice to be met with in a large manufacturing town such as Manchester.

We find that in five years Mr. Lund has treated 142 contusions of various parts of the body; wounds of sorts 122; scalds and burns 67; sprains 25; fractures 304; injuries to the brain and spinal cord 54!

What a terrible table this is, and how it unmistakably shows the dangers that still exist while working in cotton mills and on railways! and bearing in mind what the percentage of accidents formerly was on iron-works and elsewhere, how necessary it became, then, for Parliament to interfere; *à fortiori*, judging from these tables, how important it is still for Government to exercise a strict supervision. We cannot but believe that many of the accidents tabulated in this work were of a preventable nature.

In Table I, Class 1A—*Contusions*—Mr. Lund gives a short *résumé* of the cases, and in speaking of the treatment, recommends spirits of wine as an application where the skin is unbroken, and which he states is invariably

used by the London Fire Brigade, and pertinently remarks that "it is highly probable that the spirit portion of tincture of arnica and other alcoholic tinctures, rather than the vegetable extract, is that which chiefly acts as a stimulant to the surface." The observations that follow are all of a practical nature, and the remarks on the condition known as *punctiniform ecchymosis* will interest both the practitioner and the student.

Table II.—Wounds of every kind are discussed, including eight cases of gunshot wounds. In speaking of scalds and burns, Mr. Lund says: "I have drawn a distinction between these two classes of injuries, for it will be found that scalds are for the most part less dangerous and less serious than burns. In scalds it will be generally observed that the difference in the effect of water, when free from greasy matter or oil, and steam, is very considerable." The remarks that follow in illustration of this distinction are thoroughly practical. As regards the *treatment* of burns recommended, it is almost similar to what has been pursued on the iron-works in South Wales for the last thirty years, with this difference, that previously to dressing the patient with burn ointment, the abraded and injured parts were covered over and saturated for twenty-four hours with carron-oil, a practice not carried out in Manchester. As regards the addition of carbolic acid, possibly it may, as Mr. Lund says, "act as a local anæsthetic to the cutaneous nerves;" but as burns have hitherto done well under the treatment we have noted, we confess to being somewhat sceptical as to the antiseptical advantages of carbolic acid being added to the old-fashioned burn ointment. Next comes amputations for accidents and disease. The tables are very carefully drawn up, and Mr. Lund may be congratulated on his success. Two cases recovered in amputation at the hip-joint, and eight recovered after amputation of the thigh out of fourteen cases. The author then fully describes his method of dressing stumps; and as we ourselves have had the pleasure of seeing Mr. Lund's practice, we can bear testimony to the great success he has met with; better stumps we have never seen, and the rapidity with which some of them have healed was quite remarkable.

Mr. Lund's remarks on torsion are scarcely as full as we anticipated, knowing that it has been very largely practised by the staff of the Manchester Infirmary, and was very favourably alluded to in a clinical lecture by Mr. Lund which was published in the *MEDICAL CIRCULAR* last year. In Table VIII. will be found some carefully recorded cases of hernia, one especially, of a man who was operated on twice by Mr. Lund for the same inguinal hernia, and recovered—a case which the author very shrewdly remarks "will serve to illustrate the possible advantages which would occur if persons the subjects of hernia were less indisposed to submit to early operations." Then follows a series of chapters illustrating Mr. Lund's extensive practice in other departments of surgery, including tumours, diseases of bone, &c. The chapter on fractures serves to illustrate the extent and variety of practice to be seen in the wards of this Infirmary. The majority were compound, and the mode of treatment of the wounds was in every instance either Lister's method or Mr. Lund's modification, and "no cases of injury," says the writer, "have seemed to show so well the good effects of the antiseptic treatment as compound fractures." Few surgeons have followed out Mr. Lister's method with so much assiduity and care as Mr. Lund, and, unlike most enthusiasts, he does not ride his hobby to death. The various papers he has written on the subject are sound and thoroughly practical, and his extended practice of Lister's system in every variety of wound entitles him to speak with the highest authority rather than in the modest though no less dignified terms with which the chapter concludes—viz., "I think those who have watched such cases treated upon these principles should feel it to be a duty to advocate them, if not with more earnestness, possibly with greater weight and authority than I can boast."

A number of other chapters of equal practical interest follow, and if space permitted we should be glad to deal

with them *in extenso*. In the table of diseases of the bladder we notice several very interesting cases; but what has always struck us as singular is the manner the surgeons at the Manchester Infirmary perform lithotomy—kneeling. This to our mind looks very ungainly, and certainly will not bear comparison with the finished and elegant style of operating of that distinguished surgeon Sir Wm. Fergusson and his followers. Mr. Lund has set an example to his colleagues which we hope they will follow; and if the surgical experience of the whole staff was annually recorded, we feel confident a volume of clinical surgery would appear which would be highly instructive and illustrate the extent and variety of practice the Manchester School of Surgery affords.

DENTAL SURGERY. (a)

THIS volume will be as interesting to the medical practitioner as to the dentist, perhaps more so, for it occupies the very considerable field which may be looked upon as a sort of debatable ground between that occupied by the surgeon and the dentist. Dentistry proper is excluded from this work, but the principal points of dental surgery are treated with the authority to which the author is entitled from his long experience. It is just the sort of book to which the general practitioner should refer in numerous cases in which he suspects that disease may have originated in a tooth. The author's careful researches in the domain of pathology are also included in the book, and many generally interesting questions are touched upon; thus, in the second chapter, devoted to the functions of the teeth, their use as passive organs of speech is illustrated in a thorough and agreeable manner.

In chapter viii. the subject of caries is placed before the reader with great skill, and although this is, so to say, a brief essay on the subject, it is very complete, and includes the red patches in dentine which have been attributed to staining, but which extended observation has led the author to believe are not unfrequently the result of inflammation. He has found incremental bands of pink dentine in inflamed teeth, and satisfied himself that the colour was caused by hæmatine in the tubes. This position of the colour is the real distinction between inflammation and developmental staining, in which the intertubular tissue shares the pigment. Many years ago the author satisfied himself that in inflammation of the pulp hæmatic colour enters the dental tubes. We are not told what means have been taken to prove the presence of hæmatine, but we would suggest the possibility of determining this point by means of the spectro-scope.

Odontomes, diseases of the tooth-pulp, tumours and other affections of the gum, and dentigerous cysts, occupy several chapters.

We have ourselves so often seen mistakes made in cases dependent upon difficult eruption of the wisdom teeth that we desire to call the attention of all practitioners to the chapter on this subject. The treatment required may generally be carried out with ease, though difficulties are occasionally met with. The great point is the early detection of the cause of the patient's sufferings, for the relief of which application is usually made to the surgeon before the dentist.

So again, the next chapter, on alveolar abscess, is one that every practitioner of medicine or surgery should thoroughly digest.

A separate chapter is devoted to so-called abscess of the antrum, the early diagnosis of which is also of the highest importance.

Medical men will also be highly interested in Mr. Salter's account of the affections of the nervous system dependent on diseases of the teeth. These are either reflex, direct,

(a) "Dental Pathology and Surgery." By S. J. A. Salter, M.B., F.R.S., Dental Surgeon to Guy's Hospital. London: Longmans and Co. 1874.

or mixed, and many of them have from time to time been brought before the profession. Here among reflex affections we find valuable observations upon, and illustrative cases of, facial and general neuralgia, brachial neuralgia, wry-neck, epilepsy, tetanus, amaurosis, deafness, sloughing of the cheek, and ulceration of the neck, whilst among direct affections we have facial paralysis, amaurosis, antral abscess, &c.

After a sketch of phosphorus disease we come to a subject which, although mentioned by Fox, did not attract much attention until taken up by Mr. Salter, viz., necrosis and exfoliation of the alveolar processes and portions of the maxilla after attacks of the eruptive fevers. Such cases have occasionally been attributed to the administration of mercury during the fever, but Mr. Salter believes that this is an error. Descriptions, with illustrations of eight specimens, are given. The first evidence of necrosis has always been within eight or nine weeks after recovery from the fever, usually within four or five. It is not often preceded by pain, swelling, or abscess. It usually occurs on both sides, and Mr. Salter has observed that it occurred in otherwise very healthy children. He believes that the necrosis is the result of a specific poison applied to the vascular parts of the teeth, and so far analogous to the disease produced by phosphorus fumes, but in the fever case, the poison is generated within the individual. The disease only occurs after the eruptive fevers, and non-interference is the best way of meeting it. A weak solution of chloride of lime, or better still, of permanganate of potash, is recommended as a deodorising mouth-wash, and if the general health should be disturbed, ordinary principles should be carried out.

With regard to the removal of tartar, Mr. Salter, we are surprised to learn, employs hydrochloric acid, neutralising it immediately by an alkaline powder consisting of the finest pumice with a fourth part of Castile soap. In his hands we should not be afraid to trust ourselves, but we almost regret that he recommends this method, inasmuch as his authority may be used in favour of a plan which we have always considered as rather dangerous, and the ease of employing which furnishes a strong temptation to extend its use. We may add that the powder seems to us a weak alkali to neutralise a mineral acid more diluted than is here recommended.

The chapter on the extraction of teeth should be perused by everyone who occasionally performs the operation, and is followed by a chapter on the accidents that may take place, which is beyond all praise. Mr. Salter, with a rare courage, details the casualties that have occurred in his own practice. For this he deserves the gratitude of every operator. Legal proceedings of a most unjust character, but none the less disastrous to the operator, may be commenced by dissatisfied patients; and those exposed to this danger may well be thankful that an authority of Mr. Salter's skill and experience has dared to publish his failures, for of course less experienced men could scarcely hope to be equally successful. Valuable as every portion of the work is, we think for this chapter especially Mr. Salter deserves the grateful thanks of every general practitioner, and we have no doubt that dentists themselves will still more highly appreciate our author's courage.

PATHOLOGICAL ANATOMY. (a)

THIS manual professes to give a comprehensive summary of all that is important in the science of pathological ana-

(a) "Manual of Pathological Anatomy." By C. Handfield Jones, M.B. Cantab., F.R.S., F.R.C.P., Physician to and Lecturer on Clinical Medicine at St. Mary's Hospital; and Edward H. Sieveking, M.D., F.R.C.P., Physician to St. Mary's and the Lock Hospitals, Physician Extraordinary to the Queen, Physician-in-Ordinary to the Prince of Wales. Second edition, revised, enlarged, and edited by Joseph Frank Payne, M.B. Oxon., F.R.C.P., Fellow of Magdalen College, Oxford, Assistant Physician to and Late Demonstrator of Morbid Anatomy at St. Thomas's Hospital. London: J. and A. Churchill. 1875.

atomy. Drs. Jones and Sieveking have not worked jointly at the whole subject, but each has written certain divisions of the work, and the table of contents tells us which author is responsible for the several parts. Dr. Payne has revised the whole of this second edition, and he tells us that in doing so he has constantly consulted Rokitsansky, Forster, Cornil and Ranvier, and Rindfleisch. There are 195 wood engravings distributed through the work, many of them being new, and from the editor's original preparations.

The first part of this handbook is devoted to general pathological anatomy, extends over 222 pages, and is from the facile pen of Dr. Handfield Jones. After a chapter of general observations the author devotes one to the morbid states of the blood. Chapter iii. is on inflammation, and is a very able summary of this important subject. In this chapter are included pyæmia and septicæmia as results, though only occasional ones, of the inflammatory process. Of course, the ordinary products and results of inflammation receive attention. In chapter iv. Dr. Jones treats of textural changes, a considerable portion of this being occupied by degenerations. The subject of chapter v. is new formations, which are treated exhaustively, and the illustrations of which are numerous and admirable. In the next chapter, tubercle and allied products are disposed of; whilst with chapter vii., on the vegetable and animal parasites of the human body, Dr. Handfield Jones concludes the first part of the work. As an illustration of how this is brought down to date, we remark that the nematoid parasites discovered by Dr. Lewis are included. We heartily commend Part I. of this manual, as perhaps the best summary in the English language of general pathological anatomy.

Of Part II. we have not space to speak at length. This part is devoted to special pathological anatomy, which is treated of in eight sub-divisions. Of these, Dr. Sieveking contributes those on the pathological anatomy of the nervous system, of the organs of circulation and of respiration, the female organs of generation, and the osseous system. The other sections are written by Dr. Handfield Jones, and comprise the pathological anatomy of the alimentary canal, of the urinary apparatus, and of the joints. This last may be taken as a sample of the book. A paragraph on malformations is followed by inflammation of the synovial membrane and of the joints. In the last, though commonly classed as synovitis, the cartilages are involved. On acute rheumatism, Messrs. Cornil and Ranvier are cited as describing an inflammation of the synovial surface similar to the same disease in other serous membranes marked by the production of large compound cells with several nuclei, corpuscles like those of pus and sometimes fibrinous reticulum. The same authors speak of changes in the cartilage cells resulting in the production of secondary capsules and splitting up of the cellular substance. Pulpy degeneration of the synovial membrane, first described by the late Sir Benjamin Brodie, generally extends to the synovial membrane of the cartilages. This subject has been enlarged upon by our authors in the Pathological Report for 1848 and 1849, and is full of interest.

Atrophy, or usure of cartilage, is described in a manner that tallies with the observations of Dr. Wilks, and illustrated by an engraving representing a vertical section of cartilage of patella in this condition. Ulceration is also illustrated by a drawing representing a vertical section. Scrofulous and tubercular disease of the joints, disease of the articulations of the vertebrae, and ankylosis, true and false, being briefly disposed of, the section closes with chronic rheumatoid arthritis, the description of which is for the most part drawn from the writings of Mr. Adams.

As a specimen of Dr. Sieveking's share of the work we may refer to the section on the organs of circulation, the pathological anatomy of which is given with great fullness. In this section, the chapter on thrombosis and embolism attracts our attention. The varieties of thrombi, and their occurrence in different classes of vessels, as well as the metamorphoses they undergo, are carefully described; and

here we are glad to see credit is given to Mr. Gulliver as having first distinguished softening from suppuration. Under embolism, the secondary changes in the parts affected by the supply of blood being suddenly cut off naturally occupy more attention than the transformations of the hæmorrhagic infarctus. The recent investigations of Cohnheim are included, but we do not notice any mention of the observations of Sir James Paget or any other English authority.

This illustrates what we are inclined to consider almost the only defect of the work—the comparative neglect of British authors and the almost complete dependence on German writers.

Correspondence.

THE INQUEST AT HENLEY-IN-ARDEN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—My attention has just been called to the article in your paper of the 7th instant, in which you have thought proper to comment upon an inquest which I was called upon to hold on John Aubrey at Stratford-on-Avon a few weeks ago.

You assert that the man "perished from neglect, never having had medical advice, although he was dying of acute bronchitis," and "the poor man died probably for want of reasonable care and competent advice," &c., &c. You do not appear to indicate who was responsible for the neglect, or in what way such men as Aubrey can obtain "competent medical advice." If it had answered your purpose to inform yourself correctly before writing your comments you would have ascertained that neither the man or anyone on his behalf had ever made application to the only source open to him, viz., the parish authorities or the union doctor, for either care or advice, which may be taken as tolerably conclusive that he required neither the one or the other, and that your comments are based upon a state of things for which there was no authority whatever.

The evidence of the medical man examined at the inquest, which I annex, will show what was his opinion of the cause of death, and how far Mr. James (whom you consistently designate as "the prisoner") was responsible for it. The rest of your comments are equally disgraceful. I notice them only to correct any misapprehension which even such language may cause if uncontradicted.

Your obedient servant,

T. B. COUCHMAN.

April 19th, 1875.

"Mr. Rice—I examined the body of deceased yesterday evening; it was that of a feeble old man, not over-well nourished, small chest capacity, no external marks of violence, and nothing which could positively point to the cause of death. I have examined the prescription, and tested the bottle produced, and say that no matter what the man's state may have been, and assuming the bottle to correspond with the prescription, which I have no reason to doubt from the taste, the dose which he is said to have taken could not by any possibility have caused his death, which I am of opinion was an ordinary case of asthenia—by which I mean to say want of strength, or in other words a natural death."

Medical News.

Royal College of Surgeons of England.—The following gentlemen were admitted members of the College at meetings of the Court of Examiners on the 20th, 21st, and 22nd April:

Anningson, Thirkell, Burnley.

Barnes, John James, L.R.C.P.Ed., Bolton.

Base, Charles William, L.S.A., Barnsley.

Beaumont, William Mardon, L.S.A., Oxford, Middlesex Hospital.

Bell, John Duncan, L.S.A., Antigua, St. Bartholomew's Hospital.

Bond, George Weddall, L.S.A., Pulham, Guy's Hospital.

Buck, Charles William, Settle, Yorks.

Cadge, W. H., Castle Carlton, Norfolk, St. George's Hospital.

Cosgrave, Alexander, Fairfield.

Crétin, Eugene, L.S.A., the Mauritius.

Davies, John Wm., L.R.C.P.Lond., Ebbw Vale, Mon.

Day, Edward Joseph, L.S.A., Woodyates, Dorset.

Edmond, Wm. Richardson, Swansea.

Edwards, David, Mold, University College.

Gossett, George, Westward Ho!

Graham, John Thomas, M.B. Glas., Tottenham.

Greenwood, Thomas Porter, Easton, Northamptonshire.

Greenwood, Charles, Nether Broughton, University College.

Gurdon, Edwin John, L.R.C.P.Ed., Colchester.

Hames, George Henry, Woburn Place, Russell Square.

Hartley, John F., Thorne Salvin, Yorks, University College.

Hellier, John Benjamin, Headingley, Yorks.

Hobson, John Morrison, L.R.C.P.Lond., Forest Hill.

Hodson, Henry Algernon, Bishops Stortford.

Hope, T. M., L.R.C.P.Ed., Wastoe, South Shields.

Houlbrook, Edward, L.S.A., Ilkley, Yorks.

Hunt, John Aspinall, Ockbrook, Derby.

Jackson, Robert Alexander, Notting Hill Square.

Jameson, Leander Starr, Earl's Court Road.

Johnson, E. T., South Norwood, St. Mary's Hospital.

Lockwood, John Parker, New Hampton, Guy's Hospital.

Martin, Samuel Edgar, M.D. Q.U.I., Newry.

Miller, Frederic Daniell, L.S.A., Streatham.

Nankivell, Frank, York.

Newton, George, Newcastle-on-Tyne.

Orchard, James Stuart, M.B. Aberd., Salford.

Parker, George Roger, Lancaster.

Potter, Henry Percy, Denmark Hill.

Rawlings, Alfred, L.S.A., Plympton, Devon.

Rees, John, L.R.C.P.Ed., Dover.

Rees, David Valentine, Carmarthen.

Richardson, Arthur, Rusholme.

Romano, Frederick W. R., L.S.A., Brazil.

Smith, Charles Edwin, L.R.C.P.Lond., Preston.

Smith, William Romanis, Oxford, King's College.

Thompson, Alfred, L.S.A., Spilsby, Lincolnshire.

Treves, Frederick, L.S.A., South Hackney.

Walker, William, L.S.A., Landsend, Lancashire.

Waterhouse, Joseph Bourne, Burslem.

Of the 62 candidates examined during the week 14 failed to satisfy the Court of Examiners, and were referred for six months' further professional study.

St. Thomas's Hospital.—At a general court of governors of St. Thomas's Hospital, held on Wednesday last, the treasurer informed the court that the president, Sir John Musgrove, Bart., had founded a scholarship of the annual value of 40 guineas, to be awarded biennially in the medical school of that hospital, and to be held for two years by the second year's student placed highest in the first class at the winter examination. Sir John Musgrove has transferred the sum of £1,400 Consols into the names of the treasurer and other trustees, and a deed of trust defining the conditions on which the scholarship is to be awarded and held has been executed. A very cordial expression of thanks to Sir John Musgrove was unanimously passed.

The Remedial Use of Sea Water as a Beverage.

DR. LISLE, in the *Bulletin de Thérapeutique*, recommends sea water as often beneficial. He finds that its continued use increases the appetite, facilitates digestion, quickens nutritive changes, and augments the proportion of red corpuscles in the blood. Accordingly he recommends:—

1. During convalescence from acute diseases; 2, in the pyretic forms of dyspepsia; 3, in neuroses associated with impoverishment of the blood; 4, in the scrofulous and tuberculous diathesis; 5, in diabetes.

Sea water may be agreeably administered in bread, in the form of a syrup, or in that of an elixir. Bread made from sea water can only be procured at the seaside; it is very palatable, and contains nearly five grammes of the mineral constituents of the water in each pound. The syrup is prepared by mixing 250 grammes of sea water with a sufficiency of sugar and distilled water to make 500 grammes. Each tablespoonful of the syrup contains about twenty-five centigrammes (3½ grains) of the saline residue of sea water; from two to five tablespoonfuls may be taken daily.

The formula for the elixir is: sea water, 200 grammes; rum, 200 grammes; sugar and distilled water up to 500 grammes. The dose at first is a tablespoonful three times a day.

To the obvious objection that a pharmaceutical mixture of

the saline constituents of sea water in their due proportions would serve the same remedial purposes as the sea water itself, Lisle replies that the efficacy of all natural mineral waters is very much greater than that of their manufactured counterparts, the testimony of those who have instituted comparative trials being all but unanimous on this point.

The Diagnosis and Treatment of Placenta Prævia.

DR. CHARPENTIER, in the *Archives de Tocologie*, gives some practical directions on this subject:—

If attention be paid to the following points, the diagnosis can be made without much difficulty. First, the time at which the hæmorrhage first makes its appearance, viz., from the seventh to the eighth month, in some rare cases as early as the sixth month; the fact that it comes on suddenly, without any known cause, and stops as suddenly; and that it reappears at uncertain intervals, but in increasing quantities, up to the time of labour. Second, the absence of ballottement, the thick mass of the placenta being interposed between the finger and the foetal presentation.

The hæmorrhage, in cases of placenta prævia, is always external; it takes place during the uterine diastole, but is expelled during the systole, and if the latter were continuous it could hardly take place at all.

Artificial delivery is a most dangerous method, only suited to most urgent cases. The rupture of the membranes is very good treatment, provided the os is partially dilated. It is hard to do when the presentation is complete. The use of ergot is a powerful auxiliary, but it increases greatly the danger to the child, and is contra-indicated in contraction of the pelvis, organic disease of the uterus, and mal-presentation.

The author looks upon the plug as the treatment *par excellence*. It requires to be applied skilfully to be of any great use. Charpie or tow are the best materials with which to plug, and if properly applied, the author considers such a plug superior to any description of india-rubber bag which can be introduced into the uterus and inflated. The great point to attend to when plugging is to introduce enough of the charpie or tow, as much as a pound and a half of the former material being sometimes necessary. The bladder and rectum should both be emptied before we proceed to plug. Some practitioners dip the first pledget in a solution of perchloride of iron. This is not necessary.

The charpie should be rolled into small balls, the first twenty or thirty of which should have a piece of thread attached. Before being introduced they should be well covered with cerate. This renders a speculum unnecessary.

The author lays great stress on packing tightly the anterior and posterior *cul-de-sac*, but especially the latter. The success of the operation depends to a great extent on this being well done. The vagina itself should be filled with the small pledgets, until they appear externally. Then you apply a handful or more of dry charpie, and over that three or four compresses, the whole being fixed by a T bandage. If this plug be well applied there can be no hæmorrhage. If the charpie at the vulva become moist it is a proof that the plug is badly applied, and it should be removed at once and reapplied. To be of much service the plug should be left in from twelve to twenty-four hours.

NOTICES TO CORRESPONDENTS.

DR. DUGGAN.—Your paper on "Treatment of Pulmonary Cavities" shall appear, if possible, in our next.

DR. CAREY and DR. MEADOWS.—We regret that your copies have again miscarried. Complaints have been made to the Postmaster-General, and the grievance will probably be remedied.

MR. H. JAMESON.—If you are "A Constant Reader," as you describe yourself, you ought to know by this time that we never give the name of any particular practitioner for this or that disease. For such advice you must go to that quack publication "Whom to Consult;" none of the recognised journals will publish the information you seek. "SUBSCRIBER" should enclose his card, not necessarily for publication, but as evidence of good faith.

DR. DUNCAK.—Some of the back numbers of the journal are out of print; the remainder will be sent you as soon as our publisher can look them out.

MR. LANN'S BOOK.—This little brochure, which first appeared in these columns, and was subsequently reprinted in book form, has had a remarkably successful run. In six weeks a large edition was out of print, and now a second edition is before us, and we are informed by the publishers that this is meeting with an equally rapid demand. We wish Lann's "Philosophy of Voice" continued success.

A "CAUTION."

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me through your journal to caution medical gentlemen against accepting Government medical appointments in the Leeward or Windward Islands of the West Indies.

For further information vide *Lancet* of 17th April, page 562, which can faithfully corroborate, as having been victimised by the Government and defrauded of part payment of salary, after serving over three years of the hardest existence ever I endured without ever receiving a day's leave of absence, although applied for at a time when imminent danger threatened two members of my family.

The Colonial Office authorities should indeed appoint presidents gentlemen of culture and education *specialty qualified* for the duties incumbent on them, which would add materially to the welfare of their subordinate officers.

Yours very faithfully,
A SUBSCRIBER.

N.B.—Other journals will confer a favour by inserting the above the edification of the Faculty.

VACANCIES.

Broadmoor Criminal Lunatic Asylum. Assistant Medical Officer Commencing salary at £200 per annum, with furnished apartments, &c. (See Advt.)

County of Tipperary Infirmary. Surgeon. Salary, £100 per annum. Applications to be lodged with the Secretary of the Committee. (Advt.)

Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 66 Market Street, Bradford.

Liverpool Dispensaries. House Surgeon. Commencing salary a £103. Applications to the Secretary.

Barnstaple Union. Medical Officer. Salary, £96, with extra fees. Applications to Mr. W. H. Toller, Barnstaple.

Hull Borough Asylum. Resident Medical Superintendent. Salary £850, with residence, &c. Applicants must apply to the Committee Visitors, under cover, to the Clerk.

Droitwich Union. Medical Officer of Health. Inclusive Salary, £150 Applications, endorsed "Medical Officer of Health," to the Clerks of the Committee.

Great Yarmouth Hospital. House Surgeon. Salary, £100, with nished apartments. Testimonials, &c., to the Hon. Sec.

Metropolitan Free Hospital, London. Assistant House Surgeon. No salary, apartments and board free. Applications to the Secretary Devonshire Square, City.

St. George's, Hanover Square. Dispensary Physician. Honorary Testimonials to the Secretary, 78 Park Street, W.

APPOINTMENTS.

BARNES, E. G., M.R.C.S.E., Medical Officer for the Eye District and the Workhouse of the Hartismere Union, Suffolk.

BELL, C. A., M.B., L.R.C.S.I., Lecturer on Chemistry at the Stevens's Hospital Medical School, Dublin.

BURKE, J. P., M.D., L.R.C.S.Ed., Medical Officer, &c., for the Claremorris Dispensary District of the Claremorris Union, co. Mayo.

COOKE, E. M., M.R.C.S.E., second Assistant Medical Officer to the Worcester County and City Lunatic Asylum, Powick.

COOMBS, R. H., L.R.C.P.L., Assistant Physician to the General Infirmary, Bedford.

DAVIDSON, D. C., L.R.C.P.Ed., L.R.C.S.Ed., Senior House Surgeon the Birkenhead Borough Hospital.

DAVIES, F. P., M.B., C.M., M.R.C.S.E., Senior Assistant Medical Officer to the Kent County Lunatic Asylum, Barming-heath, near Maidstone.

EWART, J. C., M.B., C.M., Curator of the Museums of Anatomy and Comparative Anatomy at University College, London.

HEMBROUGH, J. W., M.R.C.S.E., Medical Officer for the Waltham District of the Caistor Union.

JONES, E., M.R.C.S.E., L.M., Medical Officer to the Merthyr Tydfil Union Infirmary at Aberdare.

LAING, J. M.B., C.M., a Medical Officer to St. Mary's Hospital and Dispensary for Women and Children, Manchester.

MOLODY, P. J., M.D., L.M.K.Q.C.P.L., Medical Officer to the Chester-union Workhouse.

MOORE, J. W., M.D., F.K.Q.C.P.I., a Physician to the Meath Hospital and County of Dublin Infirmary.

NICHOLSON, H. A., M.D., Professor of Botany and Natural History at the University of St. Andrews.

PIERCE, E., M.D., F.R.C.S.Ed., L.F.P. & S. Glas., Medical Officer for the Llanrhaidir District of the Ruthin Union.

RAINSFORD, R., M.B., C.M., F.R.C.S.I., Lecturer on Ophthalmic Surgery at the Ledwith School of Medicine, Dublin.

RICHARDSON, C. S., L.K.Q.C.P.I., a Medical Officer to St. Mary's Hospital and Dispensary for Women and Children, Manchester.

RICHARDSON, J. B., M.B., House Surgeon to the Torbay Infirmary Torquay.

STONE, Dr., Medical Officer, &c., for the Abbeyleix Dispensary District of the Abbeyleix Union, Queen's County.

WARREN, F. W., L.K.Q.C.P.I., L.R.C.S.I., L.M., Lecturer on Botany at the Stevens's Hospital Medical School, Dublin.

Deaths.

COX.—On the 16th April, W. H. Cox, M.R.C.S.E., of Burlington House, Oxford Road, Manchester, aged 58.

M'MILLAN.—On the 5th April, Alex. M'Millan, L.R.C.S.Ed., of Whitehorn, Wigtonshire, aged 83.

NICOL.—On the 12th April, John Nicol, M.D., of Ardmarnoch, Argyllshire, aged 84.

NORMAN.—On the 22nd March, of yellow fever, at Rio de Janeiro, Hugh Norman, L.K.Q.C.P.I., &c., surgeon s.s. *Memnon*, aged 98.

RICHARDS.—On the 7th April, at Redruth, William Joseph Richards, M.R.C.S., aged 31.

SAYERS.—On the 20th April, at 18 Claremont Place, Dublin, James Brydges Sayers, M.D., formerly of Limerick, aged 83.

TYNDALL.—On the 17th April, at the Lodge, Gorey, co. Wexford, of acute bronchitis, John Tyndall, M.D., M.R.C.S.E., Member of the Royal Historical and Archaeological Society of Ireland, aged 67.

WALKER.—On the 16th April, Benj. Walker, M.R.C.S.E., of Queen's Road, Chelsea, aged 61.

S. T. GEORGE'S HOSPITAL MEDICAL SCHOOL.—The SUMMER SESSION commences on MONDAY, MAY 3rd. The Hospital contains 350 beds. Clinical Lectures are delivered by the Physicians and Surgeons every week. The usual Courses of Lectures are also given by the appointed Teachers. Dr. Robert Barnes has this year been chosen Lecturer on Midwifery, and Dr. Brailey Lecturer on Comparative Anatomy. Further information may be obtained from the Treasurer or Dean of the School, at the Hospital.

S. T. MARY'S HOSPITAL MEDICAL SCHOOL, PADDINGTON.—The SUMMER SESSION will commence MAY 1. The Prospectus and full information may be obtained on application to the Dean at the Hospital, Cambridge Place, Paddington. The Medical Tutor receives into his house to board and lodge a certain number of Students, whom, in addition, he prepares for their Examinations, &c.
A. B. SHEPHERD, M.B., Dean of the School.

LONDON HOSPITAL MEDICAL COLLEGE.—The next SUMMER SESSION will commence on Saturday, May 1st, 1875.

General fee to Lectures and Hospital Practice, with two years' Practical Anatomy, 90 guineas, payable in two instalments of 45 guineas each. Library fee, 1 guinea. Special entries can be made to Lectures or Practice.

The Hospital contains 600 beds. The In-patients during 1873 were 5,613, and the Out-patients 43,868; total, 49,421.

The following Prizes and Appointments are given without any further payments to Students paying the general fee of 90 guineas:—

1. A Scholarship of £30 to the Student of less than three months' standing who passes in October the best examination in the subjects required at the Preliminary Examination.
2. A Scholarship of £20 to the Student of less than three months' standing placed second in the above examination.
3. A Scholarship of £20 in Human Anatomy for first-year Students; to be awarded in April, 1876.
4. A Scholarship, value £25, in Anatomy, Physiology, and Chemistry, for first-year and second year Students; to be awarded in April, 1876.
5. A Hospital Scholarship, value £20, for Clinical Medicine; to be awarded in April, 1876.
6. A Hospital Scholarship, value £20, for Clinical Surgery; to be awarded in April, 1876.
7. A Hospital Scholarship, value £20, for Clinical Obstetrics; to be awarded in April, 1876; and a Prize of £5 to the Student who has attended most Midwifery Cases for the Hospital during the preceding twelve months.

The Duckworth Nelson Prize, value £10, for Practical Medicine and Surgery (Biennial), 1876.

Money Prizes to the value of £60 given annually by the Committee for and in Dressing Out-patients and knowledge of Minor Surgery.

Four House-Surgeons, tenable for three or six months, and Dressorship to In-patients, open to all. Dressorships to Out-patients, with the privilege of competing for the Prizes above mentioned.

The office of Resident Medical Officer, tenable for two years, with a salary of £75 for the first year and £100 the second year.

Two Junior Resident Medical Officerships, tenable for six months.

Eight Medical Assistantships, held for three or six months, with residence and board in the Hospital for three or six weeks.

The office of Resident Accoucheur, tenable for six months.

N.B.—The holders of the resident offices are provided with rooms and board free of expense.

Four offices of Clinical Assistants in the Out-patients' Department, each at a salary of £40.

A Prospectus, giving details, will be forwarded on application to the Bedell of the London Hospital Medical College, Tupper Street, E.

Further information may also be obtained from Mr. James E. Adams, Treasurer, 10 Finsbury Circus, E.C.; or Mr. Waiien Tay, Vice-Dean, at the Medical College.

BRISTOL MEDICAL SCHOOL.—The SUMMER SESSION will commence on MONDAY, MAY 3.

Prospectuses may be obtained on application to
GEORGE F. BURDER, M.D., Hon. Sec.
Medical School, Old Park, Bristol,
April, 1875.

BROADMOOR CRIMINAL LUNATIC ASYLUM.—There is at present a VACANCY at this Asylum for an ASSISTANT MEDICAL OFFICER, who must be registered under the provisions of the Medical Act of 1858, and be unmarried.

The salary commences at £200 per annum, and increases £5 annually up to £225, with furnished apartments, coal, gas, and attendance.

Application to be made, in the first instance, by letter, addressed to the Medical Superintendent, Broadmoor Asylum, near Wokingham, Berks.

QUEEN'S COLLEGE, BIRMINGHAM,
(INCORPORATED BY SPECIAL ACT OF PARLIAMENT.)
FACULTY OF MEDICINE.

THE SUMMER SESSION will COMMENCE on the 3rd of MAY next.

The Prospectus of the Medical Department, and further information may be obtained by application to the Rev. the Warden, at the College; or to Professor Hinds, M.D., 10 Easy Row, Holb. Sec. to the Professors.

HOSPITAL PRACTICE.—Arrangements have been made whereby all Students of the College will, in future, attend the Clinical Lectures and Practice at both the General and the Queen's Hospitals, for a common Fee. The Fees for Hospital Practice (£1 10s.) are to be paid to either Dr. Jolly, 133 Newhall Street, or Dr. Sawyer, 92 Newhall Street, Birmingham, Joint Secretaries to the Birmingham Clinical Board.

SCHOOL OF MEDICINE, EDINBURGH.—SUMMER SESSION, 1875.

On MONDAY, 3rd MAY, CLASSES will commence in Practical Anatomy and Demonstrations, Practical and Analytical Chemistry, Materia Medica and Therapeutics, Midwifery and Diseases of Women and Children, Medical Jurisprudence and Public Health, Clinical Surgery, Clinical Medicine, Vaccination, Diseases of the Eye, Diseases of Children, Practical Physiology, Insanity, Surgical Appliances, and Operative and Practical Surgery.

These Classes qualify for Graduation in the University of Edinburgh, and other Universities, the Royal Colleges of Physicians and Surgeons, and the other Medical and Public Boards.

STEVENSON MACADAM,
Secretary to the School of Medicine.

SLIGO DISPENSARY.

APOTHECARY WANTED.

THE COMMITTEE of MANAGEMENT of the above Dispensary will, at their Meeting, to be held on FRIDAY, the 14th of May, at Twelve o'Clock, proceed to Elect a duly-qualified APOTHECARY for the above Institution, at a Salary of £80 per annum. Age of Candidates not to exceed forty years, and personal attendance necessary.

N.B.—The Committee of Management deem it right to mention as an encouragement to Apothecaries to come forward for the above situation, that there are other vacancies in public institutions in the town for an Apothecary.

PATRICK KEIGHRON,
Hon. Sec.

April 9, 1875.

COUNTY TIPPERARY INFIRMARY.—THE GOVERNORS and GOVERNESSES of the above Institution will, at a Special Meeting to be held at the Board Room, Cashel, on TUESDAY, the 13th day of MAY next, at the hour of One o'Clock precisely, proceed to elect a properly-qualified person as SURGEON of said Institution.

The salary presentable by the Grand Jury, at Spring and Summer Assizes, in each is One Hundred Pounds, late Irish Currency, per Annum.

No person need apply unless qualified by holding a Diploma from the Royal College of Surgeons in Ireland.

Applications from Candidates, with Diplomas and Testimonials, should be lodged with me (if by letter, post paid) no later than Tuesday, 11th May, after which date no application will be received or considered.

By order of the Committee,
JOHN LAVY WHITE, Secretary.

Board Room, Cashel,
20th April, 1875.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £25 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote. Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,
W. C'NEILL, Secretary.

MIR. I. SANDHEIM,

Dentist,

16 SUFFOLK STREET,

DUBLIN.

N.B.—A Vacancy for a Pupil.

ON THE SYMPTOMS AND STRUCTURE OF POLYPI OF THE RECTUM.

By W. BATHURST WOODMAN, M.D.,

Physician to the North-Eastern Hospital for Children, and Assistant-Physician to the London Hospital.

ALTHOUGH the treatment of polypus of the rectum more properly belongs to surgeons than to physicians, the latter are far more likely to see such cases in the first instance, because children are much more likely to be brought to a physician for the hæmorrhage and diarrhœa which are so often met with in these cases than to be seen by surgeons on account of any tumour. Even when the polypus appears externally, the mothers are apt to mistake it for a pile, or for prolapse of the rectum. Dreading the idea of an operation, and almost always associating the knife with this, they will, if possible avoid seeing a surgeon. No apology is therefore necessary for a physician directing the attention of his medical brethren to this subject, more especially as the minute anatomy of these troublesome little tumours appears to have been very little studied. Nor does any apology seem to be required for the use of the word polypus. Whatever objections may be made against the term by advanced histologists and pathologists, there can, I think, be no doubt that here, as in the case of tumours of the uterus of a stalked or footed character, the word "polypus" is clinically convenient. In both cases it marks out a clinical group of tumours which, however they may differ from each other in their minute characters, or resemble others not so named in some of their symptoms, possess at least the following communities:—

(1) The stalk, pedicle, stem, or peduncle, which is more or less developed in all, and gives them their name of polypi, leads to their easy recognition by the exploring finger.

(2) The stalk also gives them a great degree of mobility, a tendency to descend and to drag down by their weight

the mucous membranes or other parts to which they are attached, giving rise to "bearing-down" feelings.

(3) This circumstance, together with the pinching or squeezing to which they often get subjected by the sphincter, &c., and the occasional occurrence of coagulation in the nutrient vessels contained in the pedicle, give rise to frequent natural or spontaneous cures. This is especially the case with rectal polypi.

(4) They are all covered with mucous membrane.

(5) They rarely degenerate into more malignant forms.

(6) They are essentially a disease of early life, although occasionally (in the case of uterine polypi) they give but little trouble till middle life, or even later.

(7) They all predispose to hæmorrhage from the contiguous parts—probably by the continual dragging and irritation they set up.

(8) They resemble each other in the ease with which they can be cured by ligature or abscission.

(9) They are often said to "return;" but the explanation of this appears to be that smaller outgrowths of the same nature afterwards grow and set up the same symptoms as those removed previously.

Polypi of the rectum are said to be "rare" by most of our systematic writers on surgery, and in most of the books specially devoted to diseases of the rectum. For instance, Mr. Curling, in his "Observations on Diseases of the Rectum," 2nd edition, p. 56, says expressly, "It is rather a rare disease, and generally occurs early in life." Compared with many other diseases of children, or diseases of the same part, they are undoubtedly rare. This word is, however, generally used in cases where we have no numerical data as to frequency, and having myself met with several cases at the North-Eastern Children's Hospital and elsewhere, I am inclined to think they are more common than generally supposed; and that they are overlooked in consequence of the spontaneous tendency to cure which I have previously mentioned, and to which I shall presently allude again in my accounts of one or two of the cases. Neither the comparative rarity of the disease, nor this tendency to cure are, in my opinion, sufficient reasons for neglecting to examine in cases which present the rational symptoms of this disease. The hæmorrhages,

though slight, are quite sufficient to injure a delicate child, and greatly alarm the parents, but the dragging discomfort and teasing diarrhoea are far more injurious than the mere loss of blood.

A brief description of the symptoms and appearances of rectal polypi in children will not be out of place here. It will be seen that, apart from inspection or feeling the tumour, none of them can be considered pathognomonic. (1) The majority of the cases suffer for a considerable time from "bearing down," or dragging feelings, referred to the anus, which lead the children to cry when using, and to want frequently to use, the *chaise percée*. (2) A little blood generally passes before or after defecation. (3) There is often diarrhoea of a somewhat dysenteric type, scanty gelatinous stools with a little blood, "blood and slime," as the parents express it. The blood is often of a very bright tint, like that in the "pink stools" of cholera. It may, however, be much darker. This symptom, though almost always present, cannot be relied upon, as small worms (*Oxyurides* and *Trichocephali disparis*, &c.) and other diseases of the lower bowel set up the same symptoms. (4) There is often a watery or thin glairy discharge, quite apart from defecation, as in uterine polypi. (5) The mother or nurse often states that "something like a cherry," or "like a strawberry," comes down when the child uses its chair, and then "has to be pushed up again." Mr. Curling justly remarks that it is generally supposed to be a "prolapse of the bowel." Once or twice, however, I have known it supposed to be a large pile. True piles are, however, really rare in children, though we occasionally see them at very early ages. It is, perhaps, well to remember that "mucous tubercles" and fissures of the anus in cases of congenital syphilis would give rise to many of the symptoms mentioned. (6) If, as sometimes happens, the child be brought with the tumour protruding at the anus, it will generally appear, as stated by Mr. Curling, "of a red colour, granular on the surface, and resembling a small strawberry or cherry." They are not, however, always "of a soft texture or consistence," as I shall presently show, but being covered with mucous membrane, they generally feel more or less so at first. On passing the finger round them, or sometimes by separating the nates, the stalk, pedicle, or foot can be distinctly felt, and, in the latter case, perhaps seen. (7) If we suspect the tumour, and cannot see or feel it so readily, we should, after first clearing the lower bowel by an enema, or a dose of castor-oil (though in some cases even this may be dispensed with), proceed to an examination of the rectum. This is usually not difficult in children, and, if only sufficient gentleness be observed, not nearly so painful a process as it generally is in the adult. The child should lie on the left side, and not lie upon its arm. The feet may, in some cases, be held—or rather the knees—but it is often not necessary if the examiner be not in too much of a hurry. After the finger is once introduced the explorer should rest for a moment or two before searching further. The posterior wall of the rectum, or part behind the finger, should be first examined, as the polypi generally grow from this part of the rectum. I have once or twice known the polypus broken off, and in fact cured, by the traction made upon it in examination. As a rule, however, the pedicle is stronger. It is scarcely needful to insist upon well oiling the finger all round—or well soaping it, if no oil be at hand—or to mention that a little soap in the nail is a good precaution for ourselves. (8) When you have once discovered the tumour, it is a good practice to put a ligature loosely round it at once, even if you do not wish to operate yourself, as it saves much time on a subsequent occasion by giving a clue to the situation of the polypus. The ends may be left about six or eight inches long, and fastened to one buttock or the back by a little bit of strapping. Should the mother object to examination, or any other reason prevent, or should the tumour not be discoverable on first examination, it is a good plan to tell the mother or nurse to tie a piece of waxed silk twist or fine string moderately tightly round it the next time it protrudes, and then to let you know

at once, that you may make further arrangements. Mr. Curling, with the practical acumen so characteristic of him, cautions against tying the ligature too tightly, even in operations—as hæmorrhage, difficult to control, may be the result.

Before proceeding to give the results of microscopic examination, I will give a few illustrative cases.

I.—*Desmoid Polypus with short pedicle*.—A little girl, aged five and a-half years, had suffered from hæmorrhage and pseudo-dysenteric stools for more than six months; almost all possible astringents had been used internally without avail. On first examination (owing to rectum being loaded?) I failed to recognise the polypus. On the second I seized it with two fingers, and the pedicle being very slender, it broke off. All the symptoms were at once relieved. (I believe I have reported this case in one of the journals, but have lost my reference.) The polypus was moderately firm, nearly globular, about one-third of an inch in diameter, and its pedicle was about an inch in length.

II.—*Soft, Gelatinous, or Mucous Polypus, almost sessile*.—A male infant, aged eleven months, had frequent gelatinous and blood-stained stools. On examination a soft, strawberry-like mass was discovered on the posterior wall of the rectum, within easy reach of the finger, and possessing scarcely any stalk. When ligatured it broke away, and there was rather free hæmorrhage. The case did very well.

III.—*Desmoid Polypus with long pedicle*.—A little girl, aged three years and two months, attended the North-Eastern Children's Hospital for supposed "prolapsus." She suffered from hæmorrhage, &c., and the bearing down and straining in her case were particularly trying. The polypus was equal in size to a large cherry, and had a pedicle nearly three inches long. It grew from a part of the rectum very near the promontory of the sacrum. In this case the polypus, by my direction, had been secured by the mother with a ligature.

IV.—*Papillomatous Polypus of Rectum, almost sessile*.—A male infant, aged seven months, suffering from want of breast-milk, had suffered for six weeks from diarrhoea and hæmorrhages. Here again the polypus grew from the posterior wall of rectum, was three quarters of an inch long in its stoutest part, almost sessile, and of drop-like shape. It was moderately firm, and very granular in outline; there were a few secondary papillæ on it.

V.—*Firm Cauliflower-like, or Warty Polypus of Rectum, growing from anterior wall, probably of syphilitic origin*.—This was in a girl aged four years, who also had several wart-like growths on the fingers, face, and external to the anus. There was a clear history of congenital syphilis. The stalk, although short, was extremely tough and firm. It required removal by the écaiseur. I shall describe the growth more particularly a little later on. The case did extremely well.

VI.—*Malignant (?) Polypus of Villous Character growing from posterior wall of Rectum in a Male Infant aged nineteen months*.—The size of this was almost equal to a walnut. The hæmorrhages had been very profuse. This child did well for a time, but I heard that he died when about nine or ten years old of "a tumour of the kidney," probably cancerous.

VII.—*Desmoid Polypus with extremely long pedicle*.—A girl, aged nine, had a polypus about the size of a large cherry, with a pedicle more than six inches long. It had protruded three or four inches from the anus. In handling the stalk broke, and as the exploring fingers failed to trace its insertion, it probably grew very high up in the rectum. (I had another tumour brought me, passed spontaneously by a child.)

VIII.—*Cystic (?) Polypus of Rectum*.—A small polypus, with a pedicle of about half an inch in length, also growing from the posterior wall, after being removed, when cut open, disclosed a cavity occupying nearly two-thirds of its bulk, filled with clear fluid, like blood serum. I shall revert to this when describing minute structure. Before doing so I shall, however, first speak

of the class of cases most affected with this disease, and a word or two more of the macroscopic appearances, before dealing with the microscopic characters.

It will, I think, be found that children of parents with the gouty or arthritic diathesis are most subject to these tumours, especially those of the desmoid, or so-called fibroid character. As these are apparently the most common variety, this establishes another community between these and uterine fibroids or polypi. These little growths are, however, by no means confined to any one class in society, or to children of any one diathesis.

As several have been stated in this paper to have the diameter or size of a cherry, &c., it is perhaps not out of place to say that smaller sizes are not infrequently met with. I have seen some about the size of a marrowfat pea. The amount of hæmorrhage or distress is not always proportional to the size of the polypus, although, for obvious reasons, the larger ones are most likely to set up such symptoms as attract attention.

Minute Structure and Mode of Origin.—Being for the most part outgrowths of the mucous membrane of the bowel, or of the remaining tissues of the large intestine, polypi may, of course, vary much in their microscopic characters, and correspondingly in their naked eye appearances, on section. The point of departure from the bowel, and the extent of the original basis, no doubt determine both the vascularity and the contents. Thus the interior of the stalk is often found hollow, and in one instance the body of the polypus was so, containing fluid like blood serum. The pedicle sometimes contains a single artery with two or more veins, sometimes two arteries with venæ comites, which will then generally be found to terminate in a loop. Smaller vessels ramify in the mucous membrane covering the larger polypi. As far as I have been able to determine by actual examination, the following are the varieties met with:—

1. *The Soft Gelatinous, or Mucous Polypus.*—Although I have only seen one example of this, I have no doubt that they are more common than might be inferred from this solitary example. It seemed very much like those commonly met with in the nose and interior of the uterus, or more strictly, like gelatinous degeneration of the alimentary canal (see Rindfleisch, Dr. Baxter's translation for New Sydenham Society, vol. i., p. 419). In this form "the septa between adjoining cysts become atrophied, the cysts coalesce to form larger cavities, until at last the affected part comes to be mainly made up of mucus, the patch assuming a jelly-like colour and consistency."

2. *The Cystic Form.*—Of this, again, I have only seen one example, and as the walls of the single cyst contained all the coats of the bowel, the interior being very much like peritoneum, I believe it was formed of a portion of the bowel inverted, and in some way constricted at its base, continuing to grow. I doubt not that simple and complex cystic growths may be formed here also, as in other situations, and become stalked. Possibly such may be formed in the same way as the *ovula Nabothi* of the uterus.

3. *Papillomatous and Villous Polypi.*—Cases IV. V. and VI. were all probably of this type originally, which doubtless starts from an hypertrophied (exaggerated) papilla or villus, and when there is a tendency to riotous growth, secondary papillæ are developed, and the epithelium becoming also involved, we may get forms of epithelioma and carcinoma. As this form of growth is well known, I need not enter into a detailed description. I may, however, state my belief, from the history of these cases, that congenital syphilis predisposes to this mode of growth.

4. *Desmoid, Dermoid, or True Polypi (Fibromata).*—Cases I., III., VII., above, and the majority of my other cases, have exhibited, on sections being made, the type of growth so familiar to us in uterine polypi, and so well described by Rindfleisch (*op. cit.* p. 160-162., vol. i., Dr. Baxter's translation). The numerous fibres and the oat-shaped nuclei, or rather cells, well characterise these

tumours; they cut firmly, and with a somewhat glistening surface; they also shrink much less in spirit than most of the other forms. Figures of this variety may be also seen in Dr. Hughes Bennett's "Clinical Medicine," p. 194, &c., and in Sir James Paget's "Lectures on Surgical Pathology," p. 473. As the patients were young, it is not surprising that embryonic tissues were largely represented in these growths.

5. *Sarcomatous and Malignant Polypi.*—I regret that in Case VI. the growth was only hastily examined whilst fresh. Although I have named the sarcomata as both possible and probable, I have not personally made microscopic examinations of any polypi of this description.

SUMMARY.

1. Polypi of the rectum in children are probably less rare than generally imagined.
2. They generally grow from the posterior wall of the rectum.
3. They are easily recognised by digital examination.
4. Such examination should be made whenever the symptoms suggest a polypus.
5. These growths should always be removed. (I have not entered on the question of how best to remove them, but believe the ligature, some form of écraseur, twisting off with forceps, or galvanic or gas cautery to be most appropriate).
6. The polypi may be gelatinous, cystic, warty, fibro-cellular (desmoid), or cancerous, and probably sarcomatous; possibly other varieties of structure may occur.
7. Of all the varieties the desmoid (fibromata) are the most common.
8. The pedicle, at all events, and sometimes the tumours themselves, are very vascular; hence the knife, if used at all, requires great caution.
9. There is often a tendency to spontaneous cure, which should not, however, be trusted too much.
10. The children of arthritic parents, and those suffering from the syphilitic, tuberculous, and cancerous cachexiæ are most liable to these affections.

THE LUMLEIAN LECTURES.

ON LIFE, AND ON VITAL ACTION IN HEALTH AND DISEASE. (a)

By LIONEL S. BEALE, M.B., F.R.S.,
Physician to King's College Hospital.

LECTURE III (continued).

The Highest Form of Vital Action—Bioplasm of Nerve.—I venture to think, therefore, that we may entirely dismiss from our minds every vestige of the notion that the action of any nervous apparatus is mechanical, or that any part of it can be formed by physics or chemistry. I beg you to utterly refuse to accept the notion that mental action is a form of physico-chemical change, on the ground that neither the structure, nor the mode of growth, nor the mode of development, nor the action of the very simplest nerve apparatus in nature can be adequately explained at this time, and because the simplest changes in the simplest living forms in existence cannot be accounted for by physics.

Let us then pass on to the consideration of the action of the nervous system, particularly with reference to the part played by the bioplasm in the construction and action of that most wonderful apparatus.

As far as I am able to learn there is, in every nervous action, something behind that part of the process which is plausibly considered to be physical. Before the simplest reflex act can be completed there must be a

(a) Delivered at the Royal College of Physicians on Friday, March 12th.

nerve current, and the latter cannot be set free unless some chemical change occur. The matter undergoing this chemical change must be *formed*, and its particles must have been so arranged that the changes ending in the development of the nerve current may occur,—but here we arrive at the bioplasm and its active forces and powers.

I am not one of those who regard the nerve force as some mysterious and very peculiar form of energy, and am quite ready to accept the view that the current that passes along the nerve fibre is electricity, or something very closely allied or related to it. I can conceive that many of the phenomena of the nervous system are a consequence of nutritive acts, and that the latter are, in their turn, controlled and regulated by nerve action. I was, in fact, the first to describe the distribution of nerves to capillaries, and to point out that these form the afferent part of a self-regulating nerve apparatus connected with the distribution of blood. I showed how, when nutrition was too active, or when the capillaries were unduly distended with blood, an impression might be produced upon the *afferent* nerve fibres of the capillaries, and by these and the fibres with which they were continuous, transmitted to the nerve centre. The immediate consequence would be a disturbance of the nerve current traversing the *efferent* nerve fibres which are distributed to the circular muscular fibres of the artery. These immediately become shortened to a certain definite extent, mainly determined by the intensity of the impression upon the afferent fibres. Thus the diameter of the vessel is temporarily lessened, and the flow of blood to the capillary vessels being reduced, the supply of nutrient material distributed to the tissues, is, for a time, lowered. As the nutritive balance is restored by the agency of the same apparatus, the constriction of the arteries is relaxed to a certain extent, and the blood supply becomes equalised. This is only a part of those wonderful and extensive arrangements existing in connection with man and the higher animals for the purpose of regulating the supply of nutrient material, equalising temperature, and generally preserving the balance with reference to the results of many conflicting actions, notwithstanding great irregularity in the supply of nutrient matter, and of substances concerned in necessary chemical change, and the most striking and rapid alterations in temperature, moisture, and other external circumstances. There is, one may say, always a tendency to the derangement of the complex phenomena of the higher organisms, but this tendency is compensated by the most elaborate and beautiful arrangements of which the self-regulating nerve "mechanism," in connection with the distribution of the blood in the capillaries, is one of the most remarkable.

We must not forget that all the nerves and nerve centres, and other tissues of which this so-called "mechanism" is constituted, were gradually formed by living matter, and that the action of this apparatus is due to the action of the bioplasm in connection with it; for when the latter is deranged the action of the "mechanism" is disturbed; if it ceases for a time the action is suspended, and if the bioplasm dies the "mechanism" is destroyed. *Vitality*, therefore, comes into play in the construction of the apparatus out of bioplasm, and in the preparation of the substances, by chemical change in which, the nerve current is established. The nerve current, whatever may be its exact nature, results from changes in matter formed by bioplasm. But the actual nature of the nerve current is only a very small part, and by no means the most important part of the great question of the general nature of nerve action. The nerve current may be the same form or mode of force in all creatures, the different results effected by it in different animals, being due rather to differences in the construction and arrangement of the nerve apparatus of the organism, than to differences in the current which the nerves transmit. But the development and arrangement of the nerves is entirely dependent upon bioplasm. It has been shown that whenever nerves are being formed bioplasm exists in large quantity, just as in the case of other

textures undergoing development. There is no reason to suppose that the part of the fibre which transmits the nerve current is a very exceptional form of tissue, or that the active part of the nerves of one of the lower animals is very different in chemical composition from that of man. It is even conceivable that some human nerves might be replaced by those of animals, and action proceed as before.

Whether the bioplasm which takes part in the development of nerve fibres, and which is found in connection with the active part of all nerve fibres, at every period of life, is concerned in receiving impressions, or whether this office is performed by the fine nerve fibre only, is a question of great interest and well worth the most careful consideration.

I have shown that in all sensitive organs, and among the peripheral ramifications of all nerves, bioplasm particles are very numerous. In the retina more than one layer consists almost entirely of bioplasm particles and the delicate nerve fibres connected with them. In connection with the nerves of the sensitive part of the cochlea they are very numerous. Many more are found upon the peripheral ramifications of the nerves of the gustatory, than upon those of the tactile papillæ of the tongue. In the tactile corpuscles, in the tactile papillæ connected with mucous membrane which are very numerous and well developed about the lips of serpents and many fishes, these masses of bioplasm exist in immense number. In short, in connection with all nerves forming the terminal expansions which constitute the essential part of sensitive nerve organs, these masses of bioplasm are numerous, and it is a fact of not less importance with reference to the question of the function of these particles, to bear in mind that numbers are found in connection with the ultimate ramifications of motor nerves distributed to some muscular fibres which are highly active, like those of the diaphragm and tongue. In the case of some muscles, the terminal nerve fibre is, at certain points, highly convoluted; and here we find the masses of bioplasm very numerous, and situated very near to one another. All these facts support the inference that these masses of bioplasm are intimately connected with the action of the nerve fibre as well as being concerned in its formation.

But, on the other hand, there are very few upon the finest ramifications of nerve fibres in the serous membranes which become extremely sensitive in disease. It might, therefore, be argued that the pain results rather from pressure upon, or stretching of the finest nerve fibres in the intervals between the bioplasts, than from any direct pressure or other influence upon the bioplasts themselves. Again, in the imago state of many insects the finest ramifications of the nerve fibres exhibit very few bioplasts in their course. I have traced excessively fine fibres and networks of fibres in the intervals between the layer of cells which forms the inner surface of the skin of the blow-fly; in connection with which I could discover minute bioplasts only at considerable intervals. The same remark holds good to a less extent with regard to the distribution of nerves to the involuntary muscles.

At the same time it must, however, be borne in mind that nowhere are the peripheral ramifications of nerve fibres *destitute of bioplasm*. If this were so, they would probably deteriorate, and no new ones could be formed. Probably one-hundredth of an inch is the greatest length of peripheral nerve fibre in the higher animals which intervenes between two bioplasts.

Upon the whole, then, I conclude that although the bioplasm is necessary to the peripheral expansion of nerves, it is not the material which is in all cases absolutely essential for the reception of impressions and their conveyance to distant parts. I think, however, there is little doubt that the bioplasm of peripheral nerves develops nerve currents, feeble perhaps as compared with those set free by central nerve cells, but yet of sufficient intensity to influence the nerve centre. This view is supported by the fact that small central nerve cells found in many of the ganglia are, as regards size, shape, and general characters, very like the masses of bioplasm attached to the peripheral

ramification of nerves—indeed, in many of the lower animals no difference whatever can be detected between the peripheral and central part of the nerve apparatus.

Besides developing feeble nerve currents the peripheral nerve-bioplasm is concerned, as has been already remarked, in the formation and renovation of the nerve fibres. This change is constantly proceeding in all nerve organs. New nerve fibres of extreme delicacy are being continually formed. Old ones as continually waste, leaving behind a small proportion of connective tissue, which we find in all nerve organs, and which increases as age advances, even to such an extent as to render it a matter of great difficulty to demonstrate the excessively delicate and almost structureless nerve-fibres embedded in the mass of fibrous material.

There is yet another important change in which these bioplasm particles, so numerous in connection with the peripheral expansion of nerves, probably take part, and this is the development of heat. I have elsewhere adduced many arguments which seem to me to render it almost certain that the growth of bioplasm generally is associated with a rise in the temperature of the body. Is it not possible that, under certain circumstances, the mode of force developed in the matter of the nerve-bioplasm may be changed, heat being rapidly produced instead of nerve force? The suggestion at once occurs, whether the explanation of such exceptional cases of high temperature as that brought by Mr. John Teale before the Clinical Society a short time since, will not probably be found to have something to do with the phenomena of nerve-bioplasm. In this case a temperature of 122 deg. was reached on several occasions, and one above 112 deg. was maintained for several days without any of the symptoms usually associated with febrile disorders in which the body heat rises.

Bioplasm of the Brain.—Let me now pass on to the last part of my theme, and endeavour to ascertain whether the most wonderful phenomena in nature, namely, those connected with the operation of mind, have their origin in bioplasm. The only instrument concerned in thought attains its highest state of development in man. Not only is man's brain, as compared with that of a lower animal, actually very large in proportion to the body, but the difference will be found to be really much greater than it appears to be. The size of a nerve centre is, as is well known, by no means determined by the size of the animal. Varied combinations of rapidly executed movements will necessitate a brain of a size very large in proportion to that of the animal, and hence, as a rule, the brains of very small animals are enormous. The smaller the species the greater will be the weight of brain in proportion to body weight. Now man's muscular movements are by no means so varied or so powerful in proportion to the amount of muscular tissue, or so rapidly executed as those of many of the lower animals, which easily beat us as to the rapidity with which they execute complex movements. We are also behind many animals as regards the sense of touch, as well as regards the great power and precision with which the voluntary muscles of many animals act in running, leaping, climbing, and other movements. The size of man's brain, therefore, is not due to those circumstances which determine the large size in proportion to the body of the brain of the mouse or of the tom-tit, for example. Man indeed can only be placed at the summit of the scale of being in certain particulars, but in these he stands alone; no lower creature approaches him, or can be compared with him. In man, the action of every tissue and organ seems subordinate to that of the higher parts of his nervous system, which constitute an instrument remarkable not less for the complexity and subtlety of its delicate actions than for the capacity exhibited by it alone for improvement after its development as an organ may be regarded as complete; and not only so, but the degree of perfection it may attain as an instrument is determined to a great extent by the will of him to whom it belongs. In the formation and action of this organ bioplasm is all important, and exists

in greatest amount in that part which, upon other grounds, we know is concerned in mental action.

The very highest form of bioplasm or living matter in the world is that which, as I believe, is concerned in mind, and this attains its highest state of activity not until the age when that part of the nervous apparatus concerned in mental operations has attained a high degree of elaboration. This period cannot be assigned with precision, for it differs in different races and in different individuals, but it is never reached until some time after growth has ceased, and every tissue and organ is fully developed. But it is certainly very remarkable that, as far as I am aware, those parts of man's brain concerned in the manifestation of his highest mental faculties constitute the only structures in nature which continue to improve for many years after the rest of the organism has attained its highest state of development. So also these, above all structures, are remarkable for continuing to improve, although many tissues of the body may have been for some time undergoing deterioration and decay.

The anatomical elements which constitute the gray matter of man's brain are well known. Large angular cells, with fibres radiating from them, the longest fibre passing upwards towards the surface near which it divides and subdivides into multitudes of the finest and most delicate threads, which form with fibres from other cells and other parts an inextricable interlacement. In this situation no doubt all the operations of the mind are performed. But to explain what happens in connection with the structures demonstrated, when the instrument is in active work, is no easy task. From a knowledge of the arrangement and action of the structure, we ought to be able to form some conception, however rough, of what happens when an idea is formed and when it is expressed so as to be rendered evident to others. The facts of the case seem to demand a means by which the mind may act upon the elaborate system of nerve fibres already referred to. We seem to require an instrument, and the means of acting upon different parts of the instrument, as we may will.

It is not easy to conceive by what means the angular cells, which form such prominent objects in the gray matter, could act. That these are concerned in the formation of the fibres is certain, and it is possible that in them nerve currents may originate, but it is very doubtful whether the bioplasm of these cells is the bioplasm concerned in thought. There are other bioplasm particles, and in enormous numbers, though they do not constitute such prominent objects as the angular or caudate cells. These are little spherical particles of bioplasm, many of which are smaller than a red blood corpuscle, and are probably connected by communicating fibres of great delicacy. These bodies are situated near the surface of the gray matter among the ultimate subdivisions of the excessively delicate nerve fibres. It is to be remarked that in this situation the supply of arterial blood is more abundant than in any other part of the nervous system, and the particles of bioplasm in question being naked and unenclosed in any cell-wall at any period of life, are just such as we should expect would undergo rapid change. These are, I believe, the active agents which, by their movements, may act upon the delicate nerve threads which ramify on all sides in very close proximity to them. When we examine these particles of bioplasm after death, they are spherical; but are we not justified in assuming that during life they may change in form, at least, as much as a mucous corpuscle or an amoeba? The slightest alteration in form would influence the current traversing the nerve fibres that were close to them. These delicate bioplasts are, I believe, during the waking state, continually undergoing changes in form. That in some situations they increase in number cannot be doubted, and it seems likely that collections might increase in extent even long after the formation of the brain had been completed. What is very remarkable is that these bioplasts retain their primitive characters throughout life.

I dare say few persons will be persuaded to believe

that the bioplasts concerned in the highest mental acts of man are bodies not more complex than the lymph corpuscle or the white blood-corpuscle; but, as I have before remarked, all evidence is in favour of the view, that exalted function is not dependent either upon complexity of constitution or upon quantity of material. There are no differential characters to be demonstrated between different forms of living matter having widely different endowments, by which the peculiarities may be accounted for. There may be difference in power not dependent upon differences as regards matter and its forces. May we venture to conclude that *mind* is the form of *vital* power which, stirring in these particles of bioplasm, causes the movement of the matter of which they consist, and that thus the elaborate mechanism slowly constructed and gradually brought to perfection is influenced? If this be so, mind is the highest form of vital power which exists in nature, by which particles of matter are caused to move in a definite manner for a definite purpose.

I have endeavoured, Mr. President and gentlemen, in these lectures to give a sketch of the phenomena peculiar to living matter, in health and disease. It would be wiser, perhaps, in the present state of knowledge, to be content with the study of phenomena, and not to speculate upon the causes of things; but ought I, in face of the facts, to resist the temptation of postulating a power the existence of which I cannot hope to demonstrate, or may I venture to refer all the wonderful changes I have described to *vitality*, a power that works in the living world only?

Let me, in conclusion, heartily thank all for their kindness in listening to a discussion which, however interesting to some, must have seemed tiresome to not a few.

SALICYLIC ACID AS A DISINFECTANT.

By C. R. C. TITCHBORNE, Ph.D., F.C.S., M.R.I.A.,
Lecturer on Chemistry at the Carmichael School of Medicine.

SOME considerable interest has been created by a paper written by Professor Kolbe, in which he describes a process for the production of salicylic acid from carbolic acid, carbonic anhydride, and soda, one molecule of carbonic anhydride being introduced into the phenate of sodium, and one-half being converted into sodium salicylate. This process was an endeavour on the part of Professor Kolbe to produce salicylic acid on a cheap manufacturing scale. So far, there are still practical difficulties in the way, and the price has not fallen very considerably, the object the Professor had in view being the production of a powerful and cheap antiseptic. "The knowledge," says Professor Kolbe, "that salicylic acid could be so easily prepared from carbolic acid and carbonic anhydride, and that it could be again decomposed by heat into the same bodies, led me to think that, similarly to carbolic acid, salicylic acid might stop, or entirely prevent fermentation and putrefactive processes, and act generally as an antiseptic."

Without wishing to deteriorate the value of Professor Kolbe's researches as regards the use of salicylic acid as a preservative, I wish to state that the physiological action of salicylic acid, and its general relation to carbolic acid, and particularly as a blood antiseptic, were all described as far back as 1872, in a paper read by myself before the Medical Society of the College of Physicians, Dublin, entitled "Disinfection in connection with Small-pox." The following remarks are partially reproduced from that paper, and bear upon this subject:—

As regards antiseptic treatment in the blood, it is a subject with which, I think, chemists are justified in dealing. Medicine may act simply by a certain portion of it getting into the circulation by diffusion, or by some inherent virtue of its own acting upon other constituents of the body, or it may act by virtue of a partial decomposition or oxidation occurring in the blood, and producing effects not directly produced from the medicament, but

from an infinitesimally small amount of a new product being liberated in the nascent condition in the blood. Xylol's action is said to be due to the fact that it becomes an antiseptic in the blood. Now it is probable that, if it does act as such, its power is due to some product of oxidation. That it is really rapidly oxidised there can be no doubt, from the fact that a peculiar odour distinct from xylol can be perceived in the urine.

It is worthy of note that this hydro-carbon xylol $C_{10}H_{12}$ may be viewed as either dimethylbenzene $C_6H_4(CH_3)_2$ or ethylbenzene $C_6H_5(C_2H_5)$. Now, if either of these be its true composition, the residual molecule benzene is the hydride of phenyl, the radical of the well-known antiseptic carbolic acid. Thus, if we act upon benzene by bromine, which is merely a convenient mode of oxidising, hydrogen is given off, and we get the bromide of the radical phenyl.

The action of sulpho-carbolates, of which some medical men speak very highly, is that the carbolic acid *per se* acts as an antiseptic, being diffused into the circulation. I have tried experiments upon diluted solutions of albumen and vibrios, from which it would appear to me that the diluted solutions of carbolic acid destroy the activity of the vibrios before they coagulate the albumen.

In seeking for a remedy for internal disinfection of blood, it is evident from my point of view that we should try and search amongst the substances which will produce in the blood antiseptics slowly, but in a nascent condition. Carbolic acid is the most available antiseptic, for the production of sulphurous acid in the circulation would be out of the question; therefore, on consideration, the first compounds that will present themselves to our consideration are the methylsalicylates ($C_6H_4M O_3$) or the salicylates. Methylsalicylates, I find, are slowly but perfectly decomposed in the cold, and in alkaline solutions, such as the blood, therefore, it is theoretically immaterial which is used.

Salicylic acid, if heated, is converted into carbolic acid and carbonic anhydride, and there seems to be a wonderful chemical reaction between these two substances *i.e.*, carbolic acid and salicylic acid, thus either of them can with facility be formed from the other.

The salicylates only require one equivalent of oxide to convert them into carbonates, and carbolate of the metal, thus:—

And if we use dilute solutions, we get the same reaction with reagents. Thus, ferric chloride gives the same beautiful violet reaction independently if we use a carbolate, sulphophenate, or salicylate; it acts in each case upon the carbolic, or phenol residue.

From the experiments of Kolbe, Thiersch, and others, it would now seem that salicylic acid is one of the most powerful antiseptics known, and therefore my observations are now confirmed by these experimenters. Professor Thiersch proposes a powder of it used with starch for cancerous surfaces or unclean wounds. Although easily crystallised from alcohol or hot water, it is very insoluble in cold, and for antiseptic treatment of wounds I would propose the use of a solution in glycerine: three grains will dissolve easily in the fluid ounce of glycerine when warmed, and will remain permanently dissolved.

The salicylate of lead $C_7H_4PbO_3$ will probably be found a valuable salt for medical uses.

REPORT ON SYPHILIS.

By C. R. DRYSDALE, M.D., M.R.C.P.L., F.R.C.S.E.,
Senior Physician to the Metropolitan Free Hospital.
PROFESSOR ZEISSL ON THE TREATMENT OF SYPHILIS.

PROFESSOR ZEISSL, of Vienna, has recently been contributing a series of articles on the treatment of syphilis to

the *Allgemeine Wiener Med. Zeitung*, Nos. 38, 39, 40, 41, 42, 44, from which I extract some notes.

In No. 40 of the journal referred to, Dr. Zeissl speaks of iodine and iodides in the treatment of the disease. In 1822 this remedy was used by Formey, Brera, and Lugol successfully for syphilis. Lugol, in 1830, cured a case of bad tertiary syphilis by iodine baths. Cullerier, before 1836, and Ricord had used iodide of potassium as a tonic; but the repute of iodide of potassium as a remedy is principally due to Wallace, of Dublin, who in 1836 narrated 132 cases of syphilis treated by it. Even in 1839, however, Ricord expressed himself in the *Gazette des Hôpitaux* that the iodide of potassium was of little service in the hard sore, or first year's manifestations of the disease, whereas it was the remedy *par excellence* of tertiary lesions.

Dr. Zeissl observes that he cannot entirely concur with these opinions of Ricord, for in weak patients occasionally the early symptoms are made to disappear by giving the iodide. If in such cases the symptoms disappear too slowly, or not at all, the use of mercury then becomes advisable. Ricord prescribed iodide in increasing doses, commencing with ten grains (0.75 grammes) dissolved in two ounces of water (70.00 grammes), taken in twenty-four hours. In five days' time the patient takes five grain doses thrice daily.

Cullerier used four grains of the iodide with one grain of iodine dissolved in an ounce of water, to be taken in twenty-four hours, raising it to ten grains of the former and two of the latter. Tincture of iodine has been used both internally and externally in ozæna by Mojeisovics, senior surgeon to the All.-Krankenhaus of Vienna.

It has been noticed, says Zeissl, that the enamel of the teeth is much injured by pure iodine, and also that trembling of the hands is caused by it, so that the iodide of potassium is now preferred, along with the iodide of sodium and of iron. Dr. Zeissl has for some years used in many cases where mercurials had been long enough employed, a mixture of half a drachm of tincture of iodine in six ounces of water, of which a teaspoonful is taken mornings and evenings, until the symptoms disappear.

Dr. Zeissl greatly praises the use of iodoform in pains caused by syphilis. He prescribes it in pills with a bitter extract, each containing one grain of iodoform, twice daily. These pills sometimes give excellent results; but all the preparations of iodine occasionally lead to some evil effects. Iodide of potassium sometimes causes excessive hunger, and also tinnitus aurium, constipation, or diarrhœa, nasal catarrh. He mentions redness and softness of the gums as occasional consequences of the long use of iodine, and once, salivation. Eruptions sometimes (acne) arise on the face and other parts of persons taking iodine for long. Sleeplessness sometimes occurs. In rare cases the pulse may rise to 140 per minute from the use of the iodides, and Wallace noticed pleurodynia occasionally.

The iodides are at present chiefly indicated, says Zeissl, in the latest phases of syphilis, as in gummy periostitis and gummy tumours of the skin, tongue, lungs, in sarcocele, eye, brain, and nerve affections, hereditary syphilis when of the scrofulous form. There are however, cases where all of such forms are obstinate to iodine, and where Zettmann's decoction of mercury succeeds. From the above it seems that iodides are the chief remedy in tertiary syphilis; but that a certain indefinite class of cases occurs where mercury is to be preferred to them.

Dr. Zeissl prescribes ten grains of iodide of potassium or sodium in two ounces of water during the twenty-four hours. This dose, if it agrees well, is raised to thirty grains daily.

In anæmic women, or syphilitic patients who have become anæmic, the iodide of iron is indicated, a preparation which has the properties both of iodine and of iron. Bancard's pills are used in such cases; each pill contains

one grain of the iodide of iron—4 or 5 to be taken daily.

In the bathing establishments of Austria iodine baths are employed; and it seems that the remedy enters the circulation through the skin, according to Dr. Rosenthal (*Wiener Medicinhalle*, 8862, No. 20).

Dr. Zeissl praises the iodide of lithium, which he uses in pills, a scruple of which pills may be taken in twenty-four hours.

No peculiar diet is recommended by Zeissl to patients taking the iodide. Water is the best drink in such cases.

There is perhaps no medicament so rapidly evolved from the body as the soluble salts of iodine; in a few hours the iodine salt is discoverable in the urine, and also in the saliva, tears and sweat. Zeissl has found it in the milk of mothers. In a few days after abandoning it, it can no longer be found in the urine. Wallace dropped some drops of dilute sulphuric acid into the urine suspected to contain iodine, and then a little chloride of calcium, when a violet-blue colour was produced. Pure iodine issues in the urine as iodide of potassium or sodium, by taking these alkalies from the blood.

Going into details of treatment, Zeissl speaks first of affections of the ear of syphilitic nature, such as secondary syphilitic affections of the external ear, acute and chronic catarrh of the middle ear in hereditary and adult cases; these with necrosis of the bones of the ear require long and careful treatment.

Zeissl recommends in cases of mucous plates in the mouth the local application of sulphate of copper or iodine in glycerine, in the proportion of ten grains of iodide of potassium, one grain of iodine, and an ounce and a half of glycerine. Mucous tubercles of the anus and genitals he treats in the same way.

When warts form, they should above all be frequently washed, and the parts kept quite clean. Plenke's paste is employed in such cases locally, and is composed of equal parts of corrosive sublimate, camphor, alum, white lead, alcohol, and vinegar. The butter-like paste which sinks to the bottom of the solution is applied to the part by a pencil made of cotton-wool rolled round a stick. This paste is not painful when first applied, and the severe pain afterwards caused may be alleviated by cold water bandages.

Zeissl also recommends the use of weak chlorine water, followed by dusting with calomel in cases of mucous tubercles.

When gummy tumours are seated on the velum pendulum palati, and about to perforate the part, the edge of the ulcer should be daily touched with a pencil of nitrate of silver. In the same way perforations in the hard palate should be frequently touched with nitrate of silver, or with collodion containing corrosive sublimate, in the proportion of a scruple of the latter in an ounce and a half of the former.

Deep ulcerations of the skin should be often cleansed and covered with Vigo's plaster, but if cicatrisation do not take place, they should be covered with pieces of lint smeared with ointment made of two grains of nitrate of silver to two drachms of cerate and half a drachm of balsam of Peru.

Ulcers following paronychia are to be covered with mercurial plaster.

Ozæna.—"There is perhaps," says Zeissl, "no form of disease caused by syphilis which is so often foolishly treated as ozæna. In persons with ozæna it is known that a very ill-smelling, putrid, and filthy secretion flows from the nostrils, or this is made to issue by frequent blowing the nose. This secretion becomes less when the patient keeps his room and often cleanses out the nostrils; but as soon as he returns to his ordinary mode of life the putrid secretion is given off in increased quantity. If then the practitioner do not possess the power of examining such cleansed nostrils, and thinks that because the necrosed pieces of bone do not come away the patient is only suffering from syphilitic nasal

catarrh, he will put him, if he be a great lover of mercury, uselessly and perhaps prejudicially under a cure by inunction. Constitutional treatment is only indicated in ozena when fresh syphilitic localisations appear on other parts of the body, or those already existing do not heal up. In these cases we may certainly try whether mercurial or iodine treatment succeeds best. Very frequently we find in cases of ozena syphilitica no other syphilitic form of disease, and in such cases this is but a residuum of the past syphilis, and the continued disease of the nasal bones and mucous membrane is kept up by the irritation which a necrosed piece of bone or several such keep up in its interior. The healing of carious pieces of bone and ulcerations of the nasal mucous membrane is only possible if the sequestrum be removed, and when this is accomplished the fetid discharge from the nostrils ceases. The bringing away of the necrosed piece of bone will be best assisted by injecting several times a day some dilute solution of hydrochloric acid or chloride of lime into the nostril, such as a drachm of dilute hydrochloric acid in eight ounces of water, or a drachm and a half of chloride of lime in ten ounces of water. The injections into the nostrils should be made four or five times a day by a squirt which is provided with a long tube. The patient holds the head back, in order to allow the fluid to remain a short time in the posterior nares. With respect to constitutional treatment of syphilitic ozena, we ought here to observe that in the majority of these scrofula is also present, so that cod-liver oil should be added to the iodide of potassium."

In *syphilitic sarcocele* Zeissl recommends locally compression in addition to constitutional treatment. If there be much fluid, he recommends puncture, and the injection of a solution containing one drachm of iodine, two drachms of iodide of potassium, and three ounces of water.

Bone and joint pains, which sometimes remain in spite of universal mercurial or iodine treatment, or in spite of narcotics, have in many cases been found to yield to Ricord's local methods of treatment. There is applied over the painful spot a so-called flying blister, and again the part without epidermis is covered with a plaister of cerate over which morphia is strewed.

Periosteal swellings are treated by topical remedies, such as tincture of iodine, or iodine in glycerine. If fluctuation occur, the abscess should be opened by means of the modern plan of suction.

Ulcers of the rectum should be cleansed several times daily, after every defæcation, and then painted with iodine in glycerine, or with pencil of nitrate of silver. If the bowel be strictured by reason of contracting scars, sponge tents, or conical pieces of laminaria digitata should be introduced into the strictured parts. If this be already formed, bougies should be used to enlarge the parts, although, unfortunately, the effect is too often not lasting. In such cases nothing remains but to use oily clysters and purges to allow their stools to pass.

A VERY SINGULAR CASE OF DILATATION OF THE ŒSOPHAGUS SIMULATING ANEURISM OF THE AORTA.

By HENRY DAVY, M.B., Ch.M. Univ. Dub.,
Medical Officer of Terenure, Co. Dublin.

On the 28th of September, 1869, I was consulted by Mr. R., aged 38, a gentleman farmer, unmarried, and of temperate habits, who had been suffering for the last ten years from difficulty in swallowing, nausea and vomiting, almost immediately on taking food, and especially after breakfast, feeling some days better, other times worse; for years he could not sleep on his left side; if he did he felt a smothering sensation, and threw up quantities of slimy fluid, which was free from acidity, and without a disagreeable taste, and at this period he lost much flesh.

In 1859, while lifting a heavy weight, he gave himself

a severe strain, and felt as if something gave way or tore inside, and from this time these symptoms gradually made their appearance. On examination I found him suffering from uneasiness and pain, as if something was tearing or raking inside, which he complained of in attempting to swallow, and which he referred to the epigastric region. He also had a sensation of heat and burning, extending along the œsophagus, and he experienced an obstruction to the passage of food into the stomach about the ensiform cartilage to the right side. He described the food as if it was churned in his stomach, and great quantities of inodorous flatus were at times eructated. The matter vomited consisted of considerable quantities of glairy mucus, like the uncoagulated white of egg. The vomiting occurred most frequently in the morning, owing probably to the accumulation of the slimy fluid during sleep, which was sometimes ejected without the simultaneous discharge of food. The sickness was in a great measure relieved by lying on his right side. His appetite was craving, and he suffered much from thirst. On applying my hand to his abdomen, a pulsation was felt about the epigastrium simulating an aneurism. There was considerable pain and soreness on pressure, and dulness on percussion in this situation, and he complained of pains in his shoulder and back. There was no enlargement of the cervical, axillary, or inguinal glands, nor hæmatemesis to indicate malignant disease. His tongue was quite clean throughout his illness, and his bowels were obstinately confined for over three weeks. His pulse varied from 92, to 120. He had a hard, dry cough, and on auscultation the heart and chest sounds were found to be normal. He was ordered granulated citrate of magnesia to relieve the sickness and act as a gentle aperient, and an enema of castor-oil and turpentine to clear out the bowels, but without effect. His diet consisted of beef-tea, milk, soda-water with a little brandy, barley-water, arrowroot, together with other farinaceous substances. The vomiting still continued, notwithstanding all the remedies I could suggest—viz, ice, champagne, hydrocyanic acid, opium, carbolic acid, bismuth, sinapisms, an issue, and other anti-emetic measures. As Mr. R. was rapidly sinking, I resolved to give the stomach rest, and I directed nutrient enemata, composed of beef-tea thickened with arrowroot, the yolk of an egg, a teaspoonful of Liebig's extract of beef, and a dessertspoonful of brandy, in bulk about half-a-pint, to be administered slowly three times a day. The enemata produced sickness of the stomach during their administration, but were generally retained, and my patient was much benefited by them; at the same time I allowed very small quantities of liquid food to be taken by the mouth, but these were invariably ejected; he was ordered occasionally a small opiate enema at night to induce sleep. This treatment was steadily continued till the 31st of October, a period of over four weeks, when he experienced a sensation in his stomach as if something had opened or given way inside, and he felt the food to pass down. After this there was a copious discharge of feculent matter from his bowels, after which the food remained in his stomach, and in a short time he became quite convalescent. Mr. R. having given up his farm, and taken a situation in the north of Ireland, continued apparently in good health for the next five years, weighing 11 stone 5 pounds, and during this time he paid me several visits when he came to Dublin, and the only inconvenience he experienced was that he was obliged to take his meals in a semi-recumbent position, with his right arm over the back of a chair, having found this the only posture that would allow the passage of the food into his stomach; in any other position he felt very uncomfortable, and experienced a smothering sensation, that brought on a violent fit of coughing. In a letter which I received about one month before his death he said: "The obstruction is growing deeper down, as it requires more forcing to get the food into the stomach. I am very strong, and take good care of myself, so far as chop for dinner; eggs, bread-and-butter for breakfast; I

don't spare the butter ; my bowels are in perfect order ; I don't take medicine."

In January 1875, he had a similar attack to that he had five years previously, and died, after an illness of ten or eleven days' duration, from inanition, no food remaining on his stomach.

Mr. R. had expressed a wish that after his decease a post-mortem examination should be made, in order that the exact cause of his death might be ascertained. Having been kindly assisted by my friend Dr. Charles Jones, of Rathgar, we made the examination about 48 hours after death, and found the œsophagus enormously dilated throughout its entire course, resembling the colon in appearance when distended with air, and measuring at its broadest part (5 inches from the cardiac extremity of the stomach) 9 inches, and above and below this 8 inches, its muscular coat being very much hypertrophied. The œsophagus was slightly distended with flatus, and contained about a wineglassful of a brown tea-like fluid which was prevented from entering the stomach by a volvulus or twist in its cardiac extremity at its passage through the diaphragm. This circumstance, in my opinion, accounted for the facility with which Mr. R. swallowed when he stretched himself, by undoing, so to speak, this twist. On filling the œsophagus with water, we found it was capable of holding two pints, or forty ounces of fluid, and we observed that the mucous membrane was covered at the dilated part with several ulcers, varying in size from a pin's head to a two-shilling piece, and were of irregular shape. We also perceived innumerable white spots (cicatrices), the remains, no doubt, of old ulcers that had healed. The cardiac extremity of the œsophagus admitted readily two fingers together, and there was no indication whatever of malignant disease, an aneurism, or tumour, to account for the pulsation which was felt during life. The stomach was very much dilated, and its coats greatly thinned, measuring when distended with air 33 inches along its greater, and 9 inches along its lesser curvature, and 21½ inches at its greatest circumference, and on filling it with water we found it capable of holding 9½ pints, or 190 fluid ounces. The stomach contained a considerable quantity of brown fluid, similar to that found in the gullet, and its mucous coat was free from any indication of ulceration or malignant disease. As to the pylorus, I may observe that it admitted the point of the little finger, and was in all respects quite normal.

In the *Edinburgh Monthly Journal of Medical Science* for March, 1855, Dr. Evans Reeves, of London, describes three forms of dilatation as occurring in the œsophagus—viz., 1st, as spindleform dilatation, which is the most frequent, where all the coats are affected ; 2nd, as saciform dilatation ; and 3rd, œsophagocele, where the mucous membrane protrudes between the muscular fibres of the canal.

Albers ("Pathol. Anatom.") considers that dilatation of the œsophagus is a congenital disease ; but Dr. Reeves regards it to be a disease of the prime and decline of life ; it is more frequent in males than females. It may be caused by a blow on the sternum, a strain after gastric fever, inflammation or ulceration of the gullet, tumours of various kinds pressing on the lower part of the œsophagus, malignant disease, &c. As to duration, it has been stated to continue from one to forty-eight years, or even a lifetime.

In some of these cases the patient is obliged to press and use friction on the neck in order to facilitate the descent of food into the stomach.

The prognosis is always very grave, the patient dying sooner or later of starvation.

As to treatment, very little can be done. The stomach-pump has been recommended to be employed to feed the patient in these cases, and with a view of allowing the contraction of the dilatation, and in using that instrument, care should be taken to allow it to glide as nearly as possible along the posterior part of the larynx. Nutrient enemata should also be administered.

CLINICAL MEMORANDA.

Reported by JOHN W. MARTIN, M.D.,
Assistant-Surgeon Mayfield Factory Dispensary, Portlaw.

Epileptic Seizures—Presystolic Mitral, Systolic Aortic Murmurs—Anæmia—Health improved under Treatment.

PATRICK D—ly, æt. 19, mill hand, came under notice December 4, 1873, the date on which the notes of the case were made.

He complained of frequently recurring epileptic attacks, had been subject to them since the age of thirteen years, but noticed that the intervals between the fits were growing shorter, and that their severity was increasing. General expression dull, heavy, stupid, and at times foolish. Inability to do his work growing daily more marked.

Examining him closely, I found pigeon-breasted deformity of the chest and the lower portion of the sternum deeply indented.

Area of precordial dulness normal. Force and situation of heart's impulse natural. No tenderness to pressure. Rhythm normal. A loud *bruit de râpe* heard in its maximum intensity over the lower portion of the sternum and about the articulation of the fourth rib on the left side, and extending along the left margin of the sternum upwards to the articulation of the third rib on the same side ; this murmur was distinctly presystolic. At the right margin of the sternum, in the second intercostal space, a short rough systolic murmur was heard accompanying the arterial pulse. Loud *bruits* were heard along the course of the carotids with each systole of the heart. With the exception of a slight weakening of the second sound, both sounds distinct and healthy. He suffered much from dyspnoea, the sense of which was constant ; exertion of every kind greatly aggravated it. Had a recurrence of the epileptic fits every six weeks, followed as usual by headache, and a state of stupor, which latterly lasted a couple of days, rendering him unfit to return to work. Never suffered from headache during the interval. His tongue was white and sodden, and very anæmic looking. Pulse 80, dichrotic. Bowels regular. Appetite good. The urine on examination was found free from albumen or any sign of urinary complication. There was no pain about the region of the heart. He never had any spitting of blood or epistaxis. With the exception of a passive effusion into the ankle-joint about eight years previous to the date of these notes, he never showed any tendency to the rheumatic dyscrasia.

Ophthalmoscopic examination of the eye showed a pale retina, contracted vessels, and an indistinct margin to the optic disc. The pupils were very sluggish.

This patient remained under treatment until the end of April, 1874.

He at first was placed upon small doses of iodide of potassium in combination with the citrate of iron and stimulants, together with cod-liver oil. The iodide of potassium was, however, soon changed for a mixture containing iron and digitalis, the cod-liver oil being continued. A glass of wine was allowed daily.

Under this treatment he rapidly and steadily improved. The fits decreased in frequency and severity. His general appearance altered greatly for the better. He lost the look of despondency which had been habitual to him, and from being heavy and stupid he became bright and cheerful. He expressed himself as having gained great courage. The heart murmurs have diminished in intensity, but remain otherwise unchanged. The improvement in his health continues up to the present time.

I regard the foregoing case as both interesting and instructive.

When first seen the fits were increasing rapidly in their violence, duration, and recurrence. The boy's mental faculties were greatly affected, so much so as to prevent his doing work of any kind.

This case was regarded both by himself and his family as a hopeless one. At first there was some difficulty in

deciding whether there might not be some active organic disease of the heart.

His general appearance, however, the state of the retina, and the strictly presystolic and systolic character of the mitral and aortic murmurs respectively, decided me in believing it to be altogether a case of anæmia, an opinion in which I am confirmed by subsequent success in the treatment.

It may perhaps be remarked that no bromide of potassium was given at any period of the treatment, and the question asked, why was the iodide prescribed?

I prescribed the latter in the commencement, whilst in doubt as to the presence or absence of organic disease of the heart, but desisted when I formed the opinion that the case was altogether one of anæmia; for the same reason I refrained from giving the bromide, as from the retinal appearances and general symptoms of the case I thought there was no evidence of any cerebral congestion.

In fact, I regarded the case as one in which a tonic line of treatment was alone called for, with special regard to the proper stimulation of the heart to the performance of its functions.

WARTY ULCER OF CICATRICES, OR MARJOLIN'S ULCER, OF THE HAND AND WRIST.

Under the care of WILLIAM I. WHEELER, F.R.C.S.

(The Notes taken by Mr. MARKS, Resident Pupil, City of Dublin Hospital.)

THE subject of this case was a patient named James Hussey, æt. 46, who had served as a soldier for twenty-one years. When about five years of age he fell into the fire and had both his left knee and foot and left hand much burned. About thirteen years ago, that is about twenty-eight years after the time of the burn, he observed a sort of pimple break out on the lower end of the ulna, which increased to about the size of a sixpence; for this he went into the Military Hospital, where he was dressed with red precipitate ointment, and touched with caustic. After two or three days he was discharged from hospital, the ulcer having become neither improved nor the contrary. For about ten years it remained in this state, almost quiescent. About two years and eight months ago it commenced to eat away round the wrist, faster on the anterior than the posterior surface, till it entirely encircled the joint; it also deepened and opened the ulnar artery, causing considerable hæmorrhage; this occurred about three months ago. After this the ulnar nerve got injured, causing numbness of the little and half the ring finger; the median nerve afterwards became implicated, the entire hand became numb and considerably swollen. About one month ago there was some slight hæmorrhage, probably from one of the interosseal arteries. He was admitted into the City of Dublin Hospital on the 30th of January, under Mr. Wheeler's care, suffering intense agony; his pulse was slightly intermittent. He was ordered digitalis, iron, and strychnia, with stimulants, and a generous and nutritious diet. Under this treatment his general condition improved sufficiently to admit of operation on the 16th of February, which Mr. Wheeler performed by the circular method, close to the shoulder-joint. Esmarch's bandage was applied from the elbow upwards, and not any blood was lost, save that coming from the distal end, where the bandage could not be applied, on account of the extent of the ulcer, and the very slender attachment of the hand to the forearm. The exact state the specimen presented is as follows: An ulcer extending round left wrist-joint and back of hand, about two inches of the ulna eaten away; the ulnar artery destroyed for about three inches; the ulnar nerve eaten across, and the median nerve partially; the scaphoid, semilunar, cuneiform, and pisiform bones all absent.

INDIAN MEDICAL NOTES.—No. XXXV.

(FROM OUR SPECIAL CORRESPONDENT.)

MEERUT, *March*, 1875.

PAST AND PRESENT.

OUR aged King's health was drunk in solemn silence; that of the Prince Regent with noble acclamation; the Duke of York and the Army with three times three; the Duke of Clarence and the Navy amid loud huzzas, followed by "Rule Britannia." Then the president called on Dr. Robinson, who, with great feeling and pathos, sang the "Old English Gentleman." In ancient days in India the clergy married with gravity, drank the bride's health with spirit, when Sir Roger de Coverley would be danced so late that parade next day would be countermanded by the colonel, who loved field-days, early rising, health marches, sea-bathing. In the order-book would he write: "The regiment will proceed right in front in light order, the *générale* to beat at four, assembly at five; all heavy baggage and women to remain behind, the surgeon taking care that no man leaves the hospital if unable to bite a cartridge, and recruits taking off shoes or gaiters were to beware of leeches, to remember also the dangers of arrack, pungent with capsicum, deleterious with datura. Owing to eating fat mutton and drinking certain water of aperient qualities, some suffered from diarrhoea, and all sound medical men declared the sudden deprivation of spirits to be injurious. The elephants had a daily tot of arrack, and would kill any person watering their grog. In strange places the road would be shown by reluctant villagers pressed into service, eager to desert unless watched by sentries or tied to tent-poles. Marches from 12 to 14 miles, the Europeans allowed a dram in the early morning. In encampments on black cotton soil, when the picket posts would not hold, there would be a stampede of horses all over the country until the bugle sounded feed. All day in the sun, all night in the rain would the horses stand, the sentries flounder amid sinking mud; yet the general health would be better than in cantonments. The battle of Plassy was fought in June; the campaign in Guzerat carried on six years at all seasons; and Seringapatam was taken in May. Sir Sydney Cotton noticed men playing games bare-headed in the blazing sun; others, at 9 a.m. and 3 p.m., wore forage-caps in watering order, iron helmets at other parades. During pressure, panics, or epidemics, the general intemperance would cause endless difficulties, and from all parts of the world are traditions handed down of wonderful men, who, like Lord Eldon, could drink any given quantity, could also bask in the sun bareheaded—their helmets in the gutter, sleep the sleep of the just, to awake none the worse. To-day information is received of men taking cannabis Indica in rum or beer, and the papers are full of the details of arsenic and diamond-dust—alleged poisoning of Colonel Phayre. Intemperance and atmospheric vicissitudes will ever figure amongst causes of disease until the burden of the song becomes monotonous. Norman Clevers tells of the punch-houses at Calcutta, one room paved with tiles, loose wide boarding through its centre covering the main sewer; upon this drunken men were laid to cool, to enjoy the breeze of the sewer air. The same author states that a temperature of 117° under the old Horse Artillery helmet can be reduced to 102° by a wet rag inserted inside; Foot Artillery cap, 122° to 114°; peaked Kilmarnock, 119° to 108°; Sepoy turban, from 130° to 106°. It would be a very simple matter to reduce fever in its various phases, possibly cholera being one, by the construction of a helmet protecting the temples, also the back of the neck, by the addition of the appendage termed puggery, and a waistcoat without sleeves, well padded down the back. Oh, the comfort of a warm, loose, shooting-coat in the hot weather! when through white clothing the sun pierces into the spine like a red-hot gimlet. Then is ice so grateful to the parched palate. Last December and

January a very large quantity of field-ice was made at Meerut, the ground strewn with sugar-cane leaf or straw, upon which are placed shallow earthen pans containing water, the resulting ice about a quarter of an inch thick. In the old days, about 160,000 pounds made for use from April to October—16 pounds per diem allotted to £10 shareholders. The price of machine-ice is very reasonable—of course, much cleaner and nicer. At Calcutta, formerly, beer and porter considered bilious—Madeira, claret, cider, perry, all drank in preference. Life was very uncertain, for persons invited to dinner might attend the host's funeral before supper. The ladies, tightly laced, danced themselves into phthisis; whilst some gentlemen encouraged putrid fever by heavy midday meals, followed by sleeping in draughts.

Hamilton Kerr Wade, travelling in palankeens, received then 32s. a visit, the chemists charging 6s. for an ounce of bark, 2s. for a dose of salts, 4s. for a blister. To-day medicines, instruments, clinical thermometers, hypodermic syringes, badly constructed, are so dear, that Messrs. Weiss and Coxeter, if they only comply with orders rapidly, would be patronised in preference. Certain persons delight in breaking thermometers until compelled to procure others.

In 1802 a ship captain introduced vaccine-threads. In 1803 a boy, bitten by a shark, recovered in three months after amputation of right leg, when £280 were collected for him. Then rheumatism and chorea were cured by electricity. In 1806 bills in duplicate and triplicate for £4,000 were voted to Edward Jenner by the inhabitants of Calcutta. Great illuminations were displayed after the battle of Waterloo—the champagne at the banquets peculiarly fine, and soda-water warranted to effervesce was introduced. A young lady's trousseau cost £500; and the flirtations on board a certain Indian man grievously troubled the parents at home, besides vexatious to the bilious Nabob in nankeen when the lady changed her mind, after he had travelled miles to meet the "Belle Packet" sailing into harbour. Perhaps he consoled himself with a mistress at 40 rupees a month—perhaps with several. Old Job Charnock annually sacrificed a cock on his wife's grave; and another eccentric offered a large sum to endow a Professorship of Atheism at Edinburgh. When John Shipp landed at Calcutta a stoppage of 8 rupees per man, without any explanation, almost led to a mutiny, until told the amount was deducted in advance to ensure a decent burial. Up in this neighbourhood natives with incurable diseases were buried, or drowned themselves, weighting the poor suffering body with sand-bags. There are many sad records of injudicious marches, of men being over-drilled, and of the contradictory views concerning cholera. A regiment stationed at Seringapatam for two months lost on an average three men daily—the jungle-fever commencing as ague, followed by burning delirium rapidly consuming the frame, baffling human skill, until Dr. Scarman, pouring the water of the river Cavery in pailfuls over the burning patients, checked the disease. According to Sir Colin Campbell, before men are stricken with sickness everything depends on commanding officers. Writing in a desultory manner to-day, altogether unsettled, let me advise medical officers to leave their measure for clothes, uniform, shirts, boots, &c., in London; it is so easy to have things sent out, whereas everything native is so bad; everything made by the European in India must be very dear, for the unfortunate tradesman cannot make profit otherwise. At certain places there are excellent tailors in a fashion, and the natives sometimes are very clever, yet uncertain. Sending money to England costs at least £10 per cent., so when the thrifty bachelor commences to save there are investments out here to try, either in beer, tea clubs, or banks, everything depending on the manager of the concerns. As said before, everything is temporary—transient; you buy gradually at sales, glass, china, furniture, horses, carriage, all to go to auction when you leave. Water-colours, chromo-lithographs, engravings, if preserved from the ants, will make the Indian home more homelike, besides selling well; also

harness and saddlery are indispensable. The married doctor too often brings out things which smash on the road, give a deal of trouble, and can be picked up just as cheaply. Here we have no abiding city, therefore, why bring plate or jewellery, or fancy china?—why perpetrate any extravagance beyond a good house well supplied with cooling dodges; as for the rest, screw and screw, hoping for leave to the divine hills—Landour, Simla, Nyna Tal, the first the healthiest.

The month of March at Meerut is pleasant, yet daily growing hotter. Now look out for neuralgia, variola, rheumatism, measles, eczema, secondary syphilis, and as the nights are cool, the days warm, the relapses of fever will occur. Erysipelas, quinsy, trifling diarrhoea, infantile dysentery, whooping-cough, influenza, trouble the residents; the new comers suffer from boils, perhaps chloasma or leucoderma, of no consequence to men, yet vexing to ladies partial to low dresses. Now do cases of menorrhagia and leucorrhoea recur. A woman from quickening to delivery suffered from uterine hæmorrhage, yet the child turned out strong and healthy. When marching to and from Rowkee last year toothache troubled many men; irritation of the bladder bothered some on a recent march in the district; and the prayers of the congregation are desired that we escape sunstroke, small-pox, cholera, or boils at Delhi. Women give a deal of trouble sometimes, objecting to being vaccinated from the most beautiful dew on a rose-leaf on a native child's healthy arm. Pneumatic aspiration applied to buboes is a triumphant success, care taken to use the largest needle to remove the stringy pus, then glue the edges of the cavity together, keeping pressure on whilst the needle is being withdrawn, then bandage. We hope for a long farewell to large wounds and horrid sinuses, for with the aspirator, as Pepys would say, "laws to see the difference." I am on the look-out for a hydrocephalic child to tap; yet it is very curious how few such cases, either amongst Europeans or natives, have been so far met with. At the Meerut races, the ground hard, the jumps severe, men are crumpled occasionally; but if singing certain comic songs sadden audiences, some races are just as dull, and life would be very tolerable without them. Steeplechase catastrophes in England sometimes are very horrible, and instead of a pleasant, quiet afternoon on the stand near the refreshment-tent, making a book, or talking to lovely women, the doctor too often has to accompany a crushed rider on a shutter home, to break the news also to the distracted wife; and many a poor jock living from hand to mouth has neither home nor friends. Pig-sticking out here leads to accidents—concussion of the brain, fractured clavicle on the lists to-day: the pig may rip up horse or rider. Accidents occur out shooting, dragging guns through hedge or sugar-cane; besides, like everything else native, the guns sold in the bazaars are rotten, unsafe, inclined to burst. At the Meerut flower-shows in March, amongst geraniums, hyacinths, roses, ferns, the primroses and daisies held their own; the vegetables, excepting asparagus, all good, the tomatoes especially. Strawberries are being sold at two shillings a basket.

March 11th.—A hot, thirsty, dusty, windy day. The cavalry occupy one end, the artillery the other, at Meerut, the infantry in the middle, and it would appear that the barracks at each end of the line have more fever yet less cholera, which generally breaks out in the middle—for instance, the Buffs in 1867, the 105th in 1872. Then the men in the barracks influence matters—their previous medical history all important. For some months the climate at Meerut is heavenly, indeed, very pleasant up to May, barring heat.

THE Society of Apothecaries of London have announced that a course of six lectures on State Medicine will be delivered at their Hall, in Blackfriars, by Surgeon-Major F. de Chaumont, Assistant-Professor of Hygiene at the Army Medical School at Netley, to commence on Saturday, May 15th, at 3 p.m.

Hospital Reports.

LONDON HOSPITAL.

(Under the care of Mr. RIVINGTON.)

Strangulated Right Acquired Oscheocele—Reduction by Taxis—Continuance of Symptoms—Exploratory Operation—No Stricture Found—Death on Third Day—Not much Peritonitis.

WM. MELLOR, 57, was admitted into the London Hospital on the 8th May, 1873. He was suffering from a right oblique and strangulated oscheocele. The testicle being distinct below the hernia, it was evidently acquired, and not congenital. He had had the hernia six years, and it had always been reducible. He used to reduce it himself when it came down. He had worn a truss. The patient stated that he found the hernia down when he got out of bed at 8 a.m. He endeavoured to reduce it himself as on previous occasions. He made great efforts, and used a good deal of force, but was unable to effect his object. He came to the hospital at 9, when taxis was applied for a quarter of an hour. He was put under the influence of ether, and taxis again applied for ten minutes, to no purpose. Ice was applied by Mr. Kebell, the house-surgeon, till 12.30, when he was seen by Mr. Rivington, who had been sent for by Mr. Kebell. At that time he seemed to be in a state of shock. He was shivering, with a small compressible pulse of 84, pale and cool skin. Nausea and vomiting. Gurgling had been felt in the tumour during the taxis. Mr. Rivington applied steady taxis for about fifteen minutes intermittently. The hernia yielded at the outset, and some went up, rendering the tumour smaller and laxer. The last portion went back suddenly on slight pressure. He passed some blood by stool after reduction. Symptoms of strangulation continued after the reduction of the hernia. The vomiting then ceased for a time, and returned on Saturday, so that Mr. Kebell sent again for Mr. Rivington on Saturday evening. The patient was in much the same state as on admission. The inguinal ring was free, but the bowel came down in a lump and in a lump could be returned.

It was thought possible that some band still held the coils of the bowel, and that it would at least be safer to explore. Cases now and then occur in which, during taxis, a circular strip is torn from the neck of the sac, and maintains strangulation. Accordingly Mr. Rivington examined the hernia under chloroform, opening the sac in the usual way. A good deal of sero-sanguineous fluid flowed from the abdomen, but there was no kind of strangulation, and the bowel was but moderately congested.

The patient did not vomit after the operation, but he gradually sank and died early the following morning. Nothing was found at the post-mortem; the sac was entire; the intestine, though congested, healthy, the serous surfaces still shining and polished, and little indication of peritonitis. The organs generally exhibited senile changes. There was no ulceration of the mucous surface of the intestine to account for the hæmorrhage from the bowels.

Transactions of Societies.

PATHOLOGICAL SOCIETY OF DUBLIN.

THE last meeting of the session was held on Saturday, April 24, Dr. ROBERT McDONNELL, President, in the chair.

ACUTE RHEUMATISM WITH GASTRO-INTESTINAL INFLAMMATION.

DR. MACSWINEY said that the morbid specimens which he presented to the Society were removed from the body of a

woman, aged about thirty years, who died in Jervis Street Hospital about three or four days ago. Her history, as far as affected her medical condition, was, as related by her, that about five years ago she was an inmate of the Meath Hospital, under the care of Dr. Foot, suffering from rheumatic fever. She passed through the disease and recovered sufficiently well to be allowed to leave, and for five years she followed her avocation of domestic servant. She understood at the time she left hospital that her heart was affected. When she entered Jervis Street Hospital she was suffering from very high fever—extremely high. Her principal joints were swollen, red, and hot, and exquisitely painful. She had all the symptoms of fever—the pulse was quick, the tongue coated, and she complained of thirst and sleeplessness. She was, in fact, labouring under exaggerated rheumatic arthritis, and at this time she also had pericarditis. The ear applied over the region of the heart perceived a condition of to and fro rub-sound, which was extremely characteristic. For ten days her state appeared most precarious, and death seemed imminent several times. It would appear to be likely to result from asthenia. She was in a condition of extreme weakness for several hours, and almost if not entirely pulseless, the pulse not being perceivable at the wrist. Out of this state she recovered sufficiently for some time to render it likely that she might rally. About a fortnight ago she began to complain of extreme distress and pain at the right side in the situation of the liver, and pressure—even the very slightest touch—over that region gave her extreme distress. It was also easy to perceive that the tissues there were hard and apparently somewhat swollen. At the same time her appetite completely failed. She ceased to take any solid food at all. She still complained of intense thirst, sleeplessness, great pain in her right side, inability to swallow any solid substance, and after a time it became clear that she was about to die. About five or six days before her death fluid was recognised in the peritoneal cavity, and finally she fell into a sort of comatose state, in which she remained for some time, and then quietly expired. He produced the heart, liver, pericardium, stomach, and duodenum. The first left articular ventricular opening was greatly contracted. The aperture did not admit one finger—it was merely a split. There were some—not very many—adhesions between the pericardium and the heart, but on the surface of the heart there was no evidence of adhesion. The sac of the pericardium was filled with fluid, and the peritoneum contained a large amount of fluid. Both pleural cavities were occupied with fluid, and in all these instances the fluid was straw-coloured, and had no particles of lymph. He was not in a position to state exactly the situation of the cardiac *bruit*. There was, however, a feeble *bruit*, but the extremely delicate condition of the patient precluded the possibility of any positive examination, further than that it was a feeble *bruit* situated at the apex of the heart. It was more expressed at one time than another. Whether it was systolic or not he was not prepared to say. His impression was that it was post-diastolic. The stomach and duodenum presented appearances that were most remarkable. At the time of the removal of the stomach the mucous membrane was quite as red as that of the stomach of a person who had died by irritant poison. It was injected with deep scarlet colour over its mucous membrane. The œsophagus was of the same colour, and the duodenum was quite novel when taken in connection with organic disease of the heart. It was greatly contracted and extremely thin in structure. It was purple in colour from congestion. It broke down on making traction, and it appeared to be almost in a gangrenous state. The stomach itself was also very much contracted in size and capacity. What the cause of the intensely congested condition of the stomach and duodenum was, he was not prepared to say, but he might remark that the woman had not partaken of food to any extent for a fortnight before her death, and in recorded cases prolonged abstinence had been followed by a condition of congestion of the mucous membrane not very different from that presented in the case now before the Society. In very many instances the intestinal tube had been found greatly contracted in cases of prolonged abstinence, but no other part of the tube was contracted or altered save only the fourteen or fifteen inches of the duodenum and jejunum, which he now exhibited. The liver was greatly engorged with fluid, and presented a very well-marked example of what was known as the nutmeg liver.

UTERINE FIBROID TUMOUR.

Dr. LOMBE ATTHILL exhibited a remarkable example of a

form of uterine fibroid, or rather what once was uterine fibroid, because there was not, he need scarcely say to those present, the smallest trace of anything fibrous in the structure before them such as the word fibroid would indicate. There was, unfortunately, no history of the patient from whom the specimen was taken—at least so far as her uterine organs were concerned, for she was admitted into the Adelaide Hospital on the 17th of April in an advanced stage of pneumonia, and died the next day. It was only in the course of the post-mortem examination that attention was drawn to the uterus at all. The woman was about sixty years of age, and in all probability had never suffered from any uterine symptom. He judged that from the fact of the situation of the fibroid being sub-peritoneal. She had not apparently suffered from menorrhagia. The uterus was of normal size, considering the age of the woman, and on the anterior surface of it was the now calcareous tumour which he exhibited. On the posterior surface was another small, but true fibroid, but on one end of it was a small calcareous deposit. There was also a third tumour, purely calcareous. The Society was well aware that uterine fibroids were liable to various changes and alterations: they were liable to oedema, to fatty degeneration, to absorption, so that they disappeared entirely, and finally to calcareous deposit. It was not uncommon to meet with cases in which there was a certain amount of calcareous deposit. This is the first instance in which the entire tumour was converted into an entire mass of calcareous matter. If this had taken place inwards instead of outwards, it might have been removed, and then it would be classed as by old writers—a uterine calculus. With respect to this case, in the liver there was a cyst which had undergone calcareous deposit, but there was a central space vacant, so that in that respect it differed from the metamorphosis which had taken place in the uterus. The case was important practically, as showing how nature cures these tumours, and it also showed that they should not be interfered with by operative means unless the symptoms were very urgent indeed.

EXTENSIVE DISEASE OF URINARY ORGANS.

Dr. BARTON showed a specimen which was a contribution to the pathology of the urinary organs of a somewhat unusual nature. The patient was a printer, forty-seven years of age—a very thin, emaciated man—and was admitted to hospital suffering from acute micturition. He suffered a severe burning pain when passing water; it commenced about the middle of the flow, and increased towards the termination, and passed away a few minutes afterwards. He never had a pain in the glans penis. He had not stone, as was proved on examination. He was obliged to relieve himself every quarter of an hour, and on one occasion, having to retain water longer than usual, he found he was passing blood. The urine was albuminous, and after it was allowed to stand for some time it was found to contain layers of ropy mucus and blood. The patient continued to get worse despite the treatment that was used, and he died about three weeks after admission, which was in March last. There was contraction of the bladder, but no stricture; there was no enlarged prostate. The kidneys were in an extensive state of disease. In the right kidney there were numerous small abscesses of a strumous character. The other organ was reduced to a mere number of dilated cysts. The ureters were not merely dilated, but remarkably thickened—so thick, in fact, as to give all the feel of stricture of the urethra. On the right side there was no opening from the ureter into the bladder at all. The coat of the bladder is greatly hypertrophied. On the base of the bladder there was an abscess which had evidently been of a chronic character, and a quantity of strumous matter exuded from it on pressure. The abscess had evidently pressed on the bladder and caused the obstruction which had kept up the micturition. The case was not merely interesting in a pathological point of view, as showing such a state of things as thickening of the ureters, accompanied by abscess in the kidneys and bladder, but might on another occasion point them to the cause of a group of symptoms such as in the case before the Society, though it might arise from some unusual cause.

The Society then adjourned until next session.

The Chicago Medical Examiner advertises a practice at one of the favourite Southern springs for sale. The yearly receipts amount to upwards of \$40,000, and \$20,000, cash or approved paper, is asked for it. The reason given for the retirement of the present occupant is that he has amassed a fortune.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, MAY 5, 1875.

ARMY MEDICAL DEPARTMENT.

We have received two pamphlets concerning the above-named department, one entitled “The Army Medical Service in the Past and the Future,” published by Messrs. J. and A. Churchill, and the other, “A Contrast, by X.,” A. M. D. The writer of the first of these pamphlets tells us that “after a prolonged trial of the mixed staff and regimental system, it was found unsatisfactory, and the amalgamation of the staff and regimental officers decided on, having mainly for its object the equalisation of duties and foreign service for officers, increased comfort for the sick in hospital, and, lastly, economy to the State.” Under the former system, says the writer, “existed a grievous distribution of labour, the regimental surgeons being greatly benefited by their strict limitation to regimental duties. In the matter of foreign service some officers, who could ill afford to pay for exchanges, were obliged to serve constantly abroad, whilst others were almost continuously at home.” While admitting the advantages which must ultimately accrue to the service should it be finally embodied into a *bona fide* staff corps, our experience up to the present is that the duties have not been equalised, or the foreign service roster put upon a proper footing, results due to the opposition of the military element, who could not believe in the efficacy of a department no longer under their control. We are glad to hear such a good account of the working of the new station hospitals, a result which must depend a great deal upon the character of the senior medical officer. We believe there are two of these institutions in Dublin, one administered under the purely staff system, and the other in charge of regimental officers. The first we much prefer, as we hold a very strong opinion that it is the best, and that no mixed system will ever succeed, or in the end be of advantage to the medical officers or economical to the State. The author touches upon one very important difficulty in the ultimate success of the new amalgamative system—a distrust upon the part of a very intelligent section of the executive ranks of receiving considerate treatment at the hands of their seniors. We quite agree

with the writer that "some of the senior ranks have much to learn in this respect from other branches of the army," and we would further add, from the custom of their brethren in civil life. On matters of duty, an administrative officer should be strict and impartial, but if he is to succeed, he must never forget that one essential in harmonious official intercourse, gentlemanly feeling and respect for the professional ideas of everyone under him. Now that the department is being united, senior medical officers must with their increased responsibilities towards their juniors be a little more hospitable and a little less stand-off than they have hitherto had the credit of being. Their position implies this: it is, in our opinion, a part of their official duty. We are only too well aware of the total non-existence in the department of "prospect, encouragement, or reward," but hope, under new management and its present distinguished head, much of this will disappear. We do not by any means despise uniforms and trappings, as the more there is perfectly similar treatment in such matters with the combatant officer the better, and hence such questions cannot be despised. The amalgamation of the department necessarily implied the removal of officers from their regiments, but we would have thought that with the exception of those who did not like foreign service, they would have benefited in a pecuniary point by being transferred to the staff. The author comments very strongly upon the absurd regulations which prevent medical officers having supreme control over the men of the Army Hospital Corps, a restriction which has marred the "whole effect of the new arrangement." This we can easily understand. The senior medical officer should be supreme over all, as is a commanding officer in his regiment. Our author classes the grievances of the department under several heads—viz., administrative officers having to serve qualifying periods for rank and pension; inadequacy of the pay of the director-general; the presence of commandants in hospitals; want of complete personal authority over hospital subordinates; slowness of promotion; no outlet for older officers; no limiting periods of age; retention of officers in the administrative ranks for unlimited periods, until executive officers are too old for promotion; withdrawal of forage allowance; inequalities regarding leave of absence; restrictions on sick-leave not according with complete relative rank; over-riding of the clauses of the Royal Warrant by after circulars; title of non-combatants; unnecessarily distinctive dress. Much of what the author says on this subject has been already anticipated in our columns and those of our contemporaries. X. points out in his more diminutive attempt that under present regulations an officer is a considerable pecuniary loser, and that the worth of the appointments as means of livelihood for young surgeons have deteriorated, a point upon which there will be little disagreement. We do not agree with the writer in objecting to promotion in batches on the completion of fifteen years' service; the advantages of such a guarantee would outweigh any imaginary benefits in other respects. The very general demand for a time-promotion proves the popularity of the idea. We do not by any means believe that injustice in selection was precluded by a *private* written report to the Commander-in-Chief. If the regulation required a statement of the

grounds of selection in the *Gazette*, as in the case of the "Victoria Cross," we would have much more faith in it, as public opinion would not tolerate any very gross job. We have no very special admiration for any such hole-and-corner proceedings. We hold that, as in the Scientific Corps of the Artillery and Engineers, an officer should be promoted by seniority, unless incompetent. He might be then passed over, which would be a sufficient hint, and no doubt be found to answer its purpose. We agree with the writer of this pamphlet, that the immediate application of the new naval regulations to the Army Medical Service, and the restoration of the rights and privileges originally conferred by the Warrant of 1858, would be a step in advance, and in the absurdity of importing into the whole question the utterly fallacious argument of comparing the pay and rank of combatant and medical officers, the latter possessing no rank, the relative rank being a merely convertible term for allowances; the medical officer carrying away with him on leaving the service no collateral advantages of title or position, while the military officer buys from the State a profession and a name which may be raised to very high honour.

THE INFLUENCE OF ILLEGITIMACY ON MORTALITY.

DR. GUSTAVE LAGNEAU has brought before the Academy of Medicine of Paris a question of great social importance.

To appreciate the influence of illegitimacy on mortality he compares legitimate and illegitimate conceptions in the different aspects of spontaneous abortions, criminal abortions, infanticides, and still-births, or deaths at various ages from birth up to adult life.

Spontaneous abortions appeared to be frequent in the case of illegitimate conceptions, for the majority of women so impregnated fall into a state of moral and physical misery which is unfavourable to gestation; and the majority of debauched women abort, he says, on account of excessive intercourse.

As to criminal abortions in France, they caused, from 1844 to '72, during 29 years, annually 24 accusations, with 60 persons implicated. This differs from America.

As to infanticides during this time, there were annually 186 accusations, implicating 211 persons. This is a very low state of criminality, and contrasts very favourably with England.

To prevent abortions and infanticides, and punish those guilty of them, it has been demanded that it should be made compulsory to register every fetus at whatever time it may be expelled, that the verification of deaths should be made general, and that the foundling turning-tables should be reviewed. But up to the present date, declarations concerning fetuses have been most irregularly made, even in Paris, since out of 10,000 still-births registered there were only 76 of three months old, 6 of two months, and 3 of one month. As to the machinery for verifying deaths, it is very imperfect, especially in country districts. And as to the turning-tables, if they permit the snatching from immediate death some newly-born infants, which would have been the victims of infanticide, we must

recognise that the mortality is so great among abandoned infants, that the result to the population is small indeed.

Whilst from 1846 to '68, of 1,000 products of legitimate or illegitimate conceptions registered, the proportion of illegitimate still-births varied from 31 to 41, that of illegitimate still-births varied from 66 to 79. This proportion, which is gradually becoming more considerable in France, is then approximately double in the case of illegitimate as compared with legitimate infants. The excess of still-births among the illegitimate is to a certain extent due to criminal manoeuvres, but also to a great degree to the state of destitution and misery in which gestation and labour take place among maiden-mothers.

From 1800 to 1810 the newly-born children registered as living in France amounted, says Lagneau, to 46,766; progressing irregularly, they rose to the annual mean number of 75,442 from 1861 to 1870. These remarks of Dr. Lagneau are to be taken with the due notice that the first censuses in France were most imperfectly made at the commencement of this century. At this moment, of 1,000 births, there are in France 75 illegitimate—a proportion which is much surpassed in divers other European states, and notably in Germany. This illegitimate birth-rate appears to depend on the mean age of marriage, which is more or less retarded. The more marriage is put off the more numerous are the unmarried men, and the more do illegitimate births increase. They increase just in proportion to the obstacles in the way of marriage.

Newly-born children, registered as living, have from birth up to one year of age a mortality about twice as great when illegitimate as when legitimate. In the first year of life, from 1857 to 1865, 1,000 legitimate newly-born children show a mortality of 165, whilst 314 is the figure for illegitimate children. This mortality, which is almost double, appears to be owing in great measure to the departure of the infants from their mothers, to the abandonment of these little creatures to mercenary nurses, who are more or less without breast-milk, often careless, and sometimes culpable. To prevent as much as possible this abandonment of infants by their mothers, it would be necessary, thinks Lagneau, that poor mothers should be admissible long before the end of their pregnancy into maternities where they could work—kinds of workshops attached to lying-in dispensaries.

Received into these institutions, where they would find labour proportionate to their physiological state, they would be delivered by chosen midwives, as at present, or in private rooms in the establishment, when they would return, after confinement, into the workshops, as in certain manufactories in Mulhouse; they could, whilst resuming their work, continue to suckle their infants. On leaving these working maternity charities, work and assistance might be procured for those women who kept their infants, for these infants, even when beyond the age of one year, continue to exhibit a considerable mortality, since, at the age of 20, when, out of 1,000 conceptions registered 20 years back, there survives 640 young persons born legitimately, at that very age there are only 238 survivors of those illegitimately born. More than three-fourths of all illegitimate children, then, die before the age of 21.

Such facts are but too clearly comprehensible by all

persons accustomed to reason on social topics. It has long been well known that the children of the poor succumb far more frequently than the children of the rich. At an early age of life poverty is so fatal to children that many poor mothers sometimes lose ten or twelve children where a rich mother would lose only two or three. At all ages, indeed, the mortality of the rich is far lower than that of the poor, and rich countries such as England and France show the lowest death-rate of all countries in Europe.

Notes on Current Topics.

Alleged Death from Ether at Manchester.

THE case of death alleged to arise from the administration of ether, to which we referred the week before last, is reported in fuller detail than we had then possessed in the *British Medical Journal* in the following terms:—

“J. F., a delicate timid boy, aged 16, became an inmate of the Manchester Workhouse Infirmary last autumn. On September 25th last, Dr. Hardie removed the right foot at the ankle-joint, chloroform being administered. He bore the anæsthetic well. On October 29th, the cuboid bone was excised. On this occasion chloroform was again administered. When the operations had been completed, some alarming symptoms showed themselves—viz., fixed dilated pupils, feebleness of pulse, extreme pallor, and absence of respiration. These quickly passed off, on the tongue being forcibly drawn forward, cold water sprinkled over the face, and galvanism applied to the phrenic nerves. On the 3rd of the present month, bare bone having been found, the boy was again placed on the operating table, having previously been given an ounce of brandy. He was asked to have the trifling operation performed without an anæsthetic, but refusing, ether was administered by Dr. Hardie, who poured about four drachms on a piece of lint, which was placed in a folded towel, and held pretty closely over the face. He inhaled the vapour more quickly than usual, there being no coughing, and but little struggling. In about four minutes from the commencement of the inhalation, and before any fresh ether was poured on the lint, he was apparently ready for the operation. Immediately afterwards, before the operation was begun, Dr. Hardie observed the respiration, which he had been closely watching, suddenly cease, and, at the same instant, an extreme pallor came over the face, and the pupils became widely dilated. At the moment when these symptoms appeared, he had not his finger on the pulse, nor did he feel for it before resorting to remedial measures. Every restorative means was resorted to without result. After twenty minutes these were discontinued. The post-mortem examination was made by the Coroner's order. The brain, larynx, liver, kidneys, and intestines were healthy. The stomach was quite empty, and no signs were observed of any attempt to vomit. The cavities of the heart were quite empty, and the lungs were neither gorged with blood nor darker than usual; their posterior portion was somewhat dark, but this was probably owing to the position of the body on its back. The spleen showed commencing amy-

loid degeneration. The larger blood-vessels contained much blood, which was very dark, and showed no tendency to form clots, but seemed loose and fluid. No microscopic examination of the heart was made, but to the naked eye it appeared healthy, only being slightly pale. It appears probable that death resulted from syncope. The ether used was Robbins' ether for local anæsthesia."

If no circumstance has been overlooked in this narrative the case would appear to have resulted from syncope after ether inhalation, and it would go to prove that it is possible in exceptionally unfavourable cases to produce death by the use of that anæsthetic. It is plain that the boy narrowly escaped with his life on the occasion of the former operation, and that he was the victim of that idiosyncrasy which leads to death from syncope after extremely small doses of chloroform. The case reacts against the idea that ether is a heart-stimulant, *not* a depressant; but, of course, no final conclusion can be deduced from this, the only case in which death has appeared to result from syncope following ether inhalation.

Physicians' Fees.

SIR GEO. BURROWS, in his Presidential Address at the Royal College of Physicians, called attention to the fact that the fee which was deemed a sufficient honorarium a century ago by no means adequately compensates the modern physician for the additional time and skill devoted to patients residing in distant parts of this vast town. In former times, Sir George said, it was seldom that a physician's practice extended beyond a circle of which the radius was a mile, the centre being his own home, and if patients resided beyond that circle the physician was almost sure to receive an extra fee. Now it is well known, that from the enormous distance to which the town has extended in all directions, the London physician may be called to patients residing in fashionable regions, at a distance of two miles or more from his home centre, and yet, unless some previous arrangement has been made, no extra fee is offered by patients, and can rarely be asked for, without giving rise to unpleasant explanations. All who have given any attentive thought to this subject, must be aware that it is not only the greater distances which the physician is compelled to traverse, but also the diminished value of money, which renders the long-established conventional fee a much smaller remuneration to physicians of the present day than that always obtained by physicians of one or two generations before our own.

The greatly advanced rent of houses in suitable localities, the increased expense of carriage and horses, the rise in the wages of servants, and the augmentation in the other expenses of living, place the physician of the present day at a great pecuniary disadvantage compared with his predecessors of a past generation. While the price in money of nearly all that is required in the establishment of a metropolitan physician has steadily and greatly advanced, his services are still estimated by the same fee that was offered him when that money was worth far beyond its present value. How is this anomaly and social hardship to be remedied? I have long and

frequently thought over this perplexing question, but I confess have not been able to lay down any principle which can be strictly carried out in the solution of the difficulty.

The long-established customary fee to the physician is an honorarium, and long may it continue to be so. The College have never laid down any fixed regulations as to the amount of honorarium to be expected by the consulting physician; and I would not presume to advise the Fellows to deviate from that principle. But I think I have brought under your consideration many reasons why the senior and leading members of our order should endeavour to impress upon the community the reasonable expectations of physicians to be more liberally treated in the recognition of their professional services, when distance or other circumstances cause an extra demand on their time. It has appeared to me right in the interests of our order that this delicate question should be ventilated, although I cannot presume to indicate the best course to be pursued to remedy this increasing injustice.

Charge of Manslaughter against a Medical Man.

THE magistrates have committed a medical man for trial at the Lincoln Assizes on a charge of manslaughter. From the evidence, as reported in the *Lincolnshire Chronicle*, it appears that Dr. Wood was sent for to attend a woman in labour. He went without delay, and found the patient flooding. He delivered her at once, and soon after left the house. It seems to have been a case of placenta previa, and two women who were present evidently thought that he ought to have waited for pains before delivering, and they were also surprised at the degree of force required. We fancy these circumstances originated the inquiry, for the patient having got worse an hour after Dr. Wood left, he was sent for again, and at once came, but only to find her dead. A post-mortem examination was held by Dr. Lowe and Dr. Spalding, and rupture of the uterus discovered. These and other medical men gave testimony which completely exonerates Dr. Wood, except on one point, that they thought he left the house too soon, and one held that he should have treated the patient for collapse, though it would not have been possible to save her life. It is clear, however, that when he left collapse had not set in, and could not be suspected. The women witnesses said a change took place an hour after Dr. Wood left. It is unusual for collapse to be so long deferred after rupture of the uterus. If the woman appeared doing well when Dr. Wood left, it is a cruel thing to blame him for not suspecting a very uncommon accident had occurred when no symptom of it was present. Again, in the matter of time we all know how easily people are deceived. To the patient's anxious friends the medical man's visit seems much shorter than it does to him who has other cases demanding his care.

So far as we can see from the report of the evidence to which we have referred, Dr. Wood seems to have acted with promptitude and skill in a difficult case, and we cannot believe a jury will convict him of manslaughter because he did not remain longer with a patient when no sign of danger was present.

Guardians and Doctors.

THE medical profession in Cork have felt themselves obliged to take a strong position in reference to an insolent resolution of the board of guardians, which implied that the union medical officers were in the habit of applying for leave of absence on false pretences, and that their application was backed by false certificates of ill-health from their friends. The Cork physicians and surgeons have, with praiseworthy unanimity, sustained their brethren who held union appointments, and have enunciated their great indignation at the insulting insinuations of the board of guardians, which are as false as they are ungentlemanly. It accords with their respect for themselves that the members of the profession should repudiate so insolent an insinuation, and they could not maintain their position if they did less: but we may remind the union medical officers of Cork and elsewhere that it is entirely their own fault if they find themselves called upon to pay substitutes in case of illness, or else the fault of the *locum tenens* if he remains unpaid. If they will consult the Regulations of the Local Government Board they will observe that they place themselves in such a dilemma by a zeal for the public service which is neither expected nor appreciated. If they fall sick and become incapable of discharging their duties, it is not for them to enter into negotiations either with the committee for the appointment of a substitute, nor to treat with the substitute as to his payment. Their legal and moral duty is simply to inform the hon. sec. of their committee of their inability to continue work, and at the same time to *recommend* a substitute. Whether the substitute so nominated will be appointed or will act, or whether he will be paid, is no affair of the invalided officer, and if he abide by the letter of the instructions he has no liability whatever. He refers any inquiries by the substitute in reference to payment to the committee, and if the substitute is fool enough to accept office without making his bargain as to payment, he should be himself the loser. The guardians will probably take advantage of his good nature or his modesty, and do him if he hesitates to make a previous contract; but the invalided officer is as untouched by the negotiation as if he had no connection with the district. This has been so often repeated that we really have no sympathy with Poor-law medical officers who thrust their heads into such a difficulty. As for the impertinence of the Cork guardians, an exhaustive experience of boards has deprived us of the quality of surprise at anything they may say or do.

The Election in the Irish College of Surgeons.

THE appointment of Courts of Examiners for the ensuing year took place yesterday, but too late to enable us to inform our readers of the result in our issue of to-day.

As we have already stated, the Council applied for the authorisation of the Chief Secretary to an alteration in their bye-laws to enable them to appoint eight examiners, instead of seven as heretofore, and the permission to do so was granted the College last week. Accordingly, by this increase in the number of the Court, and by the retirement of Mr. Fleming, there were two vacant seats, for which Mr. Croly, Dr. Stapleton, Dr. Frazer, Dr. P. C. Little, and

Dr. Thomson were candidates. For the two seats in the Council, vacated by Mr. Croly and Dr. Stapleton, we noted last week the candidature of Dr. Jacob, Dr. Mapother, Mr. McDowel, and Dr. Wheeler. Since our last issue Mr. Thornley Stoker and Mr. Corley, surgeons of the Richmond Hospital, Dr. Kilgarriff, of the Catholic University, and Dr. Montgomery Ward, of the Adelaide Hospital, have declared themselves as candidates. The meeting for the presentation of the Annual Report of the Council to the Fellows will be held on the last Monday in May, and we understand that the proposal of the Council for rebuilding the museums and library will be then submitted for the approval of the Fellows.

The Homœopaths in Ontario.

OUR readers will perhaps remember that some months ago the homœopathic members of the Ontario Medical Council, headed by Dr. Campbell of Toronto, retired from it in a body, and intimated their intention of applying to the Ontario Legislature for separate legislation. We now learn that they have reconsidered their determination, and will proceed in June next along with the other bodies to elect representatives.

Purification of Spirit.

WHEN the Committee of the House of Commons on the Adulteration of Food was holding its investigations last year the sophistication of whisky came under their notice. It may be remembered that at that time Dr. Cameron, the City Analyst of Dublin, stated that, in his opinion, the sale and consumption of new whisky containing a large quantity of fusel-oil was quite as injurious to the public as the sale of adulterated spirits, the existence of which in large quantity he doubted. This view of Dr. Cameron's has had practical result in the formation of a company in Dublin for the purpose of putting new whisky through a process which will eliminate fusel-oil and make it as "aged" and as wholesome as long-kept spirit. This purpose is effected by the "Improved Johnston Still," which purports, at a single operation, and at a greatly decreased cost, to produce spirit pure and mellow, free from fusel-oil and all other noxious ingredients, yet retaining in a marked manner the aroma hitherto characteristic only of old whisky. The spirit is said to be fit for immediate consumption so soon as it is distilled, having been purified in the process of manufacture, and the necessity for and cost of storing entirely avoided.

Chronic Catarrhal Laryngitis.

DR. ISAMBERT, in a lecture delivered at the Salpêtrière Hospital (*Le Progrès Méd.*, No. 15, '75), speaking of chronic catarrhal laryngitis, observes that it is more frequent in men than in women, because of the use of alcohol and tobacco in the former sex. Sometimes chronic catarrhal laryngitis is at once chronic, in which case it is derived from some diathetic condition. The inflammation is less generalised than it is in acute cases; it is localised in certain points, beyond which it hardly extends, during the continuance of the disease. These points are, in order of frequency, the posterior part of the epiglottis, on account of the numerous glands which are found in this

point; on the ary-epiglottic folds, and on the arytenoid eminences; on the laryngean infundibulum, and the ventricular bands, which are often reddened, swollen, and hypertrophied. The vocal cords may be attacked, and are of a more or less dark colour, sometimes with vessels as in pustular conjunctivitis.

Sometimes the redness is disposed in the form of fine points, or transversal striæ, perpendicular to the general axis of the vocal cord; then the vocal cords appear dry.

He next asks whether epithelial desquamation of the mucous membrane of the larynx may be followed by true ulceration. Are these simple catarrhal ulcerations? Several authors had thought so, but it appears doubtful. The ulcerations seen after death have always appeared to him to be caused by graver diseases than chronic catarrhal disease—phthisis, scrofula, syphilis, or herpes.

The expectoration in chronic catarrhal laryngitis is composed of thick viscous sputum, appearing usually to come from the ventricles. The cough is less frequent than it is in acute laryngitis. Aponia does not exist, but rather hoarseness, and there are no constitutional symptoms.

The diagnosis of chronic laryngitis from that depending on diathetic influences is sometimes very difficult. It should always be based on the absence of general symptoms of these diseases. As far as the larynx is concerned, we may say generally that laryngitis has more chance if primitive or simple, in proportion as it is more generalised, more diffuse, and the redness more uniform. On the other hand, in cases of laryngitis which are diathetical, the redness is confined to isolated points, according to the different variety of stains, plates, or striæ, or arborisations above mentioned, and the parts of the mucous membrane placed between the points attacked are more or less healthy.

Treatment.—The patient must repose, avoid all speech, and absolutely leave off tobacco, under all forms, or alcoholic fluids. Warm climates act admirably on this complaint. As to local treatment, emollient and astringent gargles have been recommended; but it must be noted that gargles never penetrate into the larynx; they may, however, render some service by modifying the inflammation of the neighbouring parts, and thus facilitate the resolution of the laryngitis itself. The employment of pulverised liquids has sometimes serious inconveniences. All these pulverisers which have come into fashion and which the patient himself uses are useless toys, and perhaps they are dangerous. When we wish to apply a topical remedy to the larynx we must do so directly, and as much as possible on the point diseased. This cannot take place with pulverisers, which throw the liquid not only into the larynx, but over all the neighbouring parts.

Direct local treatment, again, has very great advantages, and it consists in bringing different topical remedies to the diseased parts by means of a sponge. We employ the nitrate of silver, the sulphate of copper, and the chloride of zinc. The nitrate of silver is the most used; and the solution of chloride of zinc in the proportion of one-hundredth or one-fiftieth gives excellent results. The chloride of zinc has no action except on ulcerated or eroded parts, and leaves quite intact those still covered by epithelium. This is a fact easily seen when the neck of the uterus is cauterised with that solution. This remedy has no colour, and leaves no stain on the linen or finger^s, or white eschars

on the mucous membranes like nitrate of silver; its action is a little more energetic, and deeper than that of nitrate of silver.

The Ether Revival.

THE *New York Medical Journal* is glad to see that the English medical journals are taking up in earnest the question of the superior safety of ether to chloroform as an anæsthetic, and thinks the only wonder is that English surgeons have so long ignored American experience in this matter. "We do not like," says the writer, "to imagine that prejudice can have had anything to do with it; yet, with a comparatively safe anæsthetic within reach, the London hospitals go on year after year furnishing victims to chloroform, as if its administration were an absolute necessity. The utmost that can be said in favour of chloroform is, that a few minutes' time may be saved by its use; but with good ether, properly administered, even that small advantage is questionable. Vomiting afterward is perhaps more frequent when ether is used, but it is by no means the rule, and it does occur sometimes in using chloroform. Those who doubt whether profound anæsthesia can be easily induced and maintained by ether, must have had very little personal experience in its use. We can assure our foreign brethren that the various complicated methods proposed—of beginning with nitrous oxide gas, of supplementing the ether with chloroform, of using cumbersome inhalers—are wholly superfluous, and we recommend them to try simply an abundance of ether, and if it is of good quality they will not be disappointed with the result. The hesitating, timid method in which we have seen ether given abroad, when given at all, we suspect to be the reason why it has proved unsatisfactory on occasional trials. There is certainly some art in its proper administration."

Bloodless Surgery.

DR. CHAMPIONNIERE (*Jour. de Méd. et de Chir. Pratique*, March, '75) observes that one of the most characteristic tendencies of modern surgery is in the direction of great efforts to avoid the loss of blood during operations.

For a long time the flow of blood has been considered as a necessary thing, and as a phenomenon inherent to operations. The surgeon, doubtless, was preoccupied with not losing his patient by hæmorrhage immediately after the operation; but he was inclined to think that it was a good thing for the patient to lose blood; and we are not far from the time when, the loss of blood having been insufficient, they used to bleed the patient after the operation.

Professor Verneuil thinks that the invention of operative processes destined to avoid or to diminish the loss of blood will perhaps be the most profitable conquest of modern surgery; thus no one attaches more importance to these kinds of discoveries, no one tries to carry out more thoroughly their application.

We have frequently seen him operate, and we have heard him lecture on this subject, and we are about to try to give a rapid idea of the results he has arrived at. Thus, since we are concerned with manœuvres which are interesting to all kinds of practitioners,

we shall pass in review all the methods more or less novel suggested for some time past, and try to determine their real value.

In France, as abroad, the operation of Esmarch has for some time past made a great deal of noise. We may now say that we have applied and seen applied this method a great number of times, and that it seems fit for every-day practice. It is a good method, which we must take care not to make use of on all occasions. It may be useful to operate without the loss of a drop of blood, as in the case of certain resections; the apparatus may then be completely applied. But the tissues which have been compressed by the elastic band are perhaps apter to become gangrenous, and certainly to bleed greatly further on, or to give out a great deal of serosity, which is peculiarly unfortunate when we desire to put on a cotton apparatus. And then, the economy of blood is not very considerable. In the majority of cases, especially in amputations, there is indeed no indication for this manoeuvre, and we may be content to empty the limb of its blood by raising it up, and then apply at the root the compressing india-rubber ring.

This method, which is only a derivation from that proposed by M. Chassagnac (a large tube of india-rubber used for drainage, which surrounds the limb several times), gives an excellent compression, superior to that of the ordinary tourniquet. We have made use of it quite recently in unfavourable conditions in amputating an arm at its upper part, and the result was excellent, and such that not even an experienced assistant could have equalled.

Almost at the same time has been revived the elastic ligature, a simple procedure for avoiding bleeding, since the tissues are divided slowly by virtue of the elasticity of a loop which surrounds them. It was performed at first with very thin india-rubber tubes, then with the cords of india-rubber covered with silk, much used for ladies' dresses. This method was employed in all kinds of ways, especially by Dittel, of Austria, who is, if not the inventor, at any rate, the ardent propagator of this plan. They went so far as to amputate in this way the arm and leg.

In France this method has been employed. It has appeared slow and very painful, and erysipelatous accidents have given rise to phlegmosis, so that its efficacy is admitted only for small operations, small tumours, fistula in the anus, or for some very exceptional cases. It may, however, in the country, and whenever patients have an unconquerable objection to the knife, be a method to have recourse to. It is easily applied, since it suffices to surround the part to be cut by a loop of india-rubber. This loop is to be tightened more and more every day, according as we desire to cut quickly or slowly.

At the Société de Chirurgie, M. Verneuil has recently presented a work on Uncipressure—a new process for stilling blood, which consists in compressing in the depth of the wound by means of hooks. A short time afterwards, M. Verneuil made a long and important communication to the same society on Forcippresure. The professor thus designates the application of forceps in the wound to produce hæmostasis. Everyone employs forceps in ligaturing arteries, but it has often been proposed to leave the forceps in the wounds on any particular vessel to arrest bleeding; and M. Verneuil, after

reporting a case wherein such a practice had been useful, has given a very complete history of the operation. In this history he has shown that many surgeons had invented and reinvented forceps of more or less complicated character, with the destination of being left in the wound. He has been able in particular to show that numerous apparatus have been made to compress certain arteries which are reached or tied with difficulty, as the middle meningeal, when wounded in the operation of trephining. He showed the *serries fines* which have been invented and reinvented to stop hæmorrhage, and lastly mentioned that for a dozen years or so French or foreign surgeons have been inventing simple and complicated instruments to compress vessels during and after the operation. Within ten years he has employed a pretty great number of times what he calls necessary forcippresure—that is to say, finding difficulties in arresting a bleeding, he has applied a forceps at a point in the wound, and left it there several days. For a short time past he has generalised the employment of forceps, constantly using them during the operation, applying them on all bleeding points, then removing them and applying ligatures, or leaving the forceps in the wound.

In calling the attention of the Surgical Society to this important subject, M. Verneuil has made it his business to show that he did not put forward any pretensions to originality in it.

The Royal College of Surgeons in Ireland and Army Medical Grievances.

We believe the Council of the College will shortly come to some definite conclusion as to what action they will take upon this subject. We cannot too strongly impress upon them how important it is that any decision arrived at may be in the direction of what is for the good of all the officers, and not for the special advantage of any particular section of the department. Promotion at from twelve to fifteen years' service, the allowances and privileges of relative rank, forage, earlier and better retirements, no ambiguity in the wording of warrants, release from all unprofessional duties, complete control in military hospitals and over the men of the Army Hospital Corps, higher relative rank to the seniors of the service, and compulsory retirement at sixty years of age—which last we consider a vital point—with, for the future, a general roster and the limitation of all after appointments to meet this, appear to us the most essential requirements demanded. Pending a fair trial of the staff or unification system, we do not think it should in fairness be touched upon. On this subject we think the medical authorities can fairly claim to be the best judges.

Ashantee Honours.

In the House of Commons on April 23rd, Dr. Lush asked the Secretary of State for War whether, having regard to the fact that in the distribution of honours and rewards after the Ashantee war, combatant officers were rewarded in the proportion of one in three of those engaged, medical officers in the proportion of about one in nine, he would give some assurance to the House that in

any contemplated or fresh distribution of honours to the army such a *grave disproportion* would receive his attention with a view to its remedy.

Mr. Stanley, in the absence of the Secretary at War: Perhaps I may be allowed to answer the question. It is considered that the medical officers engaged in the Ashantee Expedition have received their full proportion of the honours and rewards bestowed on that occasion, and I am unable to hold out any definite assurance with regard to any future proceedings.

Comment upon such a reply is unnecessary. It is well known that were it not for the forethought bestowed upon the hygienic aspect of the expedition by the medical department, and the care and attention of the medical officers with the force employed, it could never have been a success. The return received appears to us something more than ingratitude.

Fearful Outbreak of Cholera.

THE *Times of India*, dated April 11, supplies the following terrible news: "Some cases of cholera among pilgrims in the city of Benares. In Oudh, a cholera panic prevails. Fearful accounts have been received from Cawnpore, Fyzabad, Jounpore, and Benares. The railway train turned out 18 corpses at Lucknow on the 8th. The Benares train, due at Lucknow on the night of the 8th, reached there on the morning of the 9th, having been delayed by frequent stoppages for the removal of the dead and dying. The grand Assoodhia Mela has been prohibited. In Lucknow, cholera cases are few, only eight deaths having taken place last week."

AN "Adulteration Act" has been passed by the Canadian Legislature, which, in its good sense, honesty, and business-like character, favourably compares with Mr. Selater-Booth's Bill for the protection of fraudulent traders. This Act differs chiefly from the corresponding Legislation in Great Britain in being initiated and executed by the Department of Inland Revenue instead of by various municipal and local authorities. This will give a consistency and uniformity of action to the proceedings, which it is expected will overcome the chief difficulties which have been experienced in its operation in Great Britain.

WE understand that Mr. Tufnell, the President of the Irish College of Surgeons, has in the press a second edition of his book on the Treatment of Internal Aneurism by the consolidation of the contents of the sac. The very remarkable case communicated this year by him to the Royal Medical and Chirurgical Society will be in the recollection of our readers.

In a recent issue of the Supplement to the MEDICAL PRESS AND CIRCULAR, which is devoted to Irish Poor-law medical affairs, we quoted *verbatim* from a local newspaper a report of proceedings of the Tralee Board of Guardians, in which it was stated that Mr. Redmond Roche, a guardian of that Union, had expressed his opinion that the medical officers should serve the summonses upon defaulters under the Compulsory Vaccination Act. Of this

proposal we expressed at the time our strong disapproval. We are informed by the solicitor for Mr. Redmond Roche that the observation attributed to him was not made by him; that "the word summonses was not even mentioned in the discussion, which referred only to noticing defaulters under the Vaccination Act to bring in their children to be vaccinated." Without in the least altering our opinion as to the insulting nature of the suggestion attributed to Mr. Roche, and without at all agreeing with him that the service of vaccination notices is a reasonable or appropriate duty for medical officers, we willingly withdraw any censure which we may have passed upon the conduct of Mr. Roche, presuming that he was inaccurately reported; and we should regret if any injustice had been done him by the publication of an incorrect statement.

Medical News.

Royal College of Physicians of London.—The following gentlemen were admitted Members of the College on April 29: Bowles, Robert Leamon, M.D. Brussels, Folkestone. Goodhart, James Frederic, M.D. Aber., 32 Finsbury Square, E.C.

Lees, David Bridge, M.B. Cam., Manchester.

Turner, Francis Charlewood, M.D. Cam., St. Thomas's Hospital, S.W.

Warwick, William Rollinson, M.D. St. And., Lambert Road, S.W.

On April 29th the following were admitted Licentiates:—

Alford, Frederick Stephen, 25 Haverstock Hill, N.W.

Barrou, Thomas Walter, Sunderland.

Boulter, Harold Baxter, St. Bartholomew's Hospital, E.C.

Bradford, Peter, University Hospital, W.C.

Brown, Walter, Tetbury, Gloucestershire.

Bull, William Henry, St. George's Hospital, S.W.

Burgess, Edward John, St. Bartholomew's Hospital, E.C.

Edwards, David, Mold.

Evans, Henry, Bramley Hill, Croydon.

Garlick, George, University Hospital, W.C.

Granger, Farington Marsden, Public Dispensary, Leeds.

Hallett, Henry Arthur, 8 Southwood Terrace, N.

Johnston, Wingate Kidd, 24 Beverley Road, S.E.

Kennedy, William Adam, Newcastle-on-Tyne.

Lathey, Arthur, Willingham, Huntingdonshire.

Morrison, Stammers, 1 Albert Square, S.W.

Smith, Charles Edwin, Royal Infirmary, Manchester.

Watts, Fred., 25 Bartholomew Close, E.C.

University of London.—At the meeting of the Senate held on Wednesday, the following were elected Examiners for 1875-76:—Practice of Medicine: Professor Wilson Fox, M.D., B.A., F.R.S., and Charles Murchison, Esq., M.D., LL.D., F.R.S. Surgery: Professor John Marshall, F.R.S., and W. S. Savory, Esq., M.B., F.R.S. Anatomy: George W. Callender, Esq., F.R.S., and Professor George Viner Ellis, F.R.C.S. Physiology, Comparative Anatomy, and Zoology: George J. Allman, Esq., M.D., LL.D., F.R.S., and Professor William Rutherford, M.D., F.R.S.E. Obstetric Medicine: J. Hall Davis, Esq., M.D., and Professor W. S. Playfair, M.D. Materia Medica and Pharmaceutical Chemistry: T. Lauder Brunton, Esq., M.D., D.Sc., C.M., F.R.S., and Professor Sydney Ringer, M.D. Forensic Medicine: Professor Arthur Gamgee, M.D., F.R.S., and Professor Henry Maudsley, M.D. *Alterations in the Regulations.*—Regulations in Medicine: The restriction on candidature for honours at the first M.B., second M.B., and B.S. examinations to candidates who have been placed in the first division at the several pass examinations has been abolished.

Royal College of Surgeons of Ireland.—The following gentlemen passed the first half of their examination for the letters testimonial at the meeting of the Court of Examiners on April 5th and following days, viz., Charles Anderson, Mathias Butler, Andrew J. Bourke, Francis V. Burton, Abraham W. Browne, Michael Callan, Patrick J. Carmody, John Chrystal, Henry Clarke, John J. Clarke, James B.

Clibborn, Thomas F. Cocran, Michael F. Cox, Thomas Cox, Wallace B. Croskerry, James M'Cumine, Thomas F. Falkiner, John W. Flood, George C. Forsyth, Kendall M. St. John Franks, Charles E. Geoghegan, John Gray, Robert C. Gunnig, Henry W. Hartford, Wm. Hedernan, John Hoey, John B. Jennings, William W. Kenny, Wm. Lee, John M'Clung, Thomas M'Evoy, Daniel Mitchell, Michael Molohan, Laurence Morris, Robert Nessbitt, Cornelius Nolan, John O'Connor, Goodwin S. O'Grady, Wm. F. O'Grady, Patrick O'Hagan, Edward D. O'Neil, Laurence O'Neil, Andrew D. Peyton, G. M. Russell, G. Searancke, R. B. Smith, Wm. B. Smith, Thomas Stanton, Reuben Turner, George D. Twigg, Edmund A. Wall, Hugh T. Warnock, George Whitaker, Charles Woods, and Alexander Going. At a meeting of the Examiners, held on the 4th April, the following gentlemen obtained certificates for proficiency in general education, viz.: First Class—John T. Thomas. Second Class—Arthur P. Harper, John Tiernan, James Barr, Charles H. Ford, and Alfred Inwood. Unclassed, arranged alphabetically—Horatio N. Atkinson, James Bolster, Michael Clery, Patrick F. Coghlan, Albert J. Duffy, John R. Elliott, Hugh Harris, John S. Hawkins, Benjamin W. Horsford, Martin J. Hughes, Thomas Kenny, Frederick W. Lewis, William J. Mackie, Robert Madders, Malcolm H. Moore, and Patrick Smith. The following gentlemen passed their final examination for the Letters Testimonial on the 19th April and following days, and having made the declaration prescribed by the charter, were admitted licentiates of the College, viz.: Andrew A. Abraham, Thomas A. Alexander, Thos. Alexander, James B. Armstrong, Geoffrey J. Bourke, Abraham W. Browne, Joseph Clarke, Alexander S. Deane, Arthur Duff, Henry G. Elliott, Robert A. Elliott, George C. Forsyth, Kendall M. St. John Franks, Patrick Gorman, John S. Hayes, Thomas G. B. Hutton, Samuel Keays, Wm. Lee, Francis J. Lynch, Hugh Mackintosh, Geoffrey M'Carthy, Owen M'Farland, Charles Nevill, George F. Nicholson, Frederick O'Connor, Henry Sampson, Charles Segrave, Edmund Tully, Frederick Tuthill, Patrick B. Walsh, Hugh T. Warnock, Patrick T. Webb, Patrick T. Whitty, and Michael Yourell.

NOTICES TO CORRESPONDENTS.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£1 2s. 6d., at the offices in London, Dublin, or Edinburgh.

HARVEIAN.—At the meeting of the Harveian Society to-morrow (Thursday) evening, at 8 p.m., Mr. Teevan will read a paper "On Urinary Affections of Children."

OBSTETRICAL.—The adjourned discussion "On the Relation of Puerperal Fever to the Infective Diseases and Pyæmia" will be resumed at the Obstetrical Society of London this evening at 8 o'clock.

DR. J. W. MARTIN shall receive the number of proofs he asks for whenever his communication appears.

DR. G. M. DICKINSON is thanked for his complimentary note.

DR. J. KENT SPENDER's communication is accepted; it will appear in an early number.

DR. COLLINS McELROY, Zanesville.—The communication to which reference is made in your note had not arrived at the time of going to press; probably it is delayed in the post, and we shall receive it before our next, when you may look for reply.

"ON GUARD."—A correspondent in India has forwarded us the last number of an excellent little magazine bearing the foregoing title. The work is devoted to the temperance cause, and contains much interesting information as to its progress amongst the various regiments quartered there. One thing is conclusively proved by reference to its pages, viz. that those who abstain from alcohol in that terrible climate are attacked less often by disease, and when attacked recover more rapidly and surely than those who imbibe. Of course some allowance must be made for the statements of its upholders; but the points to which we attach the most importance are the reports from the medical officers of the regiments, and these are invariably in favour of temperance. In the first article, "Under Canvas," we trace "our own Correspondent's" pen, although unsigned. It is crammed with jottings from every conceivable source, our only wonder being the apparent facility our Correspondent has of procuring so much and such varied information.

SUB HENRY THOMPSON.—According to the last number of the *Swiss Chronicle*, "this eminent English surgeon is promoting a 'Cremation Society,' which will arrange for the incineration of remains in the most approved manner, and will erect at a cost of about £2,500 a suitable building in which to hold religious services."

ARMY MEDICAL EXCHANGES.—In the House of Commons last Monday Mr. Hardy, in answer to Mr. O'Leary, said that in certain instances exchanges had been refused to army medical officers who had been a long time at home, and where the foreign service was disproportionately small. No reasonable application had been or was refused.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Archibald Billing, London. Dr. Lombard, Philadelphia. Dr. J. W. Lane, Bishop's Castle. Mr. Englebach, London. Mr. Starr Whitford, Brighton. Dr. Douglas, Wymondham. Dr. Waring Curran, Mansfield Woodhouse. Dr. Bathurst Woodman, Finsbury. Dr. Habershon, St. London. Dr. Johnstone, Brampton. Dr. Walker, University of St. Andrews. Mr. Teevan, London. Dr. Beale, London. Mr. J. C. Dickinson, London. Dr. Drysdale, Liverpool. Dr. Drysdale, London. Dr. Winslow, London. Dr. Beale, London. Dr. Hall, New York. Dr. Harker, Poplar. Dr. Sedgwick Saunders, London. Mr. Thompson, Liverpool. The Secretary, Medical Society of London. Dr. Carey, Meadows, Westminster. Mr. J. Horne, Scarborough. Dr. Carey, Taunton. Dr. Palfrey, London. Mr. Waren Tay, London Hospital. "Subscriber," London. Mr. Lunn, Edgbaston. Dr. T. Wilson, Silsden. Dr. Duncan, Chicago. Mr. Cuncliffe Owen, Kensington. Mr. W. B. Stott, Disley. Dr. Syson, Hartford. Dr. Martin, Forlath. Dr. Freeman, S'ho. Dr. Bayes, London. Dr. Parkinson, Burnley. Dr. Dickson, Stoke Newington. Mr. Manning, East Bergholt. Dr. Pailton, Pailton. Mr. Parker, Hamner. Mr. J. T. Jones, Corris. The Carpenter, University of London. Mr. Holden, Liverpool. The Registrar of the Royal College of Physicians of London. BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED.

The Nature and Treatment of Asiatic Cholera. By Archibald Billing, M.D. F.R.S. London: Churchill and Daldy.

Clinical Notes and Essays. By Sir James Paget. Edited by Mr. Howard Marsh. London: Longmans, Green, and Co.

Fortieth Annual Report of the British Medical Benevolent Fund.

Report upon the Sale of Food and Drugs Amended Bill. By W. Sedgwick Saunders, M.D.

Widungen: its Baths and Mineral Springs. By Chas. Harker, M.D.

Typhoid Fever: its Cause and Prevention. By Eben. Duncan, M.D.

Glasgow: James Macchese.

Chicago Medical Journal, Psychological Journal, Canada Lancet.

Boston Medical Journal, Le Progrès Médical, La France Médicale.

New York Medical Journal, Journal de Thérapeutique, Le Courrier Médical, Lyon Medical, Monthly Microscopical Journal, Pharmaco-

ceutical Journal, Allgemeine Wiener Medizinische Zeitung.

VACANCIES.

Bradmoor Criminal Lunatic Asylum. Assistant Medical Officer. Commencing salary at £200 per annum, with furnished apartments, &c. (See Advt.)

County of Tipperary Infirmary. Surgeon. Salary, £100 per annum. Applications to be lodged with the Secretary of the Committee. (See Advt.)

Bradford Infirmary. Physician. Diplomas, &c., to be sent to Secretary, 66 Market Street, Bradford.

Barnstaple Union. Medical Officer. Salary, £36, with extra fees. Applications to Mr. W. H. Toller, Barnstaple.

St. George's, Hanover Square. Dispensary Physician. Honorary Testimonials to the Secretary, 73 Park Street, W.

Salop and Montgomery Counties Lunatic Asylum. Assistant Medical Officer. Commencing salary, £100 per annum, with board, residence, &c. Applicants should address the Clerk to the Visitors, Shirehall, Shrewsbury.

Birmingham General Dispensary. Resident Surgeon. Commencing salary, £130, with board, &c. Candidates must address the Secretary.

Scarborough Dispensary. House Surgeon. Salary, £120 per annum, with residence, &c. Applications addressed to the Medical Staff.

Cambridge Sanitary Authority. Medical Officer of Health. Salary, £250. Full particulars of the Town Clerk, 60 St. Andrews Street, Cambridge.

APPOINTMENTS.

CAMPBELL, R. L., M.D., L.R.C.P.L., F.R.C.S.E., Medical Officer of Health for the Stourbridge Urban Sanitary District.

COBY, R., M.B., B.A., Assistant Obstetric Physician to St. Thomas's Hospital, vice Gervis, appointed Obstetric Physician.

GOLDING-BIRD, C. H., F.R.C.S., Assistant Surgeon to Guy's Hospital.

HOWLEY, H. G., M.S., a Surgeon to Guy's Hospital.

KESTEVY, C. R. B., M.R.C.S.E., L.R.C.P., House Surgeon to the Queen's Hospital, Birmingham.

LATIMER, H. A., M.R.C.S.E., a Medical Officer for Out-patients of the Swansea Hospital, vice Thomas, appointed a Surgeon.

LEE, P., M.R.C.S., a Surgeon Superintendent H.M.'s Government New Zealand Emigration.

LLOYD, K. M., M.R.C.S.E., Medical Officer of Health for the Holywell Urban Sanitary District.

LUCAS, R. C., B.S., Assistant Surgeon to Guy's Hospital.

LYON, R. N., L.A.H.D., Resident Medical Officer at the Coleraine Street Dispensary of the North City Sanitary District, Dublin.

MICKLEY, G., M.B., C.M., Resident Medical Superintendent of St. Luke's Hospital for Lunatics.

MILES, P. H., M.D., M.R.C.S., Surgeon to the Royal Manchester Eye Hospital.

PITT, I., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the Chilvera Cotton District of the Nuneaton Union.

SPEZBY, C., L.R.C.P.L., a Surgeon to the Northern Hospital, Liverpool.

KERRITT, E. M., B.A., B.S., Physician to the Bristol General Hospital.

THOMAS, J. W., F.C.S., Public Analyst for Pontypidd.

WALKER, J. D., L.R.C.P.Ed., L.R.C.S.Ed., L.M., Medical Officer of Health for the Fyde Rural Sanitary District.
 WATSON-PAUL, E., L.K.Q.C.P.I., M.R.C.S.E., L.M., Medical Officer for the Calde Union and Workhouse, and Medical Officer of Health and Analyst for the Rural and Urban Sanitary Districts, Calde.
 WHITWORTH, E., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the St. Agnes District of the Truro Union.

Marriages.

FALKNER-WILLIAMSON.—On the 29th ult., at the Presbyterian Church, Kingstown, Robert Falkner, M.D., L.R.C.S.I., La Vallie, Bray, to Annie, third daughter of Gerald Williamson, Cortubber House, co. Cavan.
 HILLIARD-HOULDER.—On the 29th ult., at All Saints, Henley, Surrey, Henry C. Hilliard, M.D., to Kate, younger daughter of Alfred Houlder, of the Tower, Henley, Surrey.
 M'COY-O'CALLAGHAN.—On the 24th ult., at the Cathedral, Killarney, Daniel F. M' Coy, M.D., Rathkeale, co. Limerick, to Mary Gertrude, only daughter of the late Daniel O'Callaghan, Killarney.
 WEMYSS-MARTIN.—On the 22nd ult., at Broughty-Ferry, John Wason Wemyss, M.D., to Mary, daughter of the late Andrew Martin.

Deaths.

BRENTON.—On the 25th April, at her residence, 13 Harcourt Street, Dublin, Margaret, widow of the late David Brenton, A.M., M.D.
 EVANS.—On the 20th April, D. P. Evans, M.B., of Belper, aged 53.
 FRYER.—On the 27th March, at Prospect House, Trowbridge, Thomas Fryer, M.R.C.S.E.
 GILES.—On the 17th April, at High Street, Stourbridge, Francis Giles, M.R.C.S.E., aged 55.
 GILL.—On the 24th April, at Belper, Geo. Gill, Surgeon, aged 58.
 OAKLEY.—On the 17th April, at Northampton, Charles Oakley, L.R.C.P.Ed., of Shrewsbury.
 RANKINE.—On the 21st April, at Porchester Terrace, Islington, Robert Rankine, M.R.C.S.E., aged 80.
 STURKEY.—On the 6th April, Henry G. Sturkey, L.R.C.P.Ed., of Highworth, aged 51.
 WHICHER.—On the 18th April, at Landport, Jas. Whicher, M.R.C.S.E., aged 86.
 WILLAN.—On the 17th April, at Westoe, James R. Willan, L.F.P. & S. Gias., aged 33.
 WYMAN.—On the 8th April, Geo. Wyman, M.R.C.S.E., of Alcester, aged 64.

BROADMOOR CRIMINAL LUNATIC ASYLUM.—There is at present a VACANCY at this Asylum for an ASSISTANT MEDICAL OFFICER, who must be registered under the provisions of the Medical Act of 1858, and be unmarried.

The salary commences at £200 per annum, and increases £5 annually up to £225, with furnished apartments, coal, gas, and attendance. Application to be made, in the first instance, by letter, addressed to the Medical Superintendent, Broadmoor Asylum, near Wokingham, Berks.

LECTURES ON HOMŒOPATHY, instituted by the British Homœopathic Society.—Dr. RICHARD HUGHES will deliver the next of his course of Lectures on HOMŒOPATHIC MATERIA MEDICA at the London Homœopathic Hospital to-morrow (Thursday, May 6th), at 6 p.m. Subjects: CAUSTICUM, CHAMOMILLA, CHELIDONIUM LINA, and SANTONIN.

Members of the Medical Profession admitted on presentation of address card. Medical Students can obtain admission on application to Dr. Bayes (Hon. Sec. Lectures Committee), 58 Brook Street, W.

ROYAL MEDICAL BENEVOLENT COLLEGE.—Notice is hereby given that the ANNUAL GENERAL MEETING of the GOVERNORS of the College will be held at the Office of the College, 37 Soho Square, on Wednesday, the 19th of May, at 4 o'clock precisely.

Notice is also given that the ANNUAL ELECTION of PENSIONERS and FOUNDATION SCHOLARS will take place at the Freemasons' Tavern, Great Queen Street, on Wednesday, the 26th of May, when Two Pensioners and Four Foundation Scholars will be elected. The ballot will commence at 12 o'clock and close at 3 o'clock precisely. Notice has been given to the Council that S. S. Larcombe is withdrawn as a candidate for a Foundation Scholarship.

Any Governor who may not have received the balloting-paper to which he is entitled is requested to communicate with the Secretary, at the Office of the College in Soho Square. Annual subscribers whose subscriptions are in arrear are not entitled to vote. Balloting papers are issued immediately on receipt of new subscriptions.

By order of the Council, ROBERT FREEMAN, Secretary.
 37 Soho Square, London, April 28th, 1878.

BUTLER'S MEDICAL HALL,
 53 & 54 LOWER SACKVILLE STREET,
 DUBLIN.

ESTABLISHED A.D. 1817,

For Compounding Prescriptions and Supplying Genuine Medicines, is conducted, as formerly, under the careful superintendence of
 WILLIAM STARKEY, M.D.,
 Licentiate Apothecary.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE,

50 LINCOLN'S INN FIELDS, W.C.

J. BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.,
 &c. (KING'S COLL.), and Author of VIA MEDICA.

Has always upon his books a large number of desirable Investments and available Appointments for negotiation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

PRACTICES AND PARTNERSHIPS NOW OPEN for Negotiation (in addition to those advertised in Dr. Langley's List, which is sent post free on application).

Z 167. Within 50 miles of London, a GOOD FAMILY PRACTICE, average nearly £900 a year. The connection is increasing. The district is richly agricultural, and there is little opposition. Convenient house, &c., at a moderate rent.

Z 100. WEST OF ENGLAND. For immediate disposal, under very favourable circumstances, a well-established PRACTICE of £500 a year. Appointments, £200. The practice is situate in a sea-side town, frequented as a watering-place. House contains 12 rooms, with conservatory, &c. Rent, £35. Population, 7000. Only one resident opponent. Part of the premium may be paid by instalments.

Z 168. DEATH VACANCY. In a prosperous town, containing about 10,000 inhabitants, and within 4 hours of London by direct rail. The connection is first-class, and the receipts are estimated to have been over £1,400 a year. A very efficient introduction can be given, and liberal terms would be conceded to a doubly-qualified gentleman accustomed to good society.

Z 166. PARTNERSHIP. In a pleasant town near a main line of railway, and within 60 miles of the metropolis, a senior partner's share (two-thirds) in a PRACTICE realising £1,500 a year is for sale. Patients of the very best class. By the co-operation of a suitable gentleman the receipts could be increased to £2000 a year. The residence is large, and fitted with every convenience suitable for the reception of resident patients; but a smaller house can be had if desired.

Z 165. CHANNEL ISLANDS. A well-established PRACTICE in a favourite locality, realising £500 a year. Easily worked appointments, £85. Great scope for increase. The residence is well situate, with stabling, garden, &c.

Z 164. SPECIALITY. LONDON, W. A fourth share in a first-class PRACTICE for disposal. Average income, £2,400 a year. Books open to full investigation. No gentleman need negotiate unless he is in possession of at least £1000.

Z 163. £800 A YEAR. In a town containing 15,000 inhabitants, with great scope for increase in the practice. Appointments yield upwards of £300 a year. The house is situate in the best part of the town, with good garden, &c. Rent, £50. Partnership introduction if desired.

Z 162. PARTNERSHIP in a first-class PRACTICE in a delightful part of the West of England. Receipts, £1,250 a year. Appointments, £300. Patients good class. Expenses light. The junior partner could secure a very comfortable residence. Rent, £38. A third or fourth share may be taken at first. Terms, two years' purchase.

Z 161. BAYSWATER. Excellent nucleus for transfer. Receipts, upwards of £300 a year. Midwifery from 1 to 5 guineas. Convenient house, well situate. Rent, £65.

The Medical Press & Circular.

ON THE SCIENTIFIC AND EMPIRICAL INVESTIGATION OF EPILEPSIES.

By J. HUGHLINGS JACKSON, M.D., F.R.C.P.,
Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

CHAPTER V.

PHYSIOLOGY OF EPILEPSY.

PHYSIOLOGY has to do with the dynamics of the nervous system, with the conditions for and modes of activity (discharge) of arrangements of nerve cells and fibres. It deals with the function of nerve tissue. The function of nerve tissue in health is to store up and to expend force. This twofold definition is true of all organic matter, but it is strikingly true of nerve tissue. Nerve tissue, by continuous nutrition, stores up force, and in healthy operations gives it out ("discharges") on certain definite provocations. This applies to nervous processes of all nervous centres, to those of the spinal cord, ciliary ganglion, and to the highest processes of the cerebral hemisphere.

In every movement, and also in every thought, there is a central nervous discharge. (a)

In this book the word "Physiological" is used for the two abnormalities in this healthy function of nerve tissue—

(a) The movement and thought are not of course the things comparable. In both there is discharge of nervous processes, and in all centres the nervous processes represent impressions and movements. The comparison is betwixt enervising of centres of higher and lower degrees of evolution. It is betwixt active states of nervous processes which form the anatomical substrata of mind, and active states of nervous processes of other and lower centres which (that is, as commonly supposed) have no mental

viz., for loss of its function and for over-function. (a) These are our two classes of functional changes already referred to in Chapter IV. In the first class of functional changes nerve tissue is frequently actually destroyed, as when it is broken up by a clot; but at any rate its function is lost, it cannot discharge at all. In the second class nerve tissue is unstable, it discharges too much; moreover, it discharges on slight provocation. The nerve tissue is of high tension, and also of very unstable equilibrium, or shortly, it is unstable.

There are what I call "destroying lesions" and "discharging lesions." It matters nothing for the definition how the destruction or the instability be brought about—by what abnormal nutritive processes. These are important questions in pathology, not questions in physiology at all. Let us first illustrate the difference betwixt physiology and pathology by a case of loss of function, as this is the simpler of the two classes. Destruction (or more generally speaking, destruction of function) of nerve tissue may be the result of softening from blocking of an artery, of tearing up by blood clot, of slow wasting (as in spinal amaurosis). Then it must not be forgotten that it may be the result of a strong discharge, as in cases of paralysis (b) after convulsion (epileptic hemiplegia, for

(a) The following quotation from Reynolds' (Epilepsy) is important in many ways:—

"Vital processes are necessarily correlated with physical change; neither ever occurs without the other. Hence so-called functional derangements imply the existence of modifications in the interstitial processes of the organs. Coarse lesions are, then, the remote causes of many symptoms, and that which intervenes between the two is minute nutritive change, which may or may not affect textural integrity.

"1. Negative symptoms, or the simple absence of function, may be occasioned directly by solution of continuity in portions of the body.

"2. Positive symptoms, such as excess or perversion of action, always depend directly upon minute interstitial change, which may be all that exists or may be induced by some perceptible lesion."

(b) As implied in the text, one does not mean necessarily either physical destruction of fibres and cells, or permanent loss of function of them; what is essential is loss of function, however caused.

example); here there is loss of function from exhaustion of nerve tissue.

Next as to over-function, or instability. It may, I believe, be produced by hyperæmia consequent on blocking of vessels, by the irritation of tumours, and doubtless in many other ways. I repeat, the mode of production of functional changes is a question in pathology. The most striking case, showing the difference betwixt physiology and pathology, is tumour with convulsion. No one can suppose that a tumour discharges. When we say that a tumour "causes" convulsion, the only meaning the expression can have is that the tumour *leads* to instability of grey matter, which forms part of sensori-motor processes representing movements. The discharge causing the convulsion is of this unstable grey matter.

We shall see in the next chapter that there are good grounds for the belief, that whilst loss and excess of function depend on abnormalities of nerve tissue, the pathological processes by which those abnormalities are caused *begin* in the non-nervous elements of nervous organs.

We have, of course, in a work on Epilepsy, to do more particularly with the second division of functional changes—with instability permitting abnormal nervous discharges. I must, however, say, explicitly as well as implicitly, before I go farther, that I do not use the word "functional" in senses in which it is frequently used.

The word Functional is sometimes used as a name for "minute" changes, or for those the existence of which we can only infer because nervous symptoms are present, but which we do not expect to discover *post mortem*. For instance, it is said that epilepsy and chorea are functional diseases, it being meant that the changes on which the symptoms in these two affections depend are so slight that they do not involve actual alterations of structure. It is thus a term for the neuroses. The neuroses are often spoken of as "functional diseases." This is, I think, an inconvenient way of using the word. The real meaning in this application is little more than that the morbid changes in the nervous organs are as yet undiscovered. In the second class of what I shall call functional changes—instability—the changes are slight, *i.e.*, not easily discoverable *post mortem*, if at all; but their slightness is no essential part of the definition to be given. What is essential is that the changes are of over-function (instability), or in other words, "discharging lesions." Again, it has been pointed out that the first class of changes *may* be minute or undiscoverable, as for example, when temporary hemiplegia results from temporary exhaustion of nerve-fibres by the strong discharge in a convulsion. But the essential matter here also is that there is loss of function, not that there is slightness of change.

The term functional is often used more loosely still. Thus, when a patient has a transient and imperfect paralysis—for instance, slight hemiplegia, lasting a day or two, or a few hours only—the internal changes on which it depends may be declared to be functional, *i.e.*, in the sense of slight change, *simply because the external symptom presented was a slight and transitory one*. There are several reasons why this error should be pointed out, for an error it most decidedly is. The slightness and transientness of a paralytic symptom depend on the slight *extent* of lesions of nervous organs, not on slight *degree* of change. If there be a very limited lesion, even if nerve tissue be actually destroyed, smashed up by clot, for example, the patient will recover quickly; and his recovery does not always follow, if indeed it ever does, because the damage to the motor tract is repaired. It is often irreparable. He recovers simply because he has lost only a *small quantity* of that tract. For it is manifest to those who make post-mortem examinations that recovery from paralysis occurs where a part of the motor tract is *permanently wanting*. They find gaps in the motor tract of those who died free from obvious (a) paralysis. The recognition of this fact is important in many ways for a clear knowledge of epilepsy.

(a) Nor will this be strange to those clinical observers who do not make post-mortem examinations if they consider the facts

Recoverability from paralysis is chiefly a question of the *size* of the lesion—I mean of the quantity of nerve tissue destroyed. As lesions differ in size in all degrees—there are, for example, lesions produced by clots from the size of a pea to that of a hen's egg—there are all degrees of paralysis, and many degrees of recoverability. There is no need to explain a transient paralysis by a slightly altered *state* of nerve tissue. As a mere matter of fact, transientness of paralysis cannot be taken as evidence that nervous *structure* has not been permanently destroyed, and here I mean destroyed physically, broken up. (a)

That parts of the cerebral hemisphere may be destroyed when there are no obvious or striking symptoms has long been well known. But it is so of the motor tract also. I shall have again to insist on this class of facts. They are of very great importance. They are most striking as illustrating what I call the Principle of Compensation. (See Chap. I., Pt. 2, and later on in this chapter.)

The distinction of functional changes in two divisions is at the very bottom of methodical classification of nervous diseases; it is so important that I here give a striking illustration of a way in which confusion results from ignoring it.

The term disorder of co-ordination is frequently used; but it is applied to diseases which are fundamentally different; for example, it is applied to chorea and to locomotor ataxy. Of course, both these *are* disorders of co-ordination; but the term is used without qualification, and this leads to the two different, indeed opposite, states being considered as alike in their physiological or functional causation. Chorea and locomotor ataxy are not only unlike in that different parts of the body are affected, but unlike in the functional affection. In the former there is "over-function;" in the latter there is loss of function. In view of the active motor disorder of the ataxic patient, the statement that there is loss of function of the nervous centres for locomotion seems, at first glance, absurd. But is there not wasting of nerve fibres in the posterior column of the cord? And what could this "cause?" It would "cause" nothing active. It could not "cause" the disorderly gait—in fact, it could "cause" nothing. The disorder of co-ordination in locomotor ataxy and in some other affections is owing to a double difficulty consequent on *loss* of function of nerve tissue; there is really paralysis. There is (1) over-estimate of a movement intended to be executed by the centre diseased, but not accomplished, and (2) by healthy centres, increased action of associated movements in accordance with the over-estimate. But in chorea there are morbid *discharges*; there is the very opposite condition of nerve tissue—*viz.*, that of over-function. So, then, in the one disorder of co-ordination there is a destroying lesion (loss of function), in the other disorder of co-ordination, a discharging lesion (over-function). The explanation given of the disorder of co-ordination in locomotor ataxy applies *mutatis mutandis* to the reel from disease of the cerebellum. (b)

bearing on the plan of structure of nervous organs, and that when recovery follows in a case of paralysis it observes a particular order—it is from that of the more automatic parts to that of the most voluntary.

(a) Paralysis after convulsion is often transitory, and is so because the nerve tissue affected is only exhausted, not broken up. But here, again, mistakes are made. It is sometimes said of such cases, "There can be no organic disease, because the paralysis passed off very rapidly." Now, as a mere matter of fact, these are the very cases in many of which one would really expect to find a tumour. It is true that the tumour acts very indirectly in causing paralysis. The tumour leads to instability of grey matter. There is a violent discharge through the corpus striatum, which causes convulsion. After the convulsion there is hemiplegia as a result of exhaustion of the corpus striatum by the violent discharge.

(b) The following is a quotation from the *Mirror of the Lancet*, January 30, 1875:—

"At first glance it seems absurd to speak of there being loss of power in locomotor ataxy, at any rate in an early stage of this disease. The patient has great power in his legs. Dr. Hughlings Jackson believes that there is paresis, and this only of certain

We must now consider the healthy function of the two elements of nerve tissue in order to have clear ideas of the two abnormalities of function we are speaking about. There are ganglion cells and nerve fibres. The cells store up force and discharge. The nerve fibres carry the current, and provoke discharge. (a) Correspondingly there are such symptoms as palsy and anaesthesia from destruction of fibres, and there are spasm, neuralgia, &c., from instability of cells. (b) We shall see in the chapter on Pathology that there are notable differences in the blood supply of grey and white matter—differences in their vascular condition corresponding to differences in their function. It is obvious enough that this separation of duty is to some extent artificial, for the cell is not only a mass of "explosive" matter, but also a connecting link betwixt nerves. It is not only a generator, but a conductor of nerve force. As Spencer says, the "centres in which molecular motion is liberated are also the centres in which it is co-ordinated." Similarly, as the axis cylinder of the nerve is composed of matter similar to that of the cell, we may suppose that it also stores up and expends force. It must perhaps, therefore, be admitted that instability of the axis cylinders of fibres will produce some over-function, and that destruction of the cells will produce some loss of function. But it is not likely that instability of the axis cylinder would produce such excessive discharges as occur in convulsion, chorea, and neuralgia, and it is not likely that destruction of grey matter, unless very widespread, would produce such paralysis as occurs in hemiplegia. (c)

highly special movements. As a centre (the posterior column of the cord) is affected, there could not be loss of power in single muscles or groups of muscles, but loss or defect in movements, in which several muscles co-operate. Dr. Hughlings Jackson believes that the first movement to fail in cases of locomotor ataxy is that in which the peroneus longus is the muscle chiefly concerned. In other words, there is weakening of that most important locomotor movement which serves in throwing the body over on to the other foot, pivoting on the ball of the great toe. But by this the erratic gait of ataxy is not explained. We can, however, show that from local palsy or paresis we get secondary effects; it is here that we get the explanation. To show this, we must take a simple case from another department of clinical medicine—from ophthalmology.

"In a case of paresis of the external rectus we find more than diplopia. The patient's giddiness and reeling gait are not due, as is commonly supposed, to double vision. There is, from an attempted but not accomplished movement of the eyeball, erroneous estimation of the position of objects. This is because, to use metaphorical language, the mind judges, not by the ocular movement accomplished, but by the effort to move the eyeball—judges, to use an expression of Bain's, by the "outgoing current." We note next that the strong attempt to move the paralysed or weakened external rectus leads to over-movement of an associated muscle—viz., of the internal rectus of the healthy eye; there is "secondary deviation" of that eye. Applying the principle to locomotor ataxy, we should say that there is a double difficulty to be considered in the patient's walk—erroneous estimate of the locomotor movement intended and over-action of associated movements.

"In an early stage of locomotor ataxy these ill-consequences can, whilst the eyes are open, be partly corrected by great voluntary effort, by stiffening the back and certain parts of the legs, by throwing out the arms, &c."

(a) Of course such expressions as "store up force," "carry the current," &c., are used conventionally. I have no theory as to "nerve force," or force of any kind.

(b) Let us give examples from particular motor symptoms. In the first division there is hemiplegia, reeling gait (from disease of the cerebellum causing paresis of the muscles of the spine), locomotor ataxy, loss of consciousness (or defect of consciousness in chronic insanity, for example), &c. In the second division there is hemi-chorea, hemi-spasm, and, as I would call them, hemikinases generally, tetanus (due to discharge of those processes in the cerebellum, which, in the reeling gait, are paralysed or paresed). In every member of each division the condition of nerve tissue is the same.

(c) We have already spoken of certain disorders of co-ordination (the cerebellar reel and the erratic gait of locomotor ataxy), which, being erroneously compared to chorea, may be erroneously supposed to depend on discharging lesions. They are really palsies, and depend on destroying lesions. But such disorders as the agitation in paralysis agitans, the tremor of sclerosis, and the irregular movements of the arms and hands of some ataxic patients, and some cases of chorea-like movements after hemiplegia are really, I think, essentially palsies too.

The distinction we have made, that loss of function is an affection of fibres and over-function of cells, is not absolutely correct; but it represents extreme degrees of difference, and may be taken as sufficiently correct for practical purposes.

I confess that I used to consider the two functional states of nerve tissue to be degrees of but one condition. I now see that this was a great blunder; they are diametrically opposite states. One reason I had for erroneously thinking so was that paralysis is frequently associated with convulsion. This association must have arrested the attention of every clinical observer. I will state some of the facts of it. Hemiplegia is not unfrequently found after convulsions beginning on one side of the body; it is the epileptic hemiplegia of Dr. Todd. (I now explain this remarkable sequence, as I have many times said, by the supposition that the paralysis depends on exhaustion of the corpus striatum by the strong discharge of convolutions in the fit.) But far more remarkable, there is occasionally hemiplegia (usually imperfect hemiplegia) before the first convulsion. When the attack is on, we see that those very parts which have been paralysed are those which are first and most convulsed. This puzzles some students. They think it impossible that paralysed parts should be the very ones which are "picked out" for spasm; and in trying to "remember" on which side a patient was convulsed, a student will occasionally really infer the side convulsed, as is shown by his saying, for example, "It must have been his left side, because his right side was paralysed." Were he to trust inferences, a good clinician would draw the very opposite conclusion.

I used, as above mentioned, to explain the association of palsy and spasm by the notion that the condition of nerve tissue which caused the paralysis was a more extreme degree of the same condition as that which caused the spasm. Now I think the two conditions are opposite. A satisfactory explanation can be given of the co-existence of palsy and spasm—I mean of parts permanently paralysed, being subject to occasional spasm.

Anticipating the chapter on the Principle of Compensation, I will now try to explain how it is that symptoms of loss of function and of over-function of the same external part can co-exist. Some parts of the nervous centre concerned have lost function, whilst other parts of the same centre have over-function. Unfortunately, a further digression is required to make this statement clear. We have to answer the following question: How can loss of function of one part of the corpus striatum cause palsy of muscles of one side of the body, whilst over-function of another part of the same nervous centre is causing a mobile condition of the very same muscles? Putting the question more concretely—How is it that destruction of one part of the centre causes permanent paralysis of the face, arm, and leg, whilst instability of another part of that (a) centre causes occasional convulsion of the paralysed face, arm, and leg? The reply is—1st. That the corpus striatum does not, as the question assumes, represent the muscles of the face, arm, and leg, but movements of these parts in which movements the muscles serve in all degrees and combinations; speaking metaphorically, it represents, not notes, but chords. 2nd. That each part of the corpus striatum contains nervous processes for movements of the whole of the face, arm, and leg. This second remark needs amplification and illustration.

Suppose the corpus striatum be divided into three parts from front to back, A B C. Symbolising the parts of the external region as x y and z , we say that A represents them as $x^2 y^2 z^2$, B as $x^2 y^3 z$, C as $x y^2 z^3$. (b) Each third repre-

(a) I believe the correct statement is that the convulsion results from discharge of convolutions near to the corpus striatum, the current developed passing through the corpus striatum. But for purposes of illustration the statement in the text suffices.

(b) Of course the representation is infinitely more complex; and of course I am not bound by the mere words of an illustration chosen for its simplicity, as, for example, when I speak of destruction of one-third of the corpus striatum causing only weakness of the external parts.

sents the whole region, but represents it differently. So, then, if A be destroyed, the face, arm, and leg are weakened; if B be destroyed, the face, arm, and leg are weakened; if C be destroyed, the face, arm, and leg are weakened. (a) From destruction of a third there is only weakening, because the remaining two-thirds represent the same muscles, although they represent different movements of them. (b)

There is not absolute paralysis of part of the external region from lesion of any one of the three; for example, not paralysis of the face only when A is destroyed, nor of the arm only when B is destroyed, nor of the leg only when C is destroyed. From partial destruction of the centre there is not "paralysis of parts" of the region, but "partial paralysis" throughout the region. We infer, then, that each of the three divisions A B C contains movements for the whole region. Or, leaving this clumsy and yet convenient illustration, we may say that the corpus striatum is a mass of nerve units, a mass of little corpora striata, each one of which represents movements of the whole region, the face, arm, and leg. We thus understand that loss of function of a certain number of these units may be causing partial palsy of the face, arm, and leg, whilst occasional discharge of other unstable units may cause abnormal movements of the very same external parts.

(To be continued.)

CROTON CHLORAL HYDRATE: ITS MODE OF ADMINISTRATION, THERAPEUTIC EFFECTS, AND ACTION.

By J. C. OGILVIE WILL, M.D.,

Assistant-Surgeon Aberdeen Royal Infirmary.

HAVING for the past twelve months used croton chloral extensively, having found it extremely beneficial in some forms of disease, and believing that it has not received that attention from the members of the medical profession which the success of chloral hydrate would have naturally been expected to ensure for it, and which it also—standing on its own merits—most certainly deserves, I am anxious to lay before them the particulars of a few of the cases in which I have employed it, in the hope that they may consider them sufficiently successful to warrant their according it a trial.

Before doing so I may explain the composition of the preparation of croton chloral which I now generally prescribe. Messrs. Reid and Son, chemists in this city, made a very nice syrup for me containing two grains of croton chloral to a drachm of a mixture of glycerine and syrup of orange flowers, coloured by adding a very minute quantity of tincture of cochineal. This effectually conceals the taste of the drug, which is certainly to be desired, as it seems to me decidedly unpleasant, and when taken without some flavouring agent it leaves a disagreeable, semi-acid taste in the mouth for a considerable period after swallowing it. This preparation is permanent, a matter of considerable moment, as croton chloral, though rather freely soluble in warm fluids, is only sparingly so in cold, and when first employing it I was disappointed to find that a mixture which was perfectly clear when first made, soon after became clouded, and threw down a copious deposit of crystals on becoming quite cold. It is, as stated by Wallich (a) and Diehl, (b) freely soluble in alcohol, and a strong tincture can thus be prepared;

(a) If a very small part were destroyed, there would be no permanent palsy, because the undamaged remainder of the centre would suffice for the movements which should be represented by the part destroyed. Hence the use of the word Compensation. The Compensation is never absolute.

(b) Here, again, the illustration is not to be taken literally; it is only an illustration. There are, no doubt, all shades of highly compound movements represented in the corpus striatum and thalamus opticus, from such as those in which the arm is much used and the leg scarcely at all, to movements in which the leg is very much used and the arm scarcely at all.

(a) *Lancet*, April 18, 1874.

(b) *American Practitioner*, 1874.

but, unfortunately, on the addition of water separation soon takes place, the liquid first presenting an oily-like appearance, and soon after depositing crystals. Therefore, if a strong spirituous solution is prescribed directions must be given that water in the proportion of at least a drachm to each two grains of the croton chloral should be added before the dose is taken, else the changes I have indicated will ensue, and some of the crystals are pretty sure to adhere to the spoon or glass, or to remain in the patient's mouth, an occurrence certainly not desirable, as the taste of pure croton chloral is far from agreeable.

CASE 1.—Mrs. T., æt. 30, suffering from severe facial neuralgia, occurring every night about ten o'clock, was ordered three grains of croton chloral; half an hour after the pain disappeared, and she slept well, which she had not done for some nights before. On the four following nights the pain recurred at the same hour; three grains again taken, with similar effect. On the sixth night pain not nearly so severe. On the seventh still less so, after which it did not return. On asking the patient if the mixture made her sleepy, she replied, "No, the pain left me, and then I soon went to sleep." At the time when this statement was made to me I had not seen Liebreich's (a) paper on Croton Chloral, but I have since found that it is in accordance with his experience, viz.—"that in some cases of tic douloureux the remarkable phenomenon is exhibited that pain ceases before sleep sets in."

CASE 2.—Mrs. S., æt. 43, a somewhat hysterical female, suffering from supra-orbital neuralgia, appearing every night about eleven o'clock. To take 2½ grains on appearance of pain, to be repeated in two hours if necessary. Soon after the first dose pain abated considerably; after the second it disappeared entirely, and did not return for some nights; when it did, the medicine again acted as on the former occasion.

CASE 3.—Mrs. W., æt. 31, had been for some days attacked by intense pain in her right temple, commencing soon after she arose from bed, and continuing with more or less severity during the greater part of each day. When I was called to her it was more severe than it had ever been before. She was directed to take 3 grains every second hour till relieved. Six grains sufficed, and when I visited her on the forenoon of the following day she was quite free from pain, and said that soon after the second dose she felt so well that she had been able to serve her customers "just as if nothing had ever been the matter." In this case the truth of Liebreich's statement already alluded to was well affirmed.

CASE 4.—S. M., æt. 5. Mrs. M., the mother of this child, stated that about seven o'clock of the evenings of the four preceding days the child complained of great pain in the left side of her head, that from that hour it gradually increased, the child becoming so much excited that she feared a fit would ensue. Ordered 40 drops of the syrup on the appearance of pain, to be repeated every half hour till relieved. Two doses sufficed, and the child went to sleep. Quinine to be given twice a day. The syrup was given for five days, and was not afterwards required.

CASE 5.—Mrs. H., æt. 25, facial neuralgia, pain occurring about eleven a.m., very severe. Ordered a teaspoonful of the syrup every half hour. After three teaspoonfuls pain ceased, but recurred at same time next day, when three doses were taken with a like result. Prescribed 4 grains of quinine twice a day, and syrup if required. During two following days it was required, but a smaller quantity proved sufficient, and after that, as the pain was only slight, the syrup was discontinued.

I might multiply examples of the efficiency of croton chloral in relieving neuralgia of the face and head, but I must content myself with the foregoing typical cases. In many cases it is necessary to administer quinine or phosphorus for the cure of the disease, the croton chloral being given merely to relieve the pain; but this is surely of itself a sufficient reason for its exhibition. The largest

(a) *British Medical Journal*, December 20, 1873.

quantity I have found necessary was 14 grains, taken in two hours; generally a very much smaller quantity has been all sufficient, and I agree with the opinion expressed by Dr. Burney Yeo, (a) that small frequently repeated doses is the best mode of administering it, and with this view I would suggest a teaspoonful of the syrup every half-hour till the pain disappears. Were this not found rapid enough, a larger quantity should be prescribed on the next reappearance of pain.

CASE 6.—A weakly old man was nearly every night tormented for some hours by insufferable pain along the course of the right ulnar nerve, most marked at the elbow. Ordered 3 grains of croton chloral, to be repeated in an hour. Pain somewhat subsided after second dose, but not sufficient to permit of sleep. Dose increased to 5 grains, to be repeated in an hour: pain much less after first, and disappeared completely a short time after second dose. On following nights 5 grains sometimes answered; on others 10 grains were needed. The man stated that after taking the medicine it seemed to him as if "a fight was taking place between the medicine and the pain, but that the medicine always obtained the victory," and that he did not experience any of the disagreeable effects on the following mornings which he had before been subjected to after taking opium.

CASE 7.—Mrs. W., æt. 70, a person whom I had some years before attended when suffering from sciatica, had been attacked between nine and ten o'clock on each of the three previous nights by excruciating pain, commencing on the outer side of her left foot, and extending up her leg and thigh. The pain lasted for three or four hours, and then gradually left; it was so severe that she, though well accustomed to suffering, was unable to repress her feelings, and gave vent to them in loud cries. Ordered 2 grains, to be repeated in two hours; no effect. Next night, 5 grains on appearance of pain; relief soon followed, and the patient slept soundly. On the three following nights the pain was bearable, so the medicine was not taken, but after this the pain again appeared, and a 6-grain dose was taken, and soon after its reception it was quite allayed. Before I saw the patient she had taken a large dose of a mixture of chloral hydrate and bromide of potassium, which I had on a former occasion ordered for her, but without the slightest benefit.

I may here mention that in lumbago I have twice prescribed croton chloral, but it proved useless in both.

CASE 8.—A stout, robust man, suffering great agony during the passage of a renal calculus, received great relief from croton chloral, which was substituted for opium, which he had been taking, and he was rendered comparatively easy by being kept under its influence until the calculus reached the bladder.

CASE 9.—M. B., æt. 4. Whooping-cough. Mother said that she had been obliged to rise and attend to her "nearly every half-hour" during the previous night, on account of the frequency and severity of the fits. Ordered 15 m. of syrup at eleven o'clock: child passed a fair night; fits frequent, but not nearly so much so as on previous night, and much less severe. Cough returned with former severity at six a.m. Next night, 15 m.: child slept for three hours; after that cough exceedingly frequent, but spasm somewhat lessened. Next night, 15 m. three times during night: slept well; little cough. The same treatment was continued, with the addition of 8 m. occasionally during the day, and the cough steadily decreased.

CASE 10.—M. D., æt. 5. Whooping cough. Paroxysms exceedingly frequent and severe, especially during the first hours of night. 20 m. of syrup at bed-time. Attacks reduced to half the number of former night; child slept well, though wakened occasionally by the cough; but she always fell asleep on cessation of fits of coughing, which she had not done before, as the spasms, from their severity, rendered her excited and wakeful. This case went on much as M. B.'s. The diminution of the spasm was well marked from the first night the syrup was given. In

other cases of whooping-cough where I have employed croton chloral I have had results similar to those above narrated.

CASE 11.—Mrs. S., an elderly lady, the subject of a slight attack of pleuritis, took 3 grains every fourth hour, with a double dose at night, and expressed herself as much relieved, the cough being less troublesome, while under the influence of the croton chloral, and after the 6-grain dose at bed-time she slept quietly till five a.m., coughing occasionally, but dropping off to sleep immediately afterwards. The medicine was continued for five days, when it was discontinued during the day, but the nightly draught was still administered, by which a quiet night was insured, though the patient was much troubled by dreams.

In the night-cough of phthisis I have found much benefit from the use of croton chloral. The following is a typical case:—

CASE 12.—S. W., æt. 33, complaining of distressing paroxysms of coughing, generally appearing in the early hours of the morning, and continuing with such severity that he never went to sleep after it fairly commenced. Ordered a teaspoonful of the syrup every morning. He called three days after to tell me that the cough had been much lessened, and that he had slept throughout the morning. This patient has now taken the syrup for several months, sometimes one, sometimes two teaspoonfuls, and he says he always derives benefit from its use. I have another case of the same nature under my care, and he has now taken the syrup for ten weeks with marked effect.

In the description of the foregoing cases I have endeavoured to state as concisely as possible the effects following the administration of croton chloral when given for the relief of pain; I have therefore purposely omitted the other remedial measures adopted. In the cases of whooping-cough no other treatment was employed.

Mode of Action.—Engel (a) states that under the influence of caustic potash croton chloral breaks up into allyl-chloroform and formiate of potassium, but that allyl-chloroform is extremely unstable, and decomposes rapidly into hydrochloric acid and bichlorallylene, and that the hypnotism induced after the ingestion of croton chloral is due to the product last mentioned. Liebreich also expressed his conviction that, unless when very large doses of croton chloral were given, its hypnotic effects were due to the influence of bichlorallylene. The potash necessary for effecting the decomposition of croton chloral after it has entered the system is probably obtained at the expense of the alkali of the albuminous substances of the body. This view was brought forward by Liebreich, and more recently by Personne (b) before the Paris Academy of Sciences, as the source whence the alkali required for the decomposition of ordinary chloral is got, and, though the products of decomposition of chloral hydrate and croton chloral differ, the origin of the material required is in all likelihood the same. Further, regarding the effects observed after the administration of croton chloral, Engel points out the similarity of results in the experiments conducted by Liebreich with bichlorallylene to those seen after the use of croton chloral, and this he brings forward as an additional proof of the correctness of his inferences; and he also states that, comparing the effects of chloroform and chloral on the one hand, and bichloride of ethylene and bichlorallylene on the other, he considers himself justified in asserting that, while the trichlorinated substances act upon the brain, spinal cord, and heart, the bichlorinated substances act only on the brain and spinal cord. Liebreich's statement "that croton chloral rapidly produces slumber similarly to ordinary chloral, but without its use being followed, as in the case of the latter, by lowering of the pulse and respiration," is strong testimony in favour of Engel's views. If these conclusions be correct—and, coming from those

(a) *Lancet*, January 31, 1874.

who have so carefully investigated the action of this drug, one can hardly but accept them—a wide field, in which other hypnotics are inadmissible, is opened up where croton chloral may be with safety and advantage employed. I may add that I can, from my own observations, substantiate the correctness of Liebreich's statement regarding the pulse and respiration.

In conclusion, I may state my decided conviction that, of all hypnotics, croton chloral has the least troublesome sequelæ.

INDIAN MEDICAL NOTES—XXXVI.

(FROM OUR SPECIAL CORRESPONDENT.)

DELHI, *March*, 1875.

AT DELHI AGAIN.

WEDNESDAY, March 17th, 1875, will be noted in the future annals of Delhi, for at eight in the morning the railway brought the Viceroy of India from Calcutta, the royal salute of twenty-one guns thundering from the palace of the great Moguls. As the smoke issued from the red gingerbread battlements, his Excellency, seated in a howdah (apparently of burnished silver, ornamented with gilt coronets and red velvet, placed on a gigantic elephant caparisoned with cloth of gold), commenced to pass through the city in a procession of elephants, with cavalry, artillery, and attended by the Lieutenant-Governor of the Punjab, Government officers, chiefs of the Punjab and Rajpootana. Delhi probably never looked better, what with triumphal arches, paint, green gardens, well-watered streets, superhuman sanitation; but a shower of rain dimmed the gay uniforms, tarnished the harness, perhaps let loose the dogs of war called pestilence. Our camp, nearly three miles distant from the city, not far from the Ridge, includes the Rifle Brigade from Umballa, the little force having the honour of being the personal escort—all very proud of it—though the sun's heat of 98° in tents at the present moment tries Tupman, whilst Croaker maunders about ophthalmia, diarrhoea, boils, and flies, longs for cool clothes, cooling appliances, and fondly yearns for Cashmere or Simla. Delhi has already been alluded to. The procession around the Jumma Musjid, down the silver street, past the clock and institute, then out by the Lahore gate, attracted myriads of natives, including women and children on the house-tops, many gaily dressed, the boys in smartest of tinsel. A hospital for women bore Scriptural devices, certain shops animated with the best intentions displayed looking-glasses, portraits of Moguls, pictures of all sorts, from sacred to profane, from Daniel in the den of lions to beauties in the ballet. In addition to the 33rd Native Infantry, the 55th kept a portion of the ground, besides forming a guard of honour at a point where the elephants marched past the Viceroy. Most of the men looked very healthy, very many wore good conduct badges, all were smart in spite of teetotal principles, and as their band played the National Anthem, the guard of honour presenting arms, the Viceroy took up his position, whilst rajahs, maharajahs, nawabs, sirdars, political agents, commissioners, secretaries, judges, passed by, each on smart elephants, who raise their trunks. Puttiala, Bhawalpore, Iheend, Bhuotpore, Ulwar, Kerowlie, and many other native potentates each stood up respectfully to salute the Viceroy, who wore court dress and a blue riband, probably the Star of India. Some of the European officials were in military or diplomatic uniform, or else in evening dress—claw-hammer tail coat, white gloves, and ties, the civilians taking off their hats at the saluting point. Some elephants go easy, others wabble, involving clinging to the paddle-box; the trumpeting frightens horses. Certain trappings were very gorgeous—the cloth of gold elaborately worked, the shades of light blue, purple, green, and black devices so harmoniously blended; the long pendant earrings, the crupper, a series of bright gold bosses, the howdahs, some resembling sleighs, others more like silver side-dishes,

the silver shields on the elephants' heads, consisting of dazzling bright plates surrounded by filagree work surmounted by gold peacocks, all attracted attention. All princes were great either in the way of wealth, pedigree, or reputation; the Rajahs of Ulwar and Bhawalpore, nice-looking lads, by all accounts, singularly intelligent, are very friendly to the Europeans, so was the Rajah of Puttiala in office of trouble a staunch and firm ally in 1857. Medical officers occasionally hold high positions in native courts, care taken before entering into any engagement to have everything signed, sealed, duly guaranteed, for princes from time immemorial are not to be trusted. The troops vary greatly, according to martial tendencies of rajahs, the cavalry, artillery, zouaves, sometimes smart, oftener not, the uniforms of ancient date, dilapidated coats, damaged epaulettes, wonderful helmets of another generation, flint firelocks, cast-off cavalry or infantry tunics, the effect ludicrous beyond measure. One man wore a red monkey-jacket with pearl buttons and a stove-pipe hat half covered with gold lace, a cocked hat being a pearl beyond price. Some had magnificent gold belts, sashes. The chief difficulty connected with the foot for the native is boots. Some are always playing with their toes, or fidgeting about their thighs, squatting on their hunkers at all hours. In former days drunken servants were punished by blistering their popliteal spaces, which materially interfered with the peculiar sitting posture. So far nothing professional connected with the health or sanitary arrangements of these warriors belonging to native princes has come under notice. Some fearful fascination daily allures one towards the different native encampments—some near the Ridge, others not far from the Cashmere gate—to watch the sentries, to listen to the bugle-calls similar to ours, or to hear the bands or the bag-pipes. Very handsome, doubtless, would these soldiers look in their own native clothes, and from all one hears and sees of the Sepoys serving under British rule, it is very easy to understand how in the old days, as indeed in the present, a wonderful friendship between officers and men sprung up. But as the pen, forgetful of medical subjects, would rather dwell to-day upon battles, upon beautiful women, upon sharp swords, and upon bright armour, I must apologise, for the fact is, with salutes firing, drums beating, and the magnificent band of the Rifle Brigade playing the jewel song, the waltz, the old men's chorus, the soldiers' chorus out of dear old "Faust," how can the earth system, surface drainage, Delhi sores, flies, or boils be calmly discussed? Well, the tents are hot, but day and night, the sides being raised, free perfilation of air is permitted. All the wells have been carefully tested, the best water carefully filtered, for before leaving Meerut the Macnamara filters were charged with fresh sand and charcoal. There are washing tents up for the men; a latrine trench is carried along daily; the sweepers never leave the spot; each evacuation, promptly covered with dry earth, soon becomes disinfected so long as rain keeps off. The men are directed to urinate into receptacles at a little distance from the latrines, or when at certain hours the receptacles are carted off and emptied at a distance, there are piles of dry earth, which, when soaked, are also removed. At night, to prevent men defiling the vicinity of the tents, receptacles surrounded with matting are placed convenient, each constantly coated with coal-tar, and of course emptied in the morning. Then there are separate latrines for natives, also police about to give the stick to those defiling the ground. When encamped at Roorkee it went to one's heart to prescribe a caning for an habitual offender of majestic mien, suggestive of Sennacherib, King of Assyria; it was the only way to keep off sickness. A man ran a thorn into his wrist, close to the radial artery, and beyond extraction, about two months ago: then there's a large bursa with a loud pulsation near; the thumb is oft numbed; there's tingling down the arm; no aneurismal boom; no indications of matter; poulticing, blistering no use; never had such a case before.

LORD LAURENCE has accepted the post of President of Guy's Hospital.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

APRIL 23RD, 1875.

SCALD OF THE GLOTTIS: WITH DEPOSIT OF DIPHThERIC MEMBRANE IN THE PHARYNX, LARYNX, AND BRONCHI.

MR. R. W. PARKER read notes of the case. The patient was a little girl, aged 3, under the care of Mr. Thomas Smith, in the Hospital for Sick Children. She had put her mouth to the spout of a kettle, which was boiling on the hob, and from which steam was actually issuing at the time. She would not swallow anything that same evening; but there was no difficulty with her breathing. Indeed, the immediate effects of the accident seem to have been slight, as she was not seen by a medical man for thirty-six hours. It was not until three days afterwards that the breathing became really affected, and she had a "croupy" cough for the first time. During the next two days her breathing became more laboured and her voice weaker, and on the sixth day from the accident she was admitted into the hospital. She was now exceedingly low and depressed, breathing very rapidly, and with great difficulty, but she did not struggle for breath. Her voice was entirely suppressed. There was great contraction of the hypochondriac regions with each inspiration. The mouth was carefully examined, and the lips, tongue, palate, and tonsils were found free from any visible injury. On the posterior wall of the pharynx a small patch of membrane was seen. An ice-bag was applied to the neck, but at the end of two hours there was no amelioration, so tracheotomy was performed. Two long pieces of membrane were got up with the aid of a feather; one of them was tubular, and about the size of a crow-quill. The child was greatly relieved by the operation. The general condition, however, rapidly became worse; she ceased to take notice of anything or anybody, and died thirty-six hours later of blood-poisoning and exhaustion. The post-mortem examination showed the lips, tongue, and tonsils to be normal. Two small erosions existed on the hard palate at its junction with the soft. The anterior surface of the soft palate was normal; its posterior surface was rather swollen and mammillated in appearance, from swelling of the glands of its mucous membrane. There was a small patch of membrane on the base of the uvula, and another just above the left arch of the palate, another piece on the posterior surface of the posterior pillars of the fauces; these pieces were not perfectly separable from the mucous membrane. The epiglottis was covered with membrane, and was thickened and swollen, as were also the aryteno-epiglottic folds. The tracheal mucous membrane was intensely red and injected, and coarsely granular in appearance; this appearance extended as far as the tertiary bronchi. In some of the bronchi pieces of thin, reddish, well-formed membrane were found. In the lungs there were patches of slight superficial collapse; the margins and bases were slightly emphysematous. No pneumonia was present anywhere. No urine was observable during life, but a little found in the bladder after death contained albumen and hedgehog-crystals of urates. It was argued that the membrane was not directly due to the hot steam, therefore, that it was not a slough: 1. Because those parts with which the steam would first come into contact were not injured, while parts with which the steam could not come into contact were patched with membrane; and further, because membrane was found in the tertiary bronchi, where, even if the steam penetrated at all, it must have been so cooled by admixture with the contained air, and by contact with the bronchial secretion, that it could not then have caused the extensive mischief described. 2. Because the dyspnoea did not commence until three days after the accident, and only became urgent on the sixth day. The insidious onset of the more acute symptoms, on the contrary, suggested the diphtheritic nature of the complication, and the post-mortem evidence favoured this view. Mr. Parker maintained that the fact that false membranes had been found under a variety of circumstances, such as scalds of glottis, foreign bodies in the larynx, and in cut-throat cases, could scarcely be urged as an argument in favour of the non-specific nature of such exudations, any more than that the erysipelas which attacked a hospital patient after operation was non-specific, because the patient, though in exactly the same surroundings,

had resisted the contagious influence for five or six weeks previously to his operation. Finally, the identity of croup and diphtheria was inferred from the fact that the same contagion would produce the two diseases indifferently, and, in illustration, the following cases were read. A little girl was taken into the Children's Hospital with typhoid fever, and when she was in the fourth week of the disease she had laryngeal diphtheria, and had to be tracheotomised. The disease began with a loud croupy cough, and slight hoarseness, which lasted for several days, but there was no dyspnoea. There was no enlargement or tenderness of the submaxillary glands. There was no albumen in the urine; there was no dysphagia; no marked depression; and there was no membrane about the fauces. After an emetic on the fourth day of the disease she vomited freely, and, in the effort of vomiting, she brought up some tough white membrane; other pieces were brought up on the two following days. Being much worse, she was tracheotomised. On the ninth day after the operation the urine became albuminous, and continued so for eight or ten days. She recovered. A few days later another child in this same ward, who was under Mr. Smith for scrofulous disease of the knee-joints, began to be ill, with symptoms of languor and depression; then her temperature rose to 104.4 degs. Fahr., she was flushed, and felt sick, and could not swallow without discomfort. On closer examination it was found that there was swelling and tenderness of the glands below and behind the angles of the lower jaw. The uvula was of a deep red colour and swollen. Both tonsils were enlarged, and deep red in colour, and on the inner surface of each there was a patch of white membrane of the size of a fourpenny-piece. The voice was pharyngeal in quality, otherwise not altered. There was no dyspnoea; no albumen in the urine. In eight days from the commencement the membrane had entirely disappeared, the swelling of the throat was subsiding, and the child's general condition improving. She quite recovered. A fortnight later one of the nurses in the same ward had a sore throat. On examination, the fauces were found red and congested, the tonsils large, and the left one spotted with half-a-dozen small white dots. The submaxillary glands were not enlarged. Now, had the first case not been operated on, she would quickly have died, and the disease in her case would have been found localised in and confined to the larynx, and on post-mortem examination it would have been demonstrated as true croup; while, had the second child died, the case would just as certainly have been called one of diphtheria; and there would be no hesitation in speaking of the third case as follicular tonsillitis. No doubt these three diseases were due to one and the same cause, the difference in manifestation being the result of idiosyncrasies of the individual attacked or of the organ implicated.

DR. DICKINSON could not concur in Mr. Parker's conclusions. The child must have been peculiarly unfortunate to have suffered from the effects of scald one day and on the next to have been attacked with diphtheria. Irritants, as boiling water, acids, &c., were well known to produce membranous inflammation of the larynx. The assertion that croup and diphtheria were identical was one of the most startling manifestations of the present change in the current of thought in medicine. It might, indeed, be impossible to discriminate croup and diphtheria by the occurrence of membranous inflammation of the larynx alone; but how could a case of scarlet fever be distinguished after death from one of simple cyanche pharyngea? or how, as Dr. Moxon had pointed out, could Asiatic be distinguished from English cholera when the anatomical lesion was alone presented? or contagious erysipelas from the same affection following a gumboil or inflamed tooth? Clinically, however, typical cases of croup and diphtheria differed most widely. Croup began with nasal or bronchial catarrh, and the inflammation, spreading to the larynx, led to the formation of membrane. Diphtheria had no antecedent catarrh, but was ushered in by a general febrile condition resulting from a specific poison, and was accompanied by the formation of false membrane primarily on the pharynx, which might spread to the larynx. In the worst cases the exudation was limited to the pharynx, nasal passages, and mouth, and death occurred from asthenia. The laryngeal inflammation in croup had no tendency to spread. Glandular enlargements, the early appearance of albumen in the urine, and the frequent supervention of peculiar nervous sequelae, characterised diphtheria. The etiology was different: croup was frequently traced to cold, diphtheria mostly to exposure to some definite poison—e.g., sewer-gas. The outbreak of diphtheria in the Children's Hospital, quoted by

Mr. Parker, was traced to defective drainage and escape of sewer-air into the ward.

Dr. HILTON FAGGE agreed with Dr. Dickinson, and was partly influenced by the fact that membranes might be found in the larynx under very different circumstances, as in cut-throat. Every few weeks or so a child was brought to a London hospital suffering from croup. If it died, a membrane might or might not be found in the larynx, and it might reach the bronchi. In the pharynx there was usually more or less membrane. In old times the presence of membrane on the pharynx in croup was seldom recognised; but since the introduction from the French of the term "diphtheria," it had been taught that any membrane whatever seated above the aryteno-epiglottic folds was diphtheritic. Moreover, the older physicians, recognising croup from its clinical features, might readily have passed over small patches of exudation on the palate and fauces. Only a small proportion of cases met with in an epidemic of diphtheria presented a marked laryngeal character; and, according to his experience, it was the rarest thing to find diphtheria admitted into a hospital apart from an epidemic. It was, indeed, highly probable that so-called "laryngeal diphtheria" in children was merely croup. He believed that every true case of diphtheria was as contagious as the exanthemata. Croup and diphtheria could not be distinguished by their anatomical characters; but in London a case of membranous laryngitis would probably be croup. Much of the confusion between the two affections arose from the use of the word "diphtheria" by German writers; thus Virchow gave the term "diphtheritic" to that form of inflammation in which the deeper layers of the mucous membrane were infiltrated, the whole altered membrane sloughing off; and Niemeyer, adopting this view, applied it to epidemic diphtheria. This was clearly erroneous, and a more correct interpretation was given by Rindfleisch, who admitted the anatomical identity between laryngeal and pharyngeal croup (diphtheria). But it had led to the view being taken in England that the diphtheritic membranes should be inseparably adherent, and should invariably leave a raw surface when detached.

Dr. DUCKWORTH concurred with Drs. Dickinson and Fagge. He urged that although the presence of membrane on the pharynx could not be held to be distinctive of diphtheria, there was invariably in this disease a peculiar turgidity and redness of the mucous membrane of the pharynx (even in purely laryngeal cases) which was never seen in croup.

Mr. T. SMITH pointed out that Mr. Parker's case refuted the statement that the membrane resulting from local irritation was not the same as that resulting from diphtheria; for here it had no character of a slough, but was precisely the same as a diphtheritic exudation.

Dr. YEO had recently been converted to the view that croup and diphtheria were identical, for he had seen cases presenting the symptoms of croup to which diphtheritic symptoms were added. One such, a child, died from blood-poisoning, although tracheotomy had been performed with great relief. The larynx and trachea were studded with circular patches of exudation. He thought Mr. Parker was quite justified in his opinion that the scalding water did not pass the glottis. One explanation of the escape of the buccal mucous membrane might be found in the fact that this was ordinarily exposed to rough substances without injury.

Mr. BARWELL had seen several cases of scald of the throat produced by children sucking the spouts of tea-kettles. The child, being frightened, made a deep inspiration, and thus drew water into the back of the throat, so that it was quite conceivable that some might enter the larynx. In the only case he had seen after death the trachea was lined by false membrane, while the tongue was abraded from contact with the spout of the kettle. He agreed with Dr. Dickinson that it would be very remarkable had a child been attacked with diphtheria directly after it had scalded its throat.

Dr. CAYLEY pointed out that the theory of non-identity required that more than one cause could produce the same effect; in the opposite view, many effects had the same cause; one of the chief arguments against the identity of croup and diphtheria being that the identity of the membrane was no evidence of the identity of the disease. But it was notorious that the same poison or the same irritant produced very different effects in different individuals. He had had cases which, from their sudden onset and rapid course, would be called croup, proving fatal within forty-eight hours, whether

tracheotomy were performed or not. In all false membrane had occurred in the fauces. Such cases were truly laryngeal diphtheria, so rapidly fatal as not to show any other of the symptoms of that disease. He recognised two distinct forms of diphtheria: one in which the general manifestations predominated, and the other in which the local symptoms were chiefly exhibited. Cases of the latter kind occurred even in epidemics; and he held the two diseases to be identical, and both due to the same poison.

Dr. GREENHOW thought that Mr. Parker's case was one of diphtheria, in which the scald played the part of a determining cause; and he strongly upheld the view that croup and diphtheria were perfectly distinct affections. The marked depression characteristic of diphtheria was absent in croup. He had recently had under his care a case of croup, which was treated by leeching and depressing remedies, emetics, &c., with success; but such treatment could never be adopted in diphtheria. A few weeks ago a child was admitted under his care, in which the diagnosis was at first doubtful; but tracheotomy was performed without relief, and the enlargement of the glands behind the jaw pointed to diphtheria. After death some small patches of exudation were found on the fauces, beyond the reach of observation during life. Four days afterwards the sister of this patient was admitted with diphtheria, and died; while the nurse in charge of the two cases was attacked, and was only now convalescent. The nature of the membrane was of minor importance, for it differed widely in different cases of diphtheria. He had only examined after death one case of croup, in which death resulted from absolute choking by the false membrane; a tube of membrane was found confined to the larynx and trachea, the surface beneath being injected, but in other parts pallid and free from the vascularity correctly described by Dr. Duckworth as occurring in diphtheria.

Mr. PARKER, in reply, pointed out that those parts nearest to the steam were least affected; and he could not accept Mr. Barwell's explanation of the formation of the membrane in the trachea from direct irritation. His case of laryngeal diphtheria following typhoid was acknowledged by all who saw it at the time to be diphtheria, although confined to the larynx, and the membrane being exceedingly tough and white. The early symptoms in this case were those of croup—i.e., of catarrhal character; but he had seen cases of croup in which there was but little primary coryza. Diphtheria might occur without deposition of membrane, with merely coryza and reddened fauces. As to the sequelæ, evidence was wanting that paralysis was a necessary sequela of diphtheria; and it would hardly do to base the diagnosis of a disease upon its sequelæ, as had sometimes been done in diphtheria. Dropsy or perforation of intestine might be held to be distinctive of scarletina or typhoid fever in this way, though very likely these sequelæ could be prevented by timely treatment. Thus no case of scarlet fever treated from its commencement in the Children's Hospital had led to dropsy; while those cases in which dropsy supervened were precisely those in which little or no treatment had been adopted; so also with typhoid fever. With regard to albuminuria, in one of the two undoubted cases of diphtheria he had mentioned there was much albumen; in the other, none. Was croup non-contagious? In the last case in the Children's Hospital for which tracheotomy had been performed with success some of the membrane was expectorated into the eye of the nurse in charge, producing violent inflammation. Nor was the amount of depression any diagnostic feature; and he repeated that he had never seen a case of asthenic croup in an impoverished child. The type, then, varied with the individual. There was no glandular swelling in the case of diphtheria following typhoid which he had related.

University of St. Andrews.—The following gentlemen having passed the required examination, obtained the degree of Doctor of Medicine on April 22nd:—

Bird, William, York.
Devereux, Daniel, Tewkesbury.
Eyton-Jones, Thomas, Wrexham.
Kesteven, William B., London.
McVail, John C., Kilmarnock.
Ryott, Frederic E., Newbury, Berks.
Sedgwick, James, Boroughbridge, Yorks.
Sweeting, Thomas, Basingstoke, Hants.
Wolston, Christopher, Bournemouth.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, MAY 12, 1875.

THE POLLUTION OF RIVERS.

NOTWITHSTANDING the many arguments which have been adduced by Dr. Letheby and other able chemists as to the surprising power of rivers becoming pure after a very short course, even when they have passed through dense centres of population, it must, we think, be confessed that foul streams, such as exist in the midst of some of our large manufacturing cities, are no small evils.

The Marquis of Salisbury has recently called attention to these Stygian rivers in a debate before the House of Lords on April 30; and we hope that his witty and incisive remarks may not fall unheeded by the masses of his countrymen. In 1848, Parliament passed the Public Health Act, providing for the drainage of towns, and as there was no other place to put the sewage, it was sent into the rivers. Several commissions have since inquired into this question, and the evidence given before these bodies proves clearly that something must be done. It was shown that the river Clyde, at Glasgow, was so filthy that those persons who live on its banks suffered much in their health, whilst passengers by the river steamers had sometimes been so poisoned by the stench from the river as to require to be led ashore. The Aire and Calder rivers also were so foul in some places that when the water was disturbed the very froth was black instead of white; and the Bradford Beck was so foul that the gases from it could sometimes be burned readily. The River Ware, at Durham, is a most pestilential stream; and there is a river at Chester-le-Street which is occasionally as yellow as ochre, and as thick as glue, and which diffuses a terrible smell around.

The main cause of these pollutions, of course, is that manufactories have greatly increased in number, and the products of such factories are allowed to flow into the streams. It appears that the most filthy of all products from manufactories is that which issues from distilleries. These latter products are calculated, says Lord Salisbury, to be thirty-six times as concentrated as the sewage of London. In the year 1850 the Thames was most offensive; and we know the magnificent result which has followed from the purification of that great and important river.

Lord Salisbury states that on one occasion a man fell into one of these streams which are polluted by distillery products, and swallowed some of the water. He was killed at once, said the speaker, and there was no use rescuing him, for he had been poisoned by the fluid he had drunk. It not unfrequently happens, we hear, that the products of two contiguous factories are of such quality that, when mingled, the result is the elimination of sulphuretted hydrogen gas, which is most dangerous in its effects on the health of persons living on the river banks. All of these facts show how necessary it is that some legislation should take place; for it is quite impossible any longer to trust to the practices of local authorities in such matters. In large manufacturing towns the rich mill-owners usually live at a distance from these fetid streams, and they seem, in many instances, to care nothing at all about the health of their operatives, who are poisoned by their noxious exhalations. Lord Salisbury therefore proposes that Government should appeal to the assistance of an officer who is daily growing in importance—the county court judge—and that all offences in relation to the pollution of rivers should be tried before him.

What the Government proposes to do is simply to forbid the pouring of any filthy or injurious matter into any stream, and to leave it to the good sense of the judge and jury to determine whether any particular stream is noxious or not. At the same time, they must make some distinction in the case of manufactories and mines; and it is proposed to make it incumbent on any manufacturers and miners who have poured noxious matters into towns for twelve years and less to make their products harmless within the next two years; those who have continued to do so for longer than twelve years are, however, to be simply henceforth compelled to use the best means they can to render the impurity harmless.

It is to be hoped that by the introduction of this excellent measure the Government may do a great deal towards improving the health and increasing the amenities of life among a large portion of our humble fellow-countrymen whose occupations compel them to inhabit dwellings so contiguous to such filthy and polluted streams as are to be met with in most of our large and densely populated cities. It would be premature to endeavour to enter into the engineering and chemical difficulties which may be encountered in endeavouring to carry out this important advance in public hygiene. One thing is quite clear, and that is, that the day is past when an excuse can any longer be entertained by the Legislature for the carrying on of large manufactories in our crowded cities in such a way as to lower the health of the poor or operative classes.

We have long held that all noxious trades should be remorselessly put a stop to by the supreme power, unless it be shown that the processes carried out by such manufactories are free from danger to any operative exercising ordinary care and attention to the rules of health demanded by the perils of his craft. Lead-poisoning is even now terribly frequent in some parts of London, and the frequency of the “grinder’s rot” of Sheffield and other cities is a disgrace to the civilisation of England. And what shall we say of the hygienic state of our legislation so long as a rich man or a company of capitalists have the power of polluting the clear streams of any village or city with

perfect impunity, and thereby rendering the locality unbearable to any save those whom sordid poverty or social degradation has rendered ready to put up with any misery so long as they are given the wherewithal to sustain a wretched and unfortunate existence. *Salus populi suprema lex esto.*

AN EXPOSURE OF THE IRISH DRUG CONTRACT SYSTEM.

THROUGH our columns those of the profession who have not already personal experience of the fact have learned from time to time that the system of contracting for drugs for Irish unions has been, and continues to be, inefficient, ill-regulated, and, in many instances, corrupt. The Irish drug contract system has been, in fact, a crying sin for many years, and it was the subject of a weak and ill-considered attempt at reform by the Poor-law Commissioners a couple of years ago. Nevertheless, the atrocious abuses which have fleeced the ratepayers, half-poisoned the paupers, and enriched certain unscrupulous traders still continues, and no effort is made by the Local Government Board to remedy a state of things which the Board recognises publicly as utterly corrupt and indefensible. Much light has been thrown on the matter by a recent and protracted official inquiry into an extraordinary discrepancy between the quantity of medicine consumed respectively in the North and South Dublin Unions.

During the year 1865 the cost for each ticket issued in the North Dublin district was 3½d., but it has gradually increased to 6½d., or nearly double what it was then; whereas the expenditure for the same purpose in the South Dublin dispensary district has been for the most part a uniform charge of 1d., which it is at present, and there must, it would seem, be some cause to account for the very great disproportion that exists. In the south district 38,301 persons were relieved at a cost of £169; at the same time that 32,490 persons were relieved in the north district at a cost of £885. It has been contended, as a means of accounting for this difference, that in the South Union all the medicines required and used were contracted for, but that in the North Union the medical officers have been in the habit of ordering drugs which were not included in the tender, and which were consequently charged for at a high price, and this statement appears to be founded in fact, and will go some way in accounting for the difference, but not to any great extent.

The Local Government Board set forth certain reasons which, they are of opinion, account for the discrepancy, and they deliver their verdict in the following terms:—

“The medical officers in the north district use a larger quantity of medicines, particularly the more expensive medicines, than the officers in the south districts. Some medical men have confidence in one description of drug, others in medicines of the same class, but of higher price; and, whilst caution must be observed in any endeavour to fetter the exercise of professional discretion, the medical officers might be requested to be as economical as possible in prescribing the more expensive drugs. On a review of all the circumstances elicited at the inquiry which has been made, it appears to the Board that the distribution of drugs and surgical appliances is too limited

in the South Dublin district and rather free in the North. It would probably be of advantage to the sick poor if more liberality in prescribing were adopted in the south district, and the expenditure in the north district may admit of considerable curtailment without detriment to the sick poor, and with considerable relief to the ratepayers.”

The foregoing facts are of much interest, and suggest therapeutic considerations somewhat puzzling in their nature. If 32,490 sick persons really do require for the scientific treatment of their illness nearly £900 worth of medicine, how is it possible that the disease of a greater number (38,301) can be done justice to within the same sanitary conditions for about a sixth of the money (£169)? *per contra*, if the 38,000 southern patients are well cared for and effectually treated for £169, how terrible must be the drenching and physicking under which their northern neighbours suffer! The comparison will, no doubt, be availed of by the homœopaths “to point their moral and adorn their tale.”

But in the interest of departmental reform, and indeed, of common honesty, the succeeding portion of the letter of the Local Government Board is more valuable to us:—

“The Inspector who conducted the inquiry observes that he had occasion to examine the contracts which had been accepted by both the North and South Dublin Unions, and that he failed to discover any fixed principle upon which the prices set forth in the accepted tenders had been based. He states that they were not founded upon the fair trading prices of the open market, inasmuch as some drugs were charged for at high prices, some far beneath their commercial value, especially if they were drugs little used, and that in fact the tenders seemed to be framed in such a manner that it would be difficult to suggest any reason for such commercial eccentricities, except on the supposition that they were constructed in accordance with the amount of opposition expected from rival competitors or some other personal considerations. The same firm is the contractor for 1874-5 in both unions, and it might be expected that the prices would be the same in both tenders, which were sent in at precisely the same time in each union; but such is not the case. Of 412 articles tendered for in both unions there is a difference in price in no less than 287 instances. In 149 instances the prices demanded from the North Union exceeds that for which the same article is contracted for in the South, and in 138 instances the price charged in the South exceeds the price contracted for in the North for the same drug, the difference in price being in some cases double, others treble, in others four times, or even six times the amount. Several articles were under contract in the South Union which were not contracted for in the North Union—for example, methylated spirits; and this, while supplied to the South at 3s. 8d. a gallon, was charged 5s. a gallon to the North. Chlorodyne contracted for in the South at 2d. an ounce, was charged 2s. to the North. Several articles contracted for in both, such as compound colocynth pill, hippo wine, and opium, and its several preparations, are given at a price so far below their commercial value that they could not be supplied at the price tendered for except at a serious loss to the contractor. Dr. King observes, as regards the compound colocynth pill, that the principal ingredient

and possibly most important is "scammony," and if it be omitted the pill mass could be sold at a low figure. This pill mass is contracted for at 3s. 6d. per lb., but any respectable trader is aware that the genuine drug could not be sold at the price. It will be seen from the trade lists enclosed that the selling price of this pill mass is 14s. per lb., and there is reason, Dr. King reports, to suspect that the colocynth pill supplied does not act as it should do. Again, as to opium, the genuine article could not be supplied with any profit at double the price charged in the contracts, 15s. per lb. in one and 16s. in the other."

Could any statement of facts afford more conclusive proof than this of the utter stupidity of the present drug contract system—of the total incapacity of guardians to form an opinion on such a matter—of the gross dishonesty of contractors, where unchecked, in the perpetration of such tricks? Can anything be more humiliating to the Local Government Board than the necessity of confessing that such a state of things exists uncontrolled within their own department?

The statement of the Inspector would excite indignation in the profession, were it not that the facts which he narrates have been well known, and the dishonesty of the every-day transactions in the drug contract trade have been fully recognised.

The Local Government Board have for years been aware that the veriest trash of the drug market was habitually put off upon the unions at prices frequently exceeding enormously those of genuine drugs; that tinctures made with methylated spirit were in some instances the invariable rule; that pills without their most potent ingredients, and drugs with 50 per cent. of adulteration were the articles frequently supplied to unions: and yet they have tolerated, almost patronised, these most disgraceful transactions.

It may be said with much truth that a board which has evinced its unwillingness or its incompetency to cope with a little reform of detail is not likely to carry the sanitary legislation of the country into satisfactory effect.

We trust that this elucidation of the system will yield some result in an earnest attempt to stop the fraudulent traffic in drugs for Irish unions.

THE METROPOLITAN HOSPITAL SUNDAY FUND.

At a meeting, convened by a resolution of the Council of the Metropolitan Hospital Sunday Fund, in the Egyptian Hall of the Mansion House, on Friday last, and to which ministers of all denominations were invited, to frame rules and form a constitution for the future guidance of the Distribution Committee, a degree of unanimity prevailed which strikingly contrasted with that of the 8th of March.

Doubtless the factious spirit then displayed would never have broken out had those at the head of the movement earlier seen the necessity for framing a code of rules which should be binding upon all parties interested. But the fact is, that the Fund has taken a firmer hold of the public mind, and grown into greater importance than was anticipated, even by the founders and originators of the movement. This led the prime movers,

those who were labouring hard to attain to an increased success, to act towards those who came with any show of a grievance in a spirit of conciliation, whereas by having rules to fall back upon they would have been curtly and instantly dismissed without a hearing. The Council will, after the proceedings of Friday, never be likely to drift again into the troubled waters of the beginning of the year. The several resolutions of the 7th were either proposed or seconded by the Bishop of London, Cardinal Manning, the Rev. Dr. Kennedy, Professor Marks, Sir Charles Trevelyan, Sir Antonio Brady, Mr. Samuel Morley, the Rev. Mr. Humphrey, the Rev. Canon Nesbit, the Rev. Dr. Allon, the Rev. Canon Harvey, Dr. Glover, &c. The mere enumeration of these names will at once show that every care and consideration was bestowed upon the questions at issue, and from the discussion which followed it will be gathered that nothing was left unsaid that might tell for or against resolutions intended to meet differences of opinion, and which, we may add, were almost unanimously carried, at one of the largest and most influential meetings ever assembled in the Mansion House to consider matters in connection with the Metropolitan Hospital Sunday Fund.

We mention this in order that our readers may know that everything has been done to satisfy the most exacting.

The resolutions carried were as follows:—

"1. That this meeting, summoned by the resolution of the Council of March 16th, 1875, and consisting of representatives of the various congregations which have contributed to the Hospital Sunday Fund, approves the action of the Council in appealing from the decision arrived at by the public meeting of March 8th, and proceeds to lay down the principles upon which the Fund shall be managed and distributed.

"2. That such congregations as have forwarded contributions to the Fund during either of the two preceding years be entitled to a voice in the management of the Fund; and that the minister and two laymen representing every such contributing congregation be summoned to meet the Council in the month of December in each year to receive the annual report of the Council for the year, and to elect the Council for the succeeding year.

"3. That the Council consist of *not more than fifty clerical and fifty lay members*, with whom shall rest the power to arrange for the collection, to appoint the Committee of Distribution, to receive its report, and to frame such rules as may be needful for the proper administration of the Fund.

"4. That the Committee of Distribution, consisting of nine members, and the Lord Mayor as president *ex officio*, be elected at an early meeting of the Council after its appointment.

"5. That awards to hospitals, &c., be primarily based on the total expenditure of each institution after deducting therefrom—(1) the income derived from endowments and realised property; (2) the amount received in legacies exceeding £100 each; (3) the amount of expenses of management. But that in every case the merits and pecuniary needs of the institution concerned be fully inquired into and considered by the Distribution Committee, and that the award made be determined in accordance with the judgment of the Distribution Committee upon such merits and needs, provided that in no case shall the grant be so reduced or withheld until a conference shall have been sought with the Managing Committee of the said hospital, &c.

"6. That *payments made by or on behalf of patients* be left to the discretion of the Distribution Committee, to be dealt with, in each case, as they may see fit.

"7. That no institution, to the benefits of which ad

mission can only be gained by election from the general body of subscribers, be eligible for grants from the Fund.

"8. That hospitals, &c., receiving grants from this Fund, be required to place at the disposal of the Council the same number of letters of recommendation for patients to which an individual contributor would be entitled for an annual subscription equal to the amount of the grant.

"9. That in the event of a congregational collection, *made on Hospital Sunday*, being given to a particular hospital, dispensary, or institution, instead of being sent to the general fund, the amount so sent shall be deducted from the grant made to that hospital, &c.

"10. That, in making their awards, it be an instruction to the Committee of Distribution to take into their favourable consideration the amount of congregational collections received by the several hospitals, &c., during the three years preceding the institution of the Hospital Sunday Fund.

"11. That the Committee of Distribution shall present their report to the Council before the Fund is finally distributed."

Notes on Current Topics.

Domestic Scavenging in Dublin.

THE *Sanitary Record* says:—

"We think the Irish Local Government Board must have fallen into a state of semi-insensibility when it declares that the Corporation of Dublin has made due provision for the cleansing of the ash-pits and privies of the city. In the poorer part of the city there is not such a thing to be found as a properly constructed or properly cleansed ash-pit or privy. The whole city is reeking with filth. The complaint is universal that ash-pits and privies cannot be cleansed except at a ruinous expense. The rate of mortality in the city of Dublin has been on an average at least 30 per 1000 for the last ten years, and it is quite manifest that the filthy condition of the city, and the obstinate refusal of the authorities to cleanse it is the chief cause. This alarming rate of mortality in an English town would at once have produced an inquiry by the English Local Government Board. Negligent as that Board may sometimes be, it certainly shows more signs of vitality than its Irish namesake."

We can corroborate by experience the statement that domestic scavenging by the Corporation in Dublin is a disappointing delusion. If an ash-pit requires to be cleaned, the householder may pursue one of two courses—either he sends for a working cleaner, gets the work done in a day, and pays for it, say 4s.; or else he employs the Corporation, which necessitates his going to the City Hall, filling up certain forms, lodging 10s., waiting as long as may be necessary, then, after the work is done, returning to the abode of the *patres conscripti*, filling up more forms, and waiting for the restitution of the unexpended balance; four journeys back and forward and a fortnight's delay is usually about the inevitable requirement.

Barbarian Obstetrics.

A CORRESPONDENT of the *Lancet* furnishes a description of the obstetric performance as conducted in the North of England colliery districts.

"Two ordinary chairs," he says, "are tied together by the two inner front legs; the chairs are then separated from behind, leaving an aperture on which the patient seats herself, two of her female friends or attendants then sit on the chairs on either side of her, she placing her

arms on the shoulders of the two supporting, and the surgeon plants himself on a low stool behind to assist to support the perinæum, &c., &c. The woman gets on the chairs often long before the surgeon arrives. The child may descend with such force as not only to cause death, but, by pulling suddenly and forcibly an adherent placenta, cause serious accidents to the mother."

We trust that the monopoly of this sort of practice, and, we may add, of the services of such surgeons as occupy the low stool *à posteriori*, may be left to the constituents of Dr. Kenealy at Stoke and to a few other picked centres of ignorance. We are quite sure that such a beastly proceeding would be sought for in vain amongst even the outer barbarians of the west of Ireland deserts.

Society for Relief of Widows and Orphans of Medical Men.

THE annual meeting of the Society was held on Friday, April 30th, by the kind permission of the Royal Medical and Chirurgical Society of London, in their rooms. The chair was taken by the President, Sir George Burrows, Bart., F.R.S.

From a summary read by the Secretary, it was shown that the total receipts available for payments for the year 1874 amounted to £3,065 15s., and the total grants and expenses for the same period to £3,174 14s., exhibiting an excess of expenditure over receipts of £108 19s. The ordinary grants for the year were £2,601 10s., an increase of £71 10s. on those of 1873. The grants had been augmented at Christmas to the amount of £329, caused by a donation of £5 to each widow, £2 to each child, and £5 to each of the recipients from the Copeland Fund, making in all £2,930 10s. granted during the year. The expenses had been £244 4s. The funded property had been increased by the purchase of £500 (Stock) of the Metropolitan Consolidated 3½ per Cent. Fund.

Nine members had died (four leaving their widows to the charge of the society), four had resigned, or ceased to be members, and twelve new members had been elected, leaving the list of members at 396, one less than in 1873. Among the deaths were mentioned those of B. Bond Cabbell, Esq., honorary member and arbitrator, and of John Miles, Esq., V.P., and one of the oldest members of the Society, elected in 1818.

During the year four widows had died, each in receipt of £50 per annum; six widows were added to the list of recipients of grants; seven children had become ineligible, leaving only seventeen chargeable to the fund.

At the annual general meeting of 1874 alterations in the bye-laws had been proposed by the acting treasurer. The alterations were to facilitate the election of members, and to provide for cases where members through ill-health were unable to continue their subscriptions.

The following gentlemen were chosen in place of the six senior directors, who retired by rotation, viz.: Dr. Paregrine, Dr. Halford, Nathaniel Stevenson, Esq., Dr. Peacock, Dr. Sieveking, and John Couper, Esq.

Votes of thanks were passed to the President and Court of Directors for their kind attention to the business of the Society, to the editors of the medical journals, and to the Chairman, and the meeting separated.

The Privilege of Abuse in Courts of Law.

THE Sheffield daily papers afford us an illustration of the method in which an unscrupulous attorney may be permitted, under cover of the law, to defame a medical man. A woman was injured by the break-down of a stand at a circus, and Dr. Mason, of Sheffield, was called to attend. He was obliged to drive seven miles to his patient and back again, and he charged the very moderate fee of a guinea a visit for the journey. The attorney of the patient, finding it impossible to dispute the claim, "pays off the doctor" by stating in open court that he refuses to "place him in the box as a truthful witness and as a man on whom he could rely, but under the circumstances he really could not rely upon his evidence." We don't imagine that the impertinence of a pettifogging attorney can matter much to Dr. Mason, but it seems to be an anomalous state of the law that an insult such as this should be permitted by the presiding judge, there being no shadow of foundation for doubt of Dr. Mason's veracity.

Leprosy.

DR. VANDYKE CARTER has been commissioned by the India Office to visit various places in the East to investigate the habitats of leprosy. At Milan he saw pellagra, but could trace no resemblance in that disease to leprosy. He found no leprosy in Algiers, Tunis, or in Greece proper, but much of the disease in the Archipelago, where asylums for those diseased are occasionally met with.

Death from Chloroform.

ANOTHER death from chloroform in France! The *Gazette Méd. de Bordeaux*, November, 1874, mentions a case of death from this anæsthetic of a man, æt. 42, who had cancer of the penis, on whom Dr. Lande operated by means of galvano-cautery. When 12 to 15 grammes of chloroform had been inhaled, in two minutes, the respiration stopped and the patient died.

Quarantine.

IN 1874, fifty-seven vessels arrived at the port of New York and were put into quarantine. Eight had small-pox on board, and 121 cases of yellow fever occurred in 44 vessels. And yet there are persons who object to quarantine!

Abuse of Poor-law Medical Relief.

THE Committee of the Toomevara Dispensary have resolved that red tickets shall no longer be issued (which entitle the recipients to gratuitous visits from the physician, and medicine) to people whose circumstances enable them to pay something, and that such persons shall be given instead a letter to the medical officer, recommending his attendance, for which a fee of 10s. or 7s. 6d. shall be charged, according to the circumstances of the applicant. The example is one worthy of imitation by other boards, as the medical relief provided by the Poor-law is often availed of by persons not merely above paupers, but comparatively wealthy.

The Closing of Graveyards in Ireland.

THE Irish Court of Queen's Bench granted last week a conditional order on behalf of Mr. Peter Radcliff, who

seeks to have an order of the Local Government Board quashed. This order, it appears, directs that after the 1st June, 1875, no interments shall be made in a certain graveyard situated within the demesne of Lord Talbot de Malahide. From Mr. Heron's statement it appeared that the Local Government Board formerly made a similar order respecting this graveyard, but that order was quashed, as the Board did not hear the parties objecting. The Local Government Board early last year procured the insertion of a section (section 18) in the Public Health (Ireland) Act, 1874, by which permission was given to them to reinvestigate matters upon which orders might have been already made by them. Accordingly, on the 10th of December last Mr. O'Brien, Local Government Board Inspector, held a public inquiry at Malahide, and several witnesses were examined for Lord Talbot de Malahide, and also for the prosecutor and others claiming the right of burial in the graveyard. After receiving the report of Mr. O'Brien, together with the report of the evidence taken by a shorthand writer, the Local Government Board issued a report, stating that the medical evidence was so conflicting that they were unable to come to any determination on the subject. Notwithstanding this, and without any further inquiry, they, on the 31st March last, addressed a letter to the parties concerned, stating that they had submitted the evidence to Dr. J. Emerson Reynolds, an expert in analytical chemistry in the University of Dublin; and, acting on the report which he had made, they did not think further inquiry necessary, and accordingly they made an order for the closing of the graveyard on the 1st June next.

Vivisection.

A BILL to regulate the practice of vivisection has been introduced into the House of Lords by Lord Henniker. It proposes to enact that after the 1st January next vivisection is only to be performed in places duly registered, and upon notice being given to the Secretary of State, or in Ireland to the Chief Secretary. Any inspector of anatomy may at any time visit and inspect a registered place. The penalty for an offence against the act is not to exceed £20. A petition, signed by the majority of the Fellows of Trinity College, Dublin, has been forwarded to Parliament, protesting against the cruelties of vivisection, and praying the House to take measures to prevent the practice. It is stated that the initiation of the memorial is due to Mrs. Lloyd, the wife of the Provost.

Another Fasting Girl.

THE *Manchester Guardian* says that the case of the "sleeping girl" of Turville, in Buckinghamshire, is likely to crop up soon again. It is now about two years since the London daily papers sent "specials" to inquire into and to report upon the phenomenon in question. The girl, it was alleged by her mother, had even then lain asleep or in a state of trance for two years. From that time until the present, it is said that her condition has remained unchanged, and that the child gives no sign of awakening from a slumber of now four years' duration. As imposture on part of the mother is still suspected, the Home Secretary has lately forwarded an authoritative document to the effect that, failing to provide suitable nourishment and proper medical attendance, should the girl die, her parents will be responsible. It is not pretended the sleeper subsists without any food. Two or three times a week a little

milk is poured through an aperture in her clenched teeth, but this is all. The girl is now 16 years of age, and it is said that her lower limbs have recently assumed the appearance of those of a corpse, though her face has still a natural blush upon it.

Small-pox Inoculation.

Two prosecutions of a man named Mullany for small-pox inoculation were heard at Balla, in the county Mayo, last week. The case was perfectly clear, but without exception the whole of the witnesses pretended ignorance, and boldly perjured themselves for the protection of the inoculator, and the cases were necessarily dismissed.

It is melancholy to observe such ignorance and obstinacy amongst the peasantry, especially when it is recollected that forty deaths from small-pox have taken place in the district within a month. The resident magistrate expressed the opinion that it was impossible to expect that the constabulary could suppress or stop inoculation as long as the people were so obstinate in refusing to prosecute the offenders, and was of opinion that, until the present statute was amended, the ends of justice could not be arrived at. He further added that it was to be deplored to see the people so misguided as to believe in such quackery—so dangerous to society, law, and order.

Hampstead Again!

IN consequence of a report of Dr. Frankland's, stating that there was danger through the proximity of the reservoir of the Grand Junction Waterworks to the proposed new site, Dr. Letheby was requested by the opponents of the Board to inspect it, and he reports that the reservoir is situated upon the highest point of ground, and that the general dip of the land is such that all drainage matters must flow from the reservoir to the lower level, where it is proposed to make a drain at a distance of 400 feet from the reservoir, and at a depth of thirty feet below the bed of the reservoir. Dr. Letheby says the soil to the depth of at least forty feet, as shown by the adjoining railway cutting, is composed of stiff, impervious clay. Without therefore considering the question of the substantial structure of the reservoir, as regards the impermeability to water, as its use would indicate, he has no hesitation in saying that from the natural conditions and features of the site there is no possibility of danger from soakage of drainage matters into the reservoir. He adds that the situation appeared to be remarkably well suited for a fever hospital, as it was at a high level, in the open country, at a considerable distance from residential property, and was bounded on three sides by the railway and cemetery, so as to prevent the approach of houses.

Treatment of Cholera.

THE approach of summer may, as has been predicted, again give rise to rumours of cholera; at any rate, the subject has lately occupied attention in various quarters, especially as the disease has again broken out in India.

We may be pretty sure that whenever another epidemic appears the treatment of the disease will be as unsettled as at the last invasion. Yet this is not for want of observa-

tion. We are induced to write thus by the appearance of another edition of Dr. Billing's practical pamphlet on the subject. Those who are familiar with that author's "Principles of Medicine"—and those who are not would do well to peruse forthwith that suggestive work—will remember that he has recommended a simple mode of treating cholera, on which, from great clinical experience, he places great reliance. The pamphlet on cholera is chiefly a reprint from the larger work, and treats of the disease entirely from a clinical point of view. This edition is dedicated to Dr. Gopaul Chunder Roy, who some time since wrote a paper on Papaya, showing that this plant assisted the digestion of certain foods. Dr. Billing, in a note, draws attention to this, and calls the remedy "vegetable pepsine." This seems to indicate a still further use for papaya, for although the plant has been known to botanists for ages, and is used by all Indians for culinary purposes, no one has ever hinted at its being a "vegetable pepsine" until Dr. Billing mentioned it as such in the note to this brochure on cholera.

Snake Poison.

SOME years since one of our clever novelists wrote a satirical account of the "Circumlocution Office," and "The Way not to do It;" and since our late articles, 24th March and 21st April, on the "Cure of Snake-bites by Halford's Method," copied from the *Melbourne Argus*, some person or persons connected with the experiments (a) made in India to "discover the way not to cure snake-bites, in which they succeeded," and consequently disbelieve Halford's success, instead of discussing the question fairly in any medical journal, resort to a paragraph in the *Times* to show "the way not to do it," and even quote a passage in the *Melbourne Argus*, the staunch supporter of Halford, to justify their imbecility—the *Argus* merely quoting the report of the unsatisfactory Indian Commission, who assert to have found that "the bites of Indian snakes are from six to sixteen times more poisonous than those from Australia," when they were most likely half dead, from the unnatural state in which they were after travelling and confinement, though well able to kill men and beasts in their own country, as testified by Australians. But this correspondent of the *Times* goes the whole animal, and says: "In fact, the result of the experiments made by the Commissioners on dogs goes to show that the venous injection of ammonia after snake-bite possesses no antidotal or remedial power, but, on the contrary (probably by promoting the absorption of the poison?), rather expedites than retards the tendency to death." So, then, they did actually succeed in killing some animals, but found out "how not to do it," that is, to cure them, as Halford does.

Statistics of Births in Massachusetts.

AT a recent meeting of the Obstetrical Society of Boston Dr. Draper gave the following account of his investigations about the births in Massachusetts. Most children had been born in the latter half of the year. In the last twenty-

(a) For a detailed account of those unsatisfactory and inconclusive experiments *vide* the elaborate and beautifully illustrated work on the natural history of serpents edited by Dr. Fayer, and "got up (like a lady's dress) totally regardless of expense" by the Indian Government, entitled "*Thunatophidia*," not "*Therapophidia*."

five years the proportion of males to females born had been 104 to 105. The births of children of American parentage have decreased from 63.02 per cent. in 1849 to 39.38 per cent. in 1873; the births of children of foreign parentage have increased from 35.96 per cent. in 1849 to 48.24 per cent. in 1873; while those of mixed parentage, one parent being foreign, the other American, have increased during the same period from 1.02 per cent. to 11.78 per cent. Still-born males have been greatly in excess of the females. Of plural births the proportion is constant, 1 to 100. In 1873 there were three cases of triplets.

The facts brought forward as to the paucity of births from American parents point to very grave evils which at present are occurring in Boston, New York, and elsewhere. The practice of criminal abortion is very prevalent indeed; and we hear of women making large fortunes and living in splendid houses in New York who are maintained by practising abortion on married and unmarried women every day of their lives.

Spinal Irritation.

At a recent meeting of the Clinical Society Mr. Thomas Smith related the following case, which is specially interesting, inasmuch as disordered nerve function is so much rarer in infancy than in adult age.

L. C., a girl 16 months old, the only child of healthy middle-aged parents, was under the care of Dr. Chaldecott of Chertsey. She was healthy up to a year old, when she could walk. At this time she began to cut her teeth rapidly, and suffered from disordered bowels, being for the most part troubled by obstinate constipation, but occasionally suffering from diarrhoea. Her urine became high-coloured and very offensive. She gradually lost strength, became unable to walk, and finally was too feeble even to sit up. She had no convulsions. When first seen by Mr. Smith she had been ill for four months; her expression was anxious; face pallid; she was very irritable; she could neither sit nor stand. The skin was everywhere harsh and dry; on the front of the belly it was shrivelled, and looked as if she had borne children. The pulse, tongue, and respiration were natural; the bowels, though obstinately constipated, were less so than heretofore. There was scarcely any hair on the head. She held her hands to her head like a child suffering from cervical caries. There was tenderness over the spine in the sacral region. There was no paralysis of sensation or motion. The urine and fæces were normally retained. The following phenomena were observed. The child, who was extremely fretful and irritable, could at once be quieted by scratching roughly either the palms of the hands or soles of the feet. If this were done she at once became quiet, the expression of her face completely changed, her muscles relaxed, and in a minute or two the parts scratched lost their dry and horny condition, and became warm and soft. Meantime, perspiration began to flow most profusely, until it dripped from the surface. The parents said that as long as this irritation was continued the same phenomena were observable, and that the child would remain quiet even for hours. The same results could be obtained by scratching the scalp or by plucking out the hair. The present hairless condition of the head was due to the child having torn off her own hair for her own pleasure. She had been treated with

advantage by bromide of potassium and hydrocyanic acid, and her constipation had been relieved by small doses of jalapin with podophyllin. Two months later, under the continuance of the same treatment, all symptoms, with the exception of the constipation, had disappeared. The urine was normal; the skin moist and soft; the palms and soles were no longer dry and horny, and she could not bear to have them touched. The hair was growing well on the head; she had no pain; she could sit up, and even walk. The improvement had been gradual and persistent.

Small-pox in the Co. Sligo.

THE usual annual training of the Co. Sligo Rifle Militia has been postponed till further notice, because of the existence of small-pox in a portion of the county (Tobercurry district), as it was feared that any recruits that would come from that district might help to spread the disease in Sligo amongst the rank and file of the regiment. We understand, however, that this disease as an epidemic is beginning to disappear.

Liverpool and its Health.

DR. FRENCH, the Medical Officer of Health for Liverpool, reports that in 1874 the death-rate of the borough of Liverpool was 31.9 per 1000. Zymotic diseases killed 4,793 persons, or about 30 per cent. of the whole deaths were caused by them. Scarlet fever killed no less than 1,911. The Health Committee ten years ago caused two large disinfecting depôts to be erected at the northern and southern ends of the city, which have disinfected 330,000 pieces of clothing and bedding by dry heat. There were 35,000 visits paid to the 1,091 lodging-houses in the register in Liverpool, resulting in finding 42 cases of over-crowding, 204 of filthy dwellings and other breaches of the law.

Epidemic of Enteric Fever at Chorley.

DR. JAMES RIGBY, Medical Officer of Health for Chorley reports the occurrence of a terrible outbreak of enteric fever in that town. He has attended 18 or 20 cases in one district. The outbreak is attributed to the fact that the neighbouring town of Darwen is now being thoroughly cleansed, and that in the dry weather the dust charged with typhoid poison is blown into Chorley. But, if this be the case, why is one district alone attacked?

de Janeiro, and the deaths amount to some twelve or more daily.

MR. ERASMUS WILSON has most generously given a donation of one hundred guineas to the British Medical Benevolent Fund.

THE *soirées* of the Pharmaceutical Society at the South Kensington Museum is fixed for Wednesday evening, May 19th.

Two maiden ladies, daughters of a Glasgow merchant, have just died, leaving the enormous sum of £100,000 for charitable institutions in that city.

HER MAJESTY THE QUEEN, who was to have inspected the troops at Aldershot on Monday, has deferred that event, in consequence of a case of scarlet fever having broken out in the Royal Pavilion.

HIS GRACE THE DUKE OF PORTLAND has granted a magnificent and extensive site, overlooking Sherwood Forest, for the erection of a new hospital at Mansfield-Woodhouse, Notts, under the superintendency of Dr. Waring Curran.

FIFTY-SIX out of 176 candidates at the physiological examination for the diploma of membership at the College of Surgeons of England were lately sent back. The education of the candidates for examination seems to be carried out in a slovenly manner, which, indeed, we might expect from the poor remuneration of teachers in the metropolis.

ONE of those fearful catastrophes which now and again seem to strike feelings of awe into a people occurred at midnight on Friday, when one of the magnificent steamships, the Schiller, of the German Transatlantic Company's line, ran in a dense fog on to the Scilly Isles ridges, and out of passengers and crew numbering nearly 400 souls, only 43 survived. The captain and surgeon, to the honour of their memory be it recorded, stuck to their posts, refusing to avail themselves of the boats, and both perished in the general catastrophe.

A REMARKABLE discovery of human remains was recently made in a bog in the townland of Drumgallon, near Drumquin, County Tyrone. Some men, cutting turf, accidentally came on the skeleton of a man, seemingly fully dressed, and tied with ropes to some boards, with two handspokes on each side, and two hooped sticks in which the hands apparently rested. The body was enveloped in what had the appearance of a large military cloak, while around the waist was a belt in which had been stuck a knife, a horse-comb, a common comb, and some other articles whose uses are now unknown here. On the legs were tight trousers reaching to the knees, over which stockings seemed to have been drawn and then strapped on and buckled. On the feet were curious

A SEVERE outbreak of yellow fever has occurred at Rio

made shoes and silver buckles, and the hands had gloves, while on the head—the hair of which still remains, and must have reached to the shoulder—was a long cap.

THE election of the Courts of Examiners took place on Tuesday last, at the Irish College of Surgeons. The Council had, as we have reported, obtained permission of the Chief Secretary to alter their bye-laws to enable them to elect eight surgical examiners instead of seven, as heretofore. There were by this enlargement of the Court and by the retirement of Dr. Christopher Fleming two necessary vacancies. In addition to the outgoing examiners who sought re-election, the following gentlemen offered themselves: Mr. Henry Gray Croly, Dr. William Frazer, Dr. Henry J. Gogarty, Dr. Peter C. Little, Mr. M. Harry Stapleton, and Dr. William Thomson.

According to the terms of the Charter, the following seven members of Council were chosen by lot to elect, viz.—Dr. Chaplin, Dr. Morgan, Dr. Ledwich, Dr. Smyly, Dr. Kirkpatrick, Mr. John Hamilton, and the Vice-President, Dr. Edward Hamilton. Mr. Croly and Mr. Thomson were ultimately chosen to join the former Examiners in the new Court.

The following gentlemen were elected unopposed:—

Examiners in Midwifery.—Dr. Henry Croly, Dr. John R. Kirkpatrick, and Dr. William Roe.

Examinership in General Education.—Dr. Henry J. Tweedy, Dr. Stewart Woodhouse, and Dr. Frank J. Davys.

At the Clinical Society of London on April 23rd a case of fibroma was related, under the care of Dr. Gustavus Fritsche, weighing thirty-five pounds, and successfully removed in the surgical clinical establishment at Warsaw by Dr. Kosinski. The growth in all probability was congenital, as directly after birth a little dark spot was observed in the position of the subsequent growth. It increased slowly, and assumed great dimensions, so that the patient could not stand long, could not lie on her back, and could not work. Three years before admission she observed a sore place on the lowest part of the growth, whence escaped an enormous quantity of serous fluid. When admitted, the patient was seen to be of medium stature and weakly constitution. Her skin was pale, rough, and covered with a great number of dark brown spots, especially on the extremities. In the sacro-lumbar region was a large tumour hanging to the knees of the patient when she was in the erect position. The pedicle of the tumour extended from the eleventh dorsal vertebra to the junction of the sacrum to the coccyx, and on the sides to lines drawn perpendicular from the ends of the eleventh ribs. The skin covering the growth was of a brown colour, and was very thick. At its lower part were numerous enormously enlarged lymphatic vessels in and under the skin. The whole mass was very soft, and felt like a bag filled with a gelatinous mass. The tumour was removed by a circular incision made round the pedicle; and afterwards, by a few deep cuts, the mass was separated from the body. A large quantity of blood was lost, and the patient after the operation was very weak and exhausted. The healing of the wound, which was retarded by an attack of erysipelas, occupied six

months. The growth weighed thirty-three pounds, without the fluid and blood which escaped during the operation, and which would have weighed at least two pounds. Microscopic examination of the tumour showed that it consisted of long bundles of cellular tissue, which was in some places very loose. These bundles contained many spindle-cells, and formed a network, the meshes of which contained much fluid, with a great percentage of albumen and many wandering cells.

THE MEDICAL BENEVOLENT COLLEGE AND THE VOTING SYSTEM.

THE following memorial, signed by 1,342 governors and subscribers as a protest against the abuses of the present system of voting and canvassing, was presented to the Council of the Medical Benevolent College by an influential deputation on Wednesday last:—

“To the Council of the Royal Medical Benevolent College.

“We, the undersigned subscribers, beg respectfully to submit our views on the mode of appointment to the benefits of charitable institutions, and on the abuses arising out of canvassing, with the hope of inducing you to take some further step with a view to the relief of the applicants for the benefits of this institution.

“We fully acknowledge that in passing the following resolution you have already taken one step, though but a slight one, in order to mitigate the evils so generally admitted to exist.

“*Resolution already passed.*—‘That the names of such governors as shall signify to the secretary in writing their objection to be canvassed be placed in the catalogue on a separate list.’

“The aim of this resolution is to relieve those subscribers who object to be canvassed from the personal annoyance of receiving applications; it will no doubt, to a certain extent, effect this object, but in so doing, it will only relieve those who are perfectly well able to help themselves; it leaves the candidates exposed to the wear and tear, to the expense, and, as regards a large proportion who never succeed, to the eventual increased disappointment and loss arising out of the system of canvassing. Although, therefore, we recognise with pleasure in this resolution a proof that the Council of the Royal Medical Benevolent College are ready to give consideration to the objections to the system of canvassing, we are of opinion that the arrangement proposed by the resolution cannot be accepted as a material step towards the solution of the real question at issue. The great evils to which we would beg most especially to draw your attention are the expense, the harassing anxieties, and the waste of valuable time inflicted upon the whole of the long lists of candidates by the necessity of canvassing for the benefits to be conferred only on a few. As it is not proposed in the resolution already passed to abolish canvassing, but only to permit particular subscribers to express their desire not to be canvassed, the objections to this part of the existing system are not removed. Another most serious objection to the present system is that it furnishes no criterion of the comparative necessities and qualifications of the candidates (necessities and qualifications which vary widely), but on the contrary, that it enables those who have the wealthiest and most influential friends to succeed, to the detriment of the most helpless and friendless. The only possible remedy for this as it appears to us, is that the cases of all the candidates should be investigated and classified as they already are in several other charities, and that canvassing be no longer permitted. To this, as a solution of this important question, we recommend that the attention of the Council should be directed. We therefore beg respectfully to record our opinion against the existing system, which obliges the applicants to undergo a laborious, uncertain, and expen-

sive canvass in order to obtain votes which, under the existing system, must be necessarily given without due investigation and comparison on the part of either the committee or the voters.

"In conclusion, we beg to assure you of our continued and cordial sympathy with the objects of this charity, at the same time remembering that our aim must ever be the relief of distress in a manner as free as possible from its needless aggravation."

We trust this memorial may exercise its legitimate influence on the Council of the Medical Benevolent College in determining the steps to be taken towards initiating a reform of acknowledged abuses which surround the present scandalous voting system, and whereby the helpless and friendless mostly go to the wall. The hopeless scramble for the few annual vacancies that must take place may be gathered from the present list. There are forty-one candidates to fill *four vacancies*; the applicant whose name heads the list is up for the *sixth* and last time, and wanting 3,000 votes to win an election. What a shameful and hopeless waste of time and money must the mother of this boy have been cruelly subjected to, and for no good purpose whatever! while another poor widow, Mrs. Nind, left with *ten children, without provision even for the most immediate wants of the family*, writes through a friend: "The circumstances of this case are very distressing, and from the expense incurred in canvassing votes, it seems very doubtful if funds for a second canvass can be procured."

Can this mockery of charity be permitted to go on in an institution ostensibly devoted to the relief of the widow and the fatherless?

Literature.

THE ELEMENTS OF EMBRYOLOGY. (a).

THE series of which this book forms the first part will supply a want long felt by many who have either desired to enter upon the investigation of this most fruitful subject, or to obtain a comprehensive and detailed account of the development of the embryo. The literature of any country cannot boast the possession of a work containing a complete history of the subject to the present time. The celebrated work of Kelliker is now five years old, and owing to the rapid strides made by the science during that period the work has become one of many landmarks to indicate the progress made in this field of observation, instead of being, as formerly, a text-book for the embryologist. The necessity for such a work as that now under consideration is evident when we consider that, owing to the huge number of labourers in this field of research, accurate and important observations are scattered through the literature of every civilised country. The collection of these facts becomes to the linguist a work of no small difficulty, and yet it is of the greatest importance for the advancement of the science that embryologists should know what has already been done. The warmest thanks are due to the authors, not only for having weeded out important assertions from this abundant literature, but for having confirmed the observations so collected before presenting them to the student. The work is, therefore, no less especially designed for those who, not content with reading the results obtained by others, wish to verify such observations, or intend to tread the pathless territories of original research, than for the less ambitious, who would trace out *practically* the development of the embryo for themselves. To meet these ends the authors have arranged their matter in such an admirable manner that the various phases from the impreg-

nation of the ovum to the birth of the mature animal may be studied with the greatest facility.

The path of original histological investigation is beset with many, very many, difficulties, not the least being the attainment of a knowledge of the various methods adopted by other investigators. Much discrepancy in recorded observations may certainly be attributed to a want of uniformity in the application of "methods." A great step in the advancement of science would be made if the expounders of original research were to publish with their discoveries *an accurate account* of the methods employed in arriving at them. Such an arrangement was partially carried out by some of the writers in "Stricker's Handbook of Human and Comparative Histology," but then it ended with merely a statement of the reagent employed, no directions being given for their application. Dr. Greene has appended to the last edition of his "Pathological Anatomy" a fairly good description of the simple methods of preparing tissue for examination, and, as was anticipated, it has proved invaluable to students. We are very glad to see the difficulty removed from the work now under consideration by the introduction of an appendix containing practical instructions for studying the development of the chick. Amongst other matter of great interest is found a description of incubators, instructions for hardening, embedding, section cutting, staining, and mounting preparations; at the same time a list is given of the important points to be noticed in the preparations made in accordance with the foregoing instructions, forming a complete guide for the demonstration of every statement contained in the text. The authors are evidently fully alive to the value of teaching by direct observation, for we find it stated in the preface—"The worth of such a book as this will be very small if the student simply contents himself with reading what is written; and to facilitate the only really useful mode of study, that of actual observation, a few practical instructions have been added."

The development of the chick forms the theme of the present volume, "being the animal which has been most studied, and the study of which is easiest and most fruitful for the beginner."

In the second part the authors propose to consider the embryonic histories of other vertebrates, in so far as they differ from that of the bird, the development of the special organs receiving a more detailed consideration.

The third part will be devoted to an exposition of the main facts of invertebrate embryology, and to the discussion of general morphological considerations.

The introduction presents a short but interesting review of the history of the subject from Aristotle to the present time.

The first chapter treats of the structure of the hen's egg, its earlier history, including impregnation, yolk cleavage, formation of blastoderm, and descent of the ovum..

The second chapter presents a brief summary of the whole history of incubation, and forms an introduction to the subsequent six chapters, each of which is devoted to a minute account of the changes occurring on the first day, second day, and so on to the sixth; this latter includes all the subsequent changes to the end of incubation, since by this time all the organs have become differentiated, and have taken up their position.

In the last chapter we find a special account of the development of the skull, which, the authors hope, may serve as an introduction to the study of Professor Kitchen Parker's elaborate Memoirs.

The text is printed in two types, the larger containing the more important facts, whilst debated matters and details of minor importance have been put in small type. The text is illustrated by upwards of seventy figures, many of which are original. Both text and illustrations are alike remarkable for their clearness and freedom from error, indicating the immense amount of labour and care expended in the production of this most valuable addition to scientific literature.

(a) "The Elements of Embryology." Part I. By M. Foster, M.A., M.D., F.R.S., Fellow of Trinity College, Cambridge, and F. M. Balfour, B.A., Fellow of Trinity College, Cambridge. London: Macmillan. 1875.

Correspondence.

BELLADONNA AS A PROPHYLACTIC OF SCARLATINA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR.—In reply to some observations made by Dr. Lowe on an article contributed by me to your very valuable journal as to belladonna being a prophylactic of scarlatina, I wish to state that in bringing forward my "solitary instance" I lay no claim whatever to any originality, being aware that Hahnemann introduced the drug as a prophylactic on the ground that it produces effects analogous to those of scarlatina. I thought some time ago that I would administer it as a prophylactic of scarlatina even in solitary instances, without waiting for an epidemic, with the idea that by its aid I would have only a solitary instance, and belladonna has not altogether disappointed me. Dr. Woods, in his "Practice of Medicine," states that Dr. John Gardner has treated thirty cases, some of which were of alarming violence, by means of belladonna, without the loss of a patient; high German authorities have successfully used it as a prophylactic; so I came to a *thinking conclusion* that whatsoever good results may be attributed to the use of belladonna as a prophylactic of scarlatina, no bad results could be. I thought I was bound to use every possible precaution to prevent the "solitary instance" alluded to spreading to an epidemic, so I administered belladonna as a prophylactic, and perhaps it was the means of preventing its spread, as the solitary instance, I am glad to say, was the only one in the district of Delvin.

I am, Sir, your obedient servant,
WILLIAM CARLETON.

Delvin, Killucan, 25th April, 1875.

REPRESENTATION ON THE COUNCIL OF THE IRISH COLLEGE OF SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR.—The time is now fast approaching for the election of the Council of the Royal College of Surgeons in Ireland, and I wish to direct the attention of the Fellows to the unequal representation on the Council of the College of the Medical Schools.

On consulting the pages of the "Irish Medical Directory" I find that the School of the Royal College of Surgeons, with about 190 students, has four representatives on the Council; the Ledwich School, with nearly the same number, two representatives; Trinity College, with about 170 students, two representatives; Steevens' Hospital School, with about 70 students, two representatives; whilst the Catholic University School, with about 90 students, and the Carmichael School, with about 80 students, are not represented at all.

The College derives its income solely from the fees paid by the pupils of these schools, and it is but fair and reasonable that they should be represented on its Board.

I am, Sir, your obedient servant,
M. J. KILGARRIFF, F.R.C.S.I.

MR. RICHARDSON'S PRESSE ARTERE—THE FRENCH AND DUBLIN SCHOOLS OF SURGERY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—The *Jour. de Méd. et de Chir. Pratique*, March, 1875, in an article on "Bloodless Surgery," contains the following: "A short time since M. Verneuil made a long and important communication to the Société de Chirurgie on 'Forcippresure.' The professor thus designates the application of forceps in the wound to produce hæmostasis; everyone employs forceps in ligaturing arteries, but it has often been PROPOSED to leave the forceps in the wound on any particular vessel to arrest bleeding, and M. Verneuil, after reporting a case wherein such a practice had been useful, has given a very complete history of the operation. In this history he has shown that many surgeons had invented and reinvented forceps of more or less complicated character," &c., &c.

On reading the above I thought it might not be out of place to remind your readers of the "Presse Artère" invented by Mr. Richardson, of the Adelaide Hospital. In the month of April, 1869, I was present, and assisted at an operation—a modification of Symes' section of the ankle-joint, when

Mr. Richardson employed his "tubular presse artères," one placed on the anterior tibial artery, and a second on a bunch of vessels in the underneath flap, which, after thirty hours, was removed. No hæmorrhage followed. I watched the case daily. Next day the presse artère was removed from the "anterior tibial," when slight bleeding ensued, which ceased spontaneously.

In December, 1870, Mr. Richardson, in amputating at the knee-joint, applied his presse artère to the popliteal artery, and allowed it to remain 121 hours. On its removal not a drop of blood escaped. The results in both cases were perfectly satisfactory. My reasons for making these observations are to show that six years ago forcippresure was successfully practised in Dublin, and also that on reading the remainder of the communication by M. Verneuil, I am convinced that he must not have been acquainted with, or must have overlooked the safe, simple, beautiful, and uncomplicated presse artère invented by Mr. Richardson, a description of which will be found in the *Dublin Quarterly Journal of Medical Science*, November, 1869.

I am, dear Sir,
Yours faithfully,
ALEXANDER PHAYRE.

St. John's Bridge, Kilkenny,
May 6, 1875.

Obituary.

HENRY THOMPSON, M.D., F.R.C.S.I.

Few surgeons have attained a higher rank in their profession than Dr. Thompson, who for 29 years so ably filled the responsible position of Surgeon to the County Tyrone Infirmary, and whose death, on the 8th of last month, it is to-day our melancholy duty to record. Born in the year 1812, of an old Irish family, he at an early age showed an uncommon aptitude for scientific pursuits. Educated at Portora Royal School, he entered Trinity College. Finding that the arts course interfered with his medical studies, he left the University, and attached himself to Dr. Steevens' Hospital, under the late Mr. A. Colles, whose confidential pupil and apprentice he was for upwards of five years. In the year 1833 he obtained the licence in surgery and midwifery, and eleven years after the Fellowship of the Royal College of Surgeons. From Dublin he proceeded to Glasgow, where he obtained his M.D. degree in 1834. He shortly after entered on practice in Dublin, and was rapidly rising to a good position, when his health gave way, and he was most reluctantly obliged to seek employment in the country.

The Richill Dispensary was vacant, and he was appointed to it. Two years afterwards he was elected physician to the Trillick Dispensary, where he remained for seven years; and on the Tyrone Infirmary becoming vacant he was unanimously appointed surgeon to it, and the County Gaol. When leaving Trillick he was presented with a handsome silver tea-service as a token of the value entertained of his services by those among whom he laboured, and by whom he was so much esteemed and respected. Dr. Thompson's contributions to medical and surgical literature are many and valuable. It was he who invented and first employed the principle of sudden relaxation in the reduction of dislocations—an invention the immense value of which is well-known; he was the first surgeon in this country who successfully excised the elbow-joint, giving the patient a most admirable and useful arm; as he was also the first in Ireland who successfully excised the knee-joint for a gunshot injury as a primary operation. Among his other writings we may mention three successful cases of lithotomy and one of popliteal aneurism (*Dublin Hosp. Gaz.*), case of typhus, illustrating the effect of large doses of quinine in fever (*Dublin Med. Journal*), a case of amputation of both feet by Chopart's method, showing the advantage of conservative surgery, several cases of amputation of the thigh, and one illustrating the good results and advantages of a peculiar method of forming the anterior and posterior flaps, as suggested by him some time previously (MED. PRESS AND CIRCULAR). A few years ago he published in the *Dublin Medical Journal* a second paper on popliteal aneurism, with a drawing of an instrument devised by him for the application of continuous pressure, and with which he treated a patient and was able to effect a cure when all other methods had failed. Dr.

Thompson was a brilliant and most successful operator, as the cases from time to time published in this and other journals fully testify; he was also a well-educated and accomplished physician, a thorough gentleman, kind, humane, and tender with his patients; he was beloved by them, looked up to by all creeds and classes, and universally respected for his ability, his high reputation, his unsullied honour—he was, in truth, an ornament to his profession and to the country in which he lived. No higher tribute could be paid to any man, and certainly none deserved it better. Among the leading members of his own profession he held the very highest place, and under his able management the Tyrone Infirmary attained a name second to that of no other hospital in Ireland or in any other country for the successful treatment of medical and surgical cases.

The grave has now closed over all that was mortal of our dear departed brother, and it remains but for us to express our deep sympathy with his widow and family in their great sorrow. We sincerely hope that the mantle worn by a worthy father may descend upon the son, who, we are glad to see, has been so fortunate as to succeed to all his father's appointments, so that he may follow his bright example and be an honour, like him, to the profession which he follows.

Medical Affairs in Parliament.

HOUSE OF LORDS.—*Friday, April 30th.*

THE POLLUTION OF RIVERS.

The Marquis of Salisbury, after directing attention to the state of the law regarding the pollution of rivers, laid a Bill on the table to provide a remedy for the present objectionable state of things. With this object, he proposed to refer all cases of alleged pollution to the County Court, to prohibit the pouring of noxious matters into rivers hereafter, and to compel those who now exercised the right of doing so to render the matter as innocuous as possible. Power was also given to the Local Government Board to sue the local sanitary authority, where it neglected to enforce the law in such cases.

The Artisans' Dwellings Bill was read a third time.

HOUSE OF COMMONS.—*Monday, May 3rd.*

THE VACCINATION ACT.

Mr. Sclater-Booth, in reply to Mr. B. Denison, who asked whether his attention had been formally called to the systematic evasion of the Vaccination Act by the Skipton and Keighley Boards of Guardians, and the consequent greatly increased death-rate from small-pox, said that he had received no report of the systematic evasion of the vaccination laws at Skipton, where only one death from small-pox had occurred during the last quarter; but they stated in their last report that the guardians had stated it to be their intention to proceed against defaulters. At Keighley there had been thirty-seven deaths during the last quarter from small-pox, and the guardians had distinctly refused to instruct their officers to enforce the provisions of the Vaccination Act. The Local Government Board had, therefore, given directions that measures should be taken for an application to the Court of Queen's Bench to enforce the provisions of the law.

Monday, May 10th.

VIVISECTION.

Dr. Lyon Playfair gave notice to introduce a bill to prevent cruelty and abuse in experiments made upon living animals for the purpose of promoting scientific studies.

Medical News.

Royal College of Surgeons of England.—The following gentlemen passed their primary examination in Anatomy and Physiology at a meeting of the Court of Examiners on March 30:—

Barker, Frederick R., St. Thomas's Hospital.
Bennett, Henry James Lee, St. George's Hospital.
Birdwood, Roger Alan, Guy's Hospital.

Broster, Arthur Erdswick, University College.
Collington, Arthur G., Guy's Hospital.
Culhane, Frederick William Slater, University College.
Davies, Morgan, London Hospital.
Diamorr, Henry, Guy's Hospital.
Goodridge, E. W. G., St. Thomas's Hospital.
Heald, Robert, University College.
Hearnnden, William Frank, Guy's Hospital.
Jakins, Percy Septimus, St. Mary's Hospital.
Lewis, Charles Blake, King's College.
Loader, Edward James, St. Thomas's Hospital.
Nicholson, William Rumney, University College.
Pain, Alfred, Guy's Hospital.
Pendleton, Henry Nathaniel, St. Mary's Hospital.
Rigby, William Bradshaw, St. Bartholomew's Hospital.
Salter, John Reynolds, University College.
Shaw, Charles Thomas Knox, Guy's Hospital.
Stamp, William Dunn, Guy's Hospital.
Tritton, William Parsons, King's College.
Young, Archibald Pringle, St. George's Hospital.

The following gentlemen passed on May 3rd, viz. :—

Battams, James Scott, St. Mary's Hospital.
Bradley, Charles Augustus, Manchester School.
Burt, Alfred, Guy's Hospital.
Buxton, Alfred St. Clair, Guy's Hospital.
Campbell, Robert Huntly, St. Thomas's Hospital.
Chubb, William Lindsay, Guy's Hospital.
Coffin, Thomas Walker, King's College.
Collington, John William, Guy's Hospital.
Crallan, G. E., B.A. Cantab., St. Bartholomew's Hosp.
Creagh, Stephen Henry, St. George's Hospital.
Evans, Edward Pritchard, Middlesex Hospital.
Foster, Nelson Spersholt, King's College.
Gabb, James Percy Alwyne, University College.
Hall, Robert Dunsterville Grant, St. Thomas's Hospital.
McCrea, John Frederick, Guy's Hospital.
Manby, Herbert Lynsey, Guy's Hospital.
Mortimer, John, University College.
Sayer, Tom, University College.
Steventon, Walter Thomas, University College.
Strover, Walter, Guy's Hospital.
Thomas, John Raglan, St. Bartholomew's Hospital.
Watts, Edward Corrigham, King's College.
Webster, John, University College.
Wright, Christopher St. John, Guy's Hospital.
Young, Williams Henry Frome, St. George's Hospital.

The following gentlemen passed on May 4th, viz. :—

Bucky, Robert Greville, University College.
Cooper, Peter, University College.
Corbyn, Frederic Henry, King's College.
Corder, Sheppard Ransome, University College.
Cross, Horace Edward Firmin, King's College.
Ensor, Theodore Francis, King's College.
Fabien, Lewis, University College.
Goulder, Frank Samuel, University College.
Hamilton, Henry T., Charing-cross Hospital.
Harris, Arthur Byam, King's College.
Hinton, James Thomas, Guy's Hospital.
Hudson, James, University College.
Lee, Roger, Guy's Hospital.
Lynn, Edward, Guy's Hospital.
Marsh, Frank, King's College.
Risk, Reginald Rodd Tudor, King's College.
Shepherd, Henry John, Guy's Hospital.

Fifty-five candidates out of the 176 examined having failed to acquit themselves to the satisfaction of the Court of Examiners, were referred to their anatomical and physiological studies for three months.

Complimentary Dinner to Dr. D. Campbell Black.—Many of our readers will doubtless remember some of the various contributions to this journal by Dr. Black. It appears that this gentleman, who is one of the Physicians to the Glasgow Royal Infirmary, has resolved to quit Scotland for the more extended field of practice in London. This resolve being known, a considerable number of professional and lay friends resolved to invite him to a farewell dinner, and to present him with some token of their esteem and good wishes. Accordingly a dinner was arranged last week, presided over by Professors Buchanan and Macleod, to which about sixty sat down. After the usual loyal toasts, the Chairman proposed the toast of the evening, "Health and prosperity to Dr. Black," in the course of which he paid a high compliment

to Dr. Black for his energy and professional skill, and expressed what he was sure was the sincere wish of all present, that success might attend Dr. Black in the field of enterprise to which he was about to transfer his energy and ability. Dr. Black acknowledged the honour which had been done him, bearing testimony to the kindly feelings which since his entrance on active life had characterised his relations with his professional brethren. Mr. Raphael then, in the name of the subscribers, presented Dr. Black with a handsome microscope, which was suitably acknowledged, and the meeting separated.

The Hospital for Sick Children, London.—The twenty-third annual meeting of the governors of this hospital was held on Thursday last, under the presidency of the Hon. Arthur Kinnaird, M.P. According to the report of the committee of management, during the year ending December 31st, 1874, above 15,000 children were under treatment. The handsome new building which is being completed close to the hospital is the chief feature of the society's work in the past twelve months. It is expected that it will be publicly opened at the close of this summer. The additional number of inmates which can be received when it is finished, and the increased facilities for the development of the general objects of the institution, will be of immense benefit to many of the poor of the metropolis, and it will also afford wider scope for the scientific and professional aims of the staff. Dr. West was elected a vice-president, and the names of several gentlemen were added to the committee. The chairman appealed through the press to the public, that in order to complete and furnish the new building, which would be worthy of the metropolis, 10,000*l.* would not only be acceptable, but very necessary. The proceedings concluded with a vote of thanks to the chairman.

NOTICES TO CORRESPONDENTS.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—*£12s. 6d.*, at the offices in London, Dublin, or Edinburgh.

SOCIETY FOR RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN.—At the annual meeting of the Society, held last Friday, the following resolution was carried unanimously:—
"That a vote of thanks be given to the editors of the medical journals for their great kindness in giving publicity to the proceedings of the Society in every possible way."

DR. COLLINS McELROY, Zanesville.—Communication received, and will be considered.

DR. W. H. D.—The addition has been made.

ANALYST.—A paper will be read this evening upon the subject of your note at the Society of Arts by Mr. Jabez Hogg at 8 p.m. The Secretary will doubtless furnish you with a ticket on application.

DR. POWERS.—A correspondent has forwarded us a circular which is being freely distributed through the post and otherwise, wherein the individual bearing this name, and laying claim to various diplomas and degrees, offers to cure all manner of diseases of the eye, including certain forms of blindness. Our correspondent is much annoyed in the neighbourhood of this man, and wants to know what he is to do. If he chooses to put the law in force we think he will have no difficulty in proving him to be practising illegally. We have before expressed our opinion that he is an arrant quack.

DR. HY. B.—*Hall's Journal of Health* is an American publication. We do not know if it is kept in this country by any of the American houses.

CLINICAL SOCIETY OF LONDON.—On Friday evening, at 8½ p.m., Mr. Jonathan Hutchinson will exhibit a Patient with a rare form of Malformation of the Head, with Protosis. Dr. T. Henry Green, "On a Case of Acute Fatty Degeneration of the Heart." Dr. Broadbent, "Absence of Pulsation in both Radial Arteries, the Vessels being full of Blood." Dr. Geo. H. Evans, "On a Case of Dilated Heart from Valvular Disease; Right Ventricle tapped by error, not only without harm, but with relief of symptoms."

To the Editor of the MEDICAL PRESS AND CIRCULAR.

Sir,—Permit me to inform those of your readers who may still be in doubt as to my views upon medical subjects that the system which I practise differs widely from that of Hahnemann, and that I altogether object *stare sub nomine umbra*. I have written to the same effect to the *Lancet* and the *Medical Times and Gazette*.

I am, Sir, your obedient servant,

Upper Norwood, London, S.E., EDWARD HAUGHTON, A.B., M.D.
4th May, 1875.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Routh, London. Dr. Campbell Black, Glasgow. Dr. Boyd Muesett, New Brighton. Dr. Bathazar Foster, Birmingham. Dr. Billing, London. Dr. T. Parkinson, Burnley. Mr. J. Parkinson, Prestwich. Dr. Morgan, Dublin. Mr. Rivington, London. Dr. J. W. Martin, Portlaur. Dr. Davy, Terenure. Mr. Tichborne, Dublin. Dr. Drysdale, London. Dr. Bathurst Woodman, London. Dr. Macnamara, Torquay. Dr. Ogilvie Will, Aberdeen. Dr. Griffiths, Dublin. Dr. Waring Curran, Mansfield. Dr. Davidson, Chester. Mr. Blackett, Society for Relief of Widows of Medical Men. Dr. Robert Pringle, Edinburgh. Dr. Cornish, Modbury. Dr. Kely, Walsall. Mr. Baker, London. Mr. Higgs, London. Mr. Jabez Hogg, London. Dr. Collins McElroy, Zanesville. Dr. Gillespie, Clonsa. Dr. Blakely, Dublin. Dr. Townsend, Miltown-Malbay. Dr. Lynch, Williamstown. Dr. Fulton, Saint field. Dr. Rowan, Moneylane. Dr. Moore, Rockcorry. Dr. Donovan, Killynane. Dr. Stoney, Durrrow. Dr. Robinson, Ballintra. Dr. Letheby, London. Dr. Hamilton, Dublin. Dr. Anderson, Newry. Dr. White, Londonderry. Dr. Burgess, Fethard. Dr. Murdoch, Dublin. Dr. Bridge, Wellington. Dr. Kirkpatrick, Dublin. Dr. Petar, Longford. Dr. Blackett, Southwold, Notts, &c.

VACANCIES.

Abbeyleix Union, Ballinakill Dispensary District. Medical Officer. Salary, *£100*, exclusive of fees. An emolument is also attached of *£20* as Sanitary Officer. (See Advt.)

Royal Free Hospital. Honorary Surgeon. Application to Mr. Blyth, at the Hospital. (See Advt.)

Central London Sick Asylum District. Assistant Medical Officer for the Infirmary at Highgate. Salary, *£100*, with board and residence. Also a second Assistant and Dispenser. Salary, *£110*, with dinner. Non-resident. Printed forms of application supplied on application to the Clerk at the Infirmary, N.

Worcester Union. District Medical Officer. Salary, *£45*, with fees extra. Applications to Mr. Knott, 14 Foregate Street, Worcester.

Leighton Buzzard Union. Medical Officer of the Union and Medical Officer of Health. Combined salaries, *£203* per annum. Applications, testimonials, &c., to the Clerk to the Guardians, Leighton Buzzard.

Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 65 Market Street, Bradford.

Salop and Montgomery Counties Lunatic Asylum. Assistant Medical Officer. Commencing salary, *£100* per annum, with board, residence, &c. Applicants should address the Clerk to the Visitors, Shirshall, Shrewsbury.

Birmingham General Dispensary. Resident Surgeon. Commencing salary, *£130*, with board, &c. Candidates must address the Secretary.

APPOINTMENTS.

AVELING, E. B., B.Sc., Lecturer on Comparative Anatomy at the London Hospital Medical College.

BLAKISTON, Mr. A. A., Resident Clinical Assistant at the Hospital for Consumption and Diseases of the Chest, Brompton.

BRAZORS, A. E., M.D., a Physician to the Mineral Water Hospital, Bath.

CARTER, R., M.B., a Surgeon to the Mineral Water Hospital, Bath. HEMMING, C., M.D., M.R.C.S.E., Medical Officer for the Workhouse and for No. 2 District of the Abingdon Union.

JACKSON, J., L.R.C.P.Ed., L.R.C.S.Ed., L.M., Medical Officer for the North Bierley Union Workhouse.

KITCHENER, T., M.D., M.B.C.S.E., Medical Officer for the Etwell District of the Burton-on-Trent Union.

M'CORMACK, M. P. C., L.R.C.P. Government Medical Officer, Jamaica Mill, C. J., L.R.C.S.Ed., Medical Officer and Public Vaccinator for the Parish of Kerrisuir, Forfarshire.

MOLONY, J. L.K.Q.C.F.I., L.R.C.S.I., Medical Officer and Sanitary Officer, &c., for the Dromahaire Dispensary District of the Manorhamilton Union, co. Leitrim.

ORB, J. W., L.R.C.P.Ed., Resident Clinical Assistant at the Hospital for Consumption and Diseases of the Chest, Brompton.

PALMER, M. H. C., M.R.C.S.E., Medical Officer for No. 2 District of the Newbury Union.

PATTERSON, T. A.B., M.D., Medical Officer to the Oldham Workhouse.

POWELL, R. D., M.D., F.R.C.P.L., a Physician to the Hospital for Consumption and Diseases of the Chest, Brompton.

SANDELL, H. W. A., L.R.C.P.Ed., Medical Officer for the Milton District and of the Workhouse of the Gravesend and Milton Union.

STEWART, Dr. E. S., Junior Resident House Surgeon to the Ardwick and Ancoats Dispensary, Manchester.

Marriage.

LEVER—WOODS.—At St. George's Church, Dublin, John Lever, M.D., Gowran, co. Kilkenny, to Helena Maria, eldest daughter of Thos. Woods, M.D., Parsonstown, King's County.

Deaths.

CROTTY.—On the 29th April, Richard S. Crotty, L.R.C.P.Ed., of Liverpool, aged 38.

HAMMOND.—On the 27th April, at Pitt Street, Edinburgh, William Hammond, M.D.

KAVANAUGH.—On the 30th April, Michael T. Kavanaugh, L.R.C.P.Ed., L.S.A., of Jamaica Road, Berrynosey, in his 27th year.

LANG.—On the 15th April, at Fawcett Street, Sunderland, John Lang, Surgeon, aged 78.

MACSWINNEY.—On the 1st May, James MacSwinney, L.A.H.D., of Galway, aged 64.

NORMAN.—On the 22nd March, at Rio de Janeiro, Hugh Norman, L.K.Q.C.F.I., Medical Officer S.S. *Merrion*, aged 28.

RIDLEY.—On the 3rd May, at his residence, Moore Hall, Tullamore, King's County, John Ridley, M.D., aged 69.

WILKINSON.—On the 25th April, John Wilkinson, M.R.C.S.E., of Charlotte Street, Hull.

Advertisements.

ROYAL MEDICAL BENEVOLENT COLLEGE.—Notice is hereby given that the ANNUAL GENERAL MEETING of the GOVERNORS of the College will be held at the Office of the College, 37 Soho Square, on Wednesday, the 19th of May, at 4 o'clock precisely.

Notice is also given that the ANNUAL ELECTION of PENSIONERS and FOUNDATION SCHOLARS will take place at the Freemasons' Tavern, Great Queen Street, on Wednesday, the 26th of May, when Two Pensioners and Four Foundation Scholars will be elected. The ballot will commence at 12 o'clock and close at 3 o'clock precisely. Notice has been given to the Council that S. S. Larcombe is withdrawn as a candidate for a Foundation Scholarship.

Any Governor who may not have received the balloting-paper to which he is entitled is requested to communicate with the Secretary, at the Office of the College in Soho Square. Annual subscribers whose subscriptions are in arrear are not entitled to vote. Balloting papers are issued immediately on receipt of new subscriptions.

By order of the Council,
ROBERT FREEMAN, Secretary.

37 Soho Square, London, April 28th, 1875.

DUBLIN INFIRMARY for DISEASES of the EYE and EAR, Ely Place.

Ophthalmic and Aural Surgeon:
ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S., Ex-Ophthalmic and Aural Surgeon to the City of Dublin Hospital.

Consulting Physician:
EVORY KENNEDY, M.D. (Hon. Caus.) T.C.D. and Edin., Fellow and Ex-President King and Queen's College of Physicians.

Consulting Surgeon:
GEORGE H. PORTER, F.R.C.S.I.: M.Ch. T.C.D. (Hon. Caus.), Surgeon in Ordinary to Her Majesty the Queen in Ireland; Fellow and Ex-President, R.C.S.I.; Senior Surgeon to the Meath Hospital.

Obstetric Physician:
JOHN CRONYN, M.D., F.R.C.S., Professor of Midwifery, Roy. Col. Surgeons; Ex-Assistant Physician Rotunda Hospital.

Work, Income, and Expenditure for Twelve Months			
Annual number of Dispensary patients
Number of visits paid by such patients	5,847
Number of patients within the Infirmary	124
Number of operations performed	163
Total gross expenditure per bed per annum	...	£27	15 0
Average expenditure per intern patient	1 10 6

The Infirmary is wholly dependent on private benefactions, and is in debt to the Medical Officer. SUBSCRIPTIONS ARE EARNESTLY SOLICITED

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £35 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of five guineas gives the donor a life-vote. Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office.

40 MOLESWORTH STREET, DUBLIN,
W. O'NEILL, Secretary.

ABBEYLEIX UNION.

BALLINAKILL DISPENSARY DISTRICT.

MEDICAL OFFICER WANTED.—The Committee of Management of the above Dispensary District will, at their Meeting to be held in Ballinakill, at 12 o'clock noon, on THURSDAY, the 20th MAY next, proceed to elect a properly-qualified MEDICAL OFFICER for the District, at a Salary of £10 per annum, exclusive of Registration and Vaccination Fees, and £20 a year for Salary as Sanitary Officer of the District. No Candidate will be elected by the said Committee unless he is prepared, as he will be required, to reside in the town or townland of Ballinakill.

Applications, with Testimonials, Diploma, &c., to be lodged with me before 12 o'clock on the 20th instant.

The personal attendance of Candidates on the day of Election will be required.
By order,
CHARLES COMERFORD,
Honorary Secretary.
Dispensary, Ballinakill,
3rd May, 1875.

ROYAL FREE HOSPITAL, Gray's-inn-road.—There is a VACANCY for a SURGEON in the HONORARY MEDICAL STAFF of this Hospital, in consequence of the death of Mr. John D. Hill. Candidates must be Fellows of the Royal College of Surgeons of England. The election rests solely with the General Committee of Management.—Applications, with testimonials, to be forwarded to the Secretary, at the Hospital, on or before MONDAY, the 24th May.
JAMES S. BLYTH, Secretary.

HUNGARIAN WINES.

Mr. MAX GREGER (from HUNGARY),
WINE MERCHANT to HER MAJESTY THE QUEEN, THE LORD LIEUTENANT of IRELAND, AND THE GENTLEMEN of THE HOUSE OF COMMONS,

Begs to inform the public that he has appropriated a convenient room above his vaults at 7 MINCING LANE, E.C., and 2 OLD BOND STREET, W., London, where every description of Hungarian Wines can be tasted free of any expense.

Ready for supply, sample dozen cases, each containing two bottles of six different kinds of such Wines, which are highly recommended by the Medical Faculty. Prices at 30s., 50s., and 44s. per case. Carriage free. Cash on delivery.

Country orders to be accompanied by a P.O.O. or cheques crossed "the Bank of England."

Agents for Ireland ANDREWS & CO. and SMYTH & SON, Dublin.

HOFF'S MALT EXTRACT.

PATRONISED by the PRINCE OF WALES and the ROYAL FAMILY of Great Britain, and principal Courts of Europe, Nobility and Gentry of England and the Continent, also by the principal Physicians and Medical Practitioners at home and abroad.

HOFF'S MALT EXTRACT is beneficial in cases of Weakened or Diseased Digestion; in obstinate Catarrhs and Coughs, Hoarseness; Catarrhal Diseases of the Bronchial Tubes; in cases of Progressive and Tubercular Consumption; and in cases of Bodily Weakness and Exhaustion.

HOFF'S MALT EXTRACT has the best and most Testimonials of any medicinal and invigorating preparation yet produced. It is in high repute and the demand fast increasing while the testimonials daily received bear out its intrinsic worth.

HOFF'S MALT EXTRACT has, by its own intrinsic merits, earned for itself a reputation as a curative and invigorating remedy, not surpassed by any other. It possesses a very agreeable flavour, and is adapted to the most enfeebled digestion.

HOFF'S MALT EXTRACT. Pamphlets, with Directions for use, and Testimonials Distinctions from Emperors, Kings, Princes, Physicians, with Medals from Learned Societies, may be had (post free) of the Sole Consignee—

S. NEWMAN, 31 King William St., City, London.
Price 2s. per dozen, carriage free. Sold by all respectable Chemists.

BICHLORIDE OF METHYLENE.
THE NEW ANÆSTHETIC.
Superior in its action, and pronounced to be much safer for administration than chloroform, 2s. per oz.
COMPOUND ANÆSTHETIC ETHER, for producing Local Anæsthesia.—SPECIAL ADVANTAGES: Lower specific gravity and boiling point than pure Sulphuric Ether, less odour, and quicker action in producing insensibility. In 4-oz., 10-oz., and 20 oz. stoppered bottles, 2s., 4s., and 7s.
STYPTIC COLLOID, for promoting the Healing of Wounds by the first intention, for treating Open or Fetid Wounds, and for arresting Hæmorrhage. In 2-oz. and 4-oz. bottles, with brush, 2s. 6d., and 4s. 6d.; 16-oz., 12s.
OZONIC ETHER, or ETHERIAL PEROXIDE of HYDROGEN, for Diabetes. In 4-oz. bottles, 3s. 6d.; 16-oz., 12s.
PEROXIDE OF HYDROGEN. In 4-oz. bottles, 2s.; 8-oz., 3s. 6d.; 16-oz., 6s.
CHARCOAL CAPSULES, containing pure Vegetable Ivory Charcoal. In boxes, 2s. 6d. each.

The Medical Press & Circular.

ON THE SCIENTIFIC AND EMPIRICAL INVESTIGATION OF EPILEPSIES.

By J. HUGHLINGS JACKSON, M.D., F.R.C.P.,
Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

CHAPTER V. (continued). PHYSIOLOGY OF EPILEPSIES.

As I have stated in Chapter II., on Definition, the discharging lesion in every epilepsy is supposed to be a permanent lesion; there is grey matter, which, since it is permanently under conditions of abnormal nutrition, is permanently abnormal in function. This permanent abnormality is, however, varying; the grey matter occasionally reaches high tension, and therefore occasionally discharges (or is discharged). There are waves of stability and instability in the "discharging lesion." (a)

(a) It follows from this that the first fit is supposed to be a discharge of a part which has for some time before been in a state of mal-nutrition; and a still further inference is, that such "causes" of epilepsies as fright are only determining causes of the first explosion. Many of the "premonitory symptoms" of a first attack are probably results of slight discharges. They are miniature fits. I think, too, that very slight discharges are causes of irritability and distress to epileptics. Their general nervous tension is high. I once congratulated a mother on the fact that her son had not had a severe fit. She, however, regretted it, saying that the severe fit "cleared his system," while the slight fits rendered him, from their frequency, unable to go to business. Medically speaking, I think it better that a patient should have many slight fits than that he should have one violent seizure. Indeed, were it possible to frequently discharge the area of epileptic grey matter, it would, I think, be good practice to do so. The object would be to discharge it when its tension was small and its potential energy little. When tension is high and the potential energy great, discharge of the morbid part leads, I think, to discharges of lower and healthy centres, and thus to discharges of respiration and other disastrous effects; slight dis-

It is not difficult to understand that from a permanent abnormality of nutrition of a part, there can result occasional disorderly exhibition of function of that part. The process in epilepsies roughly corresponds to what is supposed to occur normally in the ganglia of the heart. There is here, it seems to me, only a particular application of a certain physiological principle long since put forward by Paget. Thus, I quote from Baker's edition (seventh) of Dr. Kirkes' "Physiology" (p. 141): "Why these nervous centres [nervous ganglia of the heart] should issue impulses for rhythmic rather than for continuous action, is still a debatable point. The most philosophical interpretation yet given of it, and of rhythmic processes in general, is that by Mr. Paget, who regards them as dependent on rhythmic nutrition—i.e., on a method of nutrition in which the acting parts are gradually raised with time-regulated progress to a certain state of instability of composition, which then issues in the discharge of their functions, e.g., of nerve force in the case of the cardiac ganglia, by which force the muscular walls are excited to contraction. . . . All organic processes seem to be regulated with exact observance of time; and rhythmic nutrition and action, as exhibited in the action of the heart, are but well-marked examples of such chronometric arrangements." (No italics in original.)

Schröder van der Kolk writes, as his fourth conclusion on epilepsy, that "the special seat and starting point of these convulsive movements is situated in the ganglionic cells of the medulla oblongata, which, as reflex ganglia, possess the peculiar property that, when once brought into an excited condition, they may more or less suddenly dis-

charges would not, I think, discharge, or would not discharge many, healthy centres. The statement that cases of epilepsy in which mental infirmity follows are the very cases in which there are slight fits is not an argument against such a procedure. For really the fact is that mental infirmity follows in cases where the discharge begins in the highest nervous processes—that is to say, the true relation is with the important seat of the discharge, not so much with the slightness of the discharge and consequent slightness of the fits. In those epilepsies where the discharge begins in the very highest nervous processes mental infirmity follows, because they are the highest.

charge themselves and communicate their influence to different nervous filaments. After their discharge a certain time is required to bring them to their former degree of excitability, and to render them capable of fresh discharges, just as we see to be the case with electric batteries, or in the phenomena of an electrical fish." (a)

I use the word "instability" for the condition of the grey matter in the "discharging lesion;" it includes two things—(1) High tension (much potential energy), and (2) Unstable equilibrium (readiness for discharge, conversion of potential to actual energy). The higher the tension the more unstable the equilibrium. "Speaking generally," says Spencer ("First Principles," p. 293), "stable compounds contain comparatively little molecular motion, and in proportion as the contained molecular motion is great the instability is great."

It may, however, be asked—How is it that with a permanent local lesion of the brain there are not permanent local symptoms—symptoms in the intervals of the discharge? If a discharge of a particular part of the brain produces severe movement—say of the arm—how is it that the patient can move his arm well in the intervals of the paroxysm? For a part of the brain representing movements of that limb continues "diseased" (b) at all times, and when the patient is at his best.

For this amounts to saying that the patient can move his arm apparently well when a part of the brain which represents movements of that arm is "diseased." This is indeed the case. We have so far used the general term "diseased," but we will use a more precise expression.

A part of the brain may be altogether *destroyed* without causing any obvious symptoms; but discharge of that part would cause severe symptoms. Supposing the part of the brain to represent movements of the arm, that part may be lost without causing loss of movement of the limb (palsy); but a strong discharge of it would cause violent movement of the limb (spasm).

The reason why the patient does not suffer paralysis from lack of the part destroyed is that the movements it should represent are also represented in neighbouring parts. Let us consider this point.

We supposed (see p. 399—7c) the corpus striatum to be divided into three parts, each third representing muscles of the face, arm, and leg. Each third, however, represents all these muscles, but each represents them in a different combination; we symbolised the several representations as $x^2 y^2 z$, $x^2 y^3 z$, $x y^2 z^3$. (c) The convolutions near to this centre are evolved out of it—that is, they re-represent in more numerous and more intimate combinations the muscles which are already represented more simply in the corpus striatum. So we may suppose that the muscles of the face, arm, and leg, which are all represented in each of three places in the corpus striatum, are all represented in each of nine places in the next range of evolution—that is, in the convolutions. Thus limited destruction in this higher range will have less effect than an equal quantity of destruction of the corpus striatum. Suppose that a patient should lose from a certain sized lesion of the lower-centre (corpus striatum) one-third of the power he should have over the muscles of the face, arm, and leg, he would on the principle of evolution lose only one-ninth of his power over these muscles if a lesion of the same size occurred in

(a) "Syd. Soc. Trans.," p. 283.

(b) I have several times spoken of paralysis of a part after a convulsion in which that part had been first and most involved. I am, however, correct when using in the text for some cases the expression, "use his arm well in the intervals," because in many cases there is no obvious palsy after the seizure, and when there is it is transitory. Besides, I think when there is palsy that palsy is not due to morbid condition of the area of grey matter, which is unstable. It is owing to exhaustion of nerve fibre of some subordinate centre, consequent on discharge of that unstable grey matter.

(c) The reader must never forget that the "organ of mind," like lower centres, is supposed to represent impressions and movements.

our next stage of evolution—that is, in convolutions evolved out of the corpus striatum.

We have here another illustration of the Principle of Compensation. But next comes the question. Admitting that the patient could do *without* part of a motor nervous centre, how is it that from *discharge* of such part, when it is not destroyed, but unstable, he suffers not only spasm, but *very severe* spasm? If loss of the part causes practically no loss of function at all, why should discharge of the part lead not only to function, but to exceedingly great function?

The paradox is explained by the Principle of Evolution, many times adverted to in these chapters. Let me make a general statement. (a)

The process of Evolution results in such a kind of representation of muscles that the higher the centre the less effect does a given quantity of destruction of part of it produce, and the *more* effect does discharge of an equal quantity of it produce. The reason is that the process of Evolution is such a one that it results in a multiplication both of fibres and of ganglion cells from the lower to the higher centre. Of course the more fibres in a centre there are representing an external region, the less paralysis must result from destruction of a part of that centre; and equally obvious is it that the more ganglion cells there are, the greater external effect (convulsion) must be produced by discharge of a part of that centre. Briefly, the higher the centre the more tolerable is a given quantity of destruction, and the more intolerable a given quantity of instability. The most striking case is that if a part of the *very highest* centres be removed, there may be no obvious symptom; whereas discharge beginning in them will put instantly in action all the muscles of the body.

"The conclusion I have arrived at from the study of cases of disease is, that the higher centres are evolved out of the lower. The higher centre re-represents more specially the impressions and movements already represented generally in the one below it. The co-ordinations are continually being re-coordinated; for example, those of the pons and medulla are re-coordinated in the cerebrum. (b) There are in the lower centres sensori-motor processes for very general purposes, but in *their* higher representatives for the more special. A rude symbolisation would be to suppose the pons Varolii to represent the simpler sensori-motor processes of the cord raised to the 'fifth power,' and the cerebral hemispheres these processes suddenly raised again, let us say, to the 'fiftieth power.'"

The following quotations from Spencer's "Psychology," vol. i., bear closely on the increase of "explosive" material during increasing complexity of nervous centres (no italics in original):—

"Meanwhile these centres in which molecular motion is liberated are also the centres in which it is co-ordinated; and the successively higher and larger centres which evolve successively larger quantities of molecular motion, are also centres in which successively more complex co-ordinations are effected, whence follows the general result that along with each further development of the nervous system, enabling it to make all parts of the body work together more efficiently in simultaneous and successive actions, there goes an increased power of evolving the energy required for such larger aggregates of actions."—*Op cit.*, p. 67.

(a) In an Appendix to this chapter I give quotations from former papers, which show that I have long held the views here stated as to Compensation in nervous organs. I am anxious to show that they are not opinions hastily formed.

(b) "This progress (see 'Principles of Psychology,' vol. i., p. 67) from co-ordinations that are small and simple to those that are larger and compound, and to those that are still larger and doubly compound, is one of the best instances of that progressive integration of motions, simultaneously becoming more heterogeneous and more definite, which characterises evolution under all its forms."—*Herbert Spencer*. [This foot-note and the paragraph in the text it refers to are reproduced from "West Riding Asylum Reports," vol. iii., 1873.]

"Each vesicle, or each portion of grey matter that establishes a continuity between the central termini of fibres, is not merely a connecting link; it is also a reservoir of molecular motion, which it gives out when disturbed. Hence, if the composition of nerve is determined as above indicated, it follows that in proportion to the number, extensiveness, and complexity of the relations, simultaneous and successive, that are formed among different parts of the organism, will be the quantity of molecular motion which the nerve centres are capable of disengaging.

"... the quantity of molecular motion evolved in the nervous centres will become great in proportion as the nervous relations increase in integration and heterogeneity."—*Spencer, op. cit.*, p. 35.

I think the statement in the following quotation, although to the same effect as the two above, is better suited for my purpose:—

"— this establishment of more numerous, more involved, and more varied relations among the parts of the organism, implies not simply this grouping of fibres and this arrangement of centres, but also a multiplication of the nerve-corpuscles, or portions of grey matter, occupying their centres. And we found it to follow that where the compound relations formed are among many points, or where the points are to be combined in many orders, or both, great accumulations of grey matter are needed: an important corollary being that the quantity of this matter capable of giving out much motion increases in proportion as the combinations to be formed become large and heterogeneous."—*Spencer, op. cit.*, p. 45.

Hence, in the convolutions there is not only great complexity of representation of movements and impressions, but, as a consequence of this, there is a large quantity of explosive material.

Let us consider the process with some artificial illustrations. Suppose that a nervous centre, which we will name the First centre, represents three (a) different movements of the muscles of the same external part. The next higher centre which is evolved out of the first—we call it the second centre—will, we suppose, represent nine different movements of the external part; the third centre will represent eighty-one different movements, and so on. The higher centre re-represents more elaborately what the lower centre has represented. At length each part of the highest centres of all will fully represent innumerable different movements of just the same muscles represented by very simple movements in the lowest centre. Now, of course, however little the difference may at length become in the movements as they are greatly multiplied, the nervous process for each one of them requires new fibres and requires separate ganglion cells. We have both more conductors and more generators of nerve force. Differentiation of Function implies Differentiation of Structure. Hence, as stated, the higher the centre is in evolution, in other words, the greater the number of different movements the centre represents, the greater the multiplication of both cells and fibres.

Putting this in another way, we say that the number

(a) Of course the numbers given here are quite arbitrary. Moreover, the illustration is inadequate in other ways. It is only to be taken as an illustration for a limited purpose. The higher centre is not simply an evolution out of one lower, but sometimes out of several lower. The highest nervous processes (the anatomical substrata of consciousness) are evolved out of all lower centres. Thus the highest nervous processes represent innumerable and widely-separated movements; hence the discharge of them produces universal symptoms nearly *simultaneously*. Moreover, the highest nervous processes represent movements with innumerable intervals; hence discharge of them produces the universal symptoms nearly *contemporaneously*. It may be said that "*simultaneous*" and "*contemporaneous*" mean the same thing. It is convenient to use the two terms, because the highest centres are evolved out of lower centres which represent movements which are not simultaneous, and which occur at different times. The process by which it finally results that the highest nervous processes represent (1) the whole organism and represent its parts (2) simultaneously and (3) contemporaneously is a gradual one.

of cells and fibres in a centre does not vary simply with the size and power of the muscles themselves, but also with the number of different movements of the muscles.

Spencer has pointed out that the size of an animal's nervous system varies not only with the size of the animal, but with the complexity of its movements. He writes:—

"But after all modifying causes have been allowed for, there remain substantially intact the fundamental relations set forth—namely, that wherever much motion is evolved, a relatively large nervous system exists; that wherever the motion evolved, though not great in quantity, is *heterogeneous in kind*, a relatively large nervous system exists, and that wherever the evolved motion is both great in quantity and heterogeneous in kind, the largest nervous systems exist."—*Herbert Spencer, "Principles of Psychology,"* p. 13.

A similar idea is expressed by Schöler van der Kolk in the following quotation. He speaks of the spinal cord, but the principle is the same:—

"The want of proportion between the thickness of the spinal cord, which was about equal to that of a frog, and the extraordinary size of the muscles, seems to show that no relation exists between the thickness of the cord and the muscular power of an animal, as I should have supposed. But the small number of ganglionic cells, and the small, scarcely distinguishable, quantity of grey matter present in the spinal cord of this fish, surprised me very much. If, however, we reflect on the mode of life and motions of the animal, this peculiarity is immediately explained. The movements of the sturgeon, in fact, present but very little variety; it strikes to and fro with its tail as well as with its fins, it curves its body to one side or to the other, but the numerous combinations of the muscles of the extremities of the higher animals, and especially of man, where extensors and flexors are at the same time or alternately in action, do not here occur. The animal does not therefore need many groups of ganglionic cells and their several combinations for harmonised movements; while, moreover, in consequence of the considerable length of the spinal cord in these fishes, the cells appear to be very much separated in the longitudinal axis of the cord, so that often on a transverse section no ganglionic cells can be found.

"If we compare, in this respect, the spinal cord of a frog, we shall find that the latter scarcely differs in thickness from the same organ in a sturgeon of 120 lb. weight. The grey matter with its four horns is here distinctly present, in which numerous, although small ganglionic cells are found; but in the spring of this animal we meet a much more complicated play of muscular action, as many different muscles contribute to accomplish the jump.

"Hence we see that in animals likewise the statement is confirmed, that the more complicated their movements, the more numerous will be the ganglionic cells with their several groups, and thicker will be the anterior horns and the mass of grey substance in the spinal cord."—*Van der Kolk on "The Spinal Cord and Medulla Oblongata and on Epilepsy,"* p. 64.

(To be continued.)

INDIAN MEDICAL NOTES—XXXVII.

(FROM OUR SPECIAL CORRESPONDENT.)

DELHI, March, 1875.

IN CAMP—THE DELHI DURBAR—THE PREVENTION OF DISEASE—THE GORGEOUS EAST.

ACCORDING to the teachings of experience, the ranges of temperature in many places are not dangerous where the air is dry, say Mooltan, 25° to 120°, the humidity at Lahore represented by 44° as compared to 81° at Greenwich, which may explain the tractability of croup, bronchitis, the arrest of phthisis. Many readers are familiar

with the road between Jack Straw's Castle and the Spaniard, and the ground beyond towards Finchley. In the place just now encamped beyond the Ridge of Delhi there are certain points of resemblance to Hampstead Heath. There are also gardens near, called Rosherville by the facetious, where the pomegranate, either in fruit or in flower, would delight Lance, Miss Mutrie, or any modern painter of specialties. Some tents are pitched under the cool, welcome, delicious shade of green trees, tenanted by singing birds; others, mine, for instance, are out in the open; the temperature this afternoon, March 23rd, is 102°; the westerly wind blows in the dust, blows out the flies. The Delhi fly defies Harper Twelvetees, scoffs at catch-fly papers, apparently lives like the cruel critic, only to cause pain and annoyance—is difficult to catch or kill. What pleasure can it afford the fly to hover about or constantly to settle down on the nose of Bardolph, or to get into the food or down the throat of the undersigned, who in vain attempts to take up the parable, the discussion of the dry earth system. The fact of the matter is, what with the entrance of the Viceroy into Delhi, the visits in state paid by Rajahs, Maharajahs, Nawabs, and folks of that ilk, entitled to salutes ranging from eleven to seventeen guns, the return visits of the Viceroy, accompanied by the personal escort, and involving salutes of twenty-one guns, the gay appearance of Delhi, carriages-and-four, outriders, body-guards at every point constituting the *cortège* of native potentates of various degrees, the entertainments given by the Viceroy in the magnificent canvas palace, all are a little bewildering, requiring mental digestion. The hot weather, too, militates against medical composition. This morning the first English Durbar was held near Delhi, the first, at all events, since the Mutiny. In a splendid saloon, fitted with glass chandeliers, soft carpets, and everything suitable for such occasion, sat the Viceroy of India in a gorgeous chair of silver and gold appearance, the footstool in harmonious keeping. Behind, in uniforms of scarlet and gold, stood retainers, some holding silver maces surmounted by crowns in red velvet and gold, others had those soft silky yaks' tails, whilst the remainder carried fans with exquisite fringes, the centre ornamented with the royal arms. From the entrance into the hall up to the throne a wide clear space separates the European officers, civilians, political agents, clergy, residents, special correspondents from the Rajahs, native princes, and potentates whose turbans, flashing with diamonds and emeralds, and whose arms, encircled by bracelets of rubies, excited enthusiastic admiration—in fact, entirely dazzled the most apathetic spectator. Necklaces of pearls, rubies, emeralds, diamonds, sapphires, the most lovely colours blended in the dresses, whilst the handsome, majestic appearance of certain princes all riveted attention. One splendid old warrior had a dash of the Scotchman, Richard Cœur de Lion, and the King in Hamlet," and by all accounts dearly does he love the bagpipes. The other evening a fierce-looking chieftain, whose blood-and-thunder moustachios were tied in a knot on the top of his head, wore emeralds about the size of half-a-crown, yet they looked more like dull glass than precious stones. That evening, too, the Rajah of Puttiala wore jewels worth thousands of pounds, and his robes of azure blue and white satin well adorned a handsome, manly personage. At the review, in a general's uniform of scarlet and gold, relieved by the blue ribbon of the Star of India, by jewelled epaulettes sparkling in the sun, also wearing buckskin breeches and boots which would have delighted George IV., and mounted on a fine horse with leopard-skin trappings, the Rajah of Puttiala was the observed of all observers. So he was to-day, in another kit worthy of Sardauapalus. At the Durbar the native princes were severally introduced, very many receiving presents, such as shawls, cups, clocks inkstands, photographic albums, tea services, salvers, shields, guns. The most distinguished personages were attended to by the Viceroy, who touched the gifts bestowed on the minor magnates. Then followed the speech, every word clear

and distinct, just a casual allusion to Baroda affairs *sub judice*, to the prosperity, the tranquillity of the land, to a difficulty in Burmah; and after expressing the deep interest taken by her Majesty the Queen, it was announced that the Prince of Wales would probably visit India, the greatest of the jewels in England's Crown. All this was interpreted to the natives, who received attar of roses on the hand sufficient to leave perfume, besides betel-nut preparation wrapped up in tinfoil called pan; then the ceremony ended by the band playing a slow march, whilst the Viceroy, accompanied by the Lieutenant-Governor of Bengal and a brilliant staff, leisurely left the room under the boom of twenty-one guns. A cocked hat and green feathers in the procession suggested the doctor, and the recollection recalls the propriety of returning to professional topics. At dinner last night met Dr. De Rinzi, Sanitary Commissioner of the Punjab, who has worked so hard to improve Indian water supply, and whose writings have so greatly enriched the London medical journals—for instance, a paper in the *Lancet* on fever which clung to Millbank Prison from 1821 until 1854, when the water supply was changed, since which period the general health has been so good that barracks for troops have there been proposed. A firm believer in the contagion of cholera, the communicability of deadly diseases by water or milk, he directs attention in a recent pamphlet to the fact that from 1849 to 1865 Bombay was never free from epidemic cholera. In 1865 the Vehar water was introduced in iron pipes, and the surface wells were closed in numbers. Bombay is not particularly clean, nor the drainage immaculate, and the crowding corresponds to the slums of Glasgow or Liverpool, whilst the sun plays on the rich and poor as usual, the rain falls on the just and the unjust; still cholera has dwindled to a minimum. Colaba, formerly the Peshawur of Bombay, is now very healthy, the fact of the barracks being connected with the Vehar water pipes to be coincidentally remembered. The enormous expense of sanitary improvements, the impossibility to establish quarantine without making the remedy worse than the disease, the impossibility of medical officers in times of deadly epidemics to find calm leisure for scientific research, when their own energies, mental and bodily, are taxed to the utmost, should be considered by those who cavil at the slow progress of sanitary wheels so frequently clogged. After the subsidence of pestilence there may be but scanty sources of information, everything changed, and somehow the parallel is suggested of a visit to the smoking ruins of the Opera House, where, but a few hours before, the same person sat in the stalls in the full enjoyment of "Don Giovanni"—the difference cannot be realised. In this camp the earth system to-day is admirably worked; the urinals are separate; receptacles frequently changed—emptied at a distance; also tarred receptacles for use at night. The good well-water is passed through Macnamara filters—charged with fresh sand and charcoal before leaving Meerut fourteen days ago, the rations good, the duties light, clean straw in the tents, the sides of which are kept open night and day, allowing free perfusion, for bad air of human beings causes most mischief. White clothing worn to-day; each individual wears a belt also, and can have a bath at pleasure. A number of men of excellent character naturally ask leave to see the Fort, the gardens, temples, tombs, streets, the curious sights of Delhi three miles off. One visitor may drink at his own expense, or be treated by a friend and companion in arms, the liquor very variable, always objectionable before the cool of the day. Another, allured by the dark-eyed syrens in red pajamas, may contract a souvenir—a hard chancre. Young blood must have its course, and every dog his day; yet to the end of time will there be found, even in the ranks of medical men, opponents to sanitary endeavours to keep down that frightful pitiable terribly destructive disease termed syphilis, which kills so many innocent, virtuous women, or robs them of their children. Another pilgrim, a total abstainer, may either break the pledge and run

smuck, or else quench burning thirst with dirty water conducive to diarrhoea, dysentery, enteric fever, worms, or boils; so the sanitary arrangements in camp may be rendered futile. The temperance movement in India, involving no expense, is one of the chief stepping-stones towards the preservation of health—the prevention of disease in this thirsty land, where gradually the abstainers, receiving help, encouragement, and assistance, will be very cunning and careful about their water-supply, the safest drink being cold tea. Stopping the issue of beer and rum will only increase the trade in pernicious liquor. A certain number of persons in this exhausting climate cannot fight the battle of life without some small stimulant daily, which they do not exceed; but, unfortunately, too many take too much. In a former letter it should have been stated that the huge elephant which carried the Viceroy the other day also conveyed Lord Lake through the city of Delhi in 1803. This afternoon the jewellers, the ivory-painters, the dealers in lace, in shawls, fans, shoes, in wood-carving, in cunning work in steel and gold, in steatite, soap rock, agates, and mosaics, displayed their treasures in the Institute. These are "Medical Notes," otherwise a paper would be written on the most wonderful exhibition ever witnessed by an inveterate sight-seer whose taste for years has been amply indulged. The ladies lost their heads altogether over the rings, lockets, bracelets, tiaras flashing with pearls, rubies, emeralds, sapphires, diamonds, the embroidered shawls, banner screens, and those wonderful white Skye-terrier-looking opera-cloaks. The exquisite paintings on ivory illustrating the wonders of India, copies of portraits, some gorgeously coloured, others resembling pen-and-ink etching, would have pleased Sir Henry Thompson and Mr. Seymour Haden, both of whom have written on the earth system. There were extraordinary designs for paper weights, candlesticks of steel and gold—in fact, we were struck all of a heap with astonishment; and when such an exhibition occurs again in any part of India may we be there to see.

Hospital Reports.

METROPOLITAN FREE HOSPITAL.

(Under the care of Dr. CHARLES R. DRYSDALE.)

Inherited Syphilitic Tongue Disease.

MRS. ELIZABETH R., aged 40, came to this hospital on June 3rd, 1873. She is a Jewess.

She has been married 23 years, and has had thirteen children, of whom only two are alive. The children were born alive, but most of them had eruptions and snuffles. About a fortnight after marriage she became ill, and had eruptions on vulva; about three months after which sore throat and eruptions over the body appeared, which continued for some two years. At present the patient has some slight inflammation and ulceration of the soft palate, evidently syphilitic in character. Tertiary disease of palate.

The first child lived nine months, after her being without children for two years.

The second lived three months.

The third lived fifteen months, looked aged, and snuffled.

The fourth, Hester R., is now aged sixteen years, and was very ill as a baby, having had "terrible sores" on the buttocks, sore mouth, &c., which remained for about three months. She has always been under doctors for the last fourteen years, and is now better than usual.

The child had such peculiar and ugly upper incisors that they were removed by the dentist, the patient now having false teeth. There are the marks of sores about the mouth in infancy. Her intellect is much retarded. The tongue has several nodules in its centre, about the

size of peas, and is glazed all over, as is often the case in syphilitic tongue in adults. No affection of the eyes has occurred as yet.

The fifth child died at six weeks old.

The sixth died with measles at nine months.

The seventh died at twelve months old.

The eighth died at nine months old.

The ninth died a few months old.

The tenth was healthy, but died of scarlatina.

The eleventh child is now alive, and aged thirteen years; is reported to be quite well.

The twelfth died of scarlatina.

The thirteenth died of measles at eighteen months.

Patient ordered to take gr. x. pot. iodid. thrice daily.

This prescription had the effect of causing cicatrization of the sores on the soft palate in a week or two; but on omitting the remedy for a few weeks, two ulcers appeared on the region of hard palate, threatening perforation. These again cicatrised on taking the iodide of potassium in rather larger doses for a month or two.

The tongue of the girl was somewhat benefited by painting it with a solution of nitrate of silver once a week, and the patient's health was benefited by taking drachm doses of the syrup of the iodide of iron in infusion of quassia.

Remark.—This is one of the most remarkable cases of hereditary transmission of syphilis that has come before the notice of Dr. Drysdale for many years. In the first place, the mother was a Jewess—a fact in itself worth noting, since, as Hutchinson remarks, the Jews are not so frequently syphilitic as the rest of the world. This is one of the only cases of inherited syphilitic disease of the tongue Dr. Drysdale has met with, and in many respects it quite resembled the disease of the tongue seen in adults. The great mortality of this woman's children resembles a case published by Dr. Drysdale some twelve years back, and quoted by Professor Gross, of Philadelphia, at a recent lecture, wherein that surgeon alleged that syphilis was one of the chief causes of scrofula and consumption.

Severe Case of Tertiary Syphilis.

John Patterson, st. 47, came to this hospital on Feb. 7, 1873. He is a sea-faring man; has for seven years past suffered from various symptoms of syphilis. About eight years ago he had an eruption all over the body and sore throat; since that time he has had, off and on, pains in both arms. He had it seems a node on the right arm, and formerly on the sternum. He has attended here some time with a large node on the left humerus, which is very painful, especially when he is warm in bed. There is also a node on sternum which is not painful; he has been hoarse for three or four months; whenever he has taken pot. iodid. he gets much better for a time, and the nodes disappear.

Feb. 7th, 1873.—At present there is a painful node on left arm and on sternum, and the patient is hoarse. To take gr. xv. of pot. iodid. thrice daily. He has no children, although his wife is in good health and he has been married eight years.

April 8th, 1873.—The node on the left humerus is almost gone; patient feels much better and is not so hoarse.

April 22nd, 1873.—No more swelling in any of the bones; feels better than he has done for years. He returned to his work able to do a day's work with facility.

Feb. 16th, 1875.—Patient returned to hospital to-day after an absence of nearly two years. Has lost much flesh; is very hoarse; pulse 112; slight dulness under left clavicle; breath sounds very indistinct. There is a large and painful node on left humerus. Posterior wall of pharynx is one large cicatrix. On the left side of the tongue there is a large hard lump. To the touch the epiglottis feels enlarged, as if oedematous. The vocal cords cannot be seen in laryngoscopic examination. Tertiary ulceration on left side of the neck, behind and below the angle of the jaw. To take gr. xv. of pot. iodid. with ʒi. tinct. cinchonæ in two ounces of water thrice daily.

March 24th, 1875.—The patient's health was very greatly improved. He was not nearly so hoarse, and the epiglottis was normal to the touch, although the cords could not be easily seen. The nodes were much smaller; pulse 84; patient has gained half a stone in weight. The uvula is soldered to the posterior wall of the pharynx.

Remarks.—This was a very bad case of tertiary disease, and one that will in all probability eventually prove fatal to the patient. It exhibits one or two points for consideration: Firstly, there is no history of mercurial treatment in the early stages of the disease. The patient seems to have paid but little attention to the eruptions, which were doubtless, as they so often are, slight, and of no great extent. If Fournier and Ricord be right, a long mercurial course of some six to ten months might have completely prevented the terrible tertiary lesions, which were only to be palliated, not cured. Secondly. The patient had no children. Several observers have lately noticed that men who have suffered much from syphilis are apt to be childless. This point is not clearly made out; but my own experience shows that in a good number of cases this does happen. Thirdly. This case illustrates also the magnificent effect of iodide of potassium, for without its aid the patient would certainly have had destruction of the epiglottis and of the larynx, which would have soon rendered the opening of the trachea his only resource. But in this case the iodide of potassium could only palliate, and some terrible catastrophe must sooner or later carry him off.

LONDON HOSPITAL.

(Under the care of Mr. RIVINGTON.)

Irreducible Right Femoral Hernia, with doubtful Symptoms of Strangulation—Consultation—Operation—Sac Opened—Recovery.

SOPHIA SECKER, 45, married, was admitted on the evening of Wednesday, Dec. 17th, 1873, at 10 p.m. She had had a right femoral hernia for twenty-four years, and had worn a truss. She was troubled with a cough, and having taken off her truss the preceding night, the hernia descended during a fit of coughing at 5 a.m. on Wednesday morning. Taxis was tried by a medical man and failed. She stated that at 1 p.m. her bowels had been slightly open. She was not sick, but she seemed confused in her mind, and it was very difficult to obtain a clear consistent account from her, and it was impossible to ascertain whether she had been vomiting or not. She had tried to put the rupture back previously to admission, and had scalded the skin over it with hot water, and removed the cuticle. There were no urgent symptoms, so the house-surgeon gave her a warm bath, and subsequently had ice applied.

Dec. 18th, 2.30 p.m.—The patient was seen by Mr. Rivington; at that time a tumour existed in the right groin. It was as large as a good-sized fist, long, and running parallel to the inguinal canal; it was not in the labium. It had been diagnosed as *inguinal*, but it was clearly *femoral*, as Poupart's ligament could be felt over it and above it. The pulse was 103, and temp. 99.8°. Tongue furred. Both Mr. Rivington and Mr. Tay who also examined the case, thought there was impulse in the tumour. Mr. Hutchinson, who saw it a little later, thought not. It was soft and fluctuating, and there was some gurgling audible occasionally at the upper part. It was rather tender, and the skin over it was dusky. The patient had taken and retained some beef-tea, and it was a question whether an operation was advisable. A consultation was held, and it was considered expedient to explore.

At 4.30 p.m., chloroform having been given, an incision was made by Mr. Rivington on the inner side of the neck of the sac, and all the structures were divided outside the neck—viz., Gimbernat's ligament, bands of transversalis fascia, and subperitoneal fat. Every effort was made to reduce the swelling without opening the sac, but without suc-

cess. Mr. Rivington, finding that there was a considerable quantity of fluid in the sac below the visceral contents, punctured the sac, and evacuated a large amount of serous fluid stained with the colouring matter of the blood. As the tumour was still irreducible the sac was opened, and a knob of inflamed intestine, with adherent omentum, was discovered. It was difficult to reduce, but it was put back. The wound was closed, a pad and bandage adjusted, and the patient sent to bed, a hydropneumocoele being administered.

Dec 19th.—Passed a good night, but coughing had brought down the hernia. Pulse 100 to 108. Temp. 103°, both morning and evening. Tongue furred. No pain in abdomen. A large quantity of sanguineous serum was pressed out of the swelling by Mr. Rivington, who returned the hernia and rebanded the patient. Patient had taken soda-water lemonade only. No peritonitis.

20th.—Good night; tongue less furred. Abdomen not tender. Wound had dusky discolouration round it. Cough, with copious mucous expectoration, continued. Bowels not open. Temp. 101.8° morning, and 100.4° evening.

21st.—Temp. 100° morning, and 101.4° evening. Wound looking well. No motion, but no peritonitis.

22nd.—Still no motion. Temp. 102.4°. Enema ordered.

23rd.—Wound healthy. Free discharge. As no motion had passed, enemata were ordered to be given till they produced an evacuation. The wound healed well, and so far as the hernia was concerned, the patient recovered in less than three weeks, but she was attacked with symptoms of general paralysis, for which she passed under medical treatment. The symptoms passed off in great measure before she left the hospital.

Strangulated Right Femoral Hernia—Reduction by Taxis

Hannah Gale, 31, was admitted into the London Hospital, under Mr. Rivington, on the 21st December, 1873. Whilst lifting a tub she suddenly felt a severe pain in the left groin. This was at 4 p.m. On the 20th, at 5 p.m., she began to vomit, and continued to do so every quarter of an hour through the night. The vomited matters smelt sour, but not fecal.

21st.—11 a.m. She was brought to the hospital in a cab, and taxis having failed, Mr. Rivington was sent for, and reduced the greater part of the swelling, which was small, i.e., about the size of a crab-apple. The reducible portion of the hernia slipped up abruptly, leaving a small swelling behind, resembling a gland or a piece of omentum. The bowels were opened in the evening, proving the efficacy of the taxis. There was no more vomiting, and all the symptoms were relieved.

23rd.—Ordered truss. After obtaining truss she was discharged.

SIR JAMES PAGET in the Chair.

PRACTICAL OBSERVATIONS ON THE PULMONARY AND CARDIAC COMPLICATIONS OF ABDOMINAL TUMOURS: WITH REMARKS ON BLOOD-LETTING AFTER SURGICAL OPERATIONS.

By WILLIAM HENRY DAY, M.D., M.R.C.P.

The author first described some of the effects of solid or cystic abdominal tumours, and of large collections of fluid in the peritoneal cavity, in displacing the thoracic organs, and inducing a long series of constitutional and local symptoms. He showed the importance of ascertaining the condition of the lungs and heart before deciding upon the removal of fluid or of tumours from the abdominal cavity. He examined

the effects of rapid and of gradually increasing pressure upon the thorax, and also the results of the rapid removal of pressure by tapping or by the removal of a tumour, advocating the gradual removal of pressure whenever practicable, and giving several instances to prove the utility of venesection in cases where portions of lung which had been compressed have rapidly expanded, and congestions or hepatisation have followed. He also gave instances in which organic diseases of the lung have been relieved after the pressure which aggravated the symptoms had been removed. He compared the pulmonary symptoms which often follow operation on the abdomen with the more ordinary forms of bronchitis or pneumonia, and gave practical details of treatment in different classes of cases. The author ended his paper by endeavouring to enforce the two following conclusions: 1. The surgeon who treats cases of abdominal distension must not overlook the pulmonary and cardiac complications which are due to compression or displacement. 2. The success of operations for the removal of abdominal tumours may be increased or diminished by careful examination of the state of the chest before operation, and by equally careful attention after the operation, not only to the parts involved in the surgical proceedings, but also to those changes in the blood and in its circulation through the heart and lungs, and to the effects on these organs, which are due to sudden removal of pressure alone, or to other causes of considerable elevation in the temperature of the blood.

Mr. KNOWSLY THORNTON, who had seen the cases referred to, thought they seemed to bear out the author's remarks on blood-letting. As to the two important questions—when should blood-letting be performed? and in what class of cases? he thought that it should be done promptly, when the first symptoms appeared—flushing of the face, with rapid pulse and hot dry skin—even though there was no rise of temperature. If this period were allowed to pass, blood-letting did not seem to act so readily. The application of cold to the head was very useful in many cases, in which there appeared to be a condition of brain which led to a rise of temperature and rapid pulse. For this purpose he recommended the cap (or a modification of it) used by Mr. Lister, by which a constant stream of water was constantly poured over the head. Under the application of cold to the head, symptoms of acute bronchitis sometimes rapidly ceased. The action was too rapid to be accounted for by cooling of the blood; it seemed as if some influence were exerted directly on the brain. This method was preferable to the cold pack in hyperpyrexia, while in septicaemia the latter was especially indicated.

Dr. PROTHEROE SMITH had for many years practised venesection in preparing patients for ovariectomy.

Mr. SPENCE WELLS doubted whether small bleedings before the operation would have much influence on the result. He rather agreed with Mr. Thornton that when it was necessary to bleed after ovariectomy the bleeding should be early and free. Since Dr. Day's paper was written he had had four or five cases in which bleeding was followed by remarkable relief. He could also bear testimony to the usefulness of the ice-cap, which had the advantage over the cold pack that the patient was not disturbed. He had lately given small and repeated doses of acornite—half a drop of the pharmacopoeial tincture every half-hour—with the effect of quickly rendering the pulse slower. The effect on temperature was less marked.

A CASE OF LEFT SUBCLAVIAN ANEURISM TREATED BY TEMPORARY COMPRESSION APPLIED DIRECTLY TO THE ARTERY IN THE FIRST PART OF ITS COURSE.

By ARTHUR FERGUSSON MCGILL, F.R.C.S., Leeds.

(Communicated by JOHN WOOD, F.R.S.)

The patient, a laundress, aged 35, had been suffering from an aneurism of the third part of the left subclavian artery for three years. She had been treated by digital compression, by manipulation, and by repeated galvanopuncture. The first two methods were adopted without result; the last with great, though temporary improvement. In December, 1874, it was found on examination that the pulsation extended upwards from the centre of the clavicle for 1½ inches and downwards and outwards from the same spot for 2½ inches. The patient was suffering much from pain; her rest was impaired, and she was rapidly becoming worse. Under these circumstances it was determined to try the effect of temporary compression applied directly to the artery at the first part of its course. On January 2nd, 1875, the operation was performed. An incision was made from the centre

of the sternum upwards along the anterior border of the sterno-mastoid for two inches, and another of the same length along the clavicle; the sternal and part of the clavicular origin of the sterno-mastoid muscle was then divided, and the anterior scalenus and first rib were reached. After searching with the finger, the artery was found displaced backwards, and an aneurism-needle was passed round it. In passing the needle a small opening was made in the pleura. The artery being isolated from the surrounding structures, a pair of torsion-forceps were applied, and left on for ten hours and a half. The next day there was a return of pulsation in the sac; but this disappeared in twelve hours. She was apparently doing well, when symptoms of pleurisy and bronchitis supervened, and she died at the end of five and a half days. Leave could not be obtained to make a complete *post-mortem* examination, but a partial examination at the seat of the operation was allowed. The forceps had been applied at the point where the vertebral was given off, and at that position the artery was patent and healthy. The aneurism, which commenced a quarter of an inch from the thyroid axis, and extended outwards for 3¼ inches, was filled with a hard clot, and was in fact cured. The operation was only performed after grave consideration. It was thought (1) that no other method of treatment could be adopted with advantage; (2) that the proposed operation was practicable; and (3) that there was a reasonable prospect of success. The second of these opinions was arrived at after making many dissections on the dead body, and after learning that Dr. Rodgers, of New York, had applied a ligature to the subclavian artery in this position. It was thought that the application of a ligature in the ordinary manner was unjustifiable, as experience showed that patients on whom this operation was performed almost invariably died of secondary hæmorrhage. It was hoped that, by applying temporary compression, this accident would be avoided; while the experience of the rapid-pressure treatment of aneurism, introduced by Dr. W. Murray, showed that a cure by this procedure was not improbable. When this method of treatment was adopted, the cure was not effected by the gradual deposition of layers of fibrine, but by the sudden coagulation of the contents of the sac. This would account for the return of the pulsation on the second day after the operation. Though in this case the treatment had not been successful, it seemed probable that it might hereafter prove so in similar cases.

Mr. JOHN WOOD said that the application of direct pressure to an artery was different from pressure from without; it was difficult to regulate the force applied so as to avoid sloughing of the vessel.

Mr. HENRY LEE said that the filling of an aneurismal sac with clot was not the same thing as curing the aneurism. He had had a case of inguinal aneurism which he treated by flexion. A clot formed; but the patient would not keep his limb bent, and the clot disappeared in two or three days. This was followed by intense and long continued pain in the course of the femoral artery, as if portions of the clot had been washed down the vessel.

Mr. HULKE said that Scarpa used a broad ligature for the purpose of occluding arteries without dividing the middle and internal coats.

Sir JAMES PAGET called attention to the method recommended by Mr. John Dix of Hull, of using wire, bringing out the ends through the skin apart from the wound, and twisting them over cork, so that the ligature could be tightened or loosened at pleasure.

Mr. MCGILL replied that the pressure was to be applied as lightly as possible, in order to avoid division of the inner and middle coats of the vessel.

PATHOLOGICAL SOCIETY OF LONDON.

TUESDAY, MAY 4TH, 1875.

G. FOLLOCK, Esq., in the Chair.

THE GERM-THEORY OF DISEASE.

THE adjourned discussion on Dr. Bastian's paper on the Germ-Theory of Disease was continued.

Dr. MURCHISON said he could not agree with the view which Mr. Hutchinson expressed, that there is a great distinction between the acute specific inflammations and the so-

called acute specific fevers. He thought that if the germ-theory be applicable to the one, it is applicable to the other; and if it is to be rejected for the one, it ought to be rejected for the other; and, moreover, propagation by means of germs has been claimed for the one as well as for the other. Dr. Burdon Sanderson had said that not much good could be expected to arise from discussing theories on this matter, and that we ought to confine ourselves to the discussion of facts; and the fact on which he specially insisted was this, that during the infective process in the course of the different infective diseases, there was a great development of bacteria, but he refused to commit himself to an opinion as to whether these bacteria were to be looked upon as causal, or whether they were pathological results. Now, this way of viewing the matter is all very well for a man of Dr. Sanderson's scientific caution; but unfortunately these observations, the discovery of bacteria in various infective diseases, and even Dr. Sanderson's own observations, and those made under his immediate superintendence, have been used by other writers as strong arguments in favour of the germ-theory of disease, and also as supporting views having very great practical importance. With regard to bacteria, the following facts appeared to him established. In the first place, bacteria may be injected in large numbers into the blood of the lower animals, and they suffer nothing. In the second place, bacteria exist in large numbers in certain tissues of the living bodies in a state of health. Thirdly, they are said to multiply very greatly after death in persons who have not died of any infectious disease. In the fourth place (this he thought a very important observation), we have been told that bacteria are developed in large numbers in a vesication on the skin produced by a chemical irritant. In the fifth place, it is also said that, in certain contagious fluids, the more the bacteria multiply the less virulent the fluid becomes. Then, lastly, there is the statement, made on good authority, that neither bacteria nor bacterial germs can be found in certain fluids eminently contagious. This last statement was first made a few years ago by Dr. Beale, in one of his contributions to this subject. These facts went a long way to throw doubt upon the causal relation between bacteria and the infective diseases. On the other hand, however, arguments have been brought forward tending in an opposite direction. In the first place, it is argued that, although some bacteria may be perfectly harmless, it does not follow that other bacteria may not be very injurious indeed; but this argument had been very well answered by an experiment of Mr. Lister's, who showed that the same bacteria might produce very different results, according to the circumstances in which they are placed. If this observation be correct, the result depends not so much upon the bacteria as upon the surrounding conditions. Then, in the second place, it is stated that in erysipelas bacteria are found chiefly in what is called the spreading zone, and not in the interior of the diseased part; but this did not tell much one way or the other. He could not see that this fact is incompatible with the notion that the bacteria may be pathological results. And, thirdly, it is stated that in certain diseases, and especially in relapsing fever and in sheep-pox, there are peculiar forms of bacteria—bacteria which are only found in these diseases, specific they may be called. But, although no doubt this is the case, these peculiar forms might be accounted for by that peculiar soil in which what may be called the native bacterium of the individual is made to grow, because we also know this, that with regard to these minute growths the most varied forms are assumed, according to the soil in which they are cultivated. Now, it appears to me, continued Dr. Murchison, that this view of the case is confirmed by what we see and what we know of the so-called spirilla of relapsing fever. These minute bodies which are found in the blood make their appearance in large numbers during the primary paroxysm of fever, but before the crisis they disappear; they are absent entirely during the intermission, and with the relapse of the fever they return, and they again disappear with the second crisis. It appears to me that these appearances of spirilla, and their sudden annihilation twice over, are best accounted for by the reason that the germ-theory is untrue. There was one fact to which Dr. MacLagan attributed great importance as an argument in favour of the germ-theory: he seemed to think that the cutaneous eruptions and the local complications of the various infectious diseases were best explained on the germ-theory, because, as he has argued, the vital germs found in the organs, which became the seat of lesions, the second factor necessary for their multiplication and growth. This is an argument,

however, which to my mind certainly has very little weight, for we find that arsenic exhibits very much the same sort of selection. You find that inflammation of the stomach, and inflammation of the rectum, will be produced by arsenic, whether it is introduced into the intestinal canal or into the vagina, or the nostrils or the skin, and it is to this predilection of certain medicines for certain organs and tissues of the body that we look for some of the greatest discoveries in therapeutics. There is one other argument to which, it appears to me, a great deal too much stress has been given in favour of the germ-theory. It is alleged that the germs of disease show that they are vital by the length of time that they will retain that power, notwithstanding their being subjected to the most destructive chemical and physical influences. Now I must say that I think this argument has been too much strained. There can be no doubt that the germs of small-pox and scarlet fever will retain their vitality for a very long period indeed, under favourable circumstances; but I myself know no facts that will show, even with regard to two such contagious diseases as scarlet-fever and small-pox, that the germs will retain their vitality for any length of time if they be freely exposed to atmospheric air; and I think myself that this is an argument which has too often been overlooked, a strong argument opposed to the omnipresence of vital germs of disease, which is a necessary element, you must remember, of the germ-theory. There can be no doubt, however, that the strong argument in favour of the germ-theory of disease is the multiplication of the poison. It is this which has been aptly compared to the multiplication of living germs. It is contended that in chemistry there is no such process, that there is no existence in chemistry of a body which excites a chemical change, being itself multiplied. Now it does not follow, however, that although no such process in chemistry may have hitherto been discovered, no analogous process to that of contagion may not yet be discovered; and in reference to this, I hold in my hand a letter which I have received from Dr. Lyon Playfair, calling my attention to one process which, at all events, is somewhat similar to what takes place in the multiplication of contagion. The substance he refers to is the substance oxamide. This substance, it is well known, is decomposed when it is boiled with acids or with alkalies into oxalate of ammonia, and if the acid selected be oxalic, as Dr. Playfair says, a small proportion of this oxalic acid will convert an infinite quantity of oxamide into oxalate of ammonia; in other words oxalic acid, the substance which excites the change, will itself be independently multiplied, quite independently of the presence of any vital germs. In speaking of this matter, then, it seems to me that it is not right to speak, as is commonly done, of the poison multiplying itself; this in itself conveys a theory, and it is far more correct to say that the poison is multiplied, which is all in fact that we really know. It may so happen that it may hereafter be discovered that these diseases are propagated neither by germs nor by any chemical process; but that they may be propagated by minute particles acting by contact in producing other similar particles, just as we find in the case of tubercles or pus. This, however, is for the present a conjecture. There are two arguments, however, which have always appeared to me to be of great weight, as opposed to the germ-theory of disease. The first is this: the fact that the great majority of persons attacked with these infectious diseases recover. It seems to me very difficult to account for this on the germ-theory. I know that it is said that they recover, because the germs have exhausted all the material in the body necessary for their production and growth; but it seems to me that what occurs in relapsing fever is opposed to this explanation. In relapsing fever we have, in the first place, a febrile process lasting a week; then there is a complete intermission of another week, and then there is a relapse, similar to, but somewhat shorter than, the first attack. Now if the germs exhausted all the material necessary for their growth in the first attack, whence comes the material necessary for their growth in the second attack, in the relapse? This material cannot be produced by the febrile process, because on the germ-theory the febrile process is itself the result of the germs. And then the last argument is one to which I have already referred, namely, the circumstance that many of these infective diseases arise independently of a pre-existing cause. The germ-theory renders it impossible to admit such a possibility, and, in fact, it may be said that those who uphold the germ-theory practically deny that it is possible for any of these diseases to arise *de novo*; but it

seems to me inconceivable that any one weighing carefully the evidence on this point, in reference to such diseases as pyæmia, erysipelas, diphtheria, cholera, dysentery, and typhoid fever, can come to any other conclusion than that such a thing is possible, as the generation *de novo* of these diseases, unless their minds be already preoccupied by the germ-theory of disease.

Mr. WAGSTAFFE stated the facts he had observed lately. He divided the results into two classes: negative results and positive results. With regard to negative results, during health no organisms of any kind are usually seen in the blood; but under certain conditions, which it is very difficult to understand, organisms of certain kinds, which we are not able to distinguish from those found in disease, are found in what we may look upon as a healthy state. He instanced a man named Marks as a curious example of this kind. He came under my notice while I was examining a number of cases of erysipelas. He was in an erysipelas ward. His blood was full of these organisms, as many as from ten to twelve being in every field of the microscope, actually moving about. I examined his blood under other conditions, when he was quite well; he was still in the same ward—at times he was well, and at times he was ill, and he always showed a large number of these organisms. Taking also a number of other cases indiscriminately, it was found, on examining the whole of the side of a large ward, that none of these patients, suffering from very different diseases, showed any definite signs of these organisms in the blood. Some of these patients were suffering from acute and subacute diseases; in some the temperature was standing at 102 deg., but in the majority the temperature was low. Some had open wounds, some had no wounds at all; and none of these cases, taken indiscriminately on a certain day, showed any of these organisms whatever. Then, with regard to positive observations, the first point to which I would refer as the result of these observations is, that pus from an open wound always contained these microzymes, these small actively moving particles. Then, with regard to the blood of patients suffering from suppurative fever, it always showed these microzymes. (I use that term as a general term, including chiefly small actively moving particles, and also dumb-bells and chains apparently of the same bodies running together.) Then a third class of cases, in which I nearly always found these particles, was the class of strumous diseases particularly affecting the bone. Here the particles varied apparently in number, according to the intensity of the constitutional disease and the inflammatory process. In cellulitis also the same results were seen. Out of twenty-four cases examined, as many as twenty showed in the blood the same moving particles, the number varying with the intensity of the disease. Then, in all cases of pyæmia examined, the blood contained these particles, chiefly dumb-bells and chains; and, in addition to these, usually a number of bodies not actively moving, apparently small plastic bodies, some actively moving, but the majority of them quiet. This observation particularly differs from that which Dr. Bastian has mentioned in his address. But I have recently had the opportunity of comparing the microzymes present in the pus of a pyæmic abscess and those present in the blood of the same patient, and these bodies were apparently identical. Another class of cases in which they were nearly always found were cases of acute syphilis; and in those cases another appearance presented itself, which is rather curious. Large plates of plastic matter, extremely granular, were seen in the field of the microscope, and the number of these particles varied with the intensity of the constitutional disease. In cases of another kind, not surgical, cases where there was no wound at all, cases of general fever, particularly of acute pneumonia, the same particles were also found in the blood, but in much smaller numbers. Lastly, I may refer to the progress of an ordinary case of a large wound of amputation. In some instances I have been enabled to follow the appearance of the blood from day to day. In one case, that of a boy whose thigh was amputated, five hours after the amputation, the temperature being 102, there were as many as from twelve to twenty microzymes actively moving in each field of the microscope; and when it is remembered to each field represents only a very small portion of a drop of blood, and that each drop represents not more than a hundred thousandth part of the body, we may assume that these particles are extremely numerous in the body in such a case. On the second day, the temperature being 101.2 deg., there were as many as twenty or thirty in every field of the microscope. On the third day,

when the temperature was 101.6 deg., they were reduced to three or four in each field. On the fourth day, the temperature being the same, they were reduced to one or two, gradually diminishing in number until three weeks after the operation, when they increased in number, with the appearance of an abscess in the thigh; after this they diminished and disappeared entirely. These facts seem to show a very close relation, as no one will hesitate to allow, between the appearance of these bodies and the active changes which are going on in the body—between the bacteria (using the term as a general one) and the inflammatory process.

Dr. GOODHART said he and Dr. Moxon during the last few years had been particularly engaged in examining in the same direction as Mr. Wagstaffe, but with results that seem to clash with his. We have taken all classes of fevers, including cases of erysipelas, one or two cases of typhus, cases of measles, scarlatina, and one case of variola. The conclusion to which we came was this: first of all, that it did not apparently seem to matter very much as to what the condition was that produced the fever; whether it was a specific fever or a case of pyæmia, or surgical fever, or what not, all the cases seemed to have very much the same appearance. As contrasted with healthy blood, the appearance we noticed was, that there was a very large amount of granular matter in the blood. In no case have we found any moving particles in the blood when the patient was living; that has been our great objection to calling what we found "bacteria." We found a large number of granules which had very much the appearance of refracting granules seen in degenerating blood-corpuscles; they had a tendency to aggregate into masses; sometimes there were large masses which corresponded almost precisely to what has been called zoogloea, and in a large number of cases there were beaded chains. In no case during life did we find anything like a rod-like particle; they were only these rounded spheroids, as they have been called, or the compound aperiods, chains, or aggregated masses; we never saw them moving. Those were very much like the granules one sees in the blood, and we were hardly disposed to call them bacteria at all, more especially as, on applying the caustic potash test, they nearly always disappeared. These experiments appeared to us to coincide exactly with the observations made by Dr. Bastian, and which were laid before this Society in 1869; they only differ in this, that he at the time found rod-like particles in the blood, and so far, I suppose, these particles which Dr. Bastian found might have been called bacteria. We found nothing of the kind. I thought very likely that the difference between his results and ours might depend upon the fact that, while we examined the blood immediately it was removed from the body, he, as far as I understood, waited some five or six hours, which I thought was sufficient to develop bacteria. To ascertain if there was any relation between the spreading conditions of erysipelas and bacteria, we removed blood from the spreading edges in cases of erysipelas, and in those cases we could come to no conclusion whatever that there were any bacteria—that is to say, in the juices we removed we could not find bacteria. We found in the blood of fever-patients the same beaded chains, dumb-bells, and spheroids, but no rods, no moving particles. Lastly, we examined cases of closed abscesses, and also discharges from wounds, sores, stumps, and so on; and there we can coincide with Mr. Wagstaffe that in all cases in discharge examined from stumps and sores, moving bacteria in chains and rods, and also in spheroids and dumb-bells, were present in large quantities. In closed abscesses, also in pyæmic cases, we did certainly in five or six cases find bacteria present.

Dr. PAYNE thought, after all, it is true that, meaning by the inside of the body the blood or the solid tissues, ordinary putrefactive bacteria are not found in the body during life, unless exceptionally and rarely; but they are, as Dr. Bastian justly pointed out, there present within a certain time, within a variable time after death. Now, I will just recall to the memory of all those who have made a great many post-mortem examinations, that there are some conditions in which these particular forms of bacteria are present in enormous numbers, and so shortly after death as to suggest at once that they must have been present immediately before. There are those cases which are known as post-mortem emphysema, where the body sometimes, as I have seen it even during a hard frost, when decomposition of the ordinary kind must have been quite arrested, swells up in a very few hours—less than six after death—to a considera-

ble size, many parts of it being filled with small cavities containing gas, and this not only in the subcutaneous tissue, but more especially in the liver, spleen, and kidneys. Now, if we examine that part of the organ which is in this condition of post-mortem emphysema, we see at once that the gaseous cavities are merely developed out of pale softening spots, that the gas is produced in these pale softening spots; and, if we examine the spots, they are really nothing in the world but tissue possessed of the commonest ordinary rod-like bacteria—the ordinary bacteria of putrefaction. There is no doubt, I suppose, that the same changes are taking place in such a body as that shortly after death, as not unfrequently take place after a considerable time. Well, what conditions give rise to this post-mortem emphysema? I think, in the great majority of cases—I am not prepared to say in all, but very nearly, if not quite, in all that I have seen—there has been before death some part of the body in a state of positive death; either there has been a gangrenous limb, or some considerable extent of bruised tissue, or, as in more than one case I have seen, there has been urinary infiltration either from rupture of the urethra, or as a consequence of some operation. Well, in such a matter, of course positive proof is not to be had, but surely what is immediately suggested by such a relation of things is this: that this portion of the body, any gangrenous portion, any portion which has been severely bruised, is, we know, filled with common bacteria, such as we find in putrefaction; and also when a part of the body, such as the scrotum or subcutaneous tissue, is infiltrated with urine from rupture, and is at the same time in communication with the air, we there find that the ordinary bacteria of this kind swarm. Therefore it appears very reasonable to suppose that from that part of the body they have passed into the blood. Why then, it may be said, did they not produce during life the same changes which they produce after death? Well, to explain that I simply accept the fact which has been insisted upon against the germ-theory, namely, that a particular kind of soil is necessary for the development of a particular species of bacterium, and possibly to some extent to determine the specific character. I suppose that these putrefactive bacteria in the healthy body cannot or do not germinate or live, and that, nevertheless, when a part of the body is in a gangrenous condition, they are liable, although not certain, to be circulated through the body, and to be waiting there till death causes the change in their tissue, which permits their more perfect germination, this germination and development causing the evolution of gas, and producing the condition I have mentioned. Now, if this be at all true, it would be confirmed by an observation which Dr. Bastian also brought forward, that the bacteria of ordinary putrefactive fluid may be injected into the body without causing any very striking symptoms. Dr. Payne added that when we examine a pyæmic case after death, we do not find the evolution of gas and other signs of active putrefaction in the place where the pyæmic lesions occur, although we do find certain organisms; therefore, this is a physiological proof of the truth that these things, whatever they are called, are not the same as putrefactive bacteria, and physiological proof, in addition to the morphological difference adduced by several observers. Therefore one can, to a certain extent, trace particular forms associated with particular disease in those parts of the body where the disease has occurred, and it is not the same as common putrefaction.

Mr. Jabez Hogg.—It has always appeared to me that pus and the lymph-cells occupy a very important share in the production of those granules of which Mr. Wagstaffe has spoken. There is one experiment that I have often repeated, and it has been repeated for me by Mr. Bell, the eminent chemist of the Inland Revenue Department, in regard to the action of pus upon the fermentable materials. I have often added (as Mr. Bell has done for me) laudable pus to sweet wort, preparations of grain, and also sugar preparations, and we have obtained very active fermentation in the ordinary space of time. On all occasions the pus-cell has broken up, and produced the bodies represented in the drawing before us. Of course the result is similar to the action of yeast. There is a considerable quantity of alcohol, but only half the quantity that would be formed by yeast. We always get a certain quantity, from 7 to 9 per cent., and we have had 12 per cent. of alcohol from the action of the pus itself. I only mention this in order to hear from Dr. Bastian whether he has made these experiments, and what action he supposes the pus or lymph-cell of that kind would

have upon those granular bodies, which I have myself observed repeatedly.

Dr. BASTIAN, in his reply, said: With reference to Mr. Wagstaffe's observations on blood in various diseases, in all my examinations, made in cases of typhus fever, erysipelas, and all sorts of affections, I never once saw a single object which I could put down as a bacterium, or which I, in my own experiments, could have ventured to cite as a bacterium. I saw, of course, many times, a number of granules in the blood, more especially in cases of fever, where granular matter is extremely abundant, and in many cases the granules would possess a much more active motion than the granules of the blood usually do. I do not pretend to understand what is the cause of that active motion of these granules, but I would not venture to say that these were independent organisms at all, and I have never yet seen in the blood of any living animal independent organisms. I have examined the blood from pyæmic patients, patients dying of pyæmia, with the greatest care, over and over again. Last year, I renewed the examinations, and never was able to find a trace of anything like a bacterium in the blood of a living person suffering from pyæmia. A very great number of observations have been put upon record with regard to the presence in the blood of these micrococci. I have a distinct objection to that word "micrococci," because it means a mere granule, a thing with no specific or definite form at all; and I have the same objection to the word "microzyme," because that has been used in precisely the same sense, and means nothing. I would never venture to say in any given case that the blood contained organisms, unless I saw that it did contain organisms having a definite shape. We get granules everywhere. Let anyone boil a little albuminous urine, and look at the granules there—you get it swarming with micrococci. You may say that these are organisms. I know no means of distinguishing between these mere granules of precipitated albumen, and the mere granules which often pass as micrococci; and, therefore, unless the things do possess a definite form, I should be very reluctant to say that they were organisms at all. Then, Mr. Wagstaffe mentions acute syphilis. I have many observations recorded of syphilis, acute and chronic, and have never been able to trace anything in that disease which had the least appearance of bacteria in the blood. Dr. Goodhart mentioned that I brought some observations to the notice of the Society in 1869, in which bacteria were found present in the blood, but I really do not recollect that myself. I know I have mentioned elsewhere the fact that bacteria are found abundantly in the blood in cases of persons dying with a very high temperature, say 109 deg. or 110 deg.; that bacteria then occur in all the vessels in different parts of the body in the greatest abundance; and this leads me to remark upon a certain statement made by Dr. Payne. Dr. Payne says that he placed no significance upon the occurrence of bacteria in the alimentary canal. He says, truly enough, we are hollow animals, and bacteria may well get in from without. But it is not only in the alimentary canal that these rod-like or ordinary septic bacteria are met with; they are found just as abundantly within the epithelium and the ducts of the skin, and in other places, and they are invariably found in all parts of the body after death. It is only a question of time, and that question of time again is a question of temperature. If the temperature be high, organisms are formed very rapidly indeed, within a few hours even in the different organs of the body. If the temperature be low, organisms are formed more slowly. There is again, it is true, another disturbing condition, and that is the state of health of the patient. If the patient die in full health, these fluids and tissues of the body may be less prone to undergo this change, the bacteria are not found anything like so frequently; but if a patient die who has been half-starved and subjected to a very high febrile temperature, or in whom gangrene has occurred in a certain portion of the body, and whose blood may therefore have been poisoned, then the fluids of that person's body are devitalised, as it were, made more akin to organic fluids existing outside, and they are proportionately prone to pass over into putrefactive changes in which, as I maintain, bacteria are bred as a mere natural consequence. Dr. Sanderson commenced by reiterating, as it were, certain facts which are not at all denied, and he rather repudiated anything like belief in the germ-theory of disease as a theory. Still, I am compelled to say that this theory is his theory practically, because in all his writings, from 1870 onwards, to those which have been published even within a few months, he speaks in this manner. He says that the phenomena of the multiplication of contagia within the body are of such a kind that they seem only explicable on the

notion of organic multiplication and reproduction. Well, if they be produced by organic multiplication and reproduction, it must either be the organic multiplication of fragments of living matter which have come from the persons suffering from the disease, or they must be independent particles, independent organisms, bacteria in fact. The members of this Society heard the curt way in which Dr. Sanderson dismissed it as a matter that could not for a moment be entertained. The supposition has been advanced by Dr. Beale that these are particles which have been thrown off from the living body subject to disease; therefore what remains for Dr. Sanderson, if the phenomena of contagions could only be explained on that supposition? There is only one conclusion which remains for him, that they are independent organisms, and I may say that the tenour of all his writings, from 1870 onwards, has been to promulgate that opinion. In support of this Dr. Bastian quoted Dr. Sanderson's papers in Mr. Simon's Reports, and then offered some remarks on the other speeches made in the discussion.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, MAY 19, 1875.

POLLUTION OF RIVERS BILL.

On the motion for the second reading of the Pollution of Rivers Bill in the House of Lords on Thursday last, "a cloud no bigger than a man's hand" appeared above the horizon that seemed to portend the gathering storm which may yet shipwreck the hopes of the Government in their present attempt to deal with this most important question. Lord Morley, while admitting that the time had passed when the necessity for legislation on this subject was disputed, dwelt upon the manufacturing and commercial interests likely to be imperilled by the Bill, and thought more consideration should be given to it, or any other Bill, before it became the law of the land. While he thought it scarcely wise to abolish the tests proposed by chemists and the Rivers Pollution Commission, he was afraid that it would be rushing into the other extreme by leaving it to the common sense of the County Court judge, and for him to put what construction he might think proper on certain clauses of the Act, or should become the sole judge of what was "filthy, noxious, or polluting."

Lord Salisbury confessed his reason for leaving the matter in such hands was, if possible, to get rid of experts, as chemists are called, who, having carefully investigated the pollution of rivers, and furnished materials for protecting the public health, are no longer wanted, because "their

opinions were tainted with the accuracy and minuteness of their scientific knowledge."

This is rather too bad on the part of the Marquis, who professed himself much indebted to Professor Frankland and others for valuable aid he has rendered in this matter, but who had declared that without some scale of tests the Bill would most likely break down. It does not admit of a doubt that it is quite possible to adopt a scale which will be satisfactory without imposing any hardship upon manufacturers; but it is not improbable that the Government desire to afford as much latitude as possible to those who wish to drive the proverbial coach-and-four through the Bill, or Lord Salisbury would never have found a reason for the prescriptive advantage proposed to be given to those who had been old offenders, that is, polluting rivers for twelve years. If such a clause is retained the work of purification will not only be impeded but indefinitely postponed.

We are inclined to favour the views expressed by the Duke of Somerset, who said, "it is ten years since the agitation began, and the conclusion at which he had arrived, after reading much of the evidence, was, that our rivers were hopelessly polluted, and that we never could make their water potable. The foul matters encumbering streams might be got rid of, but the notion of their supplying water fit to drink must be altogether put aside. Towns must be supplied with pure water for drinking purposes in some other way."

In an admirable and exhaustive lecture delivered before the Society of Arts, on "River Pollution," on Wednesday last, the lecturer concluded his discourse in the following words:—

"The great evils of the present water supply will not be abated by any half measures, or by a Royal Commission. Nothing short of having recourse to subterranean stores, artesian wells sunk into the chalk or sandstone far out of the reach of sewage contamination, will, in my opinion, afford the shadow of a remedy. The large supplies of water stored up in the deepest recesses of the earth, as pointed out by Mr. Homersham in a valuable and interesting lecture delivered in this room twenty years ago, will alone remove the evils under which we labour. Such water stores are absolutely pure and brilliant. They are entirely free from all suspended matters, and from decaying organic substances, and fæcal refuse. Neither spores, seeds, fungi, ova, or the larvæ of animals can possibly penetrate to the deep recesses of the earth. Deep well water contains probably the inorganic products of the thunderstorm of a century or more ago—a little lime dissolved out of the chalk as it passes through the rock, a little chloride of sodium, washed out of the sea ages gone by and deposited in the soil, but it contains no ammonia in organic combination, and no albuminoid ammonia. It contains what we prefer, since it imparts a sparkling briskness to the water, carbonic acid gas and air. It is, therefore, absolutely safe to drink, it is wholesome, and fit for all purposes of life, domestic and dietetic."

ANÆSTHETICS IN FRANCE.

DR. DUPLAY has been reading a report upon two memoirs of M. Darin, one entitled "Recherches sur les Anæsthetics." Dr. Darin is not of the opinion of those authors who put forward that the protoxide of nitrogen causes insensibility by asphyxia. He has seen plants and animals live in an atmosphere full of it. In practice, its innocence seems proved; out of 67,000 individuals

anæsthetised by an American surgeon, there had not been any case of death, nor had any occurred out of 300,000 cases published in the States. According to the reporter, the difficulty of obtaining a great quantity of laughing-gas, and the short time the anæsthesia lasts, have made it be abandoned.

In the discussion which followed this report, Dr. Trélat said he had read recently in Claude Bernard's treatise on anæsthetics that the protoxide is an anæsthetic of asphyxiating nature. As to the figures 67,000, which, according to the reporter, had been anæsthetised by the gas by the same person, this appeared to him unlikely, and it was an assertion coming from the other side of the Atlantic, so that it might be accepted or not, as we pleased. The anæsthetic had been, he observed, abandoned because the effect was not durable enough. Chloroform and ether are not asphyxiating, but have a tonic action on the nerve centres.

Dr. Perrin said that ether and chloroform have a poisonous effect on the elements of the nerves; this is not capable of being contested; he shared the opinion of Claude Bernard as to protoxide of nitrogen. Its action is prompt as lightning, and the awakening so rapid when the inspiring instrument is withdrawn, that practitioners are obliged to apply their instrument to the tooth beforehand. As to American observations, they must be accepted with a certain reserve. Horace Wells, after the first success obtained on experimenting on himself, was so hissed by the students on making his first public experiment that he gave it up and kept a menagerie. Since that, a statue has been raised to him.

Humphry Davy first tried the laughing-gas at Clifton, in an establishment where patients were treated by the inhalation of gases, and where the protoxide of nitrogen was the most employed. There were several cases of death. The appeal which Dr. Duplay has made (said Dr. Perrin) ought to be understood, and we should all give to the Society the facts of our practice with regard to the employment of any peculiar anæsthetic agent. At Paris very little ether is used, and yet we ought to encourage attempts, according to the advice of Petrequin, and the Lyons School, which has given up chloroform; it is true that if the use of chloroform persists at Paris it is because it scarcely does any harm.

The next speaker, Dr. Magitot, said that the recent experiments of MM. Jolyet and Blanche show that the protoxide of nitrogen is irrespirable, and that the anæsthesia it causes is produced by asphyxia; it is impossible to obtain an anæsthetic state long-continued enough for practising a long operation; and he joined himself to his colleagues in asking for a committee of inquiry on the subject of anæsthetics in general, and on protoxide of nitrogen in particular.

The next speaker, Dr. Giraud Teulon, had, after an accident with chloroform, which occurred some ten years ago, employed ether as an anæsthetic, in the American method, which consists in overwhelming the patient. In children the success is immediate, and the sleep quite calm; the pulse does not slacken, and there is not that anxiety which accompanies the inhalation of chloroform. He covers the face of the patient completely with a napkin folded triangularly, which contains a sponge on which three

or four ounces of ether are poured. In less than a minute sleep appears in children without alteration of the face or pulse, and the surgeon may act fearlessly. This morning he had performed an operation for strabismus on a young girl aged 22 by this process, who fell asleep in two minutes, without presenting any alarming symptoms.

Dr. Blot gave his adhesion to the proposition of M. Trélat as to the asphyxiating property of laughing-gas, as he had latterly been present at the extraction of a tooth in a young girl who had inhaled this gas; she had all the appearance of asphyxia, and the inhalations had to be stopped, when the colour reappeared and all danger soon vanished. As to the observations of Dr. Teulon about ether, they are rather with those he had collected when he was *interne* of M. Velpeau, in 1847. He had never employed ether in large quantities, and did not approve of the English plan. Besides, it is not the quantity of the gas which kills, and, when accidents arrive, it is almost always—and in this respect we may usefully consult a report by Dr. Robert—among the first inhalations. There are some persons who, leaving out affections of the heart and lungs, or nerves, are fatally influenced by chloroform or ether, and yet we cannot certainly predict this before trial. It is in such cases that there is enormous danger in the large doses of ether.

Dr. Perrin remarked that twenty years ago, Bonnet of Lyons, employed the so-called English plan. There had been two or three accidents, and these will be communicated at the fitting time. Chloroform does not produce in children those reflex accidents noticed in adults.

Dr. Trélat said that the word overwhelming had struck him. This is a method that may be called asphyxiating. If we make the patient breathe gently vapours which are anæsthetic, we observe three periods: 1. A period of excitement; 2. A period of tolerance; 3. A period of insensibility, soon followed by complete muscular resolution. Ether may, when given in large quantity, at once produce accidents like those of chloroform.

M. Magitot said that the procedure of overwhelming is employed in anæsthesia by the protoxide of nitrogen, as the gas is contained in a vessel at a pressure of from five to six atmospheres.

Dr. Giraud Teulon said he would bring forward a number of operative facts which had given him a tranquillity he had wished for. The facts he had were new and worthy of being compared. It is certain, he said, that we may compare the anæsthetic effects of ether and chloroform; but as to the protoxide of nitrogen, that is different. Seven or eight years ago he was struck by the asphyxiated look of a patient anæsthetised by M. Preterre, in the service of M. Nélaton. Since he had employed ether for the last ten years; he had only once had any fear, and that passed away. He had just made with M. Thaon, *internes* of M. Trélat, an iridectomy on a child of eight years of age, when all at once, when the operation was finished and the dressing terminated, he was frightened by the pallor of the child's face. A few manœuvres were required to put an end to this condition. And that was the only time where he had seen any comparison between the accidents arising from ether and chloroform.

Dr. Giraldès confessed he had a weakness for chloroform. The action of this agent is far more rapid on chil-

dren than that of ether, which he had been obliged to give up; so that, until his ideas changed, he would prefer chloroform. It had happened to him in certain cases to produce anæsthesia by ether rapidly, but ten days ago he had been obliged, after employing, in the way recommended by Dr. Giraud Teulon, 200 grammes of ether, to have recourse to chloroform to anæsthetise the patient. Many English surgeons prefer chloroform; at St. George's Hospital, in London, much ether is used. There have been no accidents with ether; and if we ask practitioners why ether is such a favourite with them, they reply that they are more sure with this agent than they are with chloroform. The inhalations of ether produce first of all a characteristic drunkenness; and lately he had had to knock down with chloroform a vigorous young man he was about to operate on for phymosis, and who wished to fight with him.

Dr. Duplay said he had limited himself to the part of historian. The memoir of Dr. Darin was not original, but the analysis of many works. He thought that the question of protoxide of nitrogen was not decided; he knew the experiments of MM. Jolyet and Blanche, which were related in the memoir. M. Darin had made experiments contradictory of these. We must strive to elucidate the question, and see whether the asphyxiating property of the gas is sufficiently proved. In America it is given continuously. Marion Sims published a case of ovariectomy which lasted one hour and a half. With regard to ether, there was in the memoir a series of letters addressed to certain English journals, relative to the manner in which the Americans administer it, and ether was shown to be much safer than chloroform.

Dr. Lefort said that in England the surgeon had not the responsibility of the accidents which might arise; there is a physician especially devoted to anæsthetics. In 1845 he had been anæsthetised by laughing-gas. Since then he saw Preterre anæsthetise in the wards of Dr. Saint-Germain, at the Midi, an individual with phymosis. The blue and turgescient visage of the patient had terrified him.

Notes on Current Topics.

Chester County Asylum.

THE Commissioners in Lunacy conclude the report of their visit to this asylum as follows:—"We have to express our opinion that the condition of this asylum reflects much credit upon those to whom its management is confided."

The report of the medical superintendent, Dr. Davidson, gives some interesting points:

The recoveries of the past year, reckoned on the admissions, give a percentage of 31·8; which recovery rate compares unfavourably with that of the preceding year, the percentage being then 42·2. This less favourable result is, of course, due to the intractable or hopeless character of so many of the new cases from which the recoveries are principally drawn. In thirty of the recovered cases the length of residence in the asylum varied from less than one month to six months, and in thirteen

cases for periods from six to twelve months, most of the patients having been admitted before the disorder had been of long standing. Besides the recoveries, 22 patients were discharged as relieved, and 14 as not improved.

The number of deaths which occurred in the course of the year was 32 males and 11 females, or 21 deaths fewer than in the previous twelve months. The difference in the mortality of the sexes is very marked, and may be accounted for by the fact that the mental derangement among the men is more frequently complicated with grave bodily diseases, the women enjoying a comparative immunity from the ravages of general paralysis of the insane. It is gratifying to be able to report that the death-rate for the bygone year has been lower than for several consecutive years, the proportion being 9·8 per cent. on the average number resident, and 7 per cent. on the total number undertreatment. Judging, however, from the number of old and feeble patients who survived the close of the past year, but who had evidently soon to pay the debt of nature, Dr. Davidson fears that the mortality for the year 1875 will be somewhat high. General paralysis claimed as usual the largest number of victims, 17 patients having been carried off by that formidable disease alone, 7 died of epilepsy, 5 of phthisis pulmonalis, and 6 yielded to the decay of old age. At the time of death the average age for both sexes was 50 years, or 46 for the males and 54 for the females.

The Approaching Election of Council of the Irish College of Surgeons.

A MEETING of the Fellows of the Royal College of Surgeons in Ireland will be held on Monday, the 31st inst., at 3 o'clock, to receive the annual report of the Council.

A meeting will also be held on Monday, the 7th June next, at 1 o'clock, pursuant to the provisions of the Supplemental Charter, to elect a president, vice-president, council, and secretary, for the ensuing year.

Fellows who may desire to have their names printed on the lists of candidates for offices, are requested to signify their wish, by letter, to the Registrar of the College, on or before the 19th of May.

For reasons which will be readily understood we refrain from expressing any opinion on the eligibility of the several candidates.

We refer our readers to several letters on the subject which appear in our correspondence columns to-day.

The Coroners (Ireland) Bill.

THIS Bill, after a lengthened and somewhat hot discussion on its second reading, has got through that stage, and is referred to a select committee. The committee has not yet been struck, and it will probably not sit until the first week in June. We earnestly trust that the medical men of Ireland will bestir themselves, and by one united effort put an end to the anomalous state of the law which now exists.

Enteric Fever near London.

IN the week ending April 24, 5 deaths from enteric fever occurred in Croydon, 2 in Willesden, 2 in Tottenham, and two in West Ham.

Dr. Lyon Playfair's Vivisection Bill.

THE Bill introduced by Dr. Lyon Playfair, Mr. Spencer Walpole, and Mr. Evelyn Ashley, "to prevent abuse and cruelty in experiments on animals made for the purpose of scientific discovery," proposes to enact that painful experiments on living animals for scientific purposes shall be permissible on the following conditions:—"That the animal shall first have been made insensible by the administration of anæsthetics or otherwise, and shall continue to be insensible during the whole of such experiment; and that, if the nature of the experiment be such as to seriously injure the animal, so as to cause to it afterwards, the animal shall be killed immediately on the termination of the experiment." Experiments without the use of anæsthetics are also to be permissible, provided they are made for the purpose of new scientific discovery; that insensibility cannot be produced without necessarily frustrating the object of the experiment; that the animal should not be subjected to any unnecessary pain; and that if the nature of the experiment be such as to seriously injure the animal, so as to cause to it afterwards, the animal shall be killed immediately on the termination of the experiment. A register of all such experiments is to be kept. The Secretary of State is to be empowered to grant licences to persons provided with certificates signed by the President of the Royal Society, the Presidents of the Royal College of Surgeons, or the Colleges of Physicians in London, Edinburgh, or Dublin, and other persons specified in the Bill. The licence is to be revocable on cause shown, and any person making painful experiments on living animals, except as provided in the Act, is to be liable, on prosecution before a court of summary jurisdiction, to a penalty not exceeding £50, or imprisonment for a term not exceeding three months.

Jervis Street Hospital, Dublin.

Two vacancies in the medical staff of this hospital have taken place by the appointment of Dr. Corley to the Richmond Hospital, and by the resignation of Dr. Kane, who is going abroad. We understand that Dr. Kilgariffe, of the Catholic University, and Dr. Collins, of the School of Physic, are likely to be appointed.

The Curriculum for an Irish Apothecary.

THE rejections at the recent "primary" of this body, it is stated in the *Students' Journal*, amounted to nearly 75 per cent. Most of the rejected candidates failed in anatomy (which included questions on fresh dissections). The examination of the "Hall" in Ireland is now considered to be a very searching and practical test of a student's knowledge.

This is the corporation which has the assurance to maintain that it has a right to prevent any person from making up a cough bottle unless he has passed this examination. A dozen persons take yearly the qualification as a medical qualification because it enables them both to practise and keep open shop, which the College of Physicians diploma does not; and, meanwhile, Ireland starves for competent dispensers to satisfy the hobby of half-a-dozen governors of the Hall.

Death from Conium.

A DEATH, probably from an over-dose of conium, occurred on the 13th of April in New York. The jury found that the deceased "died from the medical use of the fluid extract of conium." The patient suffered from tic douloureux of the face, and took, first of all, 180 drops of extract of the leaves in four doses of 40, 40, 40, and 60 drops, without any effect. He then took, after an interval of four hours, about 150 minims of the fluid extract of the seeds in three doses of 50 minims each, at intervals of about half an hour. He died suddenly in about an hour and a half after the last dose. It will be remembered that Dr. John Harley has given as much as an ounce for a dose of the succus conii.

Patent Medicines in America.

IT will be recollected that a strong course was taken in America some months ago by the Commissioners of Patents, who refused licence to certain patent medicine which had nothing whatever either novel or useful in its constituents.

It is announced officially that patents are still issued for medicines and chemical compounds, "when they are found to be new and useful, as the law requires." Within the last few months many applications for patents for medicinal mixtures have been rejected, on the ground that the alleged inventions were wanting in novelty and utility. The rejections were made by the examiner, and as no appeal has yet brought any of the applications before the Commissioner for decision, he has had no opportunity to investigate their merits.

Poisoning by Nitrate of Silver.

A CASE of poisoning by nitrate of silver is reported in the *Brighton Guardian*. A man swallowed a piece of lunar caustic in mistake for an antibilious pill. He soon felt a burning sensation in the gullet, but nothing could be felt outside. The man died, and at the post-mortem examination Mr. Eugene Hart found the stomach congested. At the back of the tongue he found a black patch in the fold of the mucous membrane, where the poison had lodged. The passage into the lungs was completely blocked up, and the throat much swollen. The deceased died from suffocation. We believe that Mr. Henry Smith saw a case where a piece of caustic got into the larynx and nearly caused death.

What is in a Name?

ONE would imagine that authors generally, and medical particularly, were anxious to answer this query, if we are to judge by the number of books continually thrown off the press, all bearing a family likeness as regards names, and not infrequently so when their interiors are scanned. In order to illustrate this, let us take as an example the subject of food, foremost in which we should rank Drs. Letheby and Pavy's treatises: thus we have "Food: its Varieties, &c.," by Dr. Letheby; "Food and Dietetics," by Dr. Pavy; "Food and Diet in Health and Disease," by Dr. Cameron; "Food: its Composition, &c.," by Dr. Marcet; "On Diet and Regimen in Health and Disease," by Dr. Dobell, 1867; "On Diet and Regimen," by Dr.

W. H. Robertson ; " On Diet and Regimen in Health and Disease," by Dr. Chambers, 1875 ; and so we might go on *ad infinitum*. Then there are the subjects of Hygiene, Public Health, each having dozens of works bearing the same resemblance ; whilst Dr. Fothergill's last work, " The Maintenance of Health," 1874, had its prototype in name in a treatise by Mr. Lowndes in 1867. Now, far be it from us to discourage any aspirant to literary distinction ; but we ask, Are a tenth of the works written of any practical use ? Do they contain anything new, or what has not already been better said before ? Paste and scissors could best answer these queries. But assuming that writers have some new discoveries, some really useful information to impart, is there any reason why reviewers' and readers' brains should be muddled by such a similarity of titles ? Surely the field is wide enough without so much copying—" a book by another name would read as well."

Mr. Simon's Report.

THE Report of the Medical Officer of the Privy Council and Local Government Board, No. 11, is the fulfilment of a promise made by Mr. Simon in his last annual report, that he would give some account of the three epidemics of typhoid fever which have lately been so much discussed, along with other matters of interest in a sanitary point of view.

This volume contains reports on the outbreak of enteric fever in the town of Sherborne, on that at Caius College, Cambridge, by Dr. Buchanan ; on that at Armley, near Leeds, and at Moseley and Balsall Heath, by Dr. Ballard. There is also a report on the outbreak of enteric fever in Marylebone, by Mr. J. N. Radcliffe and Mr. W. H. Power.

It will be remembered that Dr. Buchanan showed that the fever at Caius College had been caused by the drawing of foul air from the water-closets into the service-mains. Dr. Ballard showed that the fever at Armley had first attacked a dairyman, and then spread to a number of his customers. The well of his yard was found to be much contaminated with sewage.

In the appendix there are a series of illustrations of inspectors' reports, tabulated carefully, respecting the results of inquiries made locally as to the causes of various zymotic diseases. In all, or nearly all of these cases, enteric fever is spoken of in company with other diseases engendered by filth. Diarrhoea and typhus epidemics have also been inquired into, and in some few cases measles and small-pox have been considered. In most of the cases of such epidemics neglect on the part of the local sanitary authorities has been traceable ; there have been no drains at all, or drainage has been most imperfect, or the drains have been disgracefully filthy. The water supply in some cases has been most defective, or polluted by sewage, and foul privies and dunghills have been the causes in many instances. There is a report by Mr. J. N. Radcliffe, " On Certain Means of Preventing Excrement Nuisances in Towns and Villages," which is worth reading.

It is stated that the Cremation Society is likely for the present to be broken up for the want of the necessary guarantee fund.

The Reality of Hæmorrhagic Effusions in Hysterical Cases.

THE *Philadelphia Medical Reporter* gives an interesting abstract of the investigations in reference to Louise Lateau, who was recently made the subject of an address by Professor Virchow, and a commission appointed by the Royal Academy of Medicine, of Belgium, has reported on her case. An article, also, on " stigmatic ecstasy," in the *Gazette Médicale de Paris*, March 6, is prompted by her case. From these sources we glean a pretty full history of it :—

" Louise Lateau was born at Bois d'Haine, in Belgium, where she still lives, on January 30, 1850. She had a miserable childhood, troubled by numerous diseases ; the menses only appeared when she was eighteen years old. In March, 1868, she felt wandering pains of great intensity, completely lost her appetite, and brought up blood on several occasions. She passed a whole month on low diet, and consequently fell into a state of such weakness, that on April 15 the last sacraments were administered to her. However, she soon rallied. On the 19th the periodic function commenced, and lasted three days, when she grew better so rapidly, that on the 21st she was able to go to mass in the parish church, about a mile and a quarter distant from her home. With regard to her mental condition, Louise had always liked solitude and silence ; from her earliest childhood she repeated her morning and evening prayers with the utmost fervour, and had a particular love for prayers relating to the passion of the Saviour."

Not long after the functions were established, she commenced to experience on every Friday severe pains in the forehead, in the left side, and on the dorsal surface of the hands and feet, followed soon by an oozing of blood. These are the *stigmata*, or marks corresponding to those inflicted on Christ during his crucifixion. The oozing disappears after Friday, and does not recur until the next Friday, that being the day, according to tradition, on which the crucifixion took place.

Since March 30th, 1871, Louise asserts she has not tasted any food or drink, and has not had any action of the bowels, nor has she passed any urine. Her menstruation, however, continues regular. Such is her story.

When the Belgian Commission examined her last September, they found a young woman of twenty-five, five feet four inches in height, weighing 117 English pounds, pulse regular, moderately strong and rather quick (80 to 100), lips red, teeth white and sound, complexion rather chlorotic. The respiration was normal, her breath sweet and indicating the normal proportions of vapour of water and carbonic acid.

There was no indication of a hysterical subject, and the epigastric and dorsal pains peculiar to such were entirely absent. But it was on the Friday *stigmata* that the Commission were most intent. On Thursday afternoon Louise presented all the signs of violent arterial excitement, headache, hot and dry skin, quick and full pulse. The next morning the upper part of the forehead was covered with dried blood, which it appeared had flown from midnight until six o'clock in the morning, but had then stopped. When washed with a wet towel, the forehead became perfectly clean and remained in the same condition the rest of the day. The epidermis, when examined with the magnifying glass, showed neither erosions nor scratches. In the backs and palms of both hands there were two bleeding wounds, from three-quarters of an inch to one inch long, wider in the centre than at the ends. Red blood, like the blood of the capillaries, flowed incessantly, drop by drop, and almost continuously, from these four wounds. The *stigmata* of the back of the hand were in the centre of two shining nodes, hard to the touch and painful. Examined by the magnifying glass, the depth of the wound showed red, turgescent, acuminate papillæ of the dermis, in some places resembling true proud flesh. A fragment of the dorsal *stigmata* of one of the hands, taken out by

the scissors, showed under the microscope a papilla of the dermis and some capillaries considerably increased in size. The wounds of the two feet resembled those of the two hands, but were of smaller extent. They had only yielded a little blood. Louise had kept on woollen stockings, which arrested the flow somewhat. The bleeding on the left side followed the level of the space separating the fifth from the sixth rib, outside and a little below the centre of the left breast. The wound was about half an inch in diameter, and had yielded but little blood. There was very marked ecstasy and a cataleptic condition.

It naturally occurred to the Commission that this flow of blood might be produced by voluntary means. To avoid this source of error they devised an apparatus, which consisted of a glass globe about four inches in diameter, having a neck like an ordinary bottle at one of its poles, and at the other pole another neck about three inches in diameter. The first neck was closed by a cork, traversed by a bent glass tube not extending beyond the outside surface of the cork. The inside end of the cork, as well as that of the tube, was covered by a wire gauze, not interfering with the ingress of air, but preventing the introduction of any penetrating instrument. The corks and tubes were fixed by several seals. The second neck was covered with a kind of muff or sleeve of india-rubber cloth, fixed to its outer rim by india-rubber cement and sealed with six seals. This apparatus was put on on Thursday, January 21, at 2 p.m. After the absence of any flux from the *stigmata* had been verified, the patient's right hand was introduced into the bottle through the large opening, then the kind of muff or sleeve was brought down over the arm, which it covered as far up as the sleeve of the chemise; it was cemented to the arm by the same adhesive application, then finally closed up by a bandage, nearly an inch wide, brought twice round the arm and carefully sealed up. This done, all the apparatus was enveloped in a bag of gutta-percha cloth, fixed to the shoulder by two turns of another bandage, sealed with two seals. The india-rubber and gutta-perch cloths would inevitably betray the passage of the finest needle.

On Friday, the 22nd, at half-past ten o'clock in the morning, M. Warlomont, of the Commission, entered Louise Lateau's cell, accompanied by Professor Crocq, of Brussels, who had undertaken to remove the apparatus and declare the result. It was this:

"The right hand was closed up in the apparatus which M. Warlomont had fixed on the previous evening. The apparatus was perfectly intact, as we assured ourselves by the most careful examination of the outer envelopes and the seals, not one of which bore the slightest trace of having been tampered with. The sloping portion of the receiver was filled with a small pool of liquid blood, and the back and palm of the hand were covered with clots of blood firmly adhering to the palms. It therefore appeared that the effusions of blood did really occur spontaneously, and without the intervention of any violent means from without."

There remains no reasonable doubt, therefore, that the *stigmata* are the result of mental action only.

Instances of ecstasy with local cutaneous hæmorrhages are not rare. These are pathological accidents accompanying a low condition of the blood, and a disorder of the nervous system. The blood loses its plasticity, and a sweating of blood (hematidrosis), or an oozing from the capillaries into the adjacent tissue (ecchymosis, sugillatio), or into little "blood blisters" (hæmophilia), is the result. Naturally enough the determined expectation of such an occurrence on a particular part of the body directs the phenomenon to that part or spot, and hence the *stigmata* arise where the mystic, dreaming over the passion on the cross, expects them to. This explanation, easily supported by numerous cases quite outside religious monomania, explains the condition of Louise Lateau without convicting her of imposture in this point.

But that she has passed three years without eating,

drinking, or voiding her natural secretions, is altogether a deceit. The Commission were not allowed to have her watched at night, and hence they very justly reached the conclusion that this was evidence enough that that part of her assertion was a "pious fraud." The case, however, with this drawback, is clinically a most interesting one, and merits the attention it has attracted.

Syphilitic Tumour in the Sterno-Mastoid Muscle.

DR. SIRT (*Le Progrès Méd.*) related recently in the Société Méd. de l'Arrondissement de l'Elysée of Paris the case of a woman, æt. 32, married, and with several children, who had gummy tumour of the sternum and sterno-cleido-mastoid muscles. She was married at the age of seventeen, and had noticed soon after marriage leucorrhœa, and an eruption, without itching, on the breasts and external aspect of the labia majora. She had an infant born dead at eight months, and the second, which was born at full term, lived only six weeks. The third, born healthy, began to be emaciated towards the fortieth day, and died at the age of sixteen months; whilst three succeeding children are well and healthy.

The patient had no illness until last year, when she noticed the skin of the left subclavian region became violet in places and marbled. In eight months the superior third of the sternal region gradually became swollen, and the disease, going on to the muscle, transformed almost the whole of the sterno-cleido-mastoid into hard cords. There was no pain but in the sternal region and the extension of the head on the neck was the only movement she could not make. A year after the commencement of the symptoms a little ulceration appeared on the sterno-mastoid of the right side, and its progressive development determined in fifteen days the patient to have recourse to the physician.

The upper part of the sternal region was prominent for the length of six or seven centimetres, with slightly elastic resistance on pressure, and without change in the colour of the integuments. On the lower part of the left sterno-mastoid muscle the skin was violet in hue, rather thinned, and adhered to the underlying organs in thin points of the superficies of a large pea. The ulceration of the right sterno-mastoid muscle, situated at a centimetre above its inferior attachment, was deep, at least five millimetres, and painful to the touch; it had an oval form, and its greatest diameter was parallel with the direction of the muscle, and measured three centimetres. The edges of this ulcer were hollowed out to the extent of a centimetre around, and its floor, of a firm and whitish colour, secreted a sero-purulent fluid.

These symptoms, joined to the history, made tertiary syphilitic lesion be diagnosed, and the parts were therefore dressed with calomel ointment, and one gramme of iodide of potassium was prescribed at first, and then doubled next week. The calomel ointment was also replaced by iodine ointment. This treatment was commenced on the 3rd December, and on the 17th the wound was no longer painful, and had lost its white colour and furnished a less profuse secretion.

In the month of January the sterno-mastoids regained their normal consistence in the upper third, the violet points of the left side disappeared, and fleshy granulations

of the base of the ulcer, the edges of which had come to the level of the integuments, had disappeared. The dose of the iodides was raised to three grammes (or forty-five grains) daily. In the first fortnight of February the muscles were recovering the integrity of their functions, and the wound was cicatrising. At the end of February the left sterno-mastoid was no longer indurated, except in its lower third, and the ulceration had cicatrised. The treatment was the following: Two grammes of iodide of potassium in solution, twenty-five milligrammes of mercury in pills, and unction on the sternum, with iodide of potassium ointment every day. Cure cannot be long deferred. The interesting part of this observation was that no previous treatment had been used. We then see the most complete evidence of the fact that, in the absence of mercurial treatment or iodine, syphilitic gummy tumours had arisen, and that these accidents disappeared rapidly under the influence of the classic treatment.

Cholera.

WE are sorry to announce that the most gloomy forebodings exist in medical circles in India regarding this pestilence. Our special correspondent, whose amusing letters appear from time to time in this journal, certainly would not lead readers to suppose that he is wont to look upon the dark side of pictures generally; he nevertheless feels on the present occasion compelled to sound "a note of alarm," in order that the authorities may be prepared for any emergency. He says that the deaths have already been far in excess of the usual number at this season, and that, judging by past experience, a terrible visitation seems inevitable during the coming summer.

MR. COOPE's motion for a select committee of the House of Commons to inquire into the action of the Metropolitan District Asylums Board, with regard to the alternative sites of a fever hospital in Hampstead, has been fixed for the 15th June.

THE authorities of the Apothecaries' Society of England have announced a series of six lectures on State Medicine, to be delivered each Saturday at their hall at 3 p.m., by Surgeon-Major de Chaumont, to which all registered medical practitioners are admitted free. The first of the course was delivered on Saturday last, and was well attended.

THE thirty-fourth annual general meeting of the members of the Pharmaceutical Society of Great Britain will be held to-day, at 12 precisely, to receive the report of the Council, and to elect the council and auditors for the ensuing year.

The annual conversazione will be held at the South Kensington Museum, on the same evening, at eight o'clock. Each member of the society is entitled to a card of admission for himself and a lady.

THE Directors of the Great Western Railway Company have forwarded cheques to the value of £400 to the treasurer of the Radcliffe Infirmary, Oxford, in appreciation of the attention shown to the sufferers by the unfortunate accident at Shipton on December 24th, 1874.

Medical Affairs in Parliament.

HOUSE OF COMMONS.—Monday, May 3rd.

ARMY MEDICAL EXCHANGES.

Mr. Hardy, in answer to Mr. O'Leary, said that, in certain instances, exchanges had been refused to army medical officers who had been a long time at home, and where the foreign service was disproportionately small. No reasonable application had been or was refused.

Tuesday, May 4th.

MEDICAL OFFICERS OF THE ARMY.

Mr. George Browne asked the Secretary of State for War whether it was his intention to recommend an increase in the half-pay of medical officers of the Army after twenty years' service, as had been recently done in the Navy; and, if so, when a warrant on the subject was likely to be issued.—Mr. Hardy said that the complaints of the medical officers of the Army were receiving full consideration, but it would be premature to express an opinion upon one part of the case. He was informed that the hon. gentleman had not correctly represented what had been done in the Navy; but, at all events, he was not at present in a position to answer the question.

THE PROPOSED HAMPSTEAD HOSPITAL.

Mr. Coope has given notice that he will call attention to the action of the Metropolitan Asylums Board with reference to the proposed erection of a permanent hospital for contagious diseases near Hampstead Heath, and move for a Select Committee to inquire into and report upon the clauses of the Metropolitan Poor Act (30 Vic., c. 6), giving powers to the managers of asylums to take, hold, and dispose of lands and other property for the purposes of the Act; and Mr. Torrens will propose to add to the amendment that the said Committee shall specially report whether any new general hospital for infectious diseases in the metropolis is desirable or necessary.

Literature.

FREY'S HISTOLOGY. (a)

THE great value of Frey's work is attested by the fact that it is regarded throughout Germany as the best handbook of the subject. It has also been translated into French, and we cannot but congratulate our professional brethren that they have now the opportunity of studying it in English.

Mr. Barker deserves our thanks not only for the care he has taken in its translation, but for having so well accomplished his task that the work scarcely reads like a translation. Those who know the difficulties of rendering German into English will best appreciate Mr. Barker's labours. Bald and imperfect translations are so common, and Germanisms are so frequently met with in our current medical literature, that it is a positive treat to peruse an English version of a valuable German work in which the translator has done his part so well.

The work is arranged in three great divisions—viz., 1. The Elements of Composition and of Structure of the Body; 2. The Tissues of the Body; 3. The Organs of the Body.

The elements of composition are the organic and inorganic bodies with which histo-chemistry has to do, and

(a) "The Histology and Histo-Chemistry of Man: a Treatise on the Elements of Composition and Structure of the Human Body." By Heinrich Frey, Professor of Medicine in Zurich. Translated from the Fourth German Edition by Arthur E. J. Barker, Surgeon to the City of Dublin Hospital; Demonstrator of Anatomy, Royal College of Surgeons, Ireland; Visiting Surgeon, Convalescent Home, Stillorgan; and revised by the Author. With 600 Engravings on wood. London: J. and A. Churchill. 1874.

of which organs and tissues are built up. The albuminoid, or protein, compounds and their derivatives, are here carefully described.

The elements of structure are the cell and the parts formed from cells, and intercellular substance. With this portion of the work we have been particularly pleased. In it is condensed a most readable account of all that is known of the subject. Thus in about forty pages profusely illustrated with engravings the student will find all he wants to know of the elements of structure of the human body.

We now come to the various tissues of the body, and this portion of the subject, of course, requires much greater space. The first division is devoted to the tissues composed of simple cells with fluid intermediate substance: these are—A. The Blood; B. The Lymph and Chyle; and these chapters will be found as interesting as they are exhaustive. In the section on coagulation will be found much that is new to all who have not devoted great attention to the subject.

The third part of the work is devoted to the organs of the body, which are of two kinds—A. Organs of the Vegetative Group; B. Organs of the Animal Group. The organs of the vegetative group are five—viz., The circulatory, respiratory, digestive, urinary, and generative apparatus; while those of the animal group are the bony, muscular, nervous, and sensory apparatus.

In the sections devoted to the circulatory apparatus we have an elaborate account of the organs belonging to the lymphoid series. Here are included the thymus and the spleen, with the account of which we have been particularly pleased. With regard to the physiological significance of the spleen, it is believed to be concerned either in the destruction of the blood cells or in their reproduction. Frey believes that the first view may be defended, but not proved, and that the second theory is more capable of proof. "According to it," he says, "the spleen may be regarded as analogous in function to the lymphatic nodes, producing the colourless cells of the pulp, which, on finding their way into the blood, are known as white blood corpuscles, and which possibly, in part at least, undergo ere they leave the cavernous portions of the tissue of the spleen a transformation into coloured cells."

Pending a more satisfactory classification, which is for the present impossible, our author associates with the lymphoid parts the thyroid, the supra-renal, and the pituitary bodies, of whose functions we know so little, and which he groups together under the old name of blood-vascular glands. He thinks the thyroid is probably at its greatest pitch of development in the new-born infant, and that it becomes very sluggish in growth a few weeks after birth. He acknowledges we are still entirely in the dark as to the physiological significance of the supra-renal bodies, but suggests that the peculiar colouring matter between the medullary and cortical portions may possibly be connected with the obscure phenomena of Addison's disease. With respect to the pituitary body, formerly supposed to be glandular and subsequently classed among nervous organs, still more recent investigators are returning to the notion of its being glandular, and they regard the cells supposed to be endothelium as covering vessels situated in the interior.

In the division devoted to the respiratory apparatus, the description of the lungs, which are compared to race-mose glands, will be read with the greatest interest, and as much may be said for the account of the digestive apparatus.

Among the organs of the animal group we have only space to refer to the sensory apparatus, the description of which is as lucid as it is complete, and in which the concluding chapters on the eye and the ear may be mentioned as particularly excellent.

The work is furnished with an elaborate index, but we are sorry to say the pages are not cut.

WINTER COUGH. (a)

THE second edition of Dr. Dobell's work on "Winter Cough" appeared less than three years ago, and now the third is before us. His views on the subject are therefore pretty well known to the profession. In the form of an appendix we have a considerable quantity of new matter, among which the views of Professor Flower on the climate of Egypt are quoted at great length. There are also a number of other extracts on climatology which will be read with considerable interest. We should, however, have preferred a critical abstract of the papers rather than lengthy extracts. Dr. Dobell also gives us a new introduction on the perivascular system and its relation to diseases of the respiratory organs, which deserves attentive perusal. Ranvier, Stricker, Carter, Rindfleisch, Klein, Robin, and others are extensively quoted on this subject, showing how fully the author keeps up with the medical literature of the time, and applies it to that department of medicine to which he devotes himself. The work is illustrated by four coloured figures.

ST. GEORGE'S HOSPITAL REPORTS. (b)

THIS volume includes the record of the work done in the wards for the years 1872-4. We have, therefore, lengthy statistical tables showing the nature of the diseases and injuries for which patients were admitted during those three years. These are compiled with great care by the registrars for the time being, and of some of the cases a brief account is given. During the year 1873, 2,048 surgical cases were admitted; of these 107 terminated fatally, and 8 were brought in dead or died within twenty-four hours of admission, the rate of mortality being 4.8 per cent., and the mean time of residence within the hospital 29.3 days. There were seventeen amputations, of which five died; twenty-four compound fractures, of which eight died; sixteen cases of hernia, of which five died; and two of stone, in one of which lithotomy was performed, in the other lithotripsy—both recovered. Details of these and other operations are carefully tabulated by Mr. Rowland. In the same year, 1,683 medical cases were admitted, of which 203 died. Nine were brought in dead, or died within twenty-four hours. Fourteen deaths occurred from enteric fever, seven from acute tuberculosis—of these Dr. Laking gives a brief account. There were eight fatal cases of aneurism, all of which were examined after death, and of each of these we have also a short account.

The essays in this volume are twenty in number.

Dr. William Ogle, of Derby, furnishes a method of tabulating symptoms in clinical records under any number of headings without destroying the continuity of the history. He allots to each group of symptoms its own proper margin for the first line of the sentence, but for that line only, all subsequent lines being written across the page. It does not matter what headings are chosen, nor how many may be necessary, and the method is also applicable for indexing diseases. A reference to the schedule and the specimen case given will enable any student to comprehend it.

Dr. Wilson writes on questions connected with vaccination, and Dr. Cavafy on the effect produced on the capillary circulation by the injection of putrid fluids into the lymphatic system of amphibia. He finds that small quantities produce inflammation very rapidly, while larger quantities act as a direct poison to the nervous system,

(a) "On Winter Cough, Catarrh, Bronchitis, Emphysemæ, Asthma." A Course of Lectures delivered at the Royal Hospital for Diseases of the Chest. By Horace Dobell, M.D., Senior Physician to the Hospital, &c. Third and enlarged Edition, with Coloured Plates. London: J. and A. Churchill. 1875.

(b) "St. George's Hospital Reports." Vol. VII. Edited by John W. Ogle, M.D., and Timothy Holmes, F.R.C.S. London: J. and A. Churchill. 1875.

paralysing the heart, and thus giving rise to circulatory stasis.

Dr. J. C. J. Fenwick relates three cases of cerebral disease, to which he adds a table of cases of tubercular meningitis.

Dr. R. J. Lee publishes the notes of his course of lectures at the hospital.

Dr. Handfield Jones gives twelve cases of psoriasis, upon which he makes some valuable remarks.

Dr. Cheadle writes on exophthalmic goitre. He does not consider that the lesions of the cervical sympathetic which have been detected suffice to account for all the symptoms, but seems inclined to adopt the suggestion of Dr. Laycock, that the cilio-spinal region of the cord is affected.

Mr. Brudenell Carter contributes a very important paper on the principles of ophthalmic therapeutics, and Dr. J. W. Ogle publishes illustrations of some of the more unusual forms of disease of the abdomen. This very difficult subject he handles in a masterly manner. We regret that the space we can devote to this notice forbids us entering at length on Dr. Ogle's paper. We must therefore refer our readers to the work, which also contains several other valuable essays besides those we have mentioned.

THE MEDICAL COUNCIL.

THE annual session of the General Medical Council will take place about the 16th of June.

The only new appointment since the last session of the Council has been that of Professor George Rolleston, who now represents the University of Oxford, in the place of Dr. Acland, elected President.

EVASION OF THE MEDICAL ACT.

It would seem from a report of a Manchester inquest that the traditional coach-and-four is being habitually driven through the Acts of Parliament, and that an unqualified person can get—for a consideration—his death certificates, which he is forbidden by the Medical Act to sign himself, written out in blank by a qualified medical practitioner. A druggist in Manchester, practising over the counter, has, of course, occasional deaths in his practice; he must certify them, and the law forbids him doing so in his own name; he therefore writes to a medical man (whose assistant, he says, he formerly was), who signs the essential certificate, that "I (the medical practitioner) hereby certify that I have attended" the person deceased. The *British Medical Journal* reports these facts, but "advisedly omits" the name of the medical practitioner, and deprecates the proceeding in a milk-and-water tone, which is not usual to our contemporary when it feels a virtuous indignation on any such transaction. To our uncultivated view such a proceeding is akin to a forgery, for which the medical practitioner, whom our contemporary is too tender-hearted to name, should stand in the dock. Was there ever a greater piece of rascality? An unqualified (and probably incompetent) shopkeeper sees a patient die, and he obtains the aid of a medical man to enable him to defeat the precautions interposed by the law. The medical man signs a certificate that he has attended a person whom he has never seen in his life, and a public medical journalist comes forward to protect him by

giving him the benefit of secrecy, and administers a homily which is one-half commendation for his sharpness. But perhaps the unnamed practitioner is a member of some medical organisation?

A NEW SCHOLARSHIP AT THE LONDON HOSPITAL.

At their meeting held on Monday last the Medical Council of the London Hospital took the very important step of instituting two new prizes in association with their Medical School in the shape of Natural Science Scholarships, of the value of £60 and £40 respectively, open to students upon entrance. The first competition for these scholarships will take place in September of the present year, the only conditions imposed upon candidates being the obviously fair one that the candidates must be students of the hospital. The subjects will be similar to those now given at the preliminary scientific examination at the London University. The Council appointed a small committee to settle the details of the examination. We think the Council have acted wisely in departing from a strictly professional subject for competition for this new prize at their school, and we earnestly wish them success in this laudable effort to attach to their College students who, previous to commencing the study of their profession, have undergone a more thorough and complete educational training than is usually the case, or at any rate is sufficient to satisfy the present exceedingly moderate demands made by the examiners in general education, &c., at the College of Surgeons and Society of Apothecaries.

Mr. Waren Tay, the Vice-Dean of the College, will doubtless be glad to give intending candidates all the necessary information on the subject of these scholarships.

Correspondence.

BELLADONNA AS A PROPHYLACTIC OF SCARLATINA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR—I pray that you will allow me a portion of the very valuable space in your journal to correct the statements of Dr. Carleton in his letter which appeared in your impression of to-day.

In the first place he states—"I lay no claim to originality, &c." I did not state in my observations of the 5th ult. that he pretended originality. I merely stated that he apparently attempted to confirm, or at least strengthen, the previous experience of other physicians, and this, I think, he must admit. As to his waiting for an epidemic, I would not advise him to do so; neither would I advise any man to furnish a contribution to medical literature on a solitary instance of the effect of any drug in a given case, whose effects in such cases had been hitherto doubted by the leading physicians of the day. If he had not administered belladonna in the case referred to, it is more than probable that the same result would have been attained. He had not a second family whereon to test its prophylactic virtues, and can therefore afford no individual proof that the said drug possesses any such virtues. I have before stated that it is not at all unusual for a few children in one family to contract the disease while the others escape, and this no man of any experience in the treatment of scarlatina can deny. Dr. Carleton quotes Dr. Wood, not concerning the preventive treatment of, but

the remedies for scarlatina. Now this is not keeping to the thread of the present argument. If Dr. Carleton had quoted this excellent authority on the preventive treatment of the disease he would have quite disestablished his own argument, as the learned author differs widely from Dr. Carleton in this case; he has stated in the section on preventive treatment of scarlatina, "that different prophylactic remedies have been recommended, among which belladonna is the most conspicuous. But whatever may have been the origin of the practice, its value must be determined by experience. The weight of testimony is, I think, decidedly against its possession of any prophylactic virtues." I will quote from the seventh edition of Dr. Tanner's "Practice of Medicine," by Dr. Broadbent, the following:—"Belladonna in very minute doses has been recommended as a prophylactic against scarlatina. In an epidemic of this disease which occurred on board her Majesty's ships *Agamemnon* and *Odin*, in 1853, the remedy was freely tried without the slightest benefit. Belladonna has also now been used by many practitioners, and found useless." If Dr. Carleton is glad that his case was the only one in his district, he cannot be much interested in putting to the test any preventive remedy, as knowledge of this kind *must* be determined by very careful experiment. It is most absurd to hold that a remedy which produces the desired result in one case, in the hands of a physician, will also produce like results in all such cases.

If Dr. Carleton means to prolong this controversy, it would be more satisfactory if he would put forward some points in his defence, and not *italicise* so often his opinions, nor quote so repeatedly my very appropriate expression, "solitary instance," in my former letter.

Awaiting a reply from your learned correspondent,

I am, Sir, your obedient servant,

J. LOWE,

Assistant-Surgeon Cyfarthfa Iron Works.

Merthyr Tydfil, 12th May, 1875.

THE COMING ELECTION OF COUNCIL OF THE IRISH COLLEGE OF SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—My attention has been directed to a paragraph in the last number of your paper relative to the coming election of the Council of the Royal College of Surgeons, Ireland, in which my name is mentioned as a candidate. As I am designated therein "of the Richmond Hospital," it might lead to the belief that I put forward the hospital connection as a recommendation to the electors. The fact is, I seek the honour of election on the ground that I am one of the senior lecturers of the Carmichael School of Medicine, an institution which has not had a representative on the Council for nearly twenty years. By inserting this explanation you will much oblige

Yours very faithfully,

ANTHONY H. CORLEY, M.D., F.R.C.S.I.

30 Lower Baggot Street, Dublin, May 10, 1875.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The letter of one of the candidates for a seat on the Council of the College of Surgeons in Ireland which appeared in your last issue, and the lists of competitors for that honour which you have published from week to week, suggest to me that the influences which made themselves felt last June are producing their natural result in the constitution of the Council. Those who have interested themselves in the medical education of Ireland will recollect that this time twelvemonths the "grinding" and lecturing interest amongst the Dublin Fellows came to the front with a war-shout of alarm at the possible reduction in the number of lectures to be paid for by students—reversed the whole educational policy enacted by the Council and endorsed by themselves—cast out summarily or effectually silenced the advocates of a conjoint scheme of

examination, and triumphantly re-established the era of sham lectures and extravagant curricula. Last week we have read in your pages the inevitable result of this success. Of nine declared candidates for seats on next year's Council but one is independent of school interests and personal emoluments derived from school teaching. Three of the nine are "grinders" in active work, and four other candidates are lecturers in rival schools. Nay, more: we find one of the private teachers roundly demanding, through your columns, admission to the Council, not because he considers himself a capable medico-administrative legislator for the College, but because he is a teacher in a particular school.

It is for the Fellows to judge whether a close pecuniary interest in the increasing of the lecture curriculum and in keeping down the stringency of the College examinations ought to be considered a special qualification for any candidate—in other words, whether any Fellow can lay just claim to be admitted to legislate for schools, lectures, fees, examinations, and for the standard of medical education simply because he is personally interested in a certain disposition of these affairs.

If my fellow-voters desire to form a judgment on this question I commend to their perusal the Official Report of the Visitors of the Medical Council upon the Examinations of the College, and the chorus of condemnation of the College which that Report evoked from the lips of the English members of the Medical Council and from the pens of all journalists; and I hope it will be recollected that the system of examination which fell under the stinging censure of, I may say, the entire profession in England was the identical system of examination which was fought for, sustained, and re-enacted by the Dublin School teachers.

On behalf of the Fellows unattached to schools I enter protest against the inference, which seems to be in danger of adoption, that grinders or lecturers have a special claim to College honours, and I assert that men of standing and intelligence may be found amongst the Fellows who can discuss the various questions of medical education and qualification with a sufficient knowledge of the *status quo* and of the requirements of the profession, and without any personal interest against progressive reform in such matters.

I am, Sir, yours, &c.,

ONE OF THE OLD SCHOOL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The suggestive letter of Mr. Kilgariff, which appeared in your last number, has given rise to much comment, and an error contained in it in regard to the College School has been pointed out. In the "Irish Medical Directory" for the current year the list of Council contains only the names of three gentlemen who are teachers in the College School, and such is the condition at present. It has been also remarked that the Council should be representative of the Fellows teaching in the schools rather than of the institutions themselves. We find that the numbers of Fellows teaching in the respective schools are as follows:—School of the College, 15; Ledwich School, 9; Stevens' College, 6; Trinity College, 4; Carmichael School, 3; and Catholic University, 2.

The constitution of the Council with regard to the various hospitals is, however, more anomalous, for while the Meath has three representatives, and the House of Industry, Stevens', Mercer's, Dun's and Adelaide two each, the City of Dublin, Jervis Street, St. Vincent's, and Mater Misericordiae have not one. Moreover, not one of the ophthalmic

hospitals are in this way represented. As regards the mid-wifery hospitals, one member of Council is a present officer of the Coombe and two are past masters of the Rotunda.

I entirely deprecate the inference that seats on the Council should be allotted merely according to school or hospital interests, personal and professional considerations being set aside.

For this reason I would desire to see on the Council a larger representation of such men as Mr. Colles, who, while a Schoolman, an Hospital Surgeon, and a University Professor, commands the confidence of every Fellow.

Yours, &c.,
A FELLOW.

NOTICES TO CORRESPONDENTS.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a distinctive signature or initials, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874-£1 2s. 6d., at the offices in London, Dublin, or Edinburgh.

HIS EXCELLENCY the Governor of the Cape Colony, with the advice of the Executive Council, has been pleased to appoint William Alexander Sharpe, Esq., Surgeon to the Frontier Armed and Mounted Police Force, to be Justice of the Peace for the Eastern District of this colony.

T. L. (Hospital Resident).—The cancer cure to which you call our attention is one of those iniquitous swindles which flourish by publicity. It would do more harm than good for us to advertise it.

N. B. B. (Sandy Mount).—The gravity of the disease you name is exaggerated by medical swindlers such as those with whom you had lately to deal, and you may proceed on the assumption that every word they have told you is false. The symptom is not—unless very excessive—a dangerous one, and it requires only moderate care on your own part under proper advice to alleviate it. It is not our province to advise you whom to consult. On no account be induced to have anything to say to an advertising quack, who will infallibly lie without scruple, cheat you without mercy, and ruin your health in the end. Select for consultation a surgeon of any of the leading hospitals. Do what he bids you and do not be frightened.

"GUY'S HOSPITAL GAZETTE."—We have received last Saturday's number of this little journal, and heartily congratulate the members of the Physical Society of the hospital—those who we believe are responsible for its management—upon its improved appearance. For a long time past it has been badly done, and the printer's work of such a slovenly character that it was painful to read. All this is changed, and our modest little contemporary has now as clean a face and as nice an appearance as any journal published.

VARIETIES.—There are two medical journals published in Spain which we receive regularly. They appear to be well conducted, and suggest the existence of more scientific life and research than one would expect to find in a land continually convulsed by civil wars.

DR. PARKES, F.R.S.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

Sir,—For a number of years it has been the surprise of many that no practical steps have been taken to carry out the wishes of thousands to bring Professor Parkes, F.R.S., into Parliament. How is this? I am, Sir, your obedient servant,
ONE OF THE CROWD.

BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED.

- On Diet and Regimen in Sickness and Health. Sixth Edition. By Horace Dobell, M.D. London: H. K. Lewis.
- St. Thomas's Hospital Reports. Vol. V. London: J. and A. Churchill.
- The Province of Psychology. By Mr. Sergeant Cox.
- Transactions of the National Association for the Promotion of Social Science, 1874.
- On the Graphical Representation of the Movements of the Chest Wall in Respiration. By Arthur Rancome, M.D.
- The British Press Guide for 1875. By F. L. May.

VACANCIES.

- Mallow Union, Kilshannig District. Medical Officer. Salary, £100 per annum, with fees extra. Applications to the Hon. Sec. (See Advt.)
- Abbeyleix Union, Ballinakil Dispensary District. Medical Officer. Salary, £100, exclusive of fees. An emolument is also attached of £20 as Sanitary Officer. (See Advt.)
- Royal Free Hospital. Honorary Surgeon. Application to Mr. Blyth, at the Hospital. (See Advt.)
- Central London Sick Asylum District. Assistant Medical Officer for the Infirmary at Highgate. Salary, £100, with board and residence. Also a second Assistant and Dispenser. Salary, £110, with dinner. Non-resident. Printed forms of application supplied on application to the Clerk at the Infirmary, N.
- Bradford Infirmary. Physician. Diplomas, &c., to be sent to the Secretary, 65 Market Street, Bradford.
- Cheltenham General Hospital. Medical Officer to the Branch Dispensary. Honorary.
- Charing Cross Hospital. Resident Surgical Officer. Board and residence provided in the Hospital. Applications to the Secretary.
- Whitehaven Infirmary and Fever Hospital. House Surgeon and Dispenser. Salary, £130, with furnished apartments. Address the Secretary.
- Norwich Dispensary. Resident Medical Officer. Salary, £120, with furnished residence. Address the Secretary.
- Frome Union. Public Vaccinator. Payment by case. Particulars of the Town Clerk.

APPOINTMENTS.

- ANDERSON, A. G., Public Analyst for the Parish of Paddington.
- BISCH, P., M.R.C.S.E., House Physician to King's College Hospital.
- BLAKE, J. F., M.B., L.R.C.S.I., Assistant Resident House Surgeon to the North Dispensary, Liverpool.
- DENNING, J. V. C., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer of Health for the Greatland Rural Sanitary District.
- DOVY, H., M.R.C.S.E., Medical Officer for No. 1. District and the Workhouse of the Stow Union, Suffolk.
- FOWLER, J. K., M.R.C.S.E., House Surgeon to King's College Hospital.
- GREW, E. F. S., M.B., a House Physician to the Western Infirmary, Glasgow.
- GREVILLE, F. A., L.R.C.P.Ed., L.R.C.S.Ed., a District Surgeon to the Salford and Pendleton Royal Hospital, Manchester.
- HOLT, G. A., M.F.S., Lecturer on Botany and Materia Medica at the South London School of Pharmacy until the end of the session.
- JOB, J., M.R.C.S.E., House Surgeon to the London Hospital.
- KIRKWOOD, G., L.R.C.P.Ed., L.R.C.S.Ed., Resident House Surgeon to the Cumberland Infirmary, Carlisle.
- M'CALLMAN, D., M.B., a House Surgeon to the Western Infirmary, Glasgow.
- M'COSE, H. N., M.D., Resident Medical Superintendent of the Royal Infirmary, Dundee.
- MICHELL, G., M.R.C.S.E., L.M., Medical Officer for the Gwennap District of the Redruth Union.
- PALFREY, J., M.D., M.R.C.P.L., Senior Obstetric Physician to the London Hospital.
- STEVENSON, J., M.D., M.R.C.S.E., Medical Officer of Health for the Parish of Paddington.
- TAYLOR, G. L., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Wolverhampton and Staffordshire General Hospital.
- WALLACE, Mr. E. J., a House Physician to the Western Infirmary, Glasgow.
- WALSH, T. P., L.K.Q.C.P.I., F.R.C.S.I., Medical Officer, &c., for the Ballyroan Dispensary District of the Abbeyleix Union, Queen's County.
- WEBB, S. H., L.K.Q.C.P.I., L.R.C.S.I., L.M., Resident Medical Officer to the Dover Hospital and Dispensary.
- YOUNG, A., B.A., Resident Accoucheur to King's College Hospital.

Marriages.

- LETT-APPLEFORD—On the 13th inst., at St. John's, East Dulwich, Alfred Lett, B.A., M.B., T.C.D., only son of the late R. Lett, M.D., of Silver-tone, to Bithiab, third daughter of the late Wm. Appleford, of Coggeshall, Essex.
- M'ANDREW-EYRE—On the 12th inst., at the Church of Our Lady, St. John's Wood, James John M'Andrew, M.R.O.S.E., of Limehouse, formerly of co. Mayo, to Teresa Mary Wilhelmina, third daughter of John Joseph Eyre, J.P., of Clifden Castle, co. Galway.
- NALLY-HYNES—On the 27th ult., at the Catholic Church, Kinvarra, Wm. J. Nally of Hollymount, co. Mayo, to Lizzie M., daughter of Denis J. Hynes, M.D., Kinvarra, co. Galway.
- TABUTEAU-WEBB—On the 11th inst., at St. Paul's, Portarlington, J. M. Tabuteau, M.A., M.B., Univ. Dub., to Louisa Maria, second daughter of the late Captain George G. Webb, 6th Royals.

Deaths.

- HARRISON.—On the 6th May, at Woodbine Street, Westoe, Colpitts Harrison, L.S.A.L., aged 64.
- HUSTON.—On the 11th May, at his residence, Tynan, co. Armagh, Chas. Todd Huston, M.D., aged 50.
- M'DERMOTT.—On the 10th May, John M'Dermott, M.D., of Shrewsbury Road, Westbourne Park, aged 78.
- NEWMAN.—On the 4th May, at New John Street West, Birmingham, A. S. Newman, M.R.C.S.E.
- PETER.—On the 7th May, at his residence, Longford, David Chamney Peter, M.D., Surgeon Royal Longford Rifles.
- SHARPE.—On the 3rd May, at Wilton Street, Liverpool, Robert Sharpe, M.D., aged 47.
- WEBBER.—On the 12th May, Wm. Webber, F.R.C.S., formerly of Norfolk (Founder of the Royal Free Hospital for Incurables at Norwich), in his 76th year.

ROYAL FREE HOSPITAL, Gray's-inn-road.—There is a VACANCY for a SURGEON in the HONORARY MEDICAL STAFF of this Hospital, in consequence of the death of Mr. John D. Hill. Candidates must be Fellows of the Royal College of Surgeons of England. The election rests solely with the General Committee of Management.—Applications, with testimonials, to be forwarded to the Secretary, at the Hospital, on or before MONDAY, the 24th May.

JAMES S. BLYTH, Secretary.

THE SOCIETY OF APOTHECARIES OF LONDON give Notice, that the SECOND of a Course of Six Lectures on STATE MEDICINE will be delivered at their HALL in BLACK-FRIARS, by Surgeon-Major F. DE CHAUMONT, Assistant-Professor of Hygiene in the Army Medical School at Netley, on SATURDAY, the 22nd MAY, at Three p.m. These Lectures are open to all registered Practitioners.

Subjects of the Lecture.—General and Special Hygiene.—Division of the subject.—Air Supply and Ventilation.—Legal Enactments, existing or desirable.—Arrangements of Habitations.

DUBLIN INFIRMARY for DISEASES of the EYE and EAR, Ely Place.

Ophthalmic and Aural Surgeon:

ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S., Ex-Ophthalmic and Aural Surgeon to the City of Dublin Hospital.

Consulting Physician:

EVORY KENNEDY, M.D. (Hon. Cau.) T.C.D. and Edin., Fellow and Ex-President King and Queen's College of Physicians.

Consulting Surgeon:

GEORGE H. PORTER, F.R.C.S.I.; M.Ch. T.C.D. (Hon. Caus.), Surgeon in Ordinary to Her Majesty the Queen in Ireland; Fellow and Ex-President, R.C.S.I.; Senior Surgeon to the Meath Hospital.

Obstetric Physician:

JOHN CRONYN, M.D., F.R.C.S., Professor of Midwifery, Roy. Col. Surgeons; Ex-Assistant Physician Rotunda Hospital.

Work, Income, and Expenditure for Twelve Months.

Annual number of Dispensary patients	5,947
Number of visits paid by such patients	124
Number of patients within the Infirmary	163
Number of operations performed	247 15 0
Total gross expenditure per bed per annum	1 10 6
Average expenditure per intern patient	

The Infirmary is wholly dependent on private benefactions, and is in debt to the Medical Officer. SUBSCRIPTIONS ARE EARNESTLY SOLICITED

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £35 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote. Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,

W. O'NEILL, Secretary.

ABBEYLEIX UNION.

BALLINAKILL DISPENSARY DISTRICT.

MEDICAL OFFICER WANTED.—The Committee of Management of the above Dispensary District will, at their Meeting to be held in Ballinakill, at 12 o'clock noon, on THURSDAY, the 20th MAY next, proceed to elect a properly-qualified MEDICAL OFFICER for the District, at a Salary of £10 per annum, exclusive of Registration and Vaccination Fees, and £20 a year for Salary as Sanitary Officer of the District. No Candidate will be elected by the said Committee unless he is prepared, as he will be required, to reside in the town or townland of Ballinakill.

Applications, with Testimonials, Diploma, &c., to be lodged with me before 12 o'clock on the 20th instant.

The personal attendance of Candidates on the day of Election will be required

By order,

CHARLES COMERFORD,

Dispensary, Ballinakill,

Honorary Secretary.

3rd May, 1875.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE,

50 LINCOLN'S INN FIELDS, W.O.

J. BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.,

&c. (Kiro's Coll.), and Author of VIA MEDICA.

Has always upon his books a large number of desirable Investments and available Appointments for negotiation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

PRACTICES AND PARTNERSHIPS NOW OPEN for Negotiation (in addition to those advertised in D. Langley's List, which is sent post free on application).

Z 176. In a pleasant LONDON SUBURB, a GOOD FAMILY PRACTICE, capable of great increase, and returning about £800 a year. Patients, good class. Midwifery, chiefly £2 2s. One horse and carriage kept. The residence is in a first-class position, contains 10 rooms, with small garden, &c. The whole practice lies within a narrow radius. Domestic reasons for retirement. To a gentleman with high diplomas and good social rank the investment is exceptionally suitable.

Z 175. Improving COUNTRY PRACTICE in GLOUCESTERSHIRE. Average receipts, £450, last year, £630. Patients, chiefly good class. District agricultural. Easily worked appointments are associated with the practice. The residence contains 11 rooms, with garden, stabling, &c., at a very low rent. Excellent educational advantages in the vicinity, and ample opportunities for field sports of all kinds. Satisfactory reasons for leaving can be given.

Z 174. Within 90 miles of London, with good railway facilities in the neighbourhood, a well-established PRACTICE, yielding £420 a year. Easily worked appointments, £100. Very little midwifery. The residence is large and commodious, containing 15 rooms, with extensive garden, paddock, croquet lawn, stabling, &c. Rent, £36. The work is very light, and the whole connection transferable, as there is no opposition within 8 miles.

Z 173. SEA-SIDE NUCLEUS. Cash receipts, £250. The locality is improving, and there is considerable scope for increase. No opposition. Appointments yield £50 a year. Residence pleasantly situated, contains 12 rooms, at a low rent.

Z 172. Within 40 miles of London, a small COUNTRY PRACTICE, easily worked, and yielding £300 a year. No opposition within 5 miles. Appointments, £130. The house is very charmingly situated on the chalk, with gardens, stabling, &c., at a very low rent.

Z 171. OPEN SURGERY in a LONDON SUBURB to be transferred on easy terms. The incumbent having been in bad health, has not pushed the practice. Present returns, £3 a week; but there is scope for almost unlimited increase. The house is situated in a good thoroughfare, and is held at a low rent. Stock and fixtures estimated at about £60.

Z 170. PARTNERSHIP in an improving COUNTRY PRACTICE within 60 miles of London, with direct rail. Average receipts, about £1,100 a year. Appointments, £200. A Third Share is offered, with Succession to Half, as may be arranged. Premium, 2 years' purchase on the share taken.

Z 167. Within 50 miles of London, a GOOD FAMILY PRACTICE, average nearly £900 a year. The connection is increasing. The district is richly agricultural, and there is little opposition. Convenient house, &c., at a moderate rent.

RULES OF HEALTH TO BE OBSERVED IN CONTAGIOUS DISEASES.

By W. J. LITTLE, M.D.,

Formerly Senior Physician to the London Hospital.

IN the MEDICAL PRESS of 21st ult. is a valuable article on the "Rules of Health to be observed in Contagious Diseases," based upon the suggestions made by the Society of Medical Officers of Health, for the guidance of householders and heads of families in cases of fever and other infectious diseases. These suggestions, although not new, are of obvious utility. But I think the writer will agree with me, that measures to be taken for purifying and disinfecting the immediate atmosphere of the sick and that which is breathed by the healthy members of the family, and of the attendants, should not be confined to *above-ground* proceedings, but should extend to thorough investigation of the state of the drainage of the dwelling which is, alas! for the most part underground, lost, unfortunately, to sight, and often too little perceptible to the sense of smell of the inmates. I venture to submit to the Society of Medical Officers of Health that wherever infectious fever exists they should not confine their directions in relation to the management of "every sink, closet, or privy," to pouring daily into these places a quantity of disinfectants, but that an underground proper examination and rectification of all drains on the premises should be made. The habitual condition of half the houses which have been built more than a few years is that the earth around, outside, and along the line of drainage in the basement represents an elongated cesspool, or a series of filth pits, through escape of sulliage, owing to brick drains not having been superseded in every part by glazed pipe drains, to obstruction in some part or another, or from original imperfect connection of sink, privy, or other pipes, with the main drain of the house. Experience has

shown me that even in perfectly new houses it is not uncommon to discover gross nuisances of the kind described, from imperfect or wilfully neglected connection of the sink or w.c. pipes with the main drain. The above assertion of the existence of a faulty state of drainage in half the houses in a town or neighbourhood which have been built more than a few years may appear a hazardous and exaggerated one; but I have good reasons for believing that there is no exaggeration in it. As to houses in which typhoid and other fevers actually exist, I can affirm that I have never been called into consultation in a case of severe fever in London or in the suburbs or in the country, without having been able to point out the existence of drain smells, the existence of drain obstructions being proved to exist by proper investigation afterwards in numerous cases. I venture to suggest that in all printed directions and "rules of conduct to be observed in contagious diseases," the public should be familiarised with the imperative necessity of immediate examination of the drains by the occupier, by the public inspector of nuisances, or other competent disinterested person, and removal of all impediments to discharge outwards from the house of all gaseous fluid and solid detrimental matters, whenever a case of such fevers exists.

These hidden cesspools, or masses of slush escaped beneath the paved floors of London basements, are as dangerous to health as the barbarous custom of the Ashantees, who bury their dead beneath the earth floor of their huts, a fact revealed to us during the Ashantee expedition as one of the potent causes of the habitual mortality of the white and black population of the notorious insanitary Sierra Leone.

The search for underground drain abominations should not be confined to the perfunctory examination of a spot where something disagreeable may have been observed, or where, after search, some flaw in the arrangements for sewage flow has been discovered. Nothing should satisfy the householder but the examination of the drains *throughout* all their ramifications towards and their connections with the rain-water pipes, sinks, and w.c. pipes. This can only be done by uncovering and exposing to view their entire length. How great an evil is it

not that our house architects have not contrived a plan for placing all these necessary rain-water, sink, and sewage currents in closed pipes upon, instead of underneath the basement stone floor. By this suggested improvement any accidental escape of sewer gas or other material could be immediately observed and stopped, at a comparatively trifling expense and trouble.

When the physician is summoned to cases of fever, he often experiences difficulty in persuading the inmates that an adequate cause of production, or of intensification of fever exists in the house, because they are not conscious of the presence of an over-powering filth smell, such as they well know results from animal and human exuvia, and from the early stage of decomposition of animal and vegetable remains. They require to be taught that the materials of decomposition more immediately dangerous to human life and health are those which are evolved during a later stage of decomposition, and which, although they *stink* less, are more subtle, and are known to possess a sickening faint smell, which robs the air of all freshness and purity. Every person instinctively avoids, or exerts himself to the utmost to escape from, gusts of an over-powering odour, or from a spot in which so great a nuisance exists; but many persons, either through habit of exposure to impure air, or through want of susceptibility of the olfactory organs, do not readily perceive the presence of these later materials of decomposition. The difference of character between the smell from early and late decomposition of animal remains may be illustrated by comparing the odour of a knacker's yard with that which rises from some untrapped street sewer-grating, in town or country.

This is more important at the present time, when there appears amongst sanitary medical officers, physicians, and the public in general, a tendency to disproportionate appreciation of the concealed danger of imbibing typhoid from the water supply of the house, or even from the milk supply. Although I do not doubt the wisdom of rigorous watch being kept upon our water and our milk as possible links in the causation of fever in individual cases, and in particular districts, my experience during the observation and treatment of fever cases, and the study of the writings of the best authorities on fevers, have convinced me that the air we breathe, when it is contaminated with filth poison, is more often potent for evil as a link in the causation of fever even than water or milk, or than the original disease germ, whatever this may be proved to be, or by whatever channel it may be conveyed.

Whether or no drain-air poison be a primary or secondary link in the causation of typhoid, its mischievous secondary importance in contagious or infectious diseases, such as small-pox, scarlet fever, malignant cholera, malignant sore-throat, diphtheria, plastic croup, and similar plastic or pseudo-membranous affections of other mucous membranes (chylipoietic), and some other diseases, is not disputed.

It is doubtful whether even a constant stream of water containing disinfecting or deodorising materials passing through the drains of an air-poisoned house would suffice to remove the dangerous influences exerted by imperfect drainage, because in the most common mischief of imperfect drains it is not generally that which remains in the drain pipes, or that which flows imperfectly or sluggishly through them which causes the mischief, but that filth which escapes from the imperfect, incompleter, or damaged drain into the surrounding earth at the bottom of the house, or the gases which, in improperly trapped drains, escape into the house. Having been physician to the largest metropolitan hospital, into the wards of which for many years fever cases were freely admitted from the outside, I was long a witness to the surprising improvement often presented during the first twenty-four hours after reception even into the only comparatively pure air of a London hospital—an improvement fairly attributable in part to removal from the vitiated dens in which the poorest classes were accustomed to congregate. Abundant

evidence of the advantage of removal of individual fever patients and of fever and cholera stricken camps and crews abounds in the literature of fever.

The acknowledged influence of drain effluvia upon the air as a secondary link at least in the causation of these serious diseases, and a belief in the insufficiency of such means recommended by the Society of Health Officers as the daily pouring of disinfectants into "every sink, closet, or privy," induces me to suggest that that society should, in their suggestions for the guidance of the public, explain the legal and practical manner in which instant attention to the drains can be carried out, either by the occupier or the landlord.

The public require to be familiarised with the idea that it is only less immediately dangerous for the sick and those who are still in health to remain in the vitiated air of an ill-drained house than to leave goods and furniture in a house on fire. The parent or child lost from fever cannot be replaced; the fire assurance office can more or less completely compensate for the material loss.

I venture to criticise another recommendation of the society, which is rather palliative as regards removal from drain-evil influences than a radical relief. I allude to the advice given to remove the sufferer to an upper apartment of the house. This is valuable advice as regards the diminution of risk of infection to the rest of the inmates, inasmuch as in houses, especially in the thoroughly contiguous houses of cities, in which openings in the side walls for windows and ventilation rarely exist, the air currents have a tendency to flow upwards, and therefore the spread of contagion downwards by means of the air is impeded. But this upward tendency of the air currents favours the rise into the upper chambers of filth-laden drain particles towards the sick located there as much as it diminishes the tendency of infectious matter to travel by means of the air from the sick to the still healthy below. I have often observed drain smells at the top of the house, notwithstanding that, even in cold weather, the windows of the floor on which sinks, bath openings, or a w.c. existed, were kept freely open night and day for the benefit of the fever patient.

Further, when obstacles to removal of evil influences caused by drains, churchyards, proximity of decomposing matter of any description, are insuperable, the public needs to be impressed with the advantage to the fever patient, even more than to those who remain unaffected with it, of prompt removal under proper precautions into a fresher, purer, and healthier atmosphere. In our cities, towns, and villages, many objections to such prompt removal present themselves—the fear of disturbing the patient's mind, the risk of injurious physical disturbance, the pecuniary expense, the difficulty of finding a suitable locality and dwelling for the patient's reception, the disadvantage to the patient or to the doctor (?) of a possible change of medical attendant, and separation from family and friends. In the case of the very poor, who are readily admissible into metropolitan fever hospitals or village hospitals, and in which I suppose the mother, or one of the nearest relatives, is usually permitted to remain at the bed-side of the sufferer when dangerously ill, the main objections at once disappear. The rich can always obtain removal when it is judged to be desirable. As to the intermediate classes, it appears to be especially desirable to accustom them to the absolute necessity of either prompt removal of the drain nuisance itself, or removal of the patient from the nuisance. Amongst these classes to whom the difficulties attending removal of the sufferer to a healthier locality are greater than they are to either the very poor or the rich, the Society of Medical Officers of Health might do much by the means of suitable explanations and recommendations. Perhaps no class interests itself more in domestic and sanitary matters than that which stands between the rich and very poor, and this class is consequently the more likely to be beneficially influenced by explicit directions issued by the Society of Medical Officers of Health. The

parochial officer and the local medical officer of health may be trusted to urge attention to the necessary removal of the very poor, and the private medical attendant may be trusted to practise his usual preference for the welfare of his patient to his own immediate advantage, by urging removal of the patient wherever drain nuisance cannot be promptly and thoroughly removed.

Permit me to add a word or two on the subject of the objection to disturbing, opening, or renewing foul drains whilst a serious case of fever, or a family, is in house. It deserves to be more widely known as a fact that as soon as decomposing fluid or solid matter is freely laid bare to the influence of atmospheric currents and to that of a current of water, the temporary disagreeable odour being subdued by adequate use of deodorising agents, the sick and the healthy are in no degree injured, but, on the contrary, the healthy experience a distinct sense of relief. The greatest obstacle to prompt action in the respect of drain amendment results from the great majority of householders not being proprietors, and the too frequent ignorance of the rights which the Legislature has conferred upon the householder, through the intervention of the medical health officer and nuisance inspector, to demand from the proprietor a healthy habitation so far as the drains are concerned. In consequence of delays thus unfortunately interposed, the mild fever is liable to be converted into a severe one, and instead of early or normal recovery, there results too frequently alarming protracted symptoms, tedious convalescence, or permanently mischievous sequelæ.

Paterfamilias being the comptroller of the privy purse, and unwilling to spend money on objects he has long been accustomed to undervalue, becomes sometimes the principal sinner in the matter of hygiene. He turns at first a deaf ear to the appeal of the doctor, the sanitary inspector, or of his anxious and affectionate better half, of whose days and nights a larger portion is passed in the nursery. He sometimes reminds one of the well-known citizen, since deceased, who, before the discontinuance of Smithfield Cattle Market, gave evidence before a Committee of the House of Commons that the foul stench at that period habitually attaching to the market and its purlieus, despite the periodical removal of the greater mass of the offal, was a most healthy spot, to which he daily sent his children for their walk for health purposes.

Some people are unimpregnable on the subject of nuisances, as to the existence of which they imagine they have an interest in closing their organs of sense. During a memorable hot and rainless August, some ten or twelve years ago, Faraday exhibited at the Royal Institution a glass of suspiciously and offensively coloured Thames water, procured near the Houses of Parliament. Both Lords and Commons were then contemplating suspending the session, in consequence of the overpowering effluvia given off by the Thames, which in its urban course served as the cloaca maxima. I chanced one evening in that August to find myself in a river steamer, on my way to Greenwich, in company with the then Lord Mayor and two or three Aldermen. Each revolution of the paddle-wheels, even far below bridge, was in the highest degree noisome, and I could not refrain from directing the attention of those principal conservators of the river to its polluted condition, mainly because the Court of Aldermen had some days previously denied the existence of any nuisance, and had refused to entertain a motion for inquiry respecting it. Each of the civic magnates, my fellow-travellers, was too convinced of the heinousness of appearing to reflect upon a matter within their jurisdiction, and flatly denied that they could perceive any disagreeable odour. Happily, the hot and dry character of the year in question thoroughly tested and proved the inefficiency of the sewage arrangements of the metropolis; it stimulated the masterly exposition of Sir Humphrey Davy's able successor, and promptly led to the great scheme of intercepting sewers with distant out-falls, as well as of the unrivalled Thames

Embankment. These improvements, now completed, constitute the pride and ornament of this great city.

As none can be said to be really experienced and fully capable physicians who, in addition to excellence of sight, hearing, taste, and touch, have not the needful culture of the sense of smell, to assist, by its aid, to distinguish many of the principal diseases, such as typhus and its allied forms, variola, scarlet fever, acute rheumatism, suppuration, that of cancer in particular, advanced tuberculous consumption, and many others, so the sanitary medical officer and his inspectors should almost be certified before appointment to office as to the possession of a given or sufficient quantity of olfactory power, which I have reason to believe is sometimes defective, though great hygienic, sanitary, and therapeutic powers may be present. As colour-blindness in some persons exists, so some individuals are unable, except perhaps by putting their noses to the neck of the bottle, to distinguish by smell the difference between rhubarb and ipecacuanha. A medical health officer should not belong to this category.

POISONOUS SYMPTOMS FROM EATING LABURNUM FLOWERS—RECOVERY.

BY FRANK THORPE PORTER, L.R.C.S.,
Demonstrator, Ledwich School.

THE following case illustrating the poisonous effects of the flowers of laburnum (*Cytisus laburnum*) may prove interesting. On the evening of Saturday, May 15, 1875, a fine male child, 3 years of age, was brought to me in an almost dying state: the pulse was imperceptible, the surface of the body cold, pupils dilated, the head rigidly thrown back, and the breathing stertorous; vomiting was freely taking place, but purging was absent. The mother stated to me that the child had been detected eating laburnum flowers three hours before the child was taken to me, and that the vomiting had been profuse for two hours. On examining some of the vomited matter I noticed fragments of the flowers in a broken-down state. The treatment consisted of the free use of ammonia with bark, the application of sinapisms to epigastrium and nape of neck; castor-oil was also administered. I prescribed no emetic, because the vomiting was sufficiently well marked, and furthermore, because I consider that emetics are not to be relied on in cases where *much time* has elapsed between the introduction of a poison and the development of the symptoms. The child made a rapid recovery.

REPORT ON SYPHILIS.

BY C. R. DRYSDALE, M.D., M.R.C.P.L., F.R.C.S.E.,
Senior Physician to the Metropolitan Free Hospital.

FOURNIER ON TERTIARY SYPHILIS.

THE following is the last lecture on Tertiary Syphilis delivered by Dr. Fournier last summer at the Lourcine Hospital, and reported by Dr. Porak (*France Médicale*, No. 7, 1875):—

Several times persons have seen rectal syphilitic lesions in their progress towards forming a stricture, that is to say, having already thickened and indurated the rectum and diminished its calibre, recede under the influence of specific treatment, or, at least, arrested in their evolutions, and in short, not attain to the irremediable consequences of definitive fibrous structure. Thus, Vidal (de Cassis) has related the following case:—

A patient at the Lourcine Hospital had a rectal induration which had considerably narrowed the rectum, and especially the anus. There were knobs and tumours of extraordinary hardness on the part, which, surrounding the anus, seemed to prolong the rectum outwards. (Do you not recognise in this, gentlemen, the lesions which constitute the recto-anal syphiloma?) After administering a

methodical mercurial treatment, he extirpated the tumour which surrounded the anus, which permitted him to introduce bougies, the diameters of which were gradually augmented, and he thus obtained by general treatment, extirpation and compression, a complete cure.

M. Godebert, in his thesis, cites two cases of rectal stricture which were very notably amended by the combined employment of specifics and dilatation. In the one, it is said that "without the least doubt the indurated walls of the rectum had gained in elasticity after this treatment, and that canulas of two centimetres in diameter passed very easily through the stricture, where at first there could only be made to pass a canula of half a centimetre in diameter." The other case is relative to a cylindrical stricture, which, treated by mercury, iodine, and bougies greased with mercurial ointment, was so much amended in some months that, when the patient left hospital, "the calibre of the fæcal matters had returned almost to its normal dimensions, defæcation was much less painful, and the rectal stricture had in great part disappeared." The suppuration alone remained.

M. A. Guérin appears to have obtained a success of this kind by the administration of the iodide of potassium in a case of stricture in the progress of formation with thickening and ulceration of the mucous membrane.

Lastly, I remind you that in two cases, of which I have spoken before, I have seen the rectal syphiloma not assuredly be cured, but retrocede, lessen in extent, and in short (this is the essential point), not end in the fibrous retractile stricture which constitutes the true danger of the lesion.

Doubtless such facts are very rare, and I would even call them exceptional. But there is a reason for their rarity, a reason which you are acquainted with, and which diminishes all this pathological condition, and that is, because the rectal syphiloma, on account of its character of indolence and insidiousness, is scarcely ever recognised until beyond the time when specific treatment could have any influence on it. However rare they may be, the cases I have cited show in a clear way this essential fact, so important in practice to many, that the lesions which constitute the rectal syphiloma are susceptible when yet young in their evolutions of being favourably influenced by the giving of specifics.

This having been laid down, what remains for me to say as to the treatment applicable to the strictures when confirmed reduces itself quite naturally to but little; for, in spite of its specific origin, this stricture does not any longer at an advanced period bring with it any but indications common to it with other strictures of the rectum.

That, at this date we should still prescribe as a trial, and in order that nothing should be left undone, the anti-syphilitic medication is certainly legitimate, and I see no inconvenience likely to arise from it. I will say more, this is even indicated in certain conditions, when, for example, the lesion does not seem to be very ancient, or when its origin remains undetermined, or when we have to do with a patient who has not had any treatment. Practically, indeed, it is impossible to determine the precise date at which a neoplasm of specific nature ceases to be accessible to specific agents. And then, when in doubt, we are led to prescribe the treatment of the diathesis, even when we suppose that we may not obtain any success.

In such cases, however, it is important not to insist too much on the employment of means from which there is but little to expect, and above all, not to subordinate to an illusory therapeutic trial the only methods which can assist the patient, surgical methods.

Before a confirmed stricture, indeed, it is surgery that must play the chief part. Medicine, which is powerless, and can offer no means capable of modifying an accomplished lesion, ought to stand aside. All that we can demand of it is to satisfy the following indications:—

1st. To watch over the condition of health of the patient, to palliate the functional disturbances which are

the consequence of the stricture, and above all, to keep up the strength. It is to this end that the different agents of tonic medication may be usefully employed—cod-oil, quinine, bitters, arsenic, sulphur-baths, and moderate hydropathy. Preparations of iron should also find their place here; but the astringent and constipating action which is their property makes them more injurious than useful.

2nd. To favour, as far as possible, the regularity of the stools. To do this, watch over the hygiene of the food, and forbid any *heating* foods; as also such as cause diarrhœa, because of their irritating influence on the bowels. Recommend foods which may satisfy the double condition of being powerfully nutritious and leaving but little fæcal matter, such as meat, eggs, milk, &c.

Nevertheless, in spite of all our care, constipation is inevitable. What can we do medically against it? Enemata are useful, by diluting the fæces and permitting them to pass the stricture in a liquid form. Being otherwise inoffensive, they may always be prescribed. But they are not always efficacious; at an advanced stage of the disease they often pass quite as administered, even when mixed with substances suited to excite the intestine. Sometimes they do not even pass the stricture, unless taken up by a long canula. The rectal douches, much less made use of, are scarcely more efficacious than the simple enemata, and perhaps they would not be without danger in an intestine with walls ulcerated, thinned, and easily perforated.

A more delicate question arises: What is the value of the purges in the case, of which patients and doctors make a great use, often indeed an abuse?

Let us distinguish the indication of urgency from the habitual administration of purges as a deobstruant remedy. The indication of urgency is formal, and needs no discussion. Here is a patient who has not been to stool for a shorter or longer time; he is suffering, has the belly tympanic, and begins to feel nausea; whilst enemata have produced no effect. In this case hesitation is not admissible; we must comfort the patient as quickly as possible, and purges furnish the means to do so; so that these should be prescribed.

Quite otherwise is the question of the administration of purges as a habitual medicine. This, irrational in principle, is condemned by experience. Firstly, purges are only palliative measures, which must be constantly renewed to obtain a constant effect. In the second place, they go quite contrary to the purpose we have in view, for they constipate by reaction. Besides, when prolonged indefinitely, they keep up towards the bowel a continued irritation. Lastly, they weaken the organism in the long run, like so many serous losses.

It is right, then, to use purges only with reserve, and in view of precise indications. There is, besides, a choice to make between them, when we are forced to employ them. As they congest the rectal mucous membranes, we should avoid drastics; and saline purges constipate by reaction; laxatives are useless. From experience, castor-oil acts best in this case, and it suffices to administer it in small doses to obtain an effect in diluting the fæces, and thus we avoid fatigue of the digestive organs.

But let us not forget that the true deobstruant methods in the cases which occupy us are exclusively those which attack the intestinal obstacle. These methods belong to surgery, and are of two kinds.

The first group proposes the re-establishment of the course of the fæces by progressive dilatation of the intestine without effusion of blood.

The others are operations where blood is shed, which enlarge the calibre of the stricture by incising the stricture or incising even the whole thickness of the wall of the rectum (internal and external rectotomy, linear rectotomy).

It is not my part to detail to you here, gentlemen, the indications for these various proceedings, nor the operative practices which they bring with them, nor the inconveni-

ences attached to each of them. This is the affair of pure surgery, and I must take care not to venture on ground which does not belong to me. I send you to special works for information on these points. In a general way, simply, and as a necessary complement to the previous study, I will indicate the conclusions to which practitioners have arrived who know best about this question relatively to the last order of points.

A first point, on which, unfortunately, there is but too great agreement, is that no method and no operation can furnish a radical cure of syphilitic stricture when confirmed (with reservation concerning certain benignant strictures, incomplete and limited).

The second point is, the methods where blood is drawn, however rational, simple, and speedy these may be, expose the patient to serious dangers, sometimes even to dangers of rapid death. Consequently, we ought not to make up our minds, except in cases of urgency sufficiently established by the characters of the lesion, and by the clear insufficiency of less perilous measures.

Thirdly. Slow dilatation, when progressive, which does not offer dangers comparable, and constitutes a rather inoffensive remedy, and yet sufficient in a certain number of cases to re-establish the course of the *feces*, is the one that naturally presents itself first of all for our trial, unless circumstances contraindicate it.

After a certain time of trial this method is judged by the results, and it then becomes evident that one of two things is true, either dilatation is seen to be efficacious to re-establish the functions, at least in so far as the health does not suffer; the accidents of stercoral retention are over, so that no other method requires to be tried.

Or, again, dilatation remains insufficient, whether because it has not been rigorously applied, because of the accidents it sometimes causes (pain, local inflammation, spasms, or nervous symptoms, &c.), or because that being applied, even with all the rules, it has left phenomena of stricture remain with the consequences which these entail. In this case the indication is formal; we must abandon the "gentle methods," and have recourse to a more radical procedure. However grave the consequences, an operation is indispensable, and should be practised as quickly as possible, before the general condition has undergone serious deterioration.

Frequently, it must be recognised, patients are forced to come to this after the manifest failure of the method of dilatation. Pretty numerous, however, are the cases where dilatation renders recourse to a cutting operation unnecessary (more numerous than is thought). Doubtless dilatation does not cure (what operation does it?); doubtless it is but a palliative; but it lessens the functional disturbance, prevents complications, and, in short, permits life to persist. I have already met with a half-dozen of patients who, treated solely by dilatation, supported without general disturbance for 5, 8, or 10 years rectal strictures.

We must note that, in order to give such a result, the dilatation must be assiduous, daily at first, and then very frequently repeated, and for the whole of life. It then constitutes a most painful subjection; and yet the patients are fortunate if, by its means, they can escape from the unavoidable consequence so mortal of the infirmity they bear, or from the risk of more radical operations.

In a former lecture (*France Méd.*, No. 5, 1875) Dr. Fournier says: A last point, and that quite a special one, remains to be discussed by me as complement of the questions concerning diagnosis or causation, which I have already spoken of.

The time is not far distant from us when syphilitic stricture was almost unanimously considered as a shameful affection, resulting from unnatural habits, or from sodomy.

To give a proof of this, Delpech for instance—Delpech, that surgeon so justly celebrated and generally so judicious in his judgments—used to consider syphilitic stricture as the result of an inoculation by the anus or the rectum. It was doubtful, he thought, whether this affection might not sometimes depend on general infection operating

through other passages. Thus, in his view, all syphilitic strictures of the rectum were a clear testimony of sodomy. In our days this opinion has survived. It survives firstly among men of the world, in whose eyes all lesions of the rectum or anus are suspicious. Whenever such persons speak of similar diseases, immediately calumnious observations arise. Do you remember what took place some months ago, when a man well known died from cancer of the rectum? It was rare that the laments concerning his lot were not accompanied by some malicious insinuation. More than this, some practitioners, even among our contemporaries, are not exempt from this prejudice, and for them rectal syphilitic stricture is not without giving rise to serious suspicions.

Now, be assured, gentlemen, there is nothing worse founded, more anti-clinical than such a causation for rectal syphilis. This stricture is nothing but the evidence of constitutional infection. There result from local infection only accidents of the same kind and nature as are developed in the testes and liver. If it be supposed that they are the consequence of direct infection, it would be necessary also, to be logical, to hold that induration of the liver and testes arose from local infection—absurdity too great for anyone to maintain. On the one hand, as you know from what I have said, there does not exist one observation seriously studied to show the reality of rectal stricture consecutive on direct inoculation; and, on the other hand, there exist also no facts to prove that an original contamination of the anus may have favoured and incited later on the development of tertiary accidents of the rectum. What relation, besides, can there exist between the chancre, the initial lesion of syphilis, and the stricture which follows it 5, 10, 20, or 25 years afterwards?

I do not certainly say that the rectal excitement resulting from unnatural relations may not be an exciting cause, or a provocation to tertiary manifestations in the rectum, just as tobacco is, as is notorious, a provocation of secondary manifestations in the mouth. But what I affirm is that the rectal stricture has no need of this excitation to be produced, and that it is produced without it; and, consequently, that the fact of a rectal syphilitic lesion of tertiary order, such as hardening, in no way implies shameful habits as a cause.

In a word, the rectum of the most innocent person is exposed, by the fact of the economy being infected by syphilis, to become the seat of syphilitic stricture, and, in short, the suspicions frequently emitted as to the origin of the affection are absolutely illegitimate, if not always, at least in the enormous majority of cases. Nothing in science justifies them.

Treatment.—An essential point dominates all that is about to follow. *Anti-syphilitic treatment does not exercise any curative influence on rectal confirmed stricture.*

This is what a quantity of the most authentic observations clearly show. It is a fact about which people are only too unanimous, and this fact contrasts a good deal with the action so generally efficacious and marvellously powerful of medicine on the other accidents of the diathesis, to merit your special attention.

Never, I repeat, has a stricture in the rectum of syphilitic origin been cured by iodine or mercury, nor by a union of these remedies. No; this powerlessness of specific modification has been interpreted in a sense which it does not bear. Some practitioners have concluded that stricture of the rectum, pretended to be syphilitic, is not so in reality. Since this stricture, they say, is incurable by special agents of syphilis, it is because it is not syphilis. This is a bad interpretation, gentlemen. Doubtless the syphilitic stricture is not cured by mercury or by iodine; but this does not prove that it is not syphilitic.

Metachloral.—M. Dujardin-Beaumetz finds metachloral a useful substitute for iodoform as a local application. Metachloral is entirely free from the disagreeable odour that makes the use of iodoform unbearable to some people.

INDIAN MEDICAL NOTES.—XXXVIII.

(FROM OUR SPECIAL CORRESPONDENT.)

DELHI, *March*, 1875.CHOLERA—INDIAN HOSPITALS—RESEARCH—DELHI—
CAMP NOTES—PILGRIMAGES.

"To preserve from desecration the remains of 6,000 emigrants who died of ship-fever in 1846-47 this stone is erected by the workmen of Messrs. Peto, Brassey, and Betts, engaged in the erection of the Victoria Bridge." Thus runs an inscription on a granite column near Montreal. It appears these emigrants, after fifteen weeks' voyage, sickened of cholera, and were quarantined in wooden sheds, there nursed by Sisters of Charity, and were buried in large pits. The Victoria Bridge, a mile and three-quarters long, is about sixty feet above the river, whose depth is twenty-two feet; the current runs seven miles an hour, and when the ice breaks up, the gigantic boulders beat viciously against the piers with frightful force. From 1854 to 1859 about 3,040 men were employed: several were drowned, some suffered from snow blindness, and from July to September, 1854, cholera, followed by typhus, attacked 200. As the cold, shivering school-boy was recommended to warm himself by thinking of ginger, it is cooling under a blazing Indian sun to think of Canada; besides, a very handsome railway bridge over the Jumna at Delhi somewhat recalls to recollection on a small scale that wonder of the world at Montreal. *En passant*, the Ganges, Jumna, and all the Indian rivers yet seen are very ugly, easily-imagined streams through sand, the surrounding country all flat—somewhat suggestive of Plaistow Marshes, the rains of course spreading out the water surface. This morning the view from the hospital near the Palace of the Moguls, excepting the railway bridge, appeared very poor, the object of the ride from camp before breakfast being to see the double-storeyed buildings of brick allotted to the sick of the R.A. and 55th Regiment, quartered at Delhi: The lower rooms used for offices, the up-stair wards for patients, the space for 20 being 2373.5 superficial, 59337 cubic, the wide double verandahs outwardly supplemented by green venetians and chicks; corrugated iron roof, a beautiful floor of stone flag, the ventilation and light satisfactory, the latrines, urinals, bath-rooms on the same flight clean, wholesome, inodorous—thanks to prompt removal, the separation of liquids and solids, the sweepers, always on the spot, constantly supervised to carry out the earth system. Sick-list, 7 per cent.; fever, pneumonia, syphilis, boils—recently variola, traced to a sportsman entering an infected locality. Delhi boils are not extinct, nor are investigators unanimous—Drs. Alexander, Smith, Fleming, and others. The microscope, which has somewhat aided towards the pathological elucidation, the parasitic origin, has also, in the hands of Dr. Lewis, demonstrated the connection between worms in the blood or in tumours, in the walls of the aorta, with chyluria, elephantiasis, and other allied conditions depending on mechanical interruption to the flow of nutritive fluid in the capillaries and lymphatics. Dr. O'Neill finds filaria in a Gold Coast skin disease called *craw-craw*. Dr. D. Cunningham has investigated the fungi in opium blight. He and Dr. Lewis, specially employed trying to find out cholera, thus far note absence of fungi or bacteria, the general abundance of white blood-cells, the red corpuscles peculiarly diffident, and find no evidence of any specific poison in cholera excreta. Healthy evacuations injected into the veins of dogs produced just the same effect as cholera evacuations did. Still these gentlemen are working away. We know nothing beyond bad air, crowding, fatigue, bad water, meteorological conditions, seasonal periodical visitations, specially where inland. We can only fortify the poor human body to resist disease, next to battle with the pestilence when it has weakened the walls. Just now very many believe cholera hydrate hypodermically, but, in the words of Sir William Jenner, "a column of cures for cholera in a leading newspaper may be the death-warrant of numbers."

Whilst stationed temporarily at Delhi every place of interest has been visited, and besides the lions previously alluded to, the stranger is strongly advised to spend a day in the vicinity of Humaon's tomb, unless his soul is dead to antiquarian treasures. In a curious tomb near the ancient ruins of that wonderful city Trogluckabad one monarch has buried with him documents in duplicate without number to testify that all his offences, murders, robberies were all pecuniarily compensated by his successor, the idea being at the Resurrection these papers will open the gates of Paradise. Bernier, the physician who was here some years before the great fire of London, states that the natives, thanks to sobriety and perspiration, although a languid race, suffered rarely from gout, stone, renal ailments, catarrh, quartan ague—very mildly from syphilis. The water delicious; no wine procurable; the drinks lemonade or arrack. Canary wine the great people drank at seven crowns a bottle. In those days the King had 3,000 horses, 800 elephants, 30,000 cavalry, a force of artillery to work seventy brass guns, the pay of the latter branch very good—£20 a month, to attract trained Europeans. The eunuchs, as a rule great scamps, were often detected in equivocal positions. A very interesting book concerning Delhi past and present has yet to be written. In 1857 certain regiments hurried from the Himalayas, without time to make arrangements for carriage, sanitation, or good water supply, in the month of May, to take part in the siege. One regiment marched 60 miles in 38 hours; another did 47 miles in two marches. Some of these men had previously broken down in the plains; others had only just ascended to the temples of health—the glorious mountains; therefore, because cholera attacked these regiments it is no argument against bringing troops suddenly down from lofty elevations. Amongst the other sanitary arrangements in the present camp, certain tents accommodating 15 men had the sides open night and day, the range of temperature at this season, where the air is dry, not so conducive to malarious chills. In my tent the thermometer has ranged from 60 deg. to 103 deg. lately, the nights delicious. Some men sleep entirely in the open air; others dread the influence of the moon: my plan, if at Meerut, until the rains, will be to sleep in the garden—the musquito-curtain sufficient protection. Of course, abdominal belts are ordered to be worn by all. Free perfilation of air through tents dilutes—retards the hidden virulence of latent mischief in straw, whether variola, typhus, measles, or erysipelas. In certain months straw may be damp, or green leaves used by the careless. The sugar-cane straw in this district, if dry, makes a cheap, wholesome couch. Unavoidable circumstances may cause crowding of tents and horses; it may not be practicable to take advantage of cool, pleasant groves, for trees are very awkward in the dark, especially in the early morning, when men, horses, wagons, may be blocked; nor in certain months are groves very healthy; and the native establishments absolutely required in this country very soon defile such places undetected. The village supplies, the water for the horses influence positions, the proximity to cultivation in dangerous months sometimes unavoidable. Lofty elevations are not to be found when wanted; nor can dry ground be always ensured; neither is it always safe to run the risk of fire in burning refuse. From my tent to-day a watch can be kept on the latrine trenches, and the hot air is so dry, the sweepers never absent, the trenches filled up and carried on daily, the urine receptacles at another place taken away and emptied at a good distance, that the keenest nose smells nothing. Dry heat is very trying, enervating, enfeebling—nothing more, except to the careless, incautious persons who eat or drink injudiciously, who do not avail themselves of cold water sufficiently, inside and out, and who delight in being fuggy, or crowding without occasion. All sanitary arrangements, however, become paralysed by rain or moisture, the tents become heavier, the camels groan grievously, the bedding and clothing may evolve poison under the influence of solar or bodily heat. The tent may

be pitched in a good position, with drains outside and protection inside, the pegs gripping firmly until the storm comes—then, over the hills and far away (only there are no hills) fly your *penates*, unless careful over-night to pack things in portmanteau. It is not pleasant in a night-shirt to run about the dark, wet plain in pursuit of papers or wardrobe. Moisture, too, is a terrible opponent to the earth system, which at other times overcomes the difficulty connected with absence of sewers, want of fall, no pipes, and the other expensive alternatives. The soldier requires constant watching; but both he and the native must be forcibly converted to the doctrines of the Reverend Mr. Moule. Native latrines require a staff of police; otherwise, true to custom, the ground will be defiled: so in camp, when the native carrying a brass pot is sneaking near the wells, just watch him, if the light permits. During the rains the dry earth drier in some places than others must be stored. In this district, after the Christmas or January rains, the showers subside until June, and the west wind is healthy. To-day there is an easterly, cool breeze, indicative of impending rain, not at all desirable; for the roads this April day abound with carts drawn by miserable bullocks, all evolving an ancient and fish-like smell. The Hurdwar Easter Fair attracts myriads of pilgrims, from the toothless old grandfather down to the sucking, unvaccinated infant, the halt, the maimed, the blind, the croaking hag, the bright little boys, the bashful bride of five, the baggard matron of fifteen, compelled by custom occasionally to hide her features—all ride in the family coach, intending to bathe in the sacred Ganges, their luggage, the dearly beloved hubble-bubble pipe, and a few rags. Hurdwar is the head-quarter of cholera. An active police-officer states that variola prevails in many villages, and by all accounts vaccination, infanticide, syphilis, the registration of births, deaths, and diseases are everywhere influenced by native bribery and falsehood. Ready for the harvest, waves and nods the golden corn in the parched fields, just now, when dysentery, influenza, pneumonia, fevers, include the cases. The persistent application of coal-tar to the weeping scalp, of strong solutions of silver nitrate to the itching, burning, fiery scrotum, will not here benefit eczema, assisted by tonics and constitutional treatment, as recommended by Dr. Tilbury Fox and others, to the best of recollection. Syphilis in my practice is mostly treated non-mercurially. Dysenteric pneumonia is a curious disease. Rheumatism, seldom fatal, is treated just as in England, the characteristic smell frequently absent. Variola some treat with chlorate of potash combined with iron, the local application also of carbolic oil. Strychnine is often useful for certain cases of insomnia. Headaches cannot be cured without leeching. Homœopathy suits not the desperate diseases of India. Some of the dentists command very good incomes, for teeth soon go to the bad, the steps leading from dyspepsia to liver abscess.

Hospital Reports.

LONDON HOSPITAL.

(Under the care of Mr. RIVINGTON.)

Strangulated Right Inguinal Hernia—Reduction spontaneously under Ice.

Robert Feathers, 67, was admitted Dec. 17th, 1873, under Mr. Rivington, for a strangulated right acquired oscheocele. He had had a hernia between thirteen and fourteen years, and had been in the habit of wearing a truss. The truss was broken. He was stooping to lift a weight in pursuance of his trade as a carpenter, when the hernia came down. On his arrival the hernia, rather a large one, had been down four hours. There were symptoms of strangulation. A warm bath was given,

and subsequently ice was applied. The hernia went back by itself at 8 p.m. A truss was ordered, and the patient was discharged on Dec. 24th, 1873.

Strangulated Left Inguinal Hernia—Twenty-six Hours' Strangulation—Stricture at Neck of Sac—Sac Opened—Omentum Removed—Subsequent giving way of Intestine—Fœcal Fistula and Death.

George Smilett, 28, dock labourer, was admitted on the 7th of April, 1874, on account of a strangulated left acquired oscheocele. He stated that he had had a rupture of the size of a hen's egg for years. He had never worn a truss, and never completely reduced the hernia. Strangulation commenced at 2 p.m. on the 7th, immediately after defæcation. He vomited three times during the afternoon. After admission he did not vomit, and he appears to have slept well. Taxis was tried by the house-surgeon without effect; a warm bath was given, and subsequently ice was applied. As there was no vomiting Mr. Rivington was not sent for till the following morning.

April 8th, 11 a.m.—Seen by Mr. Rivington. Little or no anxiety. Discomfort at the seat of the hernia. He had not vomited, but he felt as if he would be sick if he took anything, and he had therefore abstained from food and drink. Pulse 80; temp. 100°. The hernia was large and scrotal. The testicle was quite distinct below it, and there was no constriction upon its surface. Impulse communicated to it from below upwards ceased just below the external ring. Mr. Rivington strongly urged the patient to submit to taxis under chloroform, and if that failed, to an operation; but he declined all interference.

4.40 p.m.—He felt worse, and having vomited, was anxious for relief. He was put under chloroform. Taxis was tried for a short time, and failed. The usual operation was performed. The stricture was constituted by a sharp thickened band at the neck of the sac, incorporated with the sac itself. The contents of the sac were a large quantity of old thickened omentum, and some small intestine very much congested and almost black in colour, together with a considerable quantity of sero-sanguineous fluid. The omentum was removed, a double catgut ligature having been passed through its base and tied on each side of it. Mr. Rivington had some doubt about returning the intestine. It was very deeply congested, and seemed to have lost a good deal of its natural elasticity, but it had no mark of constriction on it at either end, and did not seem likely to ulcerate at the seats of constriction. Moreover, it had only been strangulated a little more than 24 hours, and it seemed reasonable to expect that it might recover itself. Hence it was returned and left close to the internal rings. The wound was closed and a pad and bandage applied. Five grains of pil. sap. c. opio were ordered to be given every four hours.

The patient went on well for two days. There was no sickness, and there was no abdominal tenderness. No motion passed. He took milk and beef-tea, and seemed comfortable. His pulse, however, was rather quick, at 120 on the 9th, and 104 on the 10th, and his temperature high, at 102.8° and 101.4°. On the 10th there was some discolouration round the wound, and a stitch having been removed, some fœtid discharge issued from the wound. This was attributed to suppuration of the omentum pedicle, which occupied the upper end of the wound.

On the 11th the wound was redressed, the bandage was taken off, and a fresh one adjusted. The discharge was copious. Almost directly after he had been dressed he complained of pain in his left groin. He vomited, and continued vomiting during the night. His temperature was normal. He was ordered iced champagne. The vomiting was attributed to the bowel not having recovered itself so as to allow the passage of fœces. On the 12th the wound was redressed with tenax, and the remaining stitches were removed. A fœcal fluid issued, and later in the day there was a free escape of fœces. In the afternoon he vomited, and had an attack of hiccough. Temp. 99°. It was evident that the intestine had given way. The

wound was therefore kept freely open and some slough removed from it.

13th.—Countenance more anxious. Pulse, hitherto in proportion to the temperature, rose, whilst the temperature declined.

14th.—No vomiting since the previous day. Tongue cleaning; temp. 98.4°; pulse 100. He seemed so much better and took nourishment so well that hopes were entertained of his recovery; but on the 15th he went off suddenly into a state of collapse, and he died some hours later.

Post-mortem examination had been forbidden, but permission to inspect the abdomen was secured. A good deal of local and some general peritonitis was found; the coils of intestine round the injured portion of intestine were glued together, so that extravasation of feces was limited on all sides by adhesions, and all the feces had escaped externally. The implicated portion of intestine was a piece of ileum an inch in length, and this had become completely separated from the rest of the tube and lay free at the internal ring.

TUESDAY, MAY 11TH.

SIR JAMES PAGET in the Chair.

ON THE HISTOLOGY OF THE SO-CALLED NUTMEG LIVER.

By J. WICKHAM LEGG, M.D.

The author, after reviewing the opinions which have been held concerning the anatomy of nutmeg liver, gave the result of his examination of twenty such livers. He found the vessels in the centre of the lobules dilated, with a corresponding atrophy of the liver-cells around them, but with no new growth of connective tissue in the centre of the lobules, as Rokitsansky, Frerichs, and Virchow have held. He found, on the contrary, that the growth of the connective tissue is well marked in the capsule of Glisson, and between the lobules, just as in the early stage of primary cirrhosis, and he looks upon this overgrowth as the cause of the shrinking and hardening of the liver in advanced stages of nutmeg liver. Other cases of the overgrowth of the connective tissue in organs subject to persistent hyperæmia were brought forward; and the paper ended with a protest against the name of red atrophy given to the atrophous nutmeg liver by Rindfleisch.

Dr. THIN inquired whether Dr. Legg thought that connective tissue passed between the rows of liver-cells in a lobule; he had only referred to blood-vessels, and had made no mention of connective tissue which the mode of preparation employed might have altered.

Dr. GREEN said that the author had shown there were two distinct kinds of change in a nutmeg liver—namely, first, atrophy and pigmentation of liver-cells in the centre of each acinus; and secondly, an increase of connective tissue at the margins. The first is the most important part of the process, and he thought too much stress had been laid upon the second element. He had not seen such marked connective tissue overgrowth, especially nuclear, in the portal canals in these cases. The indurative changes set up in organs by chronic congestion were due to increase in connective tissue, often nucleated, and not to be distinguished from the appearances due to chronic inflammation. As a rule, it differs in being less nucleated, and it is certainly a question as to how much of the connective tissue in these cases is due to new growth, and how much to atrophy of vessels, &c. At any rate, it is certain that some amount of new growth results from chronic congestion.

Dr. HANDFIELD JONES had examined the liver in all stages of cirrhosis, and had never fairly satisfied himself that the process was an inflammatory one. The growth of connective tissue was often ascribed to spirit-drinking, but this was insufficient, alcoholism more often producing fatty degeneration. He had thought rather this fibroid degeneration of organs was part of a general change occurring in different

parts of the body at the same time; a change opposite to that met with in phthisis, where the new-formed tissue goes on to a cheesy condition. During life he had never been able to ascertain a previous stage of inflammation in cirrhosis of the liver.

Dr. LEGG, in reply, said he was aware of the controversy as to the existence of sheaths of connective tissue around the columns of liver-cells, in a lobule, proceeding from the portal canals to the hepatic vein. He thought "chronic inflammation" an ill-defined term, and would be the last to attribute the changes he had described to any such cause.

SEQUEL TO A PAPER ON EXCISION OF THE ANKLE-JOINT.

By Mr. HENRY LEE.

In a former communication on Resection of the Ankle-joint the plan of dislocating the lower extremity of the tibia and the upper surface of the astragalus outwards was advocated by the author as the best mode of performing the operation, but it was demonstrated that before this could be done the internal malleolus must be removed. A division of the internal lateral ligament is not sufficient; the projection of the internal malleolus when present prevents the foot being turned sufficiently inward as long as the upper surface of the astragalus is held in apposition with the lower extremity of the tibia by the tendons which pass behind the ankle-joint. The difficulties of dislocating the bones in order to perform the operation satisfactorily were considered in all the plans which had previously been suggested. A case was given, which was believed to be the only one on record, where a complete primary resection of the ankle-joint was performed, and in which a most satisfactory result was obtained. In this case the bones had been dislocated outward, and the extremities of the tibia and fibula were removed without any attempt at reduction being made. On the 27th of January last another case fell under Mr. Lee's care, in which a similar compound dislocation of the ankle had occurred; but in this case the lower extremity of the tibia was dislocated inwards, and projected for two or three inches through the skin. The extremity of the internal malleolus had been detached, and remained connected with the internal lateral ligament. The fibula was broken about three inches from its termination. In this case the lower extremity of the tibia was sawn off, and the bone replaced in its normal position; an incision was then made over the external malleolus, and the periosteum separated from the bone as much as practicable. The external lateral ligaments were then divided, and the lower broken portion of the fibula removed. The limb was then again placed on its outer side, and the upper surface of the astragalus made to protrude as much as possible through the internal wound. A deep horizontal groove was made by means of a small saw below its upper articular surface. This surface was then removed completely by means of the cutting-pliers; the two smooth surfaces of bone were then placed in apposition, and carbolic dressings applied to the wound. A very severe attack of erysipelas occurred on the fourth day, which extended up the leg and thigh, the skin being of a very deep livid colour. It was feared that gangrene of the limb might take place, as had occurred in another patient who had the same symptoms, and who was admitted about the same time with a compound fracture of the leg. A deep incision was made on each side of the leg, from which there was soon a copious discharge of pus. The skin now assumed a bright red colour, and the erysipelas, having run its course, gradually subsided. The portion of the astragalus which had been removed had, and still has, attached to it a portion of the anterior tibial artery, which had been torn through at the time of the accident. The case previously recorded offers some interesting points of contrast with the present one. In the first the bones were dislocated outward, in the second inward. In the first the internal malleolus was not removed, although detached from the tibia, and the fibula in that case was not broken. The internal malleolus, which was allowed to remain, proved to be the cause of some subsequent irritation and suppuration, and the conclusion was arrived at that both malleoli ought in this operation to be removed, whether detached or not. The principal point, however, to which the author wished to direct attention, was the much greater facility which there is in removing the upper surface of the astragalus where that bone is dislocated outward, than when an attempt is made to displace it inward. This, in the author's opinion, makes a very

great difference where a surgeon can choose which operation he will perform. Even after both malleoli are removed, the powerful tendons which run behind the joint on its inner side tend to prevent the astragalus from being inverted, and are of themselves sufficient to account for the difficulty that surgeons have experienced in attempting to turn the astragalus sufficiently inward to remove its upper articulating surface. This he did without difficulty in the first case, by a clean section through the entire upper part of the bone, but he could not do so in the second without distressing the surrounding parts more than might be desirable. After the saw had been used to a certain extent, the upper surface of the astragalus had to be removed in three different portions by the cutting forceps.

ON THE CONSTRUCTION AND USE OF A NEW FORM OF
CARDIOGRAPH.

By A. L. GALABIN, M.D.

The author pointed out the liability to error which exists in Marey's cardiograph, and in the modification of it by Dr. Burdon-Sanderson, in consequence of the use of a flexible tube containing air to transmit the motion. Two effects may be produced in this way: first, the rounding off of any abrupt features in the curve; and secondly, the introduction of oscillations. It has been shown by Dr. Rutherford that, if even a slight impulse be communicated to the instrument by the finger oscillations do occur. The mode of verification adopted by Marey, in which a motion already known was communicated to the instrument by the rotation of the eccentric, proves only that such a curve as that described by his cardiograph can be transmitted a second time without further considerable change, and not that the original cardiac motion could be accurately depicted. The most perfect cardiograms hitherto obtained have been those procured by the application of the sphygmograph directly to the apex of the heart. The sphygmograph cannot, however, be generally used in this way in cases of heart disease, for two reasons:—In the first place, the extent of the cardiac motion varies very widely, and when the heart is hypertrophied it becomes far too great to be recorded; and in the second place, when the sphygmograph is applied to the chest, not only the spring-pad, but the framework is influenced by the cardiac impulse in cases in which the apex-beat is diffused, and in this way the curve described becomes modified. The cardiograph invented by the author is such a modification of Marey's sphygmograph that these two difficulties may be avoided, and tracings obtained in all cases direct from the apex of the heart. In order to attain this object, the knife-edge by which motion is communicated to the recording lever is not rigidly connected to the spring pad, but is attached by a sliding bar, which can be fixed in any position by a screw. In this way the amount of amplification given to the motion can be varied from about ten to a hundred times the original. The instrument is also attached to a movable frame in such a way that the wooden bars on which it rests can be separated to a width of five inches. And the brass-work can be raised or lowered at either end. It can thus be adapted to a chest of any size or shape. In tracings obtained by this cardiograph, the thrill which accompanies a murmur is often depicted as a vibratile line in the curve, and then the exact relation of the murmur to systole and diastole is permanently recorded. The shape of the systolic part of the curve indicates the proportion which hypertrophy bears to dilatation, while aortic regurgitation is shown by a rapid ascent during diastole. In many cases of mitral contraction an increase and prolongation of the auricular elevation is seen, while in some others, in which a direct mitral murmur appears to be due to the venous flow, the auricular systole is either not discernible or it appears in its usual position and not prolonged.

Amputation of the Spleen.

PIETRYCKI in the *Przeglad lekarski* reports the case of a peasant girl, aged 23, from a wound in whose left hypochondrium he found a fleshy tumour three inches wide and four long extending. Externally it presented the appearance of the spleen. The general bodily condition was good. After making several futile attempts at replacing it he surrounded the pedicle with a strong ligature, and after the amputation found two small vessels which it was necessary to tie. The wound was then closed, no peritoneal symptoms manifested themselves, and in fifteen days complete recovery had taken place.—*Alig. Wien. Med. Zeit.*, Feb. 9, '75.—*The Clinic*.

THE TOPOGRAPHY OF THE BRAIN.

SINCE the study of diseases of the brain has recently received a new impulse from the important researches of Ferrier and other physiologists, it has become more and more important that our knowledge of the anatomy of that organ should be rendered more exact, and that greater details should be given as to the various convolutions which exist on its surface. For a long time it was supposed that these convolutions were disposed as it were in a haphazard manner, and that they were therefore beyond the power of description. Leuret and Gratiolet, however, have shown that there is, on the contrary, a regular plan, which may be traced from the mammifera up to man, passing through the ape.

Dr. Charcot, of Paris, has been one of the first to avail himself of the important labours of these two observers; and in a clinical lecture delivered at the Faculté de Médecine recently he observes that, among these convolutions, we may distinguish the *fundamental folds*, so called because their disposition and relations are absolutely fixed, and the *secondary folds*, which are variable. It is at any rate abundantly clear that, without a good topographical account of the convolutions, it is quite impossible to take a step in the history of any cerebral localisations, even the most important ones. For instance, in aphasia, how are we to speak of the lesions which produce aphasia if we cannot precisely determine the seat and configuration of the third convolution? And how is anyone to find out the regions called psychomotor, which have been discovered to exist in animals by the researches of Ferrier, Fritsch, and Hitzig, if we are ignorant of the disposition of the folds and furrows on the grey substance of the parietal lobe and posterior parts of the frontal lobe?

What a host of observations fitted to clear up these interesting questions of localisation have remained valueless because the exact denomination of these parts has not been known, because of an imperfect knowledge of the topography of the injured regions. The study of this department of the brain, says Dr. Charcot, does not pre-

sent the difficulties which it might be supposed to have before investigation. Ecker, in a work published in 1869, in Brunswick, has given some excellent plates of the convolutions on the convexity of the brain for the use of the medical man; and Gromier, of Paris, has also prepared a similar work for Dr. Broca, with the title of "Etude sur les Circonvolutions chez l'Homme et chez le Singe" (1874).

Comparative anatomy gives many hints in the study of the topography of this important organ. The resemblance between the ape and man is striking in regard to the fundamental sulci; and thus any particular disposition which seems almost unintelligible in man is explained without difficulty, on account of its greater simplicity, when we examine the brain of the ape. In M. Gromier's work there is a plate of the brain of the *Pithecus inuus*, an ape of rather low type, and on inspecting the external surface of the hemispheres we see first of all two long sulci. The first is the fissure of Roland, and the second the fissure of Sylvius. These two fundamental sulci converge to one point, and mark out the external aspect of the frontal lobe. Behind these comes another sulcus called the *external perpendicular* fissure, or parieto-occipital, which in the ape separates clearly the occipital lobe from the temporal lobe and the parietal lobe. This separation is much less plain in man on account of the presence of what is named the communicating convolutions, which fill this sulcus more or less completely.

The parietal and sphenoidal lobes are less exactly distinguishable in the ape, and if we desire to establish the demarcation we must prolong the fissure of Sylvius by an imaginary line passing through a sulcus named the *gyrus angularis*. If this be done the external aspect of the hemisphere is divided into four lobes—the frontal, the parietal, the sphenoidal, and the occipital. Each of these is, in its turn, divided into secondary lobes, which bear the names of sulci, or convolutions, by fissures of the second order.

In the frontal lobe the *curved sulcus frontalis* bounds in front a convolution parallel to the fissure of Sylvius, which is named the *ascending frontal*; and in order to give more interest to this enumeration, it may be noted that, according to Ferrier, the upper extremity of this convolution is occupied by the motor centres of the upper extremity of the opposite side.

Some sulci perpendicular to the direction of the preceding divide the rest of the frontal lobe into three planes. The posterior extremity of the first constitutes, according to Ferrier, a centre which presides over the movements of the head. The posterior part of the second is alleged to be the centre of motion for the face. Thirdly, there is a centre which presides over the movements of the lips and tongue. This is the point where we meet in man with the seat of articulate language. This is the third convolution, or the *convolution of Broca*, as it is called in England.

The parietal lobe is very difficult to study in man, but is very easily made out in the ape. The inter-parietal fissure divides it into two secondary lobules—the *superior parietal*, which is the centre of motion for the lower extremities, and the inferior parietal lobule; and next a sulcus, more marked in the superior apes, isolates the

ascending parietal convolution from these lobules. It is in a part of this lobule that there resides the motor centre of the upper extremity.

The sphenoidal lobe is easily understood, being limited in front by the lower border of the fissure of Sylvius. We find in it two stages, in the upper of which is the sulcus which, Ferrier says, if removed, there would be produced temporary blindness in the eye of the opposite side. In the occipital lobe a sulcus passing transversely divides it into two stages; but as yet nothing particular is known concerning either of these.

In man we easily find the fissures of Sylvius and of Rolando, which limit below and behind the frontal lobe, in which is seen the ascending frontal convolution, and the first, second, and third frontal convolutions. The parieto-occipital fissure separates in a very confused manner the occipital from the parietal and sphenoidal lobes. Behind the fissure of Rolando, between this sulcus and the inter-parietal sulcus, we may easily make out the parietal convolution. Above and behind the inter-parietal fissure we see the lobule of the parietal sulcus, that of the curved sulcus, and the curved sulcus itself.

In the sphenoidal or temporal lobe there is seen in man, just as in the ape, a fissure which is parallel to the Sylvian fissure, and above it and below the Sylvian fissure we see the first temporal convolution, whilst below it there occur the second and third temporal convolutions.

With these additions to descriptive anatomy we have a certain number of fixed points to assist us in post-mortem examinations. It appears that for some time past naked eye examination has disclosed certain differences in the composition of the grey matter, according to the different regions of the brain examined. If the lower part of the occipital lobe be examined, it is found that in the parts of this lobe which surround the posterior cornu of the lateral ventricle the grey matter has not the almost uniform aspect proper to it as seen in the other regions of the brain, as, for instance, in the anterior lobes. Vicq d'Azyr had, indeed, observed that in these parts of the occipital lobe the grey substance of the convolutions was divided very clearly into two secondary bands, separated by a white band now called the ribbon of Vicq d'Azyr. And, again, to the naked eye the convolution of the cornu Ammonis, and that of the island of Reil are distinguished from the grey matter of the convolution belonging to the other regions of the hemisphere. Hence it is to be expected that some microscopical differences are to be found in these portions of the grey matter of the brain.

INTRA-RECTAL EXAMINATION.

IN a recent number of the *New York Medical Record*, Dr. R. Weir remarks that the introduction of the hand into the rectum must be ranked as one of the most important points in the diagnosis of some obscure abdominal diseases. It was suggested in 1872 by Dr. G. Simon, of Heidelberg. With two exceptions it has been used with excellent results. Simon states that the greatest expanding capacity of the intestine is at about six or seven centimetres above the anus, where it can be stretched from twenty-

five to thirty centimetres. From this point to the superior extremity of the middle third it gradually diminishes to 20-25 cm., and from thence it rapidly lessens in circumference, until, in the middle of the upper third of the rectum, it does not measure more than 16-18 centimetres, the narrowest part being at the beginning of the sigmoid flexure. He also learned that he could rupture the intestine in the dead subject, in the upper part, by forcing his hand, measuring twenty centimetres, into this portion.

This point, at which the dangerous narrowing begins, is distant from the anus some twelve or fourteen centimetres, and corresponds to the third sacral vertebra, and also to the reflections of the peritoneum, which run forward from the rectum, in the male, to the bladder, and in the female, to the uterus, constituting the lateral boundaries of Douglas's *cul-de-sac*, and called by Simon the ligamentum semicirculare Douglasii.

When the hand rests at this point, the tips of the fingers can be introduced into the sigmoid flexure, and with the mobility obtained from the extra calibre of the intestine, and from the meso-rectum and meso-colon of the sigmoid flexure, palpation may be made in favourable cases as high as several centimetres above the umbilicus.

These explorations have not only been repeated several times on the same patient by Simon himself, but he has also allowed other physicians, with hands of a circumference of 25 to 26 centimetres, to perform the manipulation without any evil results, and, indeed, with but little or no impairment of the tonicity of the sphincter ani muscle, as the next day injections of water could be retained.

Nussbaum and Popp (*Deutsche Klinik*, March, '72) have both been enabled by intra-rectal explorations to touch the ensiform cartilage.

Dr. Weir mentions, moreover, that Dr. C. A. Leale read a paper, in November, 1873, before the Academy of Medicine, and gave a case where, for the purpose of irritating the solar plexus in poisoning by chloroform, he had safely introduced the hand (20 centimetres in circumference) to the depth of many inches, passing, without doubt, into the descending colon, and had thus recognised by the touch the inferior border of the liver, and projected his fingers forwards, so that they could be felt four inches above the umbilicus.

In a case of right lumbar colotomy presented by Dr. H. B. Sands to the New York Pathological Society (*Med. Record*, June 1, '74), the results of a manual exploration of the rectum are given, as obtained by a post-mortem examination. It is there stated that the hand was passed to a distance of twelve inches, and that the forearm was too large to go farther, as though the limit of the exploration was the possible dilatation of the anus. The similarity of this case to the one Dr. Weir describes is more striking, by the existence of a laceration of the muscular, but not peritoneal, coat of the rectum, about eight inches from the anus. Dr. Sands' hand measured less than 19 centimetres. Similar explorations have been made by various surgeons for the diagnosis of a supposed renal tumour, for aneurism in the abdomen, or intestinal obstruction. In one case there was a reducible inguinal hernia, which could be distinctly recognised through the wall of

the rectum, demonstrating the reasonableness of Nussbaum's suggestion of thus pulling the intestine out of incarcerated hernia, and particularly from those situated in the umbilical region.

Dr. Weir also gives the case of a woman, æt. 50, who summoned him in January 4, '75, for the relief of a severe fit of colic, with moderate vomiting and occasional hic-cough, which had lasted forty-eight hours, and had been preceded a week previously by a similar attack. Pulse 96; temp. 100°. The abdomen not distended, nor was any hernia seen. The transverse colon was felt along the upper part of the abdomen; it was much distended, especially in right hypochondrium, but was painless on pressure, and pitted. She had been troubled by a series of colicky pains since last spring. A rectal examination gave no indications. She was ordered to take one-eighth of a grain of acetate of morphia every hour until the pain ceased, and to have a large injection of warm water and soap-suds occasionally. This treatment relieved her.

On February 10th a recurrence of vomiting and colic ensued, and the enema brought away no motions. On the 12th stercoraceous vomiting came on. On the 14th, after an unsuccessful injection of four and a half pints of an enema composed mainly of olive-oil, through the rectal tube, introduced two feet into the intestine, an examination by the hand in the rectum was therefore made.

The patient was etherised, placed on the side, and the right hand, 22½ centimetres in circumference, was passed slowly, and duly carried into the rectum. It was introduced without difficulty to the entrance of the sigmoid flexure, which was entered by the tips of two fingers, the intestine at this point being apparently healthy. The lower border of the left kidney was recognised, and the aorta, whilst on the right the caput coli was felt.

The hand was then withdrawn, having been inserted eleven inches; and after ascertaining that there was no disease of the sigmoid flexure, it was determined to make an incision in the ascending colon.

It was noticed that during the rectal examination the patient was much depressed, with feeble pulse and pallor, but with regular respiration. This was probably due to laceration of the bowel. The gut was opened longitudinally, and about two quarts of fluid light-coloured fæces flowed out, with relief to the somewhat tense abdomen. The intestine was stitched to the skin, and the balance of the wound loosely stuffed with carbolised lint. She sank, and died on February 16th.

On post-mortem examination it was found that there was a narrow band-like stricture of the middle of the transverse colon, admitting only the tip of the little finger, and formed by a growth on the wall of the intestine, of a character yet undetermined. Above the stricture, in the fluid contained in the colon, was found an orange-pip, coated lightly with hardened fæces. As this was the only solid body found, it was inferred that it might have occasioned the final obstruction.

On raising up the small intestine from the pelvis about two teaspoonfuls of blood were found in the *cul-de-sac* of Douglas, and running from the level of the sacro-iliac synchondrosis to the bottom of the *cul-de-sac* was

seen, on the posterior aspect of the rectum, a rent involving the muscular and peritoneal coats. This was divided into two by an interposing band of longitudinal muscular fibres, but the ruptures had evidently been produced at one time.

The hand was introduced to a distance of eleven inches, measured from the tips of the extended fingers, the fingers themselves measuring four inches, and although no force was supposed to have been used, yet the unconscious action of the wedge-shaped fingers must have been considerable.

Brinton, in his work on intestinal obstruction, estimates that the large intestine contains nine pints of fluid. This case confirms the truth of this assertion.

Notes on Current Topics.

Test Examinations.

THE *Students' Journal* has an instructive article on this subject in a recent issue.

Some three years ago the Council of the Royal College of Surgeons of England decided to publish annually the number of students examined each year from each medical school, together with the number passed and plucked. As may be imagined, when this determination was made known, some consternation prevailed among the authorities of the medical schools at the prospect of unpleasant revelations being made. Nor were these fears altogether groundless, for it was well known that in the case of some schools, for a student to pass his examination at the first attempt was the exception rather than the rule; whilst among the best and largest schools the proportion of students rejected at their first examination, was, as a rule, discredibly large.

"On examining the 'passed and plucked' list for the last year," says the *Students' Journal*, "we find that the number rejected at the primary examination of the Royal College of Surgeons, from the English medical schools range from 21.4 to 80 per cent., the London Hospital taking the first position on the list, and the Sheffield School of Medicine the last, while the large hospitals averaged about 30 per cent. of rejections. This, we maintain, is much too high a percentage, but it would be still higher were it not that at some hospitals the students are not permitted to present themselves at the College until after they have passed a 'Test Examination' conducted by the lecturers in their own hospitals.

"The 'Test Examination' is a modern creation, and was instituted, we believe, at various hospitals soon after the College of Surgeons determined to publish the 'percentage list,' with a view to save their reputation by keeping back those who would probably fail at the examination.

"Formerly a student used to pay his fees, attend a few lectures, take two or three 'parts,' and dissect them himself, or by proxy, as he felt inclined, and at the end of his second winter session his schedules would be duly signed, and he could take his chance of scrambling through his primary examination. Now, however, the order of things has changed. The fees must be paid as usual, but some-

thing more than an erratic attendance at lectures and demonstrations is required. The student is expected to be regular in his attendance and diligent in dissecting. But he may be the most regular of his year in attending lectures, and the most diligent and painstaking dissector, it will not ensure his schedules being signed unless he acquit himself well at the 'Test Examination.'"

Ziemssen's Cyclopædia.

DR. JOHN WILLIAMSON PALMER, of New York, is now staying in London (23 Dorset Street, Portman Square) as the representative of the International Translation of Ziemssen's "Cyclopædia of the Practice of Medicine," of which Messrs. Sampson Low and Co. announce as publishing, by special arrangement with the German publisher and editor, a copyrighted translation.

Of this magnificent work two volumes are ready, and contain the following important articles:—Vol. I. Acute Infectious Diseases.—Part I.: Abdominal Typhus, by Professor Liebermeister. Exanthematous and Recurrent Typhus, Cholera, by Professor Lebert. The Plague, by Professor Liebermeister. Yellow Fever, by Dr. Haenisch. Dysentery, by Professor Heubner. Diphtheria, by Dr. Oertel.—Vol. II. Acute Infectious Diseases.—Part II.: Varicella, Measles, and Scarlatina, by Dr. Thomas. Variola and Varioloid, by Dr. Curschmann. Erysipelas, Miliary Fever, by Dr. Zuelzer. Malarial Infection, by Professor Hertz. Epidemic Cerebro-Spinal Meningitis, by Professor von Ziemssen.

Vol. III. will soon be out, and will contain—Chronic Infectious Diseases: Syphilis, by Professor Baeumler. Trichinosis, Echinococcus, and Cysticercus Diseases, by Professor Heller. Infection by Animal Poisons—Rabies, Glanders, Worms, Malignant Pustule, Snake-bite, Flap, Foot-rot, &c., by Professor Bollinger.

Ziemssen's Cyclopædia ably represents the present state of German medicine, and is in itself a library of reference of great value. Dr. Edward Curtis, Professor of Materia Medica and Therapeutics in the College of Physicians and Surgeons, New York, has oversight of the prescriptions and formulæ of the work, and will make them conform to the United States and the British Pharmacopœias.

In the German, *eight* volumes are already published, and *four* more are in type. The English translation of the whole fifteen volumes will probably be published within three years from this time. If we take it from the beginning that will be at the rate of about one volume per quarter.

Small-pox, Inoculation.

THE abortive prosecutions for small-pox inoculation in the co. Mayo, to which we referred last week have been still continued, and the rascal who has been spreading the pestilence in that county again escaped by the gross and palpable perjury of the witnesses.

We reprint a specimen of evidence given by two children who had themselves been inoculated, and had, no doubt, been drilled to the necessary dexterity in false swearing by their degraded parents:—

Mr. Smyth, Sub-Inspector of Foxford, had a person

named Morrelly, commonly known as "Doctor Morrelly," summoned for practising inoculation on several children, varying in age from 6 to 15 years, in the country villages between Foxford and Swinford.

It appeared that, by arrangement, the children from several townlands had been got together in the house of a person named McNulty, and there, as believed, inoculated. Six of the children were summoned by the police to give evidence.

An intelligent-looking lad of about 15 years of age was sworn and examined by Mr. Smyth, and said—I don't know who cut me; don't know whether I was cut at all or not; I believe I might be cut; was blindfolded; cannot say who bandaged my eyes; some one told me to close my eyes, and I did so; pulled my cap down on my eyes; don't know whether it was a man or a woman that told me; did not know what for; don't know the spot of ground I was standing on, or whether it was in a house, or out of a house, or on the road, or in a field; it might be on the road—it was on the road.

The Magistrate—I don't see the use of proceeding further with the examination of this boy to-day, after the swearing that we have now heard, which, in my opinion, is utterly untrue and nothing less than wilful and corrupt perjury.

The next witness produced by the police was a smart-looking little girl of about 10 years of age. In reply to the Court—She stated that she did not know the nature of an oath; did not know the difference between a lie and the truth; she went to Mass and said her prayers, and attended the National School. She further stated that she did not remember being in McNulty's house on the day in question; was never in that house; her arm was never cut; had no sore on it; did stay away from school; it was not because her arm was sore, but for the purpose of minding cows, and for turning out manure.

It is evident that the small-pox inoculators cannot be punished by any ordinary process of law, and the only remedy for the difficulty is to hold the parents of inoculated children responsible for the crime.

The deficiencies of the law in this respect have been repeatedly pointed out by the magistrates, and we should have supposed that the Local Government Board and the law officers of the Crown would have applied themselves to the subject ere this.

Atrocities in the Limerick Workhouse.

READERS of our pages must be aware that the workhouse of the Limerick Union has been for a long time the arena of every description of mismanagement and rottenness which it is possible to pack into the administration of such an institution. The guardians—or some of them—have been making violent efforts at reform, apparently not knowing which department to begin with, and investigations and slashing reports respecting the misconduct of almost every part of the workhouse have been the usual occupation of each meeting of the guardians. The medical department has been, it would seem, in a state of chronic disorganisation, worse than hopeless, and in fact, the whole concern reminds us of an Augean stable, which nothing but the broom of the Local Government Board can be expected to cleanse.

The *acme* of all this maladministration has been the death of a poor friendless child of eight years of age, under circumstances which, if rightly reported, would be fitting only to a war circle of cannibals.

As the master of the workhouse is in custody, other officials inculpated, and the doctor under censure of the

Local Government Board, we are bound to speak with great reserve. We venture only to recapitulate the sworn evidence. The poor boy was sworn to have been suffering from diarrhoea for a fortnight, of which no notice whatever had been taken. While thus sick he was attacked and struck with stones by some of his school-fellows. No notice was taken until he was, as sworn, lying against the wall, raving. He was then ordered by the schoolmaster, as he states, to be "washed," and was carried, struggling and unable to cry out, to the laboratory, where he was stripped and put under a cock of cold water for three minutes, "naked on the flags." He was then redressed and brought back to the school-room, where, being unable to sit or stand, he was propped up between two desks, and the next that was seen of him was "stretched on a table." The doctor was called in several hours afterwards, and found him "in convulsions, in a very bad state," insensible, and dying.

We trust that, for the credit of humanity, this evidence may be proved unworthy. It is too dreadful to imagine that in the presence of a crowd of boys, and under the responsibility of officials, such atrocities could be enacted upon a poor child of eight years of age. Ginx's Baby would have the realisation of its worst condition if such things prove true.

Dr. Graily Hewitt on Puerperal Fever.

DR. GRAILY HEWITT thinks that it is impossible to escape the conclusion that puerperal fever consists in nothing more or less than injection into the general circulatory fluid of a poisonous material of animal origin, that it is a form of pyæmia, of which the minutest portion of the morbid agent may prove sufficient. He entirely disbelieves in the existence of a form of fever which is sufficiently definite and precise to receive a distinctive name, in the same sense that we speak of typhus fever, or typhoid, or measles, or scarlatina, or variola. It would be profitable to divide the cases of puerperal fever into two classes. There are the cases where there is very distinct evidence of the introduction into the system from without of a morbid animal poison; there are, in the second place, cases which do not resemble these, in which the evidence is wanting of the introduction from without of such a morbid poison. There can be no question that it has over and over again happened that the disease has been produced by inoculation in those unfortunate cases where the medical man himself carries the disease, and in those cases where midwives are equally efficacious in conveying it. He thinks that the manner in which such communication takes place is, in a large proportion of cases, by means of the hand, and believes that the spaces between the nails and under the skin which covers the nails are exceedingly liable to harbour these destructive animal products. Very great care should be taken to cleanse the hands. A pot of carbolic ointment and a nail-brush are most important to a medical man attending midwifery cases. Students handling surgical wounds in an hospital should not attend puerperal cases. Dr. Hewitt thinks that water never ought to be used for cleansing the perinæum in recently-delivered women, but that a dry clean rag or cotton-wool should be used. Laceration of the perinæum is apt to set up puerperal pyæmia. Pyæmia may easily be

produced in non-puerperal women by such practice as leaving a sponge-tent in the uterus too long. The uterus after delivery resembles a sponge in texture. Concurrently with the commencement of an attack of puerperal pyæmia the uterus is found to be enlarged, or involution has been retarded. What fails in these cases is the contraction of the uterus. This acts precisely in the same way as if all the locks of a house were taken off and ingress allowed to any burglar who wished to enter the premises. The expulsion of the *débris* ceases, and there occurs a suction-action in the uterus, by which the *débris* is taken up into the circulation. It is in this way, he thinks, that scarlet fever poisons and other fever poisons apparently produce disease. They destroy the patient's vitality to a certain extent, and abolish the contraction of the uterus. The pyæmic process immediately passes into the uterine sinuses, and the puerperal pyæmia commences.

The Late Winter.

DURING the first three months of 1875 the mortality of the population of England and Wales was equal to 27.5 per 1000 per annum. About 15,000 of the persons who died in the severe season were over the age of 60. Elderly persons are evidently the greatest sufferers from extreme cold. There is also, it seems, a far greater excess in mortality in rural districts than in towns on this account. The death-rate during the first three months of 1875 was 28.9 in urban districts and 25.7 in the rural districts. Compared, however, with mean rates, the increase was 8.6 per cent. in the urban, and 16.8 in the rural population. This arises from the far higher proportion of persons over 60 inhabiting country parts as compared with cities. 5.8 per cent. of the population of the large cities of Cheshire and Lancashire are above the age of 60, whilst 9.9 per cent. of the agricultural population are of that age. The very cold weather of last winter killed about 350 persons a day in England and Wales. Great heat and great cold are both dangerous.

The Marylebone Outbreak of Enteric Fever in 1873.

MR. J. NETTEN RADCLIFFE and Mr. W. H. Power have given evidence on the epidemic of typhoid fever in Marylebone in July and August, 1873, in the Report of the Medical Officer of the Privy Council. No less than 244 cases of fever occurred, and all among comfortable people. Of these 244 cases, 218 were in houses supplied by a particular dairy. This is a most important report, and deserves careful attention on the part of all physicians.

The Prospects of Medical Reform.

THE prospects of medical reform in England do not appear as hopeful as when we last reported progress. The Medical Reform Bill of Dr. Waters and the British Medical Association is ready, but is not offered to the House of Commons, being utterly distasteful to Mr. Simon and the Privy Council, and rather weak to stand by itself against such opposition. Indeed, we observe that this week the *British Medical Journal* is preparing the way for its abandonment.

Even the legislation in favour of an English conjoint examination, which was regarded as a matter of course, seems to be in a critical condition. Our contemporary above-named says:—

“In consequence of Mr. Stansfeld's opposition to the College of Surgeons Bill, it can no longer be brought on after twelve o'clock at night, in accordance with the standing orders of the House of Commons as to opposed Bills. The result is that, unless the Government give a night, it will be impossible to carry it through this session. It is, in the present state of Parliamentary business, not in the power of a private member to carry an opposed Bill through the House, except with Government aid. No doubt, however, the Government will give that aid, as they are unquestionably in favour of conjoined examinations. It will be noticed as a strange feature in Lord Sandon's reply to Mr. Waddy's question that he intimates that 'the attention of the Government has only recently been called to the subject of the legislation desirable with a view to remedy the present system of half-qualifications by nineteen competing bodies.' Mr. Forster and Lord Ripon would have told a different story.

Bacteria in Normal Blood.

Now that bacteria are so much talked about, attention may be called to the researches of Dr. Kolaczek (*Centralblatt für Chirurgie*, No. 13, 1875). He has repeatedly found bacteria, such as are considered to be characteristic of certain diseases, in normal blood. Under a power of from one thousand to fifteen hundred diameters, certain diminutive round bodies are observed, having sharp contours, and somewhat refractive. They are sometimes arranged chain-fashion, usually two together, occasionally three, and maintain a rapid oscillatory and migratory motion, while the blood-corpuscles and their molecular derivations in the same field remain perfectly quiet. Two of the minute globules are sometimes joined together so as to look like a single one, and occasionally a couple of these double spheres join, to form a rectangular figure, possessing the above-mentioned peculiar movements.

Kolaczek's experience in the study of bacteria leads him to class these globules as bacteria or micrococci, and he therefore concludes that either bacteria are found in all blood, or that, in spite of every precaution, certain of these minute bodies enter the preparations from the external air. He thinks that it is possible they may be introduced in the food, and has examined the excretions with great care, in order to see if they could be discovered in these.

The urine was examined by passing the stream towards the end of its voidance into a reagent-glass which had been cleaned with solution of potassa and sulphuric acid and boiled in absolute alcohol. From this it was immediately drawn by a tube prepared similarly, and of which the closed capillary end had just been broken open, while the other end was stuffed with cotton. It was then examined on a slide, and with a cover prepared in like manner. The result showed micrococci, which could no more have been imported from the air than those found in the blood.

SCARLET fever is very prevalent at Tiverton, and the medical officer of health, Mr. W. F. Terry, has been commissioned by the local authorities to take all necessary steps for its prompt elimination.

What to do with our Dead.

Now that Sir Henry Thompson's cremation scheme, owing to the want of pecuniary support, and the existence of strong public prejudices, has ended in smoke, and Mr. Seymour Hayden's unpractical basket proposal is not at all likely to receive very serious consideration from any one but himself, we have another in the arena of competition in the person of Mr. Willson, an architect, who has offered to submit his plans to the City of London for a Pyramid Necropolis. The idea is that of a sanitary sepulture for the metropolis, producing interment space for 625,000 dead, in vaults, upon a superficial area of five acres of land only. The authorities have not yet given their decision upon Mr. Willson's proposal, which has at least the merit of novelty.

Death Registration in Ireland.

THE Irish Registrar-General's Report for the week ending May 8th affords an illustration of the complete unreliability of these returns for short periods, and the laxity with which the registration of deaths is carried out. The death-rate of the suburb of Blackrock is set down as 43 per 1,000 of its population, while that for Kingstown only appeared as 14 per 1000, and that of the entire Dublin district 30 per 1000. If one were to argue upon these figures—a mistake into which the Chief Justice of the Irish Queen's Bench fell a few weeks ago—it would be assumed that a person living in Blackrock was in great danger of his life, while one residing in Kingstown might live for ever. These eccentricities of statistics arise from the fact that medical officers are loaded with a monstrous quantity of unnecessary clerk's work in making the returns, and paid little or nothing for it; consequently they have a tendency to compress all their labour into one job, and make the returns of half-a-dozen weeks at the same time. Thus the dirty, petty parsimony of public departments defeats its own object.

Prescribing Druggists.

WE commend the following to the notice of Mr. Couchman, the Coroner of Stratford-on-Avon, who lately made the inquest on a man who had died without medical attendance the occasion of an elaborate eulogium on the druggist who had sent the deceased a bottle of medicine:—

An inquest was held at Manchester on the body of Matilda Hardy, aged ten months. The mother said that the deceased "seemed to have a cold," and would not take its food; "when it was a little worse," she took it to Mr. Holt, druggist, Deansgate. Mr. Holt said that the child had a severe cold, and he told witness to apply mustard and meal as poultices on the child's chest. The poultices had no effect whatever. Witness also received from Mr. Holt a bottle of medicine; but the child died.

The surgeon, who had made a post-mortem examination, said that death was caused by inflammation of the lungs, aggravated by want of medical aid. "The majority of such cases might be cured if taken earlier." The medicine produced seemed to be paregoric, and would be an improper medicine. The tendency of the doses given would be to increase the inflammation, and not to diminish it. The following verdict was returned: "Died from inflammation of the lungs, aggravated by want of medical aid." The jury censured the druggist for his treatment of the deceased, and for giving the certificate in another person's name.

Apparently the jury were not of Mr. Couchman's expressed opinion, that it is a happy thing for the middle classes that they are blessed with the ministrations of prescribing druggists, who treat life and death cases without seeing them, and dose infants for an undiscovered disease.

Irish Workhouse Milk.

AT the Drogheda Sessions a milk contractor to the workhouse of that town was prosecuted by the Local Government Board for having supplied the house with adulterated milk. Dr. Cameron's analysis showed that the adulteration ranged from 50 to 60 per cent. The defendant admitted the delivery of milk, but, arguing in mitigation of punishment, his cows had died of distemper, and that in order to fulfil his conditions of contract, he bought the best milk he could procure. The Bench inflicted fines and costs, amounting in the aggregate to £12.

Profession, not Practice.

THE widows of Sir Arthur Helps and the Rev. Charles Kingsley are each to have a pension of £200 per annum from the Civil List. Considering the earnestness with which both these distinguished authors advocated prudence and frugality as among the adorning virtues of British workmen, the *Chemist and Druggist* cogently remarks that it is a melancholy comment on the dearth of provisions to reflect that neither left his wife in a sufficiently independent position, though one as Clerk of the Council, and the other as Rector of Eversley and Canon of Westminster, had exceptional opportunities of laying by a small fund to provide for contingencies.

Health of Hastings.

THE sanitary state of this health resort is so important to many that we are glad to see from the quarterly report of Mr. Ashenden, the medical officer of health, that although the mortality is slightly heavier than in the same quarter last year, the deaths have not arisen from that (to a certain extent) preventable class of disease, the *zymotic*; there having been but seven deaths from this class—viz., croup 1, pyæmia 1, rheumatic fever 1, scarlet fever 1, enteric fever 1, influenza 1, dysentery 1. In the corresponding quarter of 1874, which was a cold and wet one, there were no less than thirty-three from the same class, *croup and whooping-cough* being then the chief scourges. No doubt the dryness of the late quarter has caused a decrease in these infantile disorders. Yet Mr. Ashenden tells us that the persistent cold and easterly winds have added to the death rate, by causing more sickness from chest affections, which have been more than usually prevalent and fatal; bronchitis and pneumonia (inflammation of the lungs) causing 37 and 22 deaths respectively; then pleurisy and throat diseases bring the total to 66, against 37 in the corresponding quarter of 1874.

He feels confident that the excessive fatality arising from inflammatory diseases of the chest and throat, more especially among the children of the poor, might be prevented in the cold seasons if those afflicted were to be nursed in one room kept at a moderate temperature; instead of which it is usual for a child to be cosily placed in a cot

near the fire of the living room during the day, and at night it is removed to a *cold bedroom* without a fire, the temperature of which is perhaps twenty or more degrees lower than the day room, with the natural consequence that the child suffers an exacerbation of symptoms in the morning, and perhaps dies in consequence of thoughtless removal from a hot apartment to a cold one.

We beg to call particular attention to the small mortality from zymotic diseases (only seven deaths during the quarter), and also to the fact that Mr. Ashenden reports an "almost entire absence of any cases of sickness from the same class."

The Sanitary Condition of Birkenhead.

FROM the Report of the Medical Officer of Health, Mr. F. Vacher, we learn that during the year 1874 the returns of the local registrars record 2,142 births and 1,064 deaths in the district of Birkenhead and Claughton-cum-Grange. The natural increase to the population for the year was therefore 1,078.

Proceeding to an analysis of the zymotic mortality of the year, we find 184 deaths ascribed to the seven chief zymotics,—viz., 1 to small-pox, 16 to measles, 67 to scarlatina, 13 to diphtheria, 16 to whooping-cough, 23 to fevers, and 48 to diarrhoea. The remaining 56 are entered to what may be called the minor zymotics—diseases less prevalent, less fatal, or less correctly zymotic. Of this 56, croup accounts for 22, erysipelas for 10, and syphilis for 7, mal-nutrition and intemperance account for 4 each, dysentery and thrush for 2 each, English cholera, pyæmia, puerperal septicæmia, purpura, and inanition for 1 each.

The two most prevalent zymotics in 1874, as in recent years, were, therefore, scarlatina and diarrhoea; the former yielding a death-rate slightly above the average, and the latter slightly below. Scarlatina, we are told, may be considered as an endemic disease of the locality, as the district is rarely, if ever, free from it. It took epidemic form in September and continued unabated during the next three months, 54 out of the 67 deaths due to it occurring in the last four months of the year.

Mr. Vacher says the diphtheria of the year was not in any way associated with the scarlatina, and that the diseases were not even concurrent; but there appears to be some connection between the diphtheria and the croup of the year. Both diseases were exceptionally prevalent, 13 deaths being due to the former and 22 to the latter, as against 5 and 15 in 1873, 9 and 6 in 1872, and a ten years' average of 7 and 16 per annum. Both were specially fatal in the first half of the year, the distribution of diphtheria deaths over the four quarters being 5 in the first, 4 in the second, 2 in the third, and 2 in the fourth; of croup deaths, 5 in the first quarter, 9 in the second, 4 in the third, and 4 in the last. Cases of deaths from each disease also occurred in contiguous localities.

Small-pox in Paris.

WE notice in an article in the *Mouvement Médical* that at length that most uncomfortable body of men who compose the *personnel* of the Assistance Publique of the city of Paris are about to take into consideration the possibility

of doing what has so long been accomplished in London, i.e., segregating small-pox patients from other unfortunate hospital patients: only, it seems, that the erection of a small-pox hospital is such a new idea, that the matter is only to be gone about slowly. We suppose that these enlightened persons will wait until some other epidemic shall carry off some host of poor Parisians before they carry their plans into effect.

The Law of Abortion.

IT may be recollected that one of the "Professors" of the diploma-selling swindle called the University of Philadelphia has been lately prosecuted, because, having killed a patient in the effort to procure abortion, he sent her body to the dissecting-room of that "University."

In summing up the case against him, the Judge laid down the principle of law in the practice of abortion in the following terms:—

"The law invests the physician with peculiar privileges. In the exercise of his profession all his acts must be considered lawful until the contrary be shown. If he be administering anywhere, the presumption is that he is lawfully there for a lawful purpose, to which he was regularly called. If it be shown that a miscarriage was produced, it must be presumed that he had nothing to do with it unless it be shown that he participated in it, or counselled, or advised, or directed it. Even if it be shown that he produced it, the presumption would be that it was lawfully done, for a lawful purpose, until the contrary be established. In this connection, however, it must not be forgotten that an intentional miscarriage, for the purpose only of producing a miscarriage, is always unlawful. These presumptions of innocence are intended to protect the honest members of a profession whose glory it is to answer the call of suffering with a promptitude which forbids an inquiry into the surroundings of a patient, or guarding themselves with witnesses in the performance of their duties. They are not, however, to be made the means of covering up crime and protecting criminals. Nor should they be extended to acts of the physician not within the scope of his professional services. With the life of his patient his responsibility ends, and his subsequent acts and conduct are to be considered and adjudged as those of other men. It would be a rare exigency, indeed, which could justify him in appropriating for dissection the body of his patient. How far the profession should be on the alert to suppress the crime of abortion, to expose and bring to punishment the perpetrators, to aid with all their great intelligence and opportunities of observation the ministers of the law, must be left for them to determine. Although it may not be necessary, I regard it as a part of my duty to call your attention to the character of the crime charged against these defendants. There is none which equals it in wickedness, or in its terrible consequences. It is greatly to be feared that abortion is no longer confined to the victims of passion and seduction. It stalks abroad so brazenly heralded, that childhood in its most guarded home may see and feel its corrupting influences. That it breaks down the guards of private and public chastity, and fills the ranks of prostitution, is the smallest of its evils."

DR. DE CHAUMONT delivered on Saturday, May 15th, the first of a course of lectures on State Medicine before the Society of Apothecaries. He remarked that the chief enemies of sanitation were ignorance and self-interest. Diagrams were shown illustrating the comparative mortality among the upper, lower, and middle classes of the town of Preston. These were compiled by Dr. Clay, a clergyman of that city.

The Council of the Royal College of Surgeons.

MR. JOHN COOPER FORSTER, Mr. Henry Smith, Mr. William Adams, Mr. Savory, Mr. Barwell, Mr. Bryant, Mr. Holmes, and Sir Henry Thompson are among the Senior Fellows in metropolitan hospitals who may possibly enter as candidates for a seat on the Council of the Royal College of Surgeons.

Drunk or Dying.

A SAD case of mistaken diagnosis occurred in London last week, upon which an adjourned investigation took place on Friday, in the board-room of University College Hospital, before Dr. Hardwicke, coroner. The deceased was a bricklayer named Truby, 56 years of age. He had some days previously fallen in the street, and was taken first to the hospital, thence to the police-station, where he was treated for intoxication, or rather was not treated at all, until too late. The verdict of the jury is somewhat severe; but after the evidence adduced we do not see that they could avoid the censure their verdict carries; it is this: "That the deceased died from apoplexy, or effusion of blood on the brain. The jury consider the medical officer at the hospital who first saw deceased highly reprehensible for allowing the deceased to be treated and charged with drunkenness, and taken away by the police; and, further, they consider the medical officers at the police-station had not exercised sound judgment in allowing the deceased to remain for several hours in the doubtful state in which they found him, without giving earlier instructions for his removal, in order to have the necessary medical treatment."

Another inquiry was opened on Saturday last on the body of a coachman named Colley, 54 years of age, who was thrown from his vehicle, and a policeman fancying him to be drunk, took him to the police-station. A day or two after he was taken from the hospital before the magistrate, and fined forty shillings for being drunk, whilst the poor fellow was suffering from an effusion of serum on the brain, from which he died soon after the fine was paid. These mistakes are truly lamentable, and suggest the utmost caution on the part of the police and hospital authorities.

The Conditions of Chemical Change.

THIS was the subject of a lecture delivered last week by Prof. Gladstone, F.R.S., at the Royal Institution. The learned lecturer commenced by exhibiting a number of salts in various stages of decomposition, by which substances used in painting and other arts are produced. It was then shown that for two kinds of matter to act chemically upon one another there must be contact, and that for free action it is essential that one at least of the original substances should be fluid. The influence of insolubility, volatility, and relative mass was illustrated by experiments. The chemical force was originally termed "affinity," from the idea that substances combine which are alike in properties, but it is now known that the strongest combination takes place when there is the greatest dissimilarity. It was also shown that there are different degrees of chemical attraction; thus different metals, such as potassium, sodium, magnesium, lead, iron, copper, have very different

powers of replacing the hydrogen in water, and the lecturer concluded by exhibiting some of his experiments on the balance of affinities among coloured salts in solution which are free to act and react.

The Unqualified Apothecary of the Galway County Infirmary.

SOME months ago we requested from Dr. Browne, the Surgeon of the Galway County Infirmary, an explanation of the fact that he had ousted, of his own mere motion, summarily and without notice, the qualified practitioner who had been doing duty and receiving the salary of apothecary to the infirmary, and had established and still maintains in his place an unqualified dispenser. We expressed our view that even permitting an uneducated person to hold a professional office in the institution for which he is responsible, or acting in concert and consultation with such a person, was a gross infraction of professional propriety of which a surgeon holding Dr. Browne's position should disdain to be guilty. But if Dr. Browne be insensible to the impropriety of such a course, the Infirmary authorities, the Grand Jury, the sitting Judge, and the Apothecaries' Company (if there be such a body in existence) ought not to be insensible to the inexpediency of allowing a person who may or may not be competent, to discharge duties involving risk to human life; nor ought they to forget that the payment of any sum by way of salary to such a person is wholly illegal. We believe that at the March Assizes the attention of the circuit judge, Mr. Justice O'Brien, was directed to the matter, and that he called upon Dr. Browne for an explanation, who, we have reason to believe, settled the matter by saying that a good "compounder" was all that was necessary for the purposes of the infirmary.

Dr. Browne may, if he likes, hold the opinion that an unqualified compounder is as good as a licentiate apothecary, but the Act of Parliament does not endorse his view, but, on the contrary, declares that no salary shall be paid to any person who is not duly qualified. We respectfully refer the responsible authorities to Section 6 of the Act 3 and 4 George III., cap. 62, which is as follows:—

"In case the governors of any infirmary or hospital shall deem it most economical or otherwise advisable to procure the medicines for the use of such infirmary from Apothecaries' Hall in Dublin, or from any wholesale dealer in medicines, it shall be lawful for such governors (out of the funds presented by the grand jury, &c.) to appropriate and pay to any apothecary who shall have duly served an apprenticeship to the art and mystery of an apothecary a sum by the year not exceeding £30 as a salary for the compounding, making up, preparing, and administering medicines to and for the use of patients of such infirmary or hospital."

If there such a thing as a statutory audit of the infirmary accounts, we should advise caution as to the signing of cheques for a payment which is manifestly illegal and may be disallowed and charged against the signers of the cheques at any moment.

Berlin Hospitals.

AN esteemed special correspondent of the *Lancet* mentions that the Charité Hospital of Berlin, large as it is, needs extension. The University Hospital is so old and

ill-constructed that it will soon be pulled down. The Bethanien and Augusta Hospitals are far from the centre of the town, and the Stadt Hospital is quite in the suburbs. The Charité and University Hospitals are the two clinical hospitals of Berlin. There is also a Jewish Hospital, which has no students. It is from the want of clinical instruction that Berlin has a much smaller number of students than Leipzig or Vienna. Only 333 medical students were enrolled in Berlin in 1873, Leipzig having 499, and Vienna 1000. Among the renowned professors of Berlin are Du Bois-Raymond, Frerichs, Langenbeck, Virchow, and Helmholtz. The medical clinique at the University Hospital is under Professor Traube; the surgical is under Langenbeck. Resection of all joints are seen in profusion, and are, as far as possibly, conducted periosteally. The Augusta Hospital, it seems, is supported mainly by voluntary subscriptions, and contains 90 beds, and consists of a central brick building, with six pavilions built of wood on a brick basement, and arranged like barracks. Dr. Küster, the surgeon to this hospital, has successfully carried out, it seems, the operation of transfusion in twenty-four cases, not one of which proved fatal. In six of the cases eight ounces of blood were taken from the human subject, and in the remaining eighteen six ounces of blood, taken from lambs, were injected, in all cases Schliep's apparatus being used. A case of lumbar colotomy was mentioned as seen in the wards, in a woman, to relieve a syphilitic stricture of the rectum.

DR. B. W. RICHARDSON, F.R.S., has been elected President of the Health Department of the Social Science Congress to be held at Brighton in October.

MR. ALFRED COOPER, F.R.C.S., Surgeon to the Royal Hospital for Diseases of the Chest and to the West London Hospital, has been elected an Honorary Fellow and a Corresponding Member of the Medical Society of St. Petersburg.

A SAD case of kleptomania occurred in London last week, for which offence the prisoner, Dr. Robert Brown, was sentenced to six weeks' hard labour. The prisoner had been drinking, and it was further stated that he had at one time been confined in a lunatic asylum.

WE understand that the total number of candidates admitted to the primary examinations for the Membership of the Royal College of Surgeons, England, during the last and present months was 455, of which 117, or more than 25 per cent. were rejected. This is a slight improvement upon the corresponding period of last year, when 133 were rejected out of 442.

THE lectures for the present year at the Royal College of Surgeons of England will be resumed on Monday, the 31st instant, by Professor Henry Lee, who will deliver six lectures on Syphilis, and on some Local Diseases affecting principally the Organs of Generation; and Mr. Turner, Professor of Anatomy in the University of Edinburgh, will also deliver three lectures on the Comparative Anatomy of the Placenta.

The Army Medical Officers and their Grievances.

THE Council of the Royal College of Surgeons in Ireland have, at their last meeting, appointed a deputation of their members to proceed to London and wait upon Mr. Gathorne Hardy to represent the feeling of the College, already formally expressed, on behalf of the Army Medical Officers.

The deputation will consist of the President, Mr. Tufnell (himself a military surgeon and ex-Professor of Military Surgery), the Vice-President, Mr. Edward Hamilton, who has recently distinguished his pen by an able pamphlet on the Army question, and Mr. Macnamara, the representative of the College on the Medical Council. We cordially wish the deputation and those on whose behalf they will speak all the success which a good cause and persuasive advocates should achieve.

MR. MALACHI KILGARIFFE, of the Catholic University School, and Mr. E. W. Collins, of Trinity College, have been elected Surgeons of Jervis Street Hospital, Dublin, in room of Dr. Kane and Mr. Corley, who has been recently appointed to the Surgeoncy of the Richmond Hospital.

THE IRISH PHARMACY REFORM BILL.

THE Irish Chief Secretary has laid upon the table his solution of the difficulty which the obstructiveness and incapacity of the Directors of the Irish Apothecaries' Hall have created, and it seems to be a measure fairly suitable to the pharmaceutical requirements of Ireland. Our readers are, of course, aware that the Directors of the Apothecaries' Company have reduced that corporation to a state almost of inanition, and have deprived the country of the services of skilled pharmacutists, influenced by the idea that they could make the L. A. H. a degree in medicine, and they have hung on to this hope until, with characteristic imbecility, they have driven the chemists and druggists into open and influential revolt, and have forced the Government to the necessity of dealing with the matter with the high hand of authority. Sir Michael Beach's Bill is the emanation of the Report of the Select Committee of last year, which recommended that neither the Directors of the Apothecaries' Hall nor the English Pharmaceutical Society should exercise the function of pharmaceutical licensing in Ireland, but that a new and distinct body should be erected to whom such duties should be confided.

The preamble declares that—

"A great deficiency exists throughout Ireland of establishments and shops for the sale of medicines and compounding of prescriptions, and great inconvenience thereby arises to the public in many parts of the country.

"And to remedy such inconvenience it is expedient to amend the Act of 1791, and to enable persons who, although they do not desire to practise the art and mystery of an apothecary, desire and are qualified to open shop for the retailing, dispensing, and compounding of poisons and medical prescriptions, to keep open shop for the purposes aforesaid."

Sir Michael Beach, it would appear, seems to labour under the erroneous idea that "the art and mystery of an

apothecary" is a profession distinct from the trade of "retailing, dispensing, and compounding of poisons and medical prescriptions"—a distinction which has never existed except in the dreams of the Directors of the Hall, and which it is very undesirable should be officially established. The preamble proceeds to declare that—

"It is expedient that persons registered as pharmaceutical chemists in Great Britain should be entitled to be registered as pharmaceutical chemists in Ireland, and that persons registered as pharmaceutical chemists in Ireland should be entitled to be registered as pharmaceutical chemists in Great Britain."

We imagine that the Irish pharmacutists will not subscribe to the doctrine that English chemists should be entitled to open shop in Ireland; but as reciprocity is the order of the day, we cannot adopt the view that the monopoly of Irish practice should be confined to Irish licentiates.

The Bill creates, in the first instance, a new Irish Pharmaceutical Society, which shall consist of certain persons, not yet nominated, together with "all other persons who shall be qualified and elected in the manner prescribed by this Act," and the aforesaid nominees are to be the first council. A distinction is made between members of the Society and persons registered as pharmaceutical chemists; but as the pharmaceutical licence is stated to be the only qualification required for membership, we are at a loss to understand what additional requirement the council will be entitled to impose. The Bill contains the usual clauses regulating the proceedings of the Society in election matters, and the keeping of a list exactly similar to the Medical Register, and proceeds to arrange the functions and authorities of the Society in the following clauses:—

12. The council of the said Pharmaceutical Society shall hold their first meeting within *six months* after the passing of this Act at such place in the city of Dublin, at such hour, and on such day as the Chief Secretary to the Lord Lieutenant of Ireland may respectively order and appoint, and they may adjourn such meeting from time to time as shall seem fit, and at such first meeting, or some adjournment of the same, they shall make regulations with respect to the matters following:—

- (1.) The meetings and other proceedings of the said council;
- (2.) The times at which and the subjects and modes in which examinations under this Act are to be held and conducted;
- (3.) The times at which and the mode in which elections of members of the said Pharmaceutical Society are to be held and conducted;
- (4.) The mode in which elections of members of the council, and of president and vice-president thereof, are to be held and conducted;
- (5.) The fees to be charged for examination, licence, and registration under this Act, and the entrance fees and annual subscriptions to be paid by members of the said Pharmaceutical Society, and the application of the same, and of all moneys received by the treasurer under this Act;
- (6.) The duties of the registrar, treasurer, clerks, and other subordinate officers, and the manner in which the same shall be discharged, and the salaries to be paid to such officers respectively; and
- (7.) Generally for all such other matters as may be necessary for the due execution of this Act.

15. For the purpose of ascertaining the qualification of persons, not being persons registered as pharmaceutical chemists on the register of pharmaceutical chemists for Great Britain, who may be desirous of keeping open shop for the retailing, dispensing, or compounding poisons or medical prescriptions, and being registered as pharmaceutical chemists under this Act, the said council shall cause examinations to be held at such times and in such manner as may be prescribed by regulations made in pursuance of this Act, and the said council shall appoint examiners to conduct the same: Provided always, that no person shall conduct any examination for the purposes of this Act until his appointment has been approved by the Lord Lieutenant and Privy Council in Ireland; and such appointment shall not in any case be in force for more than five years.

All persons desiring to be registered as pharmaceutical chemists under this Act may at any such examination present themselves for examination, and they shall be examined with respect to their knowledge of the Latin and English languages, of arithmetic, of botany, of materia medica, of pharmaceutical and general chemistry, of practical pharmacy, of the British Pharmacopœia, and of such other subjects as may from time to time be prescribed by any regulations made in pursuance of this Act; but such examination shall not include the theory and practice of medicine, surgery, or midwifery, or any branch of medicine or surgery; and the examiners appointed by the council are hereby empowered to grant or refuse to such persons, as in their discretion may seem fit, certificates of competent knowledge and qualification and skill to be registered as pharmaceutical chemists under this Act: Provided always, that in case of rejection a rejected candidate shall not present himself for re-examination until after six months after such rejection.

17. For every examination, licence, and registration such reasonable fees or charges shall be paid as shall from time to time be fixed and determined by any regulation or regulations to be made by the said council in pursuance of this Act: Provided always, that such fees or charges shall at all times be equal, as nearly as may be, to the fees fixed and determined for like purposes by any bye-law or bye-laws made by the Pharmaceutical Society of Great Britain, and such fees shall be paid to the treasurer, and shall by him be applied to the purposes of this Act in manner prescribed by such regulations.

25. From and after the it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons within the meaning of the Act of the session of the thirty-third and thirty-fourth years of the reign of her present Majesty, chapter twenty-six, or medical prescriptions, or to assume or use the title of Pharmaceutical Chemist, or Pharmaceutist, or Pharmacist, or Dispensing Chemist, in any part of Ireland, unless such person shall be registered as a pharmaceutical chemist under this Act; and any person acting in contravention of this enactment, or compounding any medicines of the British Pharmacopœia, except according to the formularies of the said Pharmacopœia, shall for every such offence be liable to pay a penalty of five pounds; but nothing in this section contained shall prevent any person from being liable to any other penalty, damage, or punishment to which he would have been subject if this Act had not passed: Provided always, that nothing in this Act contained shall affect any licentiate of the Apothecaries' Hall of the city of Dublin, or any person who shall have been registered as a legally qualified medical practitioner before the passing of this Act, or who shall be registered as a legally qualified practitioner after the passing of this Act, and who, in order to obtain his diploma, shall have passed an examination in pharmacy.

26. Nothing in this Act contained shall extend to or interfere with the making or dealing in patent medicines, or with the business of wholesale dealers in supplying poisons in the ordinary course of wholesale dealing, or of chemists or druggists who are practising as such in Ire-

land upon their own account at the time of the passing of this Act, save and except the provisions against the compounding of medical prescriptions, and against the preparing of any medicines of the British Pharmacopoeia except according to the formularies of the said Pharmacopoeia; and nothing in this Act contained shall prevent any person who is a member of the Royal College of Veterinary Surgeons of Great Britain, or holds a certificate in veterinary surgery from the Highland and Agricultural Society of Scotland, from dispensing medicines for animals under his care.

It will be observed that the existing chemists and druggists are to be allowed, without further examination, to continue in trade, and to sell or keep open shop for retailing, dispensing, or compounding poisons, "but not to compound medical prescriptions." In fact, they are left just where they are at present, and unless they submit themselves to the indicated examination cannot act as apothecaries at all. We anticipate a violent outcry on their behalf, and, although we approve the caution which makes Sir M. H. Beach unwilling to qualify them *en masse* by a clause in his Bill, still it seems to us that the pharmaceutical block in country towns cannot be speedily removed unless the local chemist is allowed to obtain his authority to compound prescriptions on such an examination as he can reasonably be expected to face.

As to the dust-encumbered old corporation which has hitherto been endowed with the control of Irish pharmacy, its epitaph may be written. The L.A.H. has never existed as a medical qualification, and it may now be said to have ceased to exist as a pharmaceutical one. The half-dozen respectable and ambitious old gentlemen who remain in control of the drug establishment of the Company may be cheerfully permitted to pursue their ceremonial worship of the image of an apothecary-physician which they set up some years ago, and to which they have adhered with a constant faith impervious to remonstrance or ruin. It remains to be seen how long the nondescript licence which they give will be allowed to rank as a qualification for the Poor-law service.

Royal College of Surgeons of England.—The following gentlemen, having passed the required examinations for the diploma, were duly admitted Members of the College at meetings of the Court of Examiners on Tuesday and Wednesday, May 18 and 19:—

Barrow, Arthur Haynes, L.S.A., Denbigh Place.
 Barrow, John, L.S.A., Hilldrop Crescent, Camden Town.
 Bell, Charles Edward W., Exeter.
 Bernays, Herbert Leopold, L.S.A., Chatham.
 Booth, John Bennion, Lancaster.
 Brown, Thomas, Kennington Park Road.
 Burrows, William Seymour, Brighton.
 Edwards, Arthur Elliott, Antigua, West Indies.
 Fenwick, Kenneth Meander, M.D., Kingston.
 Ferrand, Edward, Granville Square.
 Hall, William Henry, Caterham, Surrey.
 Harpur, Robert Russell, Holbeach, Lincolnshire.
 Hayward, Frederick Dell, Sandown.
 Henderson, Edward Guy, M.D., Belleville, Canada.
 Mallam, George Bessant, Oxford.
 Miles, George Edward, Jamaica.
 Molson, William Alexander, Montreal.
 Newton, William Thomas, L.S.A., Lakenheath.
 Pepper, Augustus Joseph, Barrowden.
 Phelps, Arthur Martin, Camden Town.
 Piggott, Allen, L.R.C.P. Edin., Beckingham, Essex.
 Richards, Robert Crout, Portreath, Cornwall.
 Ritchie, John L., M.D., Halifax, Nova Scotia.
 Seward, William Joseph, L.S.A., Hereford.
 Sherd, Henry Arthur, L.R.C.P. Edin., Sheffield.
 Smith, Maurice Henry, Queen Anne Street.
 Spark, John, Lee, Kent.
 Theed, William Cawood, L.S.A., Wokingham.
 Thompson, Harold, L.S.A., Oxford.
 Walsh, Henry W. D., Watford, Herts.
 Weakley, Samuel J. J., Upton.
 Wharton, Henry Thornton, Boundary Road.
 Williams, Edward Hanbury, Brighton.

NOTICES TO CORRESPONDENTS.

DR. KENT SPENDER's article is held over for return of proofs.

DR. DUGGAN's paper "On the Treatment of Pulmonary Cavities" shall appear, if possible, in our next. We have to express our regret to Dr. Duggan and others that an extraordinary pressure of matter during the past few months has necessitated so great a delay in the publication of their communications.

DR. P. M. KELTY, Walsall.—1. The examinations for the M.D. degree of the University of London are equally rigid with those of Oxford, Cambridge, and Dublin. 2. Socially, and by courtesy, the status of graduates of the three older Universities named is higher than those of London.

THEMUS.—Your letter on "Medical Ethics" is unavoidably held over till next week.

DR. DABBY, Monasterivan.—All communications from Ireland or on Irish business should be sent to the Irish office, 23 Ely Place, or to the editor, 79 Harcourt Street, Dublin.

PEROXIDE OF HYDROGEN—SALICYLIC ACID.—The ethereal essence of peroxide of hydrogen has been employed by Dr. Day, of Geelong, and by Mr. Samuel J. Bayfield in the treatment of diabetes. Drachm doses of the essence dissolved in water were given thrice daily. Salicylic acid should probably be given in doses of from 5 to 15 grains, but we have as yet no very reliable data.

NEWSPAPERS IN THE UNITED KINGDOM.—From *May's Press Guide*, just issued, we find that there are at the present time more than 1,700 newspapers and periodicals published in the United Kingdom. Of these 419 are published in London, 927 in the English provinces, 153 in Scotland, 138 in Ireland, 56 in Wales, and 18 in the tiny isles around, making in all a grand total of 1,711. This shows a wonderful amount of vitality in literary circles, and a corresponding increasing "search for knowledge." Of these publications 16 are gratuitous, the price of the remainder ranging from one halfpenny to two shillings each. The date of the oldest living publication, the *London Gazette* (official), is 1665, whilst several are not many days old, and probably never will be.

UNIVERSITY OF LONDON.—Notice is given that the next half-yearly examination for matriculation in this University will commence on Monday, June 28th. Notice must be sent in by candidates fourteen days previously.

GARCIA TESTIMONIAL FUND.—We have been desired to state that the Committee who are raising the Testimonial to Signor Garcia, the inventor of the laryngoscope, have appointed Dr. Eisberg, of New York, Honorary Secretary for the United States. Dr. Smyly for Ireland, Dr. McCall Anderson for Scotland, and Dr. Simpson, of Manchester, for the north of England.

DR. MYRTLE, Harrogate.—Proofs of your communication "On Digitalis and Ergot" will be sent you for an early number.

QUEKETT MICROSCOPICAL CLUB.—On Friday next, at 8 p.m., Mr. Hawkins Johnson will read a paper "On the Organic Structure of Plant and of Meerscham.".

CLINICAL SOCIETY OF LONDON.—On Friday next, at 8½ p.m., Mr. Barwell, "On Hypertrophy of Lower Half of Face." Mr. C. F. Maunder, "On a Case of Double Fistula in Ano: one treated by the Knife, the other by Elastic Ligature." Mr. J. W. Hulke, "Arterio-venous Aneurism in Thigh from a Pistol-shot." Dr. Southey, "On Acute Pemphegus."

DR. PARKES.—A correspondent, in reply to the question contained in a letter signed "One of the Crowd," in our last issue, hazards the opinion that the reason why Dr. Parkes has not been returned to Parliament by any constituency is the probability that he has never expressed his desire to be thus honoured. Doubtless one of our Universities would be glad to return the illustrious Professor of Netley were he to offer himself.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Blake, Bloombury. Dr. Morell Mackenzie, London. Dr. Watson, Kensington. Dr. Billing, London. Dr. Lionel Beale, London. Dr. Myrtle, Harrogate. Dr. Wiseman, Ossett. Mr. Bridge, Wellington. Dr. Jewell, Chigago. Dr. Elme, Sheffield. Mr. Allingham, London. Dr. Handzel Griffiths, Dublin. Dr. Palmer, New York. Dr. Palfrey, London. Mr. Ashenden, Hastings. Dr. McNally, Madras. Mr. C. Lunn. Dr. Campbell. Mr. Feacock, Scarborough. Dr. Kirby, London. Dr. Meadows, London. Dr. Cockcroft, Keighley. Mrs. Baines, London. Dr. Vacher, Birkenhead. The Registrar-General. Dr. Williams, Berry, Holmfrith. Dr. Bathurst, Woodman, Finsbury. Dr. Williams, Fulham. Mr. Sharp, Glasgow. Dr. Langley, London. Mr. J. Davis, Cerrig-y-druidion. Dr. W. A. Smith, Manchester. Dr. Symonds, Ormakirk. Mr. Grace, Bristol. Dr. Furdon, Belfast. Dr. Ransome, Manchester. Dr. Francis Hogg, India. Mr. H. Swansy, Newbury. Dr. Leeson, Ilkley Wells. Dr. Williams, Croydun. Mr. Jolliffe Tuohill, Dublin. Mr. Burke, Hatfield. Dr. W. J. Little, London. Dr. Duggan, Tullamore. Dr. Martin, Fortlaw. Dr. Luther, Capponin. Dr. Lambert, Dublin. Mr. Porter, Dublin. Dr. Kent Spender, Bath, &c., &c.

VACANCIES.

Charing Cross Hospital. Medical Registrar. Full particulars of the Secretary.

Westminster Hospital. Demonstrator of Anatomy. Attendance, three hours daily during winter session. Salary, £40. Applicants to Mr. Davy, at the Hospital.

Leicestershire Lunatic Asylum. Assistant Medical Officer. Salary, £120, with board and lodging. Applications to Mr. Reeve, New Street, Leicester.

Trinity College, Glensmond, Perth. Medical Officer. Salary, £100 per annum, with furnished apartments. Applications to the Warden.

Chorlton Union. Assistant to the Workhouse Medical Officer. Salary, £120, with residence. Address the Clerk to the Guardians, Union Offices, Grosvenor Square, Manchester.

Western General Dispensary, Marylebone. Surgeon. Honorary. Also a Resident Surgeon. Salary, £120 per annum, with furnished apartments. Address the Secretary.

Original Communications.

ON A FORM OF UROHÆMATURIA. (a)

By JOHN KENT SPENDER, M.D. Lond.,

Surgeon to the Mineral Water Hospital, Bath.

I PROPOSE to say a few words this evening on a clinical condition which is very dangerous, and often quite obscure.

When blood exists in the urine in the usual, and (so to speak) the normal way, no symptom is more self-evident; any student can see it and demonstrate it. Now and then, it is true, there are fallacies which require sagacity and experience to detect: thus, a small quantity of blood derived from the kidneys gives the well-known sooty deposit in the urine, and a dark jaundiced tint may not always be quite easy to discriminate. As a rule, however, blood appears in the urine as blood, bright and red, and unmistakable in its physical and chemical characters; while albumen can be found in direct proportion to the quantity of blood present. But it is well-known to many practitioners, though not so generally known as it should be, that a perfectly pale, almost colourless, urine, of ordinary specific gravity, may be the unsuspected vehicle of blood, which is oozing out of the system in a clandestine way, and robbing the body to a not less certain and damaging extent than if it displayed itself in all its martial colours. Nay, still more, this treacherous, colourless urine, exhibiting no danger-signals to either doctor or patient, may contain every

element of destruction, and may represent wear and waste of a most fatal kind.

Let me take a typical case. A young man or young woman, suffering from what we, as a cloak for ignorance, call hysteria or spinal irritation (or, perhaps still more darkly, "functional derangement"), has a pale lip, a blanched cheek, and a palpitating heart. Sometimes there is so much irritation about the bladder as to give rise to the suspicion of stone, and the urine passed is so pale that possibly we are astonished to find its sp. gr. very little (if any) below the normal standard. This last point ought to be quite sufficient to excite further inquiry. Now, if to this colourless and seemingly innocent urine strong hydrochloric acid be added, it rapidly assumes a port-wine tint, showing that we have an excess of combined urohæmatin, which is liberated by the acid. The case stands simply thus—that an immense destruction of blood-corpuscles may take place in the body, and their *débris* be so eliminated as to be invisible until the application of an acid sets it free. In some of these cases the excess of urohæmatin in the urine is so great that after it has been set free by an acid, and taken up with ether, the ether after standing solidifies into a red-currant-jelly-like mass, and may actually be cut with a knife.

Sometimes a great part of the urohæmatin exists in the urine in a free state, and then the urine is red in colour before any acid is added, although the addition of the acid makes it still darker. Mark, if you please, that these cases are essentially different from hæmaturia. In hæmaturia the urine is muddy, not transparent, and contains blood-corpuscles. In the cases I am describing, whatever may be the precise tint of the urine, it is always clear, and contains no blood corpuscles. Whenever we have before us a disease like chlorosis, questions should be asked about the urine; and nine times out of ten we shall be told that it is all right, perfectly clear, and quite free. We may even satisfy ourselves that it has no trace of either sugar or albumen; and yet what a danger lurks behind! Both doctor and patient may be lulled into the belief that there is nothing materially wrong, when a grave lesion is making rapid strides towards a fatal end.

Now, it is to the clinical sagacity of Dr. George Harley

(a) Read at a recent meeting of the Bath and Bristol Branch of the British Medical Association.

that we are indebted (in this country, at all events) for a knowledge of this lesion, and for the chemical means of recognising it. I have found Dr. Harley's description literally true in so many cases during the ten years that have elapsed since the publication of his original paper on this subject, that I am induced to put together these few remarks in order to elicit the experience of my medical friends. There are two distinct disorders in which this condition of the urine is clearly marked—chlorosis, and what has been termed *anæmia lymphatica*, or Hodgkin's disease. In extreme chlorosis it is sometimes really startling to observe the suddenness with which the port-wine tint is developed on the addition of strong hydrochloric acid. It is always alarming when we find in a case of this kind that the liberal administration of iron does not alter the urine, or hinder the excretion of blood under this strange guise: nay, a patient suffering from what is ignorantly termed "hysteria" may be well fed, and yet go on losing flesh, and we shall never discover the real cause until we honestly examine the urine, when we shall find in all probability that the "life's blood" (as Dr. Harley terms it) is oozing away in this unnatural channel. In every instance, therefore, that we find a person becoming thinner and more anæmic, without disease of important viscera, or other sufficient cause, the golden rule should be—analyse the urine for urohæmatin, or the insidious flux of metamorphosed blood.

It is not quite nine years ago that a tradesman of this city, a well-known confectioner, came under my care on account of extreme anæmia, associated with the characteristic marks of Hodgkin's disease—enlargement of the external lymphatic glands and of the spleen. I was merely one of a long series of doctors whose skill was equally baffled, and he was soon passed on by puzzled and dissatisfied relatives to other doctors, until (as I afterwards learnt) he came to an easy and quiet end under the tender discipline of a homœopathic practitioner. Now this case is memorable to me as being the first in which I verified Dr. Harley's observations; and the utter failure of an orthodox tonic treatment seemed very unintelligible indeed, except on the plain ground that the nutritive and absorptive functions were shattered at their very roots. In the "Guy's Hospital Reports" for 1865 are a number of cases of Hodgkin's disease, quoted from different sources by Dr. Wilks, every one of which ended fatally. Dr. Wilks believes that the essence of the disorder consists of hypertrophy of the lymphatic system—quite distinct from lardaceous disease, and not necessarily connected with leucocythæmia.

During the last few years I have, when possible, examined the urine in all cases of extreme chlorosis, and seldom without finding the reaction described by Dr. Harley in greater or less intensity. A point worth noticing is that the urohæmatin is not always in the same state of oxidation, and, like indigo, its colour depends on the amount of oxygen it contains, so that it may be pale yellow at one time, red at another, and brown at a third. In consequence of this, different acids act upon the urine differently. In one case we may find that the addition of nitric, sulphuric, or hydrochloric acid gives rise to exactly the same results; whereas in another case hydrochloric acid may turn the urine red, while nitric acid only causes it to become yellow; and in a third case sulphuric acid may develop the colour of the urohæmatin better than either of the others.

I do not profess to have brought anything original before my friends this evening, but I venture to remind them of a condition which is full of meaning, and in some instances not less full of danger. The necessity of a prompt and systematic tonic treatment in these cases must be confessed by everyone. Success may not come at first—may even not come at all; but perseverance in the only rational plan will save ourselves the reproach of not having done enough, or of not doing the right thing; and iron medicine must always be supplemented by a proper quantity and quality of protein food, pure air, and muscular exercise.

MERCER'S HOSPITAL, DUBLIN.

AN ANALYSIS OF 2,000 CASES FALLING UNDER OBSERVATION WITHIN A TERM OF SIX MONTHS.

By THOMAS LAMBERT, late Resident Pupil.

ANALYSES of cases are generally tedious reading; still, as they are written for the guidance of those about to take the office of "Resident," I hope they may be acceptable to the readers of THE MEDICAL PRESS AND CIRCULAR.

I.—RETENTION OF URINE.

There were 94 cases of this very painful and common affection, occurring mostly in middle-aged men. The majority were due to the excessive use of liquor, while a few were due to sudden exposure to cold, a few to organic stricture, and one to the use of strong injections for gonorrhœa.

CASE 605.—J—K— admitted, suffering from a spasmodic stricture of the neck of the bladder, with eighteen hours' retention. This being a very urgent case, I attempted to relieve the patient at once by passing a catheter, but failed to do so. He was put into a hip-bath (temp. 110°), and ordered 10 min. of tincture of perchloride of iron and 10 min. of tincture of opium every ten minutes, and at the end of an hour the catheter (No. 4) slipped into the bladder; but no urine came, the fact being that the bladder was so much over-distended that it had lost all its expulsive power for the time. Pressure over the part and violent strainings on the part of the patient soon overcame the difficulty, and the urine flowed freely after a period of nineteen hours' retention.

CASE 29.—F—B— came to hospital suffering from a stricture, with sixteen hours' retention; the patient said he passed the last few hours in the greatest agony; the pain was so great in this case that it was useless to attempt to pass an instrument; accordingly the hip-bath, combined with perchloride of iron and opium, were employed as before, with the best result.

In all the cases which have come under my notice, I failed to pass a catheter in six only; one of those was a case of chronic resilient stricture of seven years' standing; the second was in a patient whose penis and testicles were atrophied, being only as large as those of a boy of four or five; the remaining four were chronic strictures, which took a long time to cure.

II.—CONTUSIONS.

There were 231 cases of contusions of various parts of the body, more or less severe in their effects, a few being so severe as to detain the patients in hospital for some weeks, but in the majority it was not considered necessary to keep them in; the local applications used in nearly all cases being the muriate of ammonia lotion combined with rest.

III.—WOUNDS OF THE HEAD AND FACE.

There were 625 cases of wounds of the head and face, caused by a variety of instruments—from the far-famed shillelagh to a poker or quart measure.

Considerable difficulty will be experienced in dressing these cases, the recipients being generally under the influence of drink; however, the course to be adopted in all cases is to shave the head neatly around the wound, washing away all dirt or gravel, and then to bring the edges together by adhesive plaster, avoiding the use of sutures if possible. Of these cases I will briefly give the notes of a few.

CASE 30.—M—H—, an intelligent looking woman, was admitted to hospital, having received four severe wounds on the head, caused by a drunken husband striking her with a large iron pot, breaking it into several pieces. The head was shaved and the wounds dressed, several small vessels being secured by torsion. On examining the fourth wound (which was on the forehead), it was found that the outer table of the frontal bone was fractured. The wound was dressed with lint steeped in carbolic oil, and

the patient made a good recovery without any untoward symptoms other than high inflammatory fever.

CASE 604.—J—D—, æt. 36, came to hospital, having fallen on his head off a car. On the back of the head, near the lambdoid suture, a stellated wound was found, some inches in extent; it was at once cleansed from gravel, and neatly brought together by means of adhesive plaster, a pad of lint, and a bandage was applied, and the patient placed in a warm bed and ordered some stimulants, as he was very collapsed. In a few days he got an attack of erysipelas of the head and face, from which he but slowly recovered. This case illustrates the fact that, in severe scalp wounds with any tendency to coma or collapse, it would be almost criminal on the part of the "resident" to allow the patient out.

CASE 360.—B—K—, a young woman æt. 20 years, received a wound over the left malar bone, three inches in length. Three sutures were introduced, and the part bandaged up. In two days traumatic erysipelas set in and prevented the union of the wound "by first intention." The patient was then treated for erysipelas, and in process of time the wound healed, but leaving a very large cicatrix. Chronic intemperance was, I believe, the predisposing cause of the erysipelas in this case.

CASE 20.—L—K— received a blow from a tumbler, by which her upper lip was split down from the cartilages of the nose, the surrounding parts being very much contused. The edges of the wound being neatly trimmed, were brought together by means of two hare-lip pins and figure-of-eight suture; in a short time the wound united, leaving a very slight mark.

CASE 390.—P—W—, æt. 10 years, received a wound behind the left ear, caused by a blow from a pewter pot. When seen, blood was spouting from a wound of the posterior auris artery, which appeared to be enlarged. Torsion was applied, the wound dressed, and there was no further trouble in the case.

CASE 1,462.—M—N—, æt. 50 years, received a slight wound on the back of the head, which she neglected to get dressed. When seen, the wound was discharging pus freely, and there were numerous small abscesses on the back of the head and neck. Large poultices of linseed-meal were applied for some time, under the influence of which the abscesses resolved themselves, and the patient got quite well.

IV.—HÆMORRHAGE.

Hæmoptysis, Hæmatemesis, Epistaxis, Bleeding from Varicose Veins, Bleeding from Leech-bites, Wounds of Arteries.

There were 17 cases of the above-mentioned varieties of hæmorrhage; they are very frequently met with, and sometimes it is a difficult matter to arrest the bleeding. To take the first: hæmoptysis may be readily detected and distinguished from hæmatemesis by the difference in the colour of the blood, the manner in which it is evacuated (spitting in one case and vomiting in the other), the seat of pain, the age of the patient, his previous history, and lastly, the waxen, anæmic hue in hæmoptysis.

Epistaxis, or hæmorrhage from the nose, when slight, is of little importance, but on the contrary, in some cases, beneficial, being Nature's method of getting rid of superabundant blood. In simple cases tannic acid blown up the nose will suffice, or plugging the anterior nares with lint and applying cold to the head. In more serious cases, or when the patient is weak from loss of blood, it may be necessary to plug the posterior nares by means of Bellocq's canula or a catheter, but it is a *dernier ressort*, to be dispensed with if possible.

CASE 78.—M—G— admitted, suffering from profuse epistaxis. All the usual remedies were tried, but without avail; accordingly, I proceeded to plug the posterior nares. A pad of lint was prepared as large as the first joint of the thumb, a piece of twine being attached to the centre; the canula was threaded and passed along through the nostril till it came out through the posterior nares; the instrument was then withdrawn, and the

piece of twine hanging out of the mouth was attached to the pad, which was then introduced well behind the soft palate, and kept in position by placing a pad in the anterior nares and fixing it there; this effectually arrested the hæmorrhage.

CASE 1,904.—Miss J—, an anæmic-looking young woman, came to the hospital suffering from persistent hæmatemesis, combined with a slight attack of hæmoptysis. Immediately after being admitted she threw up about a quart of thick blood, of a dark colour, after which she spat up a small quantity of arterial blood. By this time the patient was almost bloodless: so I gave her a draught containing dilute sulphuric acid, min. xx.; sulphate of magnesia ℥i.; acid infusion of roses ℥ij. This stopped the bleeding, which did not recur.

Bleeding from varicose veins may in every case be arrested by the application of pressure, or any of the usual styptics, such as tannic acid, turpentine, matico, perchloride of iron, &c.

Wounds of arteries are pretty frequently met with. There were eight cases, including palmar arch three, plantar arch two, ulnar artery three. Torsion in all these cases succeeded in arresting the hæmorrhage, a graduated compress and a bandage being applied afterwards.

V.—FOREIGN BODIES.

There were 39 cases of foreign bodies recorded; the majority occurred in the throat, being for the most part fish-bones, pieces of meat, pieces of iron, and in two cases pins, one of which was removed by the probang.

Crochet needles were removed from various parts of the body, and a piece of the stem of a clay pipe was removed from the left nostril in one instance.

VI.—BITES.

There were 41 cases entered in the books as bites; of these the greater number were bites of dogs, and though the persons bitten seemed to be very much afraid of hydrophobia, still, as far as I can tell, no bad results followed in any of the cases. Though not absolutely necessary, I made it a practice always to wash the wound well with warm water, and to touch it freely with lunar caustic, at the same time to dispel any fears that the patient may have had regarding the injury. The remainder included bites of man, woman, cat, rat, and badger.

VII.—GASTRALGIA.

There were 38 cases entered as gastralgia, or violent pain in the stomach, entirely due to the indiscriminate use of a mixture of bad and insufficient food, bad whisky, porter, beer, &c., &c., and in nearly every case occurring in women of the lower classes of society, who are so frequently seen knocking about the streets of the metropolis under the influence of drink. What I employed in those cases, and found to be most useful, was a draught containing half a drachm of tincture of ginger, and four or five minims of tincture of capsicum, in effervescence or otherwise, with saline purgatives.

VIII.—BURNS AND SCALDS.

There were 68 cases of this very common and sometimes fatal accident. The cases were all children unable to take care of themselves when left alone in the vicinity of fire. To illustrate the principal modes of death in cases of severe burns, I will briefly give the notes of three cases.

CASE 24.—B—H—, an intelligent-looking child, æt. 7 years, was dressing herself near the fire, when her clothes became ignited, and she was so severely burned that she was brought to hospital, where she was at once admitted. The patient was burned over the anterior and posterior thoracic region; she was pale and shivering, and shrieking with intense pain. She was placed in a warm bed, ordered some stimulants, and given a full opiate, which, however, did not procure sleep or immunity from pain. The burned surface was dressed with cotton wadding smeared with "carron oil," and hot jars applied to the feet. Reaction did not set in, and the

patient lingered on in extreme pain for three days, when she died of shock to the system.

CASE 146.—A—C—, æt. 11 years, was admitted to hospital suffering from very extensive burns of the trunk. The patient, when admitted, was in a state of great collapse, which was at once remedied by the use of stimulants, &c. The burns were dressed as in the preceding case, and all went well till the tenth day, when tetanus supervened, and death occurred on the eleventh day from exhaustive suppuration and tetanus.

CASE 239.—B—McC—, æt. 4 years, admitted suffering from superficial burns of the chest and abdomen, caused by falling into a fire. Opium and stimulants were freely administered, and the patient's health supported by tonics. She, however, died from exhaustion consequent on profuse suppuration from the burned surface.

CASE 12.—M—S—, æt. 7 years, was brought to hospital, having received extensive burns through falling into a fire. The same treatment was carried out as in the preceding case, but the patient died in ten hours from shock.

It could not be said that any of these cases of burns were in any particular stage, as the first four degrees were manifested in each. The local applications used were cotton-wool smeared with "carron oil;" but lately I have used a lotion composed of collodium ℥ij., chlorodyne ℥ij., glycerine ℥i., with very beneficial results, owing to its soothing qualities.

CASE 10.—J—M—, æt. 6 years, was treated successfully for scald of the glottis, caused by drinking boiling water from the spout of a kettle. Calomel was administered in grain doses every ten minutes until green stools appeared.

CASE 36.—B—C—, æt. 4 years, was scalded in a similar manner, and was treated in the same way, with a like result.

IX.—ALCOHOLISM.

Of drunkenness, or, more technically speaking, alcoholism, or alcoholic coma, 26 cases were recorded. Some of these cases proved fatal, and others were of such a serious nature as to require prompt and vigorous measures on the part of the resident. Should the case be one in which the patient has recently partaken of a quantity of stimulants, the stomach-pump should be used at once; and should the patient be very weak or collapsed, stimulant and nutritive enemata should be administered without delay. In simple cases flagellation with a wet towel or roller will soon succeed in restoring the patient to consciousness; galvanism is also attended with beneficial results. The pernicious effects of the abuse of alcoholic stimulants are well exemplified in the following cases:—

CASE 671.—W—P—, a strong, healthy-looking man, was admitted in a state of profound coma. Hot jars were immediately applied to the feet, and mustard plasters to the chest and calves of the legs. This treatment succeeded in restoring the patient to consciousness in about an hour, during which time but little hopes were entertained of his life. He was discharged well the next day.

CASE 886.—L—M— was taken into hospital in a comatose state, which resulted from chronic intemperance and exposure to cold. The pulse was hardly perceptible, and the feet being cold, hot jars were applied, along with mustard blisters. Notwithstanding these and other efforts steadily persisted in, the patient died in twenty-four hours, not having spoken from the time he was admitted.

CASE 96.—J—B— was brought into hospital in a state of insensibility. It was ascertained upon inquiry that on the day in question "he fell down in a fit in the street," having been drinking for some weeks previous. Similar treatment was adopted as in the preceding case, with such success that he was able to leave the hospital next morning quite recovered.

The enema given in these cases contained—turpentine ℥vi., assafoetida ℥iv., sulphate of magnesia ℥i., soap-suds a pint.

CLINICAL MEMORANDA.

Reported by JOHN W. MARTIN, M.D.,

Assistant Medical Officer, Mayfield Factory Dispensary, Portlaw.

CASE I.—*Hepatic Congestion—Jaundice—Recovery.*

ON the 2nd of April, 1874, I was asked to see P—t—ck L—hy, a furnaceman, who had been ill since the 23rd of March. Not wishing to neglect his work, he thought he might recover without recourse to medical advice. The attack commenced with rigors, followed by profuse perspiration. He had pains in the small of the back and in the limbs. The motions were hard, white, and very offensive. He had no desire for food, and complained of frequent headaches and general lassitude. For some days previous to the development of the disease he found the hepatic region very painful and tender. On Tuesday, the 31st of March, he became jaundiced; and on Wednesday, the 1st of April, the tenderness in the hepatic region increased, and a violent pain set in during the night, so much so, that I was called early upon Thursday morning to see him. I found him in great pain, the skin warm and perspiring, tongue furred and dry, pulse strong and bounding, 112 per minute. Before my seeing him he had vomited a quantity of very bilious matter, resembling the yolk of an egg. The vomiting had ceased when I visited him, but he complained of great nausea and dislike to food of any kind. The tenderness over the liver was too great to permit of any but the most superficial examination. The dullness extended about an inch below the false ribs. The epigastric veins were full and prominent. He was passing water abundantly, of the usual character in cases of jaundice—a deep saffron colour, staining his linen a bright yellow.

I directed large hot linseed-meal poultices to be applied over the right hypochondriac region, and prescribed the following mixture and powders:—

R Acid. nit. mur., ℥ij.;
Sp. chloroformi, ℥ij.;
Tr. aurantii, ℥ij.;
Infus. gentianæ, ad ℥xij. M.

Two tablespoonfuls to be taken three times a day.

R Hyd. c. creta, gr. x.;
Pulv. jalapæ co., ℥ij. M.

Divide into two powders, one to be taken every second night.

April 4th.—Pain and tenderness relieved; bowels acted after medicine; tongue moist and cleaning. Second powder to be taken, and the mixture continued.

April 6th.—Able to leave the bed. Jaundiced appearance decreasing. Feels stronger and better. Tongue quite clean. Appetite returning. Bowels acting well. Still much troubled with tenderness about the hepatic region.

Mixture repeated. Stimulant liniment directed to be well rubbed in, over the seat of tenderness.

April 12th.—Convalescent. Resumed work.

CASE II.—*Consolidation of the Lungs—Hæmoptysis—Treatment resulting in Improved Health.*

UPON the 25th of February, 1874, I visited Martin Ch—sty, a delicate lad, æt. 14, who had been the subject of a sharp attack of hæmoptysis the previous night. The following is the history of the case: Two years before he had an attack of simple continued fever, for which he was treated in hospital. Since then he was subject to repeated ephemeral seizures of "cold," the symptoms of which were rigors, hot dry skin, followed by profuse perspirations, pain in the chest, nausea, and vomiting, but no cough or expectoration; their duration was so short that he never presented himself for treatment. The attack under notice commenced February 20th, with the usual febrile symptoms—rigors, hot dry skin, perspirations, and a sense of prostration. He was sufficiently recovered next day to continue at his work; towards evening, however, he felt a sharp pain in the chest, and suffered a good deal from a hard dry cough. Hæmoptysis

set in on Tuesday night, February 24th, as already mentioned, compelling him to seek advice the following day, the date of these notes.

On examination, I found his skin very hot, dry, and "pungent" to the touch; his body fairly nourished and well formed. Dulness over the whole surface of the chest, the right more than the left, especially in the sub-clavicular and mammary region. The respiration everywhere harsh and tubular, most so in the right lung, where it was accompanied by loud sibilant and musical râles, which were most marked over the dorsal surface. Bronchophony very distinct in both lungs. His tongue was clean; he had no appetite; the bowels acted daily. Pulse 72, very weak. For treatment—

R Acid. citric.,
Potassa bicarb., aa ʒij.;
Aqua acetatis amm., ʒi.;
Vin. ipecac., ʒij.;
Tr. aconiti, ʒiss.;
Liq. morph., ʒss.;
Syrupi, ʒss.;
Aqua, ad ʒviiij. M.

Two tablespoonfuls to be taken every fourth hour.

R Emplast. lyttæ, 4 x 4.

To be applied for seven hours over the upper portion of the chest.

April 26th.—Blister rose well, and gave great and immediate relief to the pain. Treatment continued.

March 2nd.—Able to be up and dressed. Felt much better, but very weak. Dulness in the affected portions of lungs diminished, but still present. The character of the respiration much improved; the sibilant râles already described, had everywhere disappeared; the sounds tubular, but to a less marked degree than before. Bronchophony, however, was still well marked, and the respiration interrupted, the voluntary muscles being called in to complete the act of inspiration, symptoms which, when taken in connection with the existing dulness and tubular character of the respiratory murmur, demonstrated grave mischief to the pulmonary tissues.

R Potass. iodidi, ʒij.;
Tr. cinchonæ, ʒiiij.;
Liq. cinchonæ, ʒi.;
Sp. am. aromat., ʒij.;
Syrupi, ʒi.;
Aqua, ad ʒviiij. M.

Two tablespoonfuls to be taken three times a day.

R Ol. morrhuæ, ʒviiij.

One tablespoonful at night in a little warm milk.

R Linimentum terebinthinæ, ʒvi.

To be well rubbed into the walls of the chest twice a day.

The subsequent history of this case was one of improved health, but not of perfect recovery.

The foregoing facts are highly interesting, illustrating as they do the damaging influence exerted in some constitutions, under certain conditions, by repeated attacks of "ephemeral colds." Each seizure lasts only for a short time, and in the interval the patient seems restored to a fair state of health. Naturally delicate, this boy's constitution was unable to throw off the ill effects of each acute attack. Exposed to the variations of heat and cold necessarily attendant upon his employment as a factory operative, the circumstances of his life were in favour of a repetition of such attacks. Each succeeding fit, left behind some additional mischief, in fresh effusion and consolidation in some previously uninvolved portion of lung. The acute symptoms readily yielded to treatment, but the old standing disease remained unaffected. By careful treatment and building up of the system further ill effects may be avoided. Neglect of the usual and proper precautions can have but one ending, *i.e.*, the development of all the well-known and much dreaded symptoms of "phthisis pulmonalis." No attack upon

the chest should be lightly passed over as unimportant without a careful examination being made, for dulness, tubular respiration, bronchophony, and the other symptoms demonstrative of lung mischief—the resultant of light and apparently unimportant attacks of pneumonia, which may safely be suspected, where an acute attack commences with more or less severe rigors, pain in the chest, hot dry skin, and a hard, dry, hacking cough with which there is no expectoration, to confirm the diagnosis by the presence of rusty sputa. I have frequent opportunities of verifying the truth of these observations, in the case of boys and girls who are exposed to the influences of the exciting causes of such attacks, and present the symptoms that I have described. The conditions of life under which dispensary patients are placed, render it impossible to guard them against the recurrence of such dangers as I have mentioned.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, MAY 5TH, 1875.

W. O. PRIESTLEY, M.D., F.R.C.P., President, in the Chair.

ADJOURNED DISCUSSION ON THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND TO PYÆMIA.

The PRESIDENT: Before the discussion commences I may state that Dr. Matthews Duncan has forwarded a letter of explanation in reference to a letter read at the last meeting. He understood that adverse comments had been made on his published letter, and he is very desirous of making some explanation regarding it, which I am sure will be interesting to the meeting.

To the Secretary of the Obstetrical Society of London.

Edinburgh, May 3rd, 1875.

My dear Sir,—As I think my former note to you was too short, I beg now to supplement it to a small extent.

One of the most important points for discussion by the Obstetrical Society at the present juncture is the conduct proper to midwifery practitioners, with a view to avoid disaster from puerperal infection; and I expect much advantage from our great Society taking up this difficult question. At the same time I feel called upon to deprecate premature decision; for the matter in both its scientific and its practical aspects is not ripe for more than intelligent, prudent, and fearless discussion. Observing recent trials of our humble and unlicensed female fellow-practitioners, I think there have been precipitancy and rashness, believing as I do that Mrs. Dymond and Mrs. Marsden have been severely, and probably also unfairly, dealt with. I judge from the meagre reports regarding the cases of these midwives in the weekly medical journals.

The charge of homicide by infection is, I believe, a new one in the history of the law; and I am further of opinion that in the present state of science and practice such a charge cannot be substantiated. I know that Mrs. Marsden is now in prison enduring penalty for homicide by infection, and that this is an example of the charge being sustained; but, while I grieve for this sufferer, I feel sure that the case would have broken down had it been tried in a proper manner.

The public, and to some extent also, the professional mind, is not well informed on the subject of puerperal mortality and puerperal infection; and there is much excitement abroad regarding the prevention of disease generally. Under these circumstances error is easily fallen into, even by authorities, when brought face to face with the terrible facts, probably for the first time.

I shall say nothing about the amount of puerperal mortality, presuming that many of the members of our Society have read some remarks on the subject in my last year's address at the Norwich meeting of the British Medical Association. But I may remind you that such high and justly respected authorities as Miss Nightingale and Dr. Wm. Farr have promulgated far too favourable views as to the small-

ness of this amount; and that exaggerated notions of the innocuousness of childbearing are fostered by the careless talk of many experienced medical men, asserting, as they are often heard to do, that they never lose a case. If it be believed, as these would have it, that there are very few deaths, it is easy to understand the panic excited by the actual facts.

On another point there seems to be still greater misunderstanding on the part of the public and of the profession, namely, the precautions taken or considered necessary by the profession to avoid communicating disease to patients. For the prevalence of this error, I can cite the evidence of the *Times* newspaper, whose utterly erroneous statement I now give as I find it in a leading article of that great organ of public opinion. "It is the invariable practice of medical men" (says the *Times*), "if they attend a case of this (puerperal) fever, to hand over the whole of their midwifery practice to other persons, for at least two or three months; and it has been shown, by ample experience, that this course is absolutely necessary to preserve the lives of their patients." Anything more inconsistent with truth it would be difficult to find. It is this error, thus widely promulgated, and no doubt entertained, that I wish to point out; but I may be allowed to add that, were this true, I would never have a chance of being in practice. I would be perennially on the shelf; and so would every one who had a large practice, especially if that practice involved hospital duty and private consultations.

The difficulties of determining the proper conduct of obstetricians are not to be solved by officious coroners foolishly sending threatening messages to practitioners, nor by judges giving decisions without due consideration; but by discussion in such a Society as ours, and by matured professional opinion. Were the conduct of the coroner in Mrs. Dymond's case, and of the judge in Mrs. Marsden's, to be held as good precedents, there is not one among us who would be secure for a day against the most terrible charges. No surgeon having a case of pyæmia or of erysipelas could go safely to any other patient. No physician having a case of scarlatina could go elsewhere. The lying-in woman, no doubt, requires special care; but such care does not differ in kind from the care of other patients. Homicide by infection may be as easily brought home to the surgeon or physician as to the midwife.

I regard the recent prosecutions of midwives as injudicious; because I believe it would be difficult to find a physician or surgeon who might not, on the same kind of grounds, be cast into prison. The crime—so called—of Mrs. Marsden is to be found, almost every week lately, confessed by ingenious practitioners writing in our journals. Moreover, I would have preferred that some man should have been first charged with this crime, and not a poor and comparatively defenceless woman; and, as I have said, it will be easy for the authorities to find a criminal man. Where is the physician or surgeon who has not many, many times exposed his patients to some risk of infection with dangerous disease? Is a physician to be found guilty of homicide who exposes his patients to no greater risk than is that of those dearest to him at his home?

The medical profession, with one voice, proclaims the necessity of extreme care and prudence on the part of medical men, and the utter abnegation of selfish views in their conduct of practice. But there is danger of the public, and of many professional men, being now led to seek for and expect a degree of safety which can in no ordinary circumstances be reached, and to entertain views as to the conduct of practice which are based on error, and lead astray from the line of expediency and prudence.

Absolute safety can in no way be attained. As practice is at present conducted by careful practitioners, I believe it is nearly as safe as it can be. Among the necessary precautions in ordinary circumstances, I do not place giving up practice for a time; and I may say, for myself, that in nearly thirty years of obstetric experience in private, in hospital, and in consultation, I have not, as a precaution, given up work for a single day. And I venture to say that it would not astonish me were it demonstrated that as much disease and death come from patients to practitioners and nurses, as go from practitioners and nurses, ordinarily and duly careful, to patients.

I must draw to a close without having said nearly all I wish to say, and merely name the following grand precautionary measures for obstetric practitioners:

1. Avoidance of the duties of nurses.

2. Avoidance of using the hands in post-mortem investigation.

3. Antiseptic cleanliness of the hands and of the dress.

One case of infection by a practitioner is as heinous as a series of cases. One homicide is as bad as four. The chapter of accidents may bring a series of cases to one practitioner, who is really careful and innocent; and the series may appear to be the result of infection. I have never had a series of cases, not even two near one another, in my private experience; and I believe such an occurrence would drive me away from my practice, whatever my theoretical views might be. Many practitioners have, in such circumstances, persisted in practice, and do so now, just as Mrs. Marsden did, in my opinion, foolishly, though not criminally, persist. If homicide by infection be a good charge of manslaughter, it is as good in a case of one infection as in a case of four, however appalling the latter may be. There are few practitioners in any department of medicine against whom such a charge might not be set up.

Allow me to express my regret at forced absence from your meeting, and believe me, dear Sir, yours faithfully,

J. MATTHEWS DUNCAE.

[We are compelled to postpone our report of the discussion that followed.]

OBSTETRICAL SOCIETY OF DUBLIN.

The usual monthly meeting of this Society was held on Saturday, the 8th of May, Dr. FLEETWOOD CHURCHILL in the chair.

Dr. M'CLINTOCK exhibited to the Society the following old obstetrical works:—1. "Eucharius Rhodion," *De Partu Hominis*. Frankfort: A.D. 1563. The first edition of this work was published in High Dutch about 1519, was translated into Latin 1532, and subsequently into German, French, and English. 2. "The Byrthe of Mankind, otherwise named The Woman's Booke," set forth in English by Thomas Raynalde, Physician. London: 1565. This work, which professed to be a translation of Rhodion's, was considerably larger than it. The first edition appeared about the year 1540, and was followed by many other editions; and for nearly 100 years, according to Denman, it was the popular treatise on midwifery in England. Dr. M'Clintock has in his possession a copy of this work, printed in 1606, but it is precisely the same as that of the year 1565. Both are printed in black letter. 3. "The Expert Midwife." London: 1637. This work, which is printed in Roman character, is a translation of the treatise of James Rueff, a surgeon of Zurich, *De Conceptu et Generatione Hominis*, the first edition of which appeared in 1554, and at Frankfort in 1587. The name of the translator or editor is not given. It contains some woodcuts, closely resembling, but not quite so rude as those in Rhodion and Raynalde's works. The most interesting point connected with this book is the description it contains of pudendal hæmatocele occurring at the time of labour, which is undoubtedly the earliest recognition (as Velpeau asserts) of this accident. 4. "The Childbearer's Cabinet." This very brief, popular little book, the authorship of which is unknown, was one of four treatises that were published in a work entitled "A Rich Closet of Physical Secrets," published at London in 1653. It contains nothing but practical directions for the management of pregnancy and childbirth, of a very short and meagre kind, and the only novel point Dr. M'Clintock could find was the recommendation of a binder to the abdomen immediately after delivery. 5. "Chambirlen's Translation of Mauriceau's Treatise on the Diseases of Women with Child and in Child-bed." London: 1672. This translation, by Dr. Hugh Chambirlen, went through at least seven editions, and the copy shown to the Society is one of the first edition, which is extremely rare; in fact, Dr. Robert Lee never saw one, and has expressed a doubt whether there be such extant. The translator of this work was the same mentioned by Mauriceau in his twenty-sixth case, as having come to Paris and vainly tried to deliver a woman by some secret means. Dr. M'Clintock, when exhibiting these works, made numerous quotations from each, as well as analytical and critical observations. He then proceeded to consider the discovery of the midwifery forceps, and the claims of Dr. Paul and Dr. Peter Chambirlen to be the inventor of this most valuable instrument. Dr. M'Clintock gave various cogent reasons for coinciding in the conclusion which Dr. Aveling has

arrived at—viz., that the honour of the discovery belongs to Dr. Peter Chamberlen (the father of Dr. Hugh Chamberlen, who translated Mauriceau), and not to his son, Dr. Paul Chamberlen (as stated by Rambotham, Churchill, Leishman, and many other writers of the highest character). Dr. M'Clintock showed to the Society models of the original Chamberlen forceps, now in the possession of the Royal Medico-Chirurgical Society of London, and also showed a print (belonging to Dr. Churchill), with the legend underneath, "Dr. Paul Chamberlen, 1658," which Dr. M'Clintock thought had probably given rise to the idea that he (Dr. Paul Chamberlen) was the inventor of the forceps. For reasons which have been very fully and plainly stated by Dr. Aveling, he (Dr. M'Clintock) entirely rejected this evidence, and regarded the print as being that of Dr. Peter Chamberlen, the father of Hugh and Paul, and who in the year 1658 (that on the picture) was fifty-seven years old, and of such age the original of the picture appears to have been. In connection with this subject Dr. M'Clintock exhibited to the Society a genealogy (in MS.) of the Chamberlen family, which had been presented to him by Dr. Aveling, who had expended a great deal of research in collecting these interesting facts. Dr. M'Clintock intimated that he would have some further exhibits for the next meeting of the Society.

The Society then adjourned.

ABSTRACT REPORT OF COUNCIL OF THE IRISH COLLEGE OF SURGEONS FOR THE PAST YEAR.

DURING the year 45 candidates were admitted to the Fellowship, and 124 gentlemen received Letters Testimonial; 22 Licentiates obtained the diploma in midwifery; 70 candidates for the junior class examination for Letters Testimonial were rejected; and 20 candidates for the final examination were rejected. 165 candidates presented themselves for the preliminary examination; of these 7 received first class certificates; 21 received second class certificates; 89 received pass certificates only; and 48 were rejected.

The entire number on the lists of the College amounts to 414 Fellows, and 2,635 Licentiates.

The Council submit an abstract of the income and expenditure of the College.

The Curator reports as follows:—

Of the donations to the museums one would appear to your Curator to call for special recognition. Upwards of 300 specimens of anatomy and pathology were lately presented to the College by Professor Bevan, and when it is considered that these specimens all exhibit the work of a master's hand, and the critical selection of a skilled pathologist, a very high value, your Curator is assured, will be placed on this donation. 40 of these, remounted, have been placed on the museum table for your inspection.

130 specimens and casts have been added to the collection, and 300 old ones have been renewed.

Resolutions of the College.

At the first meeting of Council the Secretary of the College brought down the following resolutions, which were passed at a meeting of the Fellows:—

"That it be an instruction to the Council that it is the opinion of the College that no further steps should be taken to carry out the present or any conjoint scheme of examination, without consulting the College at large, summoned specially for the purpose."

"That the incoming Council shall take steps to enlarge the library and museum."

"That it be recommended to the Council to consider the position in which the Licentiates of this College are placed in Canada and other colonies, so as to have the Licentiates of this College placed on an equal footing with other licensing bodies, &c."

When it was resolved—

"That the resolutions sent down from the College be referred, the first to the Conference Committee; the second to the Library and Museum Committee; the third to the Education Committee."

Enlargement of the Library and Museum of the College.

It was resolved—

"That plans for the enlargement of the museum and

library be advertised for; a prize of £105 to be offered for the best plan, the expense not to exceed £5,000."

At a meeting of Council held on November 19th, 1874, it was resolved:—

"That whichever plan may be eventually adopted by the Council of the College for enlarging the library and museum, the carrying out of the plan shall be entrusted to the architect of the College."

Several plans having, in pursuance of the foregoing resolution, been sent in for competition, and the architects who furnished them having been invited to the College for the purpose of explaining their plans, it was resolved:—

"That the plans of Mr. Symes for the enlargement of the museum and library of the Royal College of Surgeons in Ireland be adopted."

Salary of the Curator of the Museum.

At a meeting of Council held on January 21st, 1875, it was resolved:—

"That the salary of the Curator of the museum of the College be increased £50 per annum."

Visitors of Examinations from the Royal College of Surgeons in Ireland.

At a meeting of Council held October 8th, 1874, a letter was read from the Branch Medical Council, Ireland, requesting the Council to furnish the names of such gentlemen as would be willing to act as visitors of examinations. The terms on which such appointments will be made are that each person to be appointed will hold himself in readiness to visit and report upon such examinations held in the United Kingdom as he may be called upon to attend, the rate of remuneration to be as follows:—Travelling expenses, together with a fee of five guineas a day whilst engaged in the visitations, and an allowance of one guinea a day for hotel expenses.

When it was resolved—

"That a query be sent to each Fellow to ask whether or not he would be willing to be nominated as a candidate for the post of Visitor of Examinations, in accordance with the letter of the Branch Medical Council, and that the Council of the College shall select the names of such Fellows as may be willing to be returned to the Executive Committee of the Medical Council in London for election."

Numerous Fellows having returned their names as willing to act, it was resolved:—

"That the Council of this College forward the names of the following Fellows of the College, who are willing to act as Visitors of Examinations, in accordance with the terms of the General Medical Council, viz.—Messrs. Barton, Corley, Croly, Mapother, Morgan, Stokes, of whom Messrs. Barton and Stokes were subsequently elected by the Executive Committee of the General Medical Council."

The Letters Testimonial of the College.

Your Council have anxiously considered the best way of improving the existing method of examination for the Letters Testimonial of the College, and with that object in view have made several alterations, for a full account of which they beg to refer the Fellows to the abstract on the table.

Payment of Examiners.

On April 29th, 1875, the following recommendation from the conjoint Finance and Education Committees was read and adopted, viz:—

"That the sum of one guinea be paid to each examiner for each candidate (for the Letters Testimonial of the College), in the proportion of one-seventh for each examination."

New Bye-law—Eight instead of Seven Examiners.

At a meeting of Council held on April 1st, 1875, it was resolved—

"That the word 'eight' be substituted for the word 'seven' in the Bye-law of 9th March, 1853. That the Bye-law, so amended, be forwarded to her Majesty's Secretary of State for her Majesty's approval."

In accordance with the foregoing resolution, the amended Bye-law, having been forwarded to Mr. Secretary Cross, received her Majesty's approval, on the 29th of April, in virtue of which the Council elected, on May 4th, 1875, eight instead of seven examiners, for the Letters Testimonial of the College, for the ensuing year.

At a meeting of Council held on April 1st, 1875, it was resolved—

"That the rule requiring the attendance of four members of Council at each licentiate examination be rescinded, and that one member of Council only shall, in future, be summoned, who shall preside and superintend each examination—occupying the chair—instead of the senior member of the court, as heretofore."

Diploma in Medicine.

On November 19th, 1874, the several legal opinions taken from time to time from the attorney and solicitor-general of the day (Lord O'Hagan and Messrs. Brewster and Lawson) respecting the legality of issuing a diploma in medicine by this College having been read, it was resolved—

"That no further diplomas in medicine be issued by this College."

Army Medical Officers.

At a meeting of Council held on August 6th, 1874, it was resolved—

"That the President, Vice-President, Mr. Macnamara, and Dr. Stokes, be appointed a committee to draw up a report on the Army Medical Service to be presented to the Secretary for War."

In pursuance of the foregoing resolution, the Committee appointed drew up a report, which was adopted.

Transactions of the Council of the College.

At a meeting of Council held on August 6th, 1874, it was resolved—

"That a copy of each resolution passed at this Council be posted in the Fellows' room on the day subsequent to the meeting."

Surgical Society of Ireland.

On August 6th it was resolved that the following resolution of the Surgical Society be approved of—

"That the Council of the Surgical Society of Ireland be elected by ballot by the members, being Fellows of the Royal College of Surgeons or King and Queen's College of Physicians in Ireland, such election to take place on the first Monday in November of each year."

On January 21st, 1875, it was unanimously resolved—

"That Professor Macnamara be re-elected representative of this College on the General Medical Council for one year from the 16th of February next."

Salaries of Medical Officers under the provisions of the Public Health Act.

On November 5th it was unanimously resolved—

"That the Council of this College having had their attention directed to the very inadequate scale of remuneration, in a very great number of instances, fixed upon by the sanitary authorities, not only in this city but throughout Ireland, as salaries for the medical officers employed under the provisions of the Public Health Act, feel it to be their duty respectfully to urge upon the Local Government Board the propriety of their taking such steps as will secure for said officers a scale of remuneration more in accordance with their social and professional status, and with the important and arduous nature of the duties expected at their hands."

On November 19th a letter was read to the effect that the Local Government Board are in communication with the Lords Commissioners of her Majesty's Treasury on the subject.

At a meeting of Council held on December 3rd the resignation of Professor Sawyer was read.

On January 14th, 1875, Dr. Cronyn was appointed to the Chair of Midwifery in the School of the College.

Death of Arthur Jacob, Esq.

The President and Council heard, with profound sorrow, of the death of Dr. Arthur Jacob, who for so very many years held a seat on the Council, and to whose untiring exertions the College is much indebted for its prosperous position. The Council were not afforded an opportunity of paying the last tribute of respect to Dr. Jacob's memory, in consequence of his demise having taken place in England.

Death of Robert Adams, Esq.

On January 21st, 1875, the following resolution was passed, viz.:

"That this Council have heard with profound regret of the death of their revered colleague, Robert Adams, and that they desire to place on record their sense of the great loss thereby inflicted on their College. Whilst thus expressing their own feelings upon this melancholy event, they would also wish to

convey to his family their sympathy with them upon their sad bereavement."

Bequest of the late Francis L'Estrange, Esq., M.D., F.R.C.S.I.

Dr. Francis L'Estrange having bequeathed to this College all his original and most ingenious surgical instruments and appliances, the Council unanimously passed the following resolution, viz.:

"The President, Vice-President, and Council, in acknowledging the very valuable bequest to this College by the late Francis L'Estrange, Esq., beg to convey to his family their deep sympathy with them in their sad bereavement, and, at the same time, to express their sense of the loss their College has sustained by the death of one of their most distinguished Fellows."

Professorship of Chemistry.

At a meeting of Council held February 10th, the resignation of Dr. Emerson Reynolds was read.

When it was resolved—

"That the Council of the Royal College of Surgeons in Ireland, in accepting Dr. Emerson Reynolds's resignation, beg to convey to him their marked approbation of the manner in which he discharged the duties of his Professorship in the College."

On March 18th Dr. Charles A. Cameron was elected Professor of Chemistry in the College School, in room of Dr. Emerson Reynolds, resigned.

Deputation to London—Sanitary Act.

Early in June last a Bill for the Amendment of the Sanitary Laws of this country was before the House of Commons, and a deputation from the Irish Medical Association waited upon your Council, with a memorial from that Society, asking assistance to protect the interests of the dispensary medical officers, which were much affected by the provisions of the Bill. Communications on the same subject were also received from the College of Physicians and the Dublin Sanitary Association. Your Council resolved to send your President, with Mr. Morgan and the Hon. Secretary of the Irish Medical Association, to meet the deputations from the College of Physicians and the Dublin Sanitary Board at the Irish Office in London.

Your deputation was received by Sir M. Hicks Beach with much courtesy and kindness; and, having, during two protracted interviews, pointed out to him the various parts of the Bill which, upon public grounds as well as in the interests of the medical profession, required alterations, some of the amendments suggested by the deputation were at once adopted, but other important alterations were not made; and your President and the deputation, acting under the advice of Dr. Brady, M.P., Hon. Fellow of the College, and other Parliamentary friends, were detained for some days longer to influence by their presence some members of the House to propose and support the necessary amendments in the passage of the Bill through Committee.

The Sanitary Act is now in force, and although far from being perfect, still it has been much improved, and, doubtless in consequence of the representations made to the Chief Secretary by our President and deputation, new clauses have been added to it, and other amendments made which, taken together, place the medical officer in a much more satisfactory position, and will render the Act more useful.

De Moribus Germanorum. — Under the above title the *Clinic* publishes some literal translations from a petition presented to the Reichstag on March 30, 1869, by the Central Committee of the German Evangelical Church. "The number of illegitimate children in Berlin last year (1868) amounted to 156 in 1000 births. At Munich during the same year the illegitimate births were in the proportion of 500 to 1000. In Magdebourg there is not a street, perhaps not a house, which is not the asylum of private prostitutes. In 1868 medical statistics ascertained that there were 75,006 cases of syphilis in Magdebourg, a city of 90,000 inhabitants. At Posen (50,000 inhabitants), without counting clandestine prostitutes, 1,264 women were noticed by the police, that is to say, 1,264 prostitutes and more among about 20,000 women, or 16 per cent. In Stettin (85,000 inhabitants) there are about 20,000 adult women, and 2,000 are prostitutes, which is not inclusive of concubines. The provisions of the Prussian penal code no longer suffice; the police are debauched, and the prostitutes walk brazenly abroad."

WEDNESDAY, JUNE 2, 1875.

THE IRISH PHARMACY BILL.

THE English Pharmaceutical Society has sent a deputation to the Irish Chief Secretary to intimate the Society's intention to oppose this Bill. Their objection to it is that it admits chemists licensed by the new Irish Pharmaceutical Society to a participation in the highest privileges of the English Society, and they proceed upon the theory that, as they have no control of the Irish examinations, the standard must needs be lower than that now required for the English qualification. They therefore propose a simple extension of the English Pharmacy Act to Ireland. We report the arguments of the deputation and the replies of Sir Michael Hicks-Beach in another column, and would observe that the evils which the Society anticipate are, or ought to be, entirely hypothetical.

The Bill already provides that the Irish fees shall be the same as those in England, and that the subjects of examination shall be identical, and there is no experience whatever to justify the fear that pharmacy will be flooded with insufficiently educated men. The Chief Secretary suggested that if such fear existed it might be allayed by obliging the registered chemists of one country to pass a separate *ad eundem* examination before receiving their authority to enter into business in the other. We need not enter at length into a refutation of the statements and opinions expressed by the deputation, as most of them are disposed of by Sir Michael Beach; but we have to point out that it is admitted by the deputation that the circumstances of the two countries are, as regards pharmacy, completely diverse, and therefore a uniform pharmaceutical system would probably work badly.

From a medical point of view we may say that the incursion of the class of English counter-prescribing chemists into Ireland is greatly dreaded, and would be

resisted by the whole force of the profession. Irish medical men have heard too much of the practices of druggists who are in the habit of prescribing bottles of stuff on the faith of a case stated by some slipshod child, and without thinking it necessary to ascertain the real circumstances. Even the misrule of the Dublin Apothecaries' Hall might be preferable to the establishment of such a system in Ireland.

CAPTAIN BOYTON'S SWIMMING FEAT.

THE swim of Captain Boyton from Grisnez to the South Foreland, though probably of no great practical value to seamen or ship-passengers, is of much interest as a display of indomitable pluck and great endurance, and as an athletic feat is almost unsurpassed. Without following certain newspapers in their extravagant hallelujahs, or gazetting Captain Boyton on the heroic list in which Stanley's name appears, we think that a speculation supported by such courageous determination to win ought to succeed, and will no doubt pay handsomely as a financial venture, for it has been proved beyond doubt that a man of average strength may hold out against the perils of the sea for several hours if the circumstances are such as to allow of his putting on the dress. The most important point achieved by his apparatus—next to keeping above water—is that it seems to act as a perfect non-conductor of heat, and thus preserves the wearer from the fatal exhaustion from cold which is almost as dangerous to the shipwrecked as the sea itself. After nearly twenty-four hours' complete immersion Captain Boyton's temperature had not fallen below 99°, and his pulse stood at 71; and, in fact, he presented no symptom which would have made it impossible for him to remain another night and day in the water. As far as we can form an opinion on the medical bulletins, he was far less "pumped" than if he had rowed in the University race; and supposing him to be able to take the refreshment which he carried with him, he might have drifted about for another twenty-four hours with impunity. Captain Boyton has achieved by his Channel swim the notoriety necessary to financial success; but he had already—to our view—acquired greater personal glory by his voyage across, it is said, nearly thirty miles of the Atlantic, and his landing in Ireland in the midst of a dangerous storm.

STATE MEDICINE AND PURE WATER.

DR. F. DE CHAUMONT, of Netley, delivered the third of his interesting lectures on "State Medicine" on Saturday last before the Society of Apothecaries, at their Hall in Blackfriars.

The subject was "Water, its Purity and Supply, and the Duties of the State with regard to it." To the question of—What is a pure water? the lecturer answered: Chemically, pure water consists of oxygen and hydrogen chemically combined in definite proportions. Of these two elements water of all kinds consists; and whatever

matters are contained in it besides these are, to all intents and purposes, extraneous, and generally a sign of impurity. Subterranean, or spring water, as it is commonly termed, affords the best example of a pure water, since its temperature is uniform summer and winter, equal to the average of the year, which in this country differs but little, being about 50° Fahr., since it is clear and bright, and when seen in bulk of a transparent blue colour, and holding in solution eight or more cubic inches of gas per gallon, and being nearly free from all organic products, is decidedly the most wholesome for domestic use.

The sole objection that could be raised against subterranean water is its hardness—it holds in solution a quantity of saline salts, lime, &c.; but as these can be very easily got rid of, and by an inexpensive process almost wholly separated, such an objection falls to the ground, and we have in spring water a pleasant, refreshing, and wholesome potable water; and as to the supply, a very ample one can be obtained from the chalk hills, which absorb the whole rainfall of successive years, and thus store up a far greater quantity than is required for the consumption of the inhabitants of this country.

The greatest and most important contamination to which water is prone is that of organic matter, which has a chemical constitution wholly distinct from that of water, its distinguishing characteristic being that it contains a quantity of nitrogen, and which is greater in amount in animal than in vegetable productions. The presence, then, of organic life affords evidences of contamination with nitrogenous matter, and must be regarded as an evidence of impurity. River waters usually contain a considerable amount of organic impurities, and because their temperature rises with that of air, water at 70° absorbs and nourishes more organic matters than water at 40°. In summer, river and lake waters are often loaded with albuminoid ammonia, as well as animal and vegetable life. The various kinds of animal and vegetable life which abound in river waters were depicted in a series of admirably-drawn diagrams, which, together with charts of the chemical and mineral constituents of the several waters, were then explained. One chart in particular exhibited in an interesting and conclusive way the effect of the rise and fall of the tide upon a deep well situated 2,500 feet from the Southampton waters, but which is nevertheless influenced and increases in impurities at various periods of the day. The chlorides, for instance, oddly enough, decrease in quantity with the rise of the tide, the greatest impregnation being found at the time of low water, while the quantity of albuminoid ammonia is to some extent affected in the inverse ratio.

Dr. de Chaumont's experience of water contaminated with organic matter and albuminoid ammonia coincides with that of almost every other observer, that in all epidemic visitations of enteric fever, diarrhoea, &c., the water is the chief element in the propagation of filth-disease; that houses, which have unguarded drainage communications with cesspools or sewers may receive through such communication the same filth-infection as if the excrementitious matter stood rotting within their walls; and that public or private reservoirs or water conduits, giving accidental admission to filth, will carry the infection of the filth whithersoever their outflow reaches. Numerous

conclusive illustrations of this truism were given, and which the lecturer had fairly traced out to their source. Since it is seen to be impossible for the masses of our overgrown population to deal effectually with a polluted water supply, it clearly becomes the duty of the State to deal effectually with the danger; and it is for Parliament to say that one of the most important elements of life shall be supplied in a wholesome state and in proper quantity to every household.

DR. ANDRAL ON GLYCOSURIA.

THE illustrious veteran, Dr. Andral, has recently, from his well-earned retreat, addressed a communication on Diabetes Mellitus to the Institute of France. He analyses no less than 84 cases, of which he has kept full notes. In the 84 cases of glycosuria narrated by Andral there were only 2 met with in children of early age, *i.e.*, one was of the age of 3 and the other 5; there were 3 cases between 10 and 20 years of age; 12 between 20 and 30; 20 between 30 and 40; 20 between 40 and 50. There were 13 between 50 and 60; 12 between 60 and 70. One patient was 73, and another 78 years of age.

From these statistics it would follow that glycosuria, very rare before the age of 20, becomes less so from 20 to 30, acquires its maximum of frequency between 40 and 50, and is observed still pretty frequently between 50 and 70. After this age it is only exceptionally seen. This shows that the greatest frequency of this disease coincides with that time of life when the forces of the organism are in the greatest activity. These ages, however, are not those when the disease had commenced. He could only be certain of this time in 84 patients, and found that in these the disease had made its first appearance in 12 cases before the age of 30, in 40 between 30 and 60, and in 8 between 60 and 80.

With regard to sex, there were 52 males and 33 females.

Among these 84 cases, several may serve to show the influence of the nervous system on the production and aggravation of the disease. In several of these cases, indeed, the urine was seen to become charged with grape-sugar in greater quantities after any great moral trouble; thus, under its influence, urine which contained only 20 grammes of sugar in a litre, would contain 90 in the course of twenty-four hours afterwards; in rarer cases, the first manifestation of diabetic accidents followed immediately a similar cause. One woman became diabetic after continually breathing during several months such a quantity of ether that she was often in a kind of drunkenness; another woman became so affected after having for a long time experienced different disturbances in sensation, which alternately showed themselves in partial anæsthesia and multiple neuralgia.

One man was epileptic before he was diabetic; another, after long-continued paraplegia. A traumatic lesion preceded the glycosuria in two cases, in one of these after the patient having received a violent blow on the lower part of the occiput; in another, a fall had happened, and the nape of the neck had been gravely contused: that is to say, that in these two cases the parts of the cerebro-spinal axis which must have experienced the influence of

the wound were very near those the lesions of which, in Claude Bernard's experiments, make sugar appear in the urine. The nerve lesion must also have been near this in three cases, where he saw glycosuria supervene in individuals whose upper extremities were paralysed, without sensation being affected.

Of the 84 cases, Andral found but one where the production of the diabetes may have been produced by want of sufficient food; this was in a child of 8 years of age, which a hired nurse had allowed almost to die of hunger. He found only three cases where the patient, before becoming diabetic, had exclusively fed upon bread or potatoes. In some other cases this was the principal nourishment, to which the patients had added from time to time cheese and a little meat; but, in short, these cases were few in number, and he adds that, during the many years he has observed patients, in all ranks of society, in hospitals and out, he has met with a greater number of diabetics amongst persons in easy circumstances than among the poor. Now one of the differences between these two classes is that of their food, which is often insufficient, and in great part of vegetable nature among the latter, and proportionate to the wants of the economy, often beyond this, and in great part animal in the first. He has besides noticed more than once that diabetics, before becoming so, had been remarkable for the strength of their constitution, and that many of them had been very stout. Whatever, then, may be the ultimate disturbance which produces an excess of sugar in the blood, and afterwards in the urine, it would seem that in more cases than one at least this hyperglycemia and glycosuria, far from showing a diminution of nutritive activity, is a manifestation of its exaggeration. This idea, which is that of Claude Bernard, has its aid in another remarkable fact, namely, in the disappearance of the sugar from the urine in the latter days of existence of diabetics, as he has several times noticed.

In the 84 cases which he analyses, there were several where other disturbances had preceded the disease, although in the great majority of the cases the disease supervened in the midst of an excellent state of health. Thus, before being diabetic, 4 subjects had been dyspeptic, and 8 had been recognised to be phthisical, whilst 5 were asthmatical; 3 had an organic heart disease; 2 had suffered from renal colic; and 3 more became diabetic after convalescence from typhoid fever; and, lastly, 1 after an attack of cholera.

Any disease which complicates diabetes may make it disappear for the moment. Dr. Andral remarked this in a man who had no sugar in his urine so long as he was affected with a febrile angina, and in a woman whilst she was attacked by grave dysentery. He is not sure whether the cause in these cases may not have been the modification of the nutrition during the fever, or the leaving off food.

Andral's observations have shown him several cases of diabetes either arising hereditarily or attacking several children in a family. He noticed 2 cases in which albuminuric fathers procreated, the one a diabetic son, the other, a daughter who was diabetic. He does not think however, that there is the affinity that some might suppose between these two diseases, seeing that in the 84 cases of

glycosuria which form the basis of his work there were but 3 where the urine contained albumen at the same time with sugar.

The density of the urine is well known to be greater in diabetes than in any other disease. Whenever the urine contained more than 20 grammes of sugar in the litre, he saw the aréomètre mark more than 1030, often remain between 1032 and 1038, and also often arrive at between 1838 and 1842. There were cases where it rose to from 1042 to 1046, and once to 1047, which was the maximum he noted. He thinks he may conclude from comparative observations in this matter that, when the density of the urine is more than 1036, we may affirm the existence of glycosuria.

The quantity of sugar varied in the 84 cases between 6 and 100 grammes in a litre; and, as the patients passed in twenty-four hours several litres of urine, there was one who passed in that time 480 grammes of sugar, another 720 grammes, and another 800 grammes (nearly two pounds avoirdupois). We must at once admit in such cases that it is not alone the feculent articles of diet which furnish such quantities of glucose.

Successive analyses have shown him besides that, leaving out of account the influence of all treatment, the quantity of sugar in the urine may vary much at times very near each other, and that it may even disappear and reappear alternately. It is especially in this latter case that it may happen that the glycosuria may persist for a great number of years without the health being gravely compromised, whilst in other cases diabetes has a progress almost like that of acute diseases. He has seen it cause death in five weeks after its commencement.

The general circulation, except in cases of complication, has not presented to Dr. Andral notable disturbances. He has not seen the pulse beat more slowly than 56 times per minute, and it often was between 60 and 80. But, on the other hand, the capillary circulation was frequently disturbed. It has seemed to him that it was in diabetes more frequently than in other diseases of chronic nature that the gums were red and swollen, the conjunctivæ injected, and the skin covered with erythematous plates, and that the blood accumulated in the capillaries of the lungs, which is a frequent cause of the death of diabetic patients. He asks whether he may attribute all these congestions to the difficulty which the blood experiences in passing through the capillaries, charged, as it is, with sugar? Or does it depend on the want of action of the vaso-motor nerves?

After all, are not these expressions of over-thick blood, or over fluid-blood merely hypotheses, too easily admitted without any proof, but by which were explained many morbid states in former times? If he puts the question, it is because it seems to him answerable by the combined researches of clinical observation and experimental physiology and chemistry. If resolved in the affirmative, we should arrive at the conclusion that there is an order of hyperæmias which may arise from the composition of the blood itself.

Four of the 84 diabetic cases had gangrene; the feet and the lower parts of the lower extremities were the seat of it in 3 of the cases. In one of these Andral examined the diseased parts after death, and

found the arteries which ended in the parts obliterated by clots, the aspect of which indicated their having existed there for some time. In the fourth case, it was the inferior lobe of the right lung which was transformed into a gangrenous detritus at its centre. He regrets that the vessels were not examined.

The different humours presented to Andral without exception their natural reaction, and if it has been affirmed that in diabetes the saliva is acid, and a theory of the disease has been deduced from this, it is because it has not been examined freed from the buccal mucus, which is generally acid.

Although the extremities in diabetes are often cold, or, at any rate, cool, he has never found the temperature in the axilla below thirty-six degrees, and more commonly it maintains itself at about thirty-seven degrees.

It is not only in a passing way that we see glycosuria disappear from the urine. Five times in these 84 cases he ceased to find it there for a time long enough to make him believe in the final cure of the disease, and the more that in these 5 cases 4 regained rather quickly and preserved all the attributes of health. The fifth scarcely gained anything from the disappearance of the glycosuria, which he had had for a year, for shortly after he commenced to have epileptic attacks, which persisted.

In persons with glycosuria where autopsy was made by Andral he constantly found a congested state of most pronounced kind of the liver and kidneys, which he regarded as the consecutive result of an increased functional activity of these two organs. He was also struck with two facts which he noticed in the majority of cases. The one was a singular induration of the spleen, the dried parenchyma of which did not, on incision, allow the escape of a drop of liquid; the other was the presence of tubercular granulations in the nascent state in the parenchyma of the lungs. Seeing the slight development of these bodies, he is inclined to think that they had appeared subsequently to the diabetes, under the influence of the debility which it had caused.

The treatment generally followed in the 84 cases consisted in the administration of alkaline drinks, and in a diet formed principally, but not exclusively, of animal substances, to which he added some herbaceous vegetables and ordinary bread. During this treatment the sugar disappeared in a very small number of cases without re-appearing; in others it disappeared to return; in others, again, it remained as abundant, and was even increased. In such cases he tried to make abstinence from starchy foods absolute, and fed the patients exclusively on animal substances, whilst assuring himself that this diet was strictly observed; and yet the sugar continued to appear in the urine.

Besides, this diet cannot be followed for an indefinite time, seeing that at the end of a certain epoch patients take such a disgust at it, that we must, willy-nilly, renounce it; but here is a remarkable fact: In a patient whose urine, during this diet, had contained a greater and greater proportion of glycosuria, and successively 15, 20, 20, 44, 49 grammes per litre, the urine began to contain less, and progressively returned to the former cipher of 15 grammes, as soon as he allowed the patient to take with his meat some eggs,

milk, and a little bread and vegetables; but this happy change did not last, for, while the diet remained the same, the glycosuria again augmented, and finished by rising to 54 grammes.

Another patient, who, like the former, was submitted to an exclusively animal diet, nevertheless kept in his urine 82 grammes of sugar in the litre. These results are, indeed, confirmative of the results obtained by M. Cl. Bernard, who, in animals fed on albuminous substances, found a considerable quantity of sugar in the blood of the veins above the liver. Thus, the chemo-vital forces of the economy may in all probability transform into sugar every substance, even organic, which it receives or which composes it. They have this power in the physiological state, according to a measure imposed on them by the laws of the economy, and, in the pathological state, their superactivity displayed in a certain direction, causes the diabetes, as it causes a superabundance of fat in other persons.

What is, then, the disturbance which pre-exists and produces that exaggeration of the function of glycogenesis? Does it originate in the diabetes observed at the bedside, from the nervous system, as it clearly did in the experiments of Claude Bernard? Some of the facts observed in this memoir, says M. Andral, would make us incline towards that opinion; but the majority, without being contradictory, do not strengthen it.

He then demands whether ulterior investigations may not show in diabetic patients some alteration of the nerve-cells in the wall of the fourth ventricle, which, when it is pricked in certain animals, renders them diabetic. This is to be examined; but to admit at this moment in man that diabetes is the constant result of a nerve lesion would be to affirm what facts have not yet taught. (a)

A few years ago it was attempted to deduce from the then known facts a theory of diabetes which, appearing to make more clear the mechanism of its production, had rationally led to a treatment which some believed to be infallible; but this theory, where the question of the pathogeny of diabetes and of its treatment were reduced to a pure question of chemistry, could not maintain itself in presence of the facts which all at once were made known, showing that the problem to resolve was not entirely confined to this. In making by experiments the action of the nerves intervene, physiology has displaced, whilst it has increased in extent, the field of research; but we have just seen that, in as far as the disease called diabetes in man is concerned, the results of these researches of experiment have not been completely verified. Science, then, requires that in this point of view and in many others, facts should be added to those possessed, and observed with that attention to detail which alone can render them useful. It has need of them, in order that the systematisation of the facts relating to diabetes may be attempted, and that a viable theory may be deduced. This is why he has published these documents.

(a) We may remark that Dr. Dickenson's late researches on this point are most important and suggestive.

Notes on Current Topics.

The Vivisection Bills.

THERE are two Bills on the subject of vivisection before Parliament at this moment, one introduced into the House of Commons by Dr. Lyon Playfair, and the other in the House of Lords by Lord Hartesmere. The latter bill entirely puts a stop to any vivisection whatever, except in registered places, which are to be open at all times to the visits of inspectors. It also prohibits any experiments being made upon animals except they be placed under the influence of anæsthetics, among which curara is not admitted to claim a place. If in any case it should be deemed absolutely necessary to perform a vivisection without anæsthetics, a special licence is to be required, which will cost ten pounds, and this licence is to last six months. Justices of peace are empowered to grant a search warrant wherever there is reasonable ground to suppose that vivisections are being carried on. The definition of the word and the penalties attached to the performance of vivisection are then given. We must say that such a bill seems to us far too radical a measure, and likely to do harm instead of good. It would be inevitably disregarded, and could not fail to produce many collisions between otherwise excellent men and the magistracy.

Dr. Lyon Playfair's Bill is, as might be expected, a far more feasible one. He entitles it "A Bill to Prevent Cruelty and Abuse in Experiments on Animals made for the Purpose of Scientific Discovery." By the provisions of Dr. Playfair's Bill, any person is allowed to make experiments on a live animal for the purpose of scientific experiment, so long as the animal be rendered insensible and be killed after the experiment, if that have been of such a nature as to be likely to cause it after-suffering. A register of all experiments is to be kept; and experimenters may subject an animal to an experiment without the use of anæsthetics, so long as the experiment be solely for the purpose of new scientific discovery, and that insensibility would render the experiment valueless. All other persons except professors of physiology, medicine, anatomy, or surgery are to provide themselves with a licence to perform vivisection.

Dr. Lyon Playfair's Bill will meet with but little opposition, we think, in the ranks of the medical profession. It is much to be desired that some such measure could be carried, and that the present indignant feeling of a certain portion of the public towards those members of the grand profession of healing should be discharged and appeased. The deplorable and long-continued ignorance on the part of the multitude of all that relates to the theory and practice of medicine is apt to cause every now and again some increasing mistrust of the practices of medical inquirers. It is not so very long since dissection was rendered almost impossible by the ignorant horror against it encouraged by the theologians of past ages; and it must be remembered that in the question of vivisection the feeling of certain of the best meaning among the agitators against it has had some real tangible grounds. When we hear of thousands of dogs being killed in one laboratory alone, it is certainly time that some definition were laid down as to the ethical code of vivisectioners.

Apomorphia.

THE late observations of Dr. Victor Bourgeois have elicited the following conclusions:—

1. Apomorphia, or rather hydrochlorate of apomorphia, when pure, and employed in suitable doses, is a rapid, simple, and harmless emetic.
2. It is *rapid*, for its action always takes place, at latest, within ten minutes after administration.
3. It is a *simple* emetic, for it does not appear to exert any influence upon the other functions.
4. It is *innocent*, and does not seem to possess dangerous toxic properties.
5. Lastly, the facility with which it can be administered by hypodermic injection fulfils a therapeutic desideratum, and suggests its adoption by physicians in some special circumstances, such as the medication of children and of the insane.

Magnesium Metatartrate.

THIS salt has just been introduced to medical practice in Germany. It is a white powder, which easily dissolves in water, and thus differs essentially from the tartrate. In the solid form, magnesium metatartrate retains its solubility for an unlimited period, and even diluted solutions remain clear for a considerable time, whereas the concentrated solution soon deposits a white precipitate of the well-known magnesium tartrate. At a high temperature, such as is attained by boiling, this change is very much accelerated, and a solution of pure magnesium tartrate finally results. This preparation is particularly recommended as a substitute for magnesium citrate, which it resembles in medicinal effect and in its agreeable taste, and may be produced more economically.

Acute Tuberculosis in an Infant.

IN the meeting of the Pathological Society of May 18th, Dr. Duckworth showed organs from a case of acute tuberculosis in an infant, eight months old, brought in dead from pericardial effusion. There was enlargement and caseation of the bronchial glands, with miliary tuberculosis on lungs and other viscera, such as the spleen, but none on the pia mater or peritoneum.

Poisoning by Oil of Tobacco.

MR. WALLIS, of Hartfield, mentioned a case at a recent meeting of the South Eastern Branch of the British Association where poisoning had been caused by essential oil of tobacco. This occurred in a strong, healthy gamekeeper, age 41, a drunkard, who chewed up and swallowed a small black cutty pipe. Profound insensibility and collapse supervened, and after an hour the stomach-pump was used and vomiting encouraged by tickling the fauces with a bunch of feathers. The matters pumped up from the stomach, as well as those vomited, smelt strongly of tobacco-oil.

Boston Lying-in Hospital.

TWO years ago the trustees of the Boston Lying-in Hospital decided that the time had come to re-open the hospital, which had for so many years been closed. It was opened in January, 1873, and for the past two years three hundred and forty-two women have received treatment

within its walls, only three of the patients having died from any cause that could in any way be connected with their stay in the hospital. The average number of patients in hospital was, however, only eleven. There can be no doubt that large lying-in hospitals are very dangerous institutions, and doubtless the people of Boston are well aware of this fact.

The Statistics of Hamburg.

THE population of the city and State of Hamburg in 1873 was 357,453, of which 315,000 lived in the city. The marriage rate was 23·8 per 1000; the births were 41·3 per 1000, including 10·2 per cent. of illegitimates. There were 4·6 per cent. of still-births in the year in Hamburg in all the births. A little more than one per cent. of the births were those of twins or triplets. The mortality in 1873 was 27 per 1000, whilst in London it was only 22·5.

Ether and Chloroform.

PROFESSOR SCHIFF, of Florence, thinks that it may be said that in the present state of knowledge the practitioner is responsible for the death of any patient which occurs under ether; but is not so responsible when the death occurs during the inhalation of chloroform. He concludes that paralysis of sensation and motion are common to both ether and chloroform. Vascular and respiratory paralysis often show themselves in inverse order with reference to these two agents. With chloroform, however, either the one or the other of these kinds of palsies may first supervene, involving great danger to the animal if the vascular phenomena be the first to appear. Hence the use of chloroform should be rejected, and only ether used.

The Conditions of Chemical Change.

IN our last we gave a brief outline of the lecture on this subject given by Professor Gladstone, F.R.S., at the Royal Institution. Continuing his course last week, the learned Professor referred more particularly to Chemical Force and its Transformations, in illustration of which he exhibited some of the phenomena connected with the reciprocal decomposition of salts, using especially for this purpose the deep red sulphocyanide of iron, proving that in some instances the redistribution of acids and bases occupies not only an appreciable time, but even hours. It was explained that the chemical force, while it alters profoundly the properties of matter, does not destroy it, nor affect its weight, hence the balance is the special instrument of the chemist. It was further shown that the chemical force is capable of transformation into other forces, that it will produce heat, as in living organisms, or in the oxy-hydrogen blow-pipe light, as in the slow oxidation of phosphorus, or in the most brilliant of flames, mechanical force and sound, as in the explosion of gunpowder; electricity and magnetism, as in the voltaic cell; and the forces thus called into existence may be employed to reproduce the chemical action from which they originated.

Toughened Glass.

THE *Chemist and Druggist* reports a most notable discovery which has recently been perfected by a French gentleman, M. Francois de la Bastie, and which promises to revolutionise the glass trade.

Though the material is not yet actually on the market, the toughened glass has been manufactured in sufficient experimental quantities to prove its applicability to all purposes for which glass is now used, and to many others for which it would be employed if it were not for its fragility. Vessels manufactured of the toughened glass, though they cannot be distinguished in appearance from those to which we are now accustomed, may be thrown about the room with the utmost carelessness, but no ordinary risks will injure them. It will stand any amount of heat, and vessels made of it can be placed on the fire without danger. Consequently, its employment in chemical factories in the place of lead, earthenware, platinum and silver, is, we imagine, a question of a very short time only. Glass pipes will probably replace those of lead for water, and for other purposes, and thus diminish the prospects of lead-poisoning, and indeed it is difficult to anticipate the limits of the application of this very remarkable discovery. The one purpose for which at present there seems some difficulty about applying the toughened glass is for window-panes, for the reason that when the glass has been toughened by M. Bastie's process it cannot be cut by a diamond, though it may be cut first and toughened afterwards. The glass can, however, be engraved by the ordinary methods, and cut on the wheel.

Essentially, the process consists in heating glass up to near the softening point, and then plunging it into a bath of oil or grease.

M. Bastie, who is a gentleman of fortune, is said to have made his discovery first some seven years ago. This was after many years of investigation. But though he seemed to have succeeded for the moment, it took two years more of continual experiments before the inventor could repeat his success.

Cases of High Temperature.

DR. BACON, of Saratoga Springs, U.S., in a letter to the editor of the *New York Medical Record*, mentions two cases of pneumonia where the temperature was unusually high. In the first case, of a girl, aged 16, there was pneumonia of the left lung. The temperature began rising up to the fifth day, when it stood, as carefully noted by a self-registering thermometer, at 107·5°. The sixth day it fell to 104° in the evening. The condition of the patient otherwise showed no cause for alarm as far as consultation could decide. She became convalescent.

The second case occurred in the brother of the same girl, who was 20 years of age. He was seen twelve hours after he began to complain, and had pulse 165, with slight delirium. Examination revealed pneumonia of right lung. The temperature, very carefully taken thirty-four hours after he was first seen by physician, was 110°. The expectoration was nearly pure blood for forty-eight or fifty hours, and there was a severe cough. There was a curious feature in the case, that the temperature, which was 110° at 5 a.m. one morning, fell to 99° next morning at half-past nine.

Scarlatina at Enniskillen.

As several cases of scarlatina have occurred among the troops here, a tent has been erected on the hospital grounds on an elevated healthy position near town for the

isolation of the disease, and in which the patients are being treated. The order for removal of the troops to make room for the militia has been suspended, and it is said that either the militia or the troops will go under canvas during the training.

Use of the Stomach-pump.

WASHING out of the stomach, and the aspiration of liquids secreted by it is more and more practised in Germany, since Kussmaul highly praised this method. Dr. Schliep uses it in nearly all affections of the stomach, especially in chronic gastritis, with or without dilatation. The cure of chronic catarrh, according to his account in the *Deutsche Klinik*, vol. xiv., would require but a limited number of applications. In simple catarrh five would suffice on an average. He uses this method even in the dyspepsia of consumptive patients. In dilatation of the stomach, he empties that organ with the pump every day. He performs the washing out, even in cancer, with pure water; or adds bicarbonate of soda to the water if the liquids be very acid; or permanganate of potash if these liquids show signs of fermentation; carbolic acid when they contain vegetable parasites; boracic acid as a disinfectant, and tincture of myrrh, in atonic dyspepsia with abundant secretion of mucus.

The Approaching Election at the Irish College of Surgeons.

THE meeting of the Fellows to receive the Annual Report of the Council was held on last Monday. The Report itself we present, in abstract, in another column.

Since our last notice of the matter one more candidate—Dr. Fitzmaurice, of Tralee—has entered the lists for a seat on the Council. The following ten candidates are now in competition for the honour: Drs. Mapother, Jacob, Corley, Bennett, Stoker, B. F. McDowel, Ward, Wheeler, Kilgariff, and Fitzmaurice.

We have always maintained the view that, although high surgical character ought to constitute a strong claim to the favour of voters, yet that an interest in the College and its affairs and a progressive policy with regard to all professional matters ought to be pre-eminently the first qualification of a candidate. The best surgeon in the constituency or the cleverest medical legislator is worse than useless to the College if he cannot or does not care to give his time to the administrative duties of the College. We object, in fact, to purely ornamental councillors, who inevitably injure the College and impede the action of the Council by giving an ignorant vote on the rare occasions when they enter its walls. We do not suggest that the Fellows should overlook the rank which a candidate may hold in surgery; but we submit that they should not give their vote to any man for this reason only. In order that they may be enabled to form their own opinion on the subject, we publish here the roll of attendances of out-going councillors. As regards the new candidates, only two of them, Drs. Jacob and Mapother, have ever had the opportunity of displaying their assiduity, and of these two gentlemen it will be universally admitted that they were at all times earnest and active in the devotion of their time to the College.

The Council report that they have held 37 meetings, at which the number of attendances of each Member of Council was as follows:—The President, 33 meetings; the Vice-President, 37; Colles, 25; Stapleton, 31; Butcher, 5; Macnamara, 30; Porter, 20; M'Dowel, 21; Ledwich, 34; Walsh, 26; Morgan, 23; Kidd, 18; Smyly, 27; Kirkpatrick, 17; M'Clintock, 23; Croly, 16; Hamilton (John), 8; Denham, 25; Barton, 25; Stokes, 31; Chaplin, 22.

The following were the number of meetings held by the several Standing Committees and the attendances of each Member:—

Finance Committee. Number of Meetings, 17.—President, 13; Vice-President, 9; Colles, 16; Butcher, 0; Macnamara, 15; Porter, 8; Walsh, 12; Ledwich, 16; Denham, 7.

Library Committee. Number of Meetings, 11.—President, 2; Vice-President, 8; Colles, 11; Stapleton, 4; Porter, 2; Kidd, 4; M'Clintock, 3; Smyly, 4.

Museum Committee. Number of Meetings, 5.—President, 1; Vice-President, 2; Butcher, 0; Macnamara, 2; Ledwich, 2; Morgan, 4; Walsh, 3; Smyly, 3; Barton, 2; Stokes, 3.

Education Committee. Number of Meetings, 5.—President, 5; Vice-President, 3; Stapleton, 4; Macnamara, 5; Ledwich, 4; Barton, 4; Stokes, 5.

Chicago College of Pharmacy—Honorary Members.

AT the April meeting of the Chicago College of Pharmacy, held on Thursday, the 15th, President Mill in the chair, the following named gentlemen were elected Honorary Members of the College: Dr. C. Mehu, France; Dr. O. Hesse, Germany; Dr. J. E. De Vrij, Holland; and Dr. W. Handsel Griffiths, Ireland.

Congenital Syphilis with Ascites.

DR. CHEADLE (*Brit. Med. Journ.*, May 22) relates the case of a male infant, aged 3 months, which was the subject of syphilitic eruption and snuffles, and the legs and feet were highly œdematous, as was also the abdomen. The navel was protuberant and the liver very large. The mother had had two miscarriages and a still-born child four years back. The infant took a grain of grey powder every four hours, and had mercurial ointment rubbed into it night and morning. On this treatment it recovered greatly, and the œdema and ascites decreased greatly. On May 8th, a fortnight after admission, convulsions came on, and the infant died in the evening. At the autopsy the abdomen was found to contain a large quantity of clear straw-coloured serum, free from flakes. The gall-bladder, cystic, hepatic, and pancreatic ducts were firmly matted together, and to the duodenum and transverse colon, by old and firm adhesions. There were no signs of peritonitis elsewhere, and no recent lymph. The liver was of natural size, a little enlarged, and mottled on the surface. It was irregular to the touch, the elevations being broad and flat, about the size of a split pea, and only slightly projecting, but perceptible enough to the touch. The interlobular markings were very distinct on section; the whole organ was very hard and leathery; the finger could not be forced through the tissue, even with the hardest pressure; the right lobe was more extensively involved than the left. There were no nodules. Microscopical sections of the liver hardened in chromic acid showed structural changes. The lobules were flooded by small fibro-granular deposit, which penetrated everywhere between the liver-cells, pushing them apart and pressing on them on all sides. The gland-cells were mostly shrunken and atrophied. Here and there the liver-

cells were little changed; in most parts, however, few liver-cells of normal appearance could be seen, the lobules being almost entirely occupied by the fibro-granular deposit and atrophied gland-cells. Gubler, Simpson, and others have given similar accounts of the appearances observed in the liver of syphilitic infants.

Sir James Paget on Spermatorrhœa.

In a work entitled "Clinical Lectures and Essays," by Sir James Paget, edited by Howard Marsh, F.R.C.S., there occurs the following passage, which refers to the distressing apprehension which male patients sometimes suffer from irregularities of the genital functions: "To all alike you may try to teach a judicious carelessness about these things—a state of mind which would be an inestimable blessing to many besides these sexual hypochondriacs. Many of your patients will ask you about sexual intercourse, and some will expect you to prescribe fornication. I would just as soon prescribe theft or lying, or anything else that God has forbidden. If men will practise fornication or uncleanness, it must be of their own choice, and on their sole responsibility. We are not to advise that which is morally wrong, even if we have some reason to believe that a patient's health would be better for the wrong-doing. But in the case before us—and I can imagine none in which I should think differently—there is not ground enough for so much as raising a question about wrong-doing. Chastity does no harm to mind or body; its discipline is excellent; marriage can be safely waited for; and, among the many nervous and hypochondriacal patients who have talked to me about fornication, I have never heard one say that he was better or happier after it."

Traumatic Tetanus.

MR. SPENCER SMITH relates a case where a man, æt. 27, trod on a nail fifteen days before entering hospital, and it ran into the ball of his great toe about half-an-inch. He removed the nail. On November 5th he felt a pain between the shoulders, and his friends noticed a peculiar smile on his face. On November 8th he felt aching in the jaws along the back teeth, and could not open his mouth. When admitted he could open his mouth to the extent of one inch between the edges of the incisors, and he complained of pain between the shoulders as if a knife were being stuck in. Pulse 100; temperature 99.6°. There was a small punctured wound in the ball of the great toe of the left foot. Two grains of chloral with ten grains of bromide of potassium were given every four hours. On November 11th he had passed a restless night, and complained of pain across the abdomen. Last evening he had an [attack of opisthotonos lasting three minutes, during which the pain in the back was very severe. He complained of pain in the back and abdomen, and the muscles of the belly were quite rigid. He could open his jaws about an inch. Pulse 82; temperature 99.1°. Twenty grains of chloral were given every two hours. He continued with intermittent attacks of spasms daily until the 20th November. On the 19th he had a spasm when anyone came near him, and was treated by subcutaneous injection of one-third of a grain of morphia. He gradually became convalescent under the influence of the chloral

mixture continued every two hours, and was discharged cured on the 18th December.

Acute Fatty Degeneration of the Heart.

At a meeting of the Clinical Society, on the 14th May, Dr. Green related a case of "Acute Fatty Degeneration of the Heart." The patient, a girl, æt. 16, had a severe attack of scarlatina four years previously, which was not followed by dropsy. She was admitted into Charing Cross Hospital in November, 1874, complaining of præcordial pain and shortness of breath on exertion. Slight enlargement of right ventricle with mitral regurgitation and contraction was diagnosed. There was cough, with scanty expectoration, occasionally slight hæmoptysis; pain after food, with nausea; slight albuminuria. On January 13th she was much better, when the catamenia reappeared on the 14th, with malaise and vomiting. The menstrual discharge became profuse, with persistent and uncontrollable vomiting, great anæmia and prostration, and the case terminated fatally on the 17th. At the autopsy the pericardium was found to be healthy, the heart weighing 13½ ounces. The right ventricle and auricle dilated and thickened; the left slightly enlarged. The mitral orifice was contracted and funnel-shaped, admitting the forefinger. The muscular tissue of the heart was uniformly soft and friable, and was found microscopically to be in an advanced state of fatty degeneration, the fibres being loaded with molecules soluble in ether. The aorta was much narrowed, especially beyond the arch; its lining membrane showed a few small fatty patches. Several of the voluntary muscles were also fattily degenerated, especially those of the limbs and recti abdominis.

Colotomy in Colloid Cancer.

At a meeting of the Pathological Society of London, on the 18th May, Mr. Arnott showed the parts from a case of colloid cancer of the rectum two years after colotomy. The patient was a schoolmistress, æt. 27, who came under his care in February, 1872, with symptoms of rectal disease dating back two years. Examination showed the walls of the bowel to be infiltrated with hard material, converting it into a rigid tube. Colotomy afforded great relief, and but little inconvenience, and the patient returned to her employment. Menstruation occurred after an absence of two years. In the summer of 1873 the cancer had grown outside the anus, and converted the perinæum into a solid mass of ground-glass material; there appeared to be entire obstruction, and little bleeding. She survived the operation two years. During the latter period of her life she suffered from œdema of the lower limbs and trunk, due to the gradual involvement of the retro-peritoneal glands. The whole of the perinæum, part of the vulvæ, and the bowel up to within an inch and a half of the artificial anus, were converted into a fine cartilaginous-like mass, with the microscopic characters of colloid cancer. The glands in front of the spine and over each ovary were infiltrated with this colloid.

A COMPETITIVE examination of candidates for admission into the Medical Service of the Royal Navy will take place at the University of London on Monday, August 9th.

Dying or Drunk.

THE letters which have appeared since our last in the columns of some of our daily contemporaries must have removed all doubts which existed in the public mind as to the alleged negligence displayed by the junior officers on duty at our hospitals in the recent cases of the kind under discussion. The diagnosis of injuries of the brain is very difficult, and often is quite impossible to decide for days after the receipt of the same. The best informed and most experienced among us are liable to make an occasional mistake, and this must be as well known to the Coroner as to every other member of the profession, and therefore, on reflection, he will, we are sure, regret to find he has wounded the feelings of anyone; but in the case of Truby there does appear to be some justification for the Coroner's remarks, and at all events, both he and the jury were acting under a sense of irritation brought about by the levity displayed by some of the young men present at the inquiry, and who, because a juryman exhibited ignorance of medical matters, were betrayed into a culpable forgetfulness of what is due from one gentleman to another. While presiding over a body of men assembled together to perform an onerous and solemn duty, no excuse can be offered or accepted for unbecoming conduct on the part of the meanest person present on the occasion, much less educated men.

In the case of Colley, the coachman, no blame of any kind can attach to the hospital authorities. The poor fellow was at once admitted, and most carefully attended, and was evidently making fair progress towards recovery, when, unfortunately, he was once more handed over to the tender mercies of the police, and dragged before the Bow Street police magistrate. At this time he ought rather to have been committed to the careful nursing of his friends; but he was not, and to this misfortune must be attributed the immediate cause of his death. He was, as we now know, once more charged with drunkenness, fined forty shillings, and, in default, sent off in the police-van to prison; there he remained for some days, subjected to all the hardships usually bestowed upon this class of offenders. The least we can say of this part of the ugly business is that the magistrate showed want of thought and judgment. No error of diagnosis can be urged in extenuation of his conduct, for had he fairly sifted the case, called the policeman before him who witnessed the accident, and assisted him to mount his coach-box and drive off; or had he sent for the house-surgeon of the hospital, and the police surgeon, both could have proved the nature of the injuries received, and the probability of drunkenness; at all events, the benefit of a doubt, would have turned the scales of justice in Colley's favour. It is quite clear that had the magistrate acted with due caution, Colley would have been handed over to his friends, and in all probability rest and good nursing might have subdued the inflammatory symptoms and saved his life.

For the sake of those whom poor Colley leaves behind him, and in the name of humanity and justice, we trust some reparation will be made. The fine should be remitted, the stigma of drunkenness removed, and after this a handsome sum should be added as some compensation for the gross miscarriage of justice.

NOTICE has been given that the Council of the Royal College of Surgeons of England will, on the 10th of June, proceed to the nomination of the several Professors and of the Lecturer for the ensuing year.

The Professors of Comparative Anatomy and Physiology and of Dermatology are candidates for re-election, whilst the holders of the other two appointments are not desirous of being re-elected.

LAUNDRESSES should take warning by a case which came before the magistrates at Leamington, on Wednesday, wherein Hannah Davis, a widow woman living at Radford, was charged with transmitting certain clothing infected with scarlet fever to some person unknown. Defendant has a large family, and she takes in washing. A short time ago one of her children fell sick with scarlet fever, and, in spite of warnings from the medical officer of health and an inspector, she continued to receive the washing. She was fined 12s.

IN the House of Commons last week, Captain Nolan asked the Secretary of State for War whether he intended to postpone training of the Galway Militia in consequence of the prevalence of small-pox in that county.

Mr. G. Hardy informed the hon. member that the preliminary training of the Galway Militia was postponed from the 3rd of April, the date originally fixed, on account of the prevalence of small-pox, and was waiting further information from the authorities before deciding whether it would be necessary to dispense with the training altogether this year or not.

THE Liebig Extract of Meat Company, which was originated by the late Baron Liebig, appears to be a profitable concern. According to the balance-sheet just issued the shareholders receive on this, their ninth year, 10 per cent. free of income-tax, besides a large sum being carried forward to the reserve fund.

A MEDICAL DEFENCE ASSOCIATION has been started in London, having for its objects the prevention of unqualified practice and the prosecution of quacks. The Honorary Secretary of the Association is Mr. George Brown, of 12 Colebrook Row, Islington (Editor of the *Students' Journal* and *Hospital Gazette*), who will be glad to receive the names of intending supporters. The annual subscription is half-a-guinea, and we do not know a better way of investing a small sum than in putting down quackery, which, from the first, has been one of the objects of the MEDICAL PRESS AND CIRCULAR.

THE death after inhalation of ether at Manchester turns out, as we anticipated, not to have resulted from that agent at all. In fact, ether was not administered, but a compound fluid prepared by Messrs. Robbins on the formula of Dr. Richardson for local anæsthetic purposes.

The fluid in question is a mixture of amyl-hydride and anhydrous ether, the two fluids being blended until the specific gravity is '650; it was never intended for general anæsthesia, and has, in Dr. Richardson's belief, always

been sent out by the manufacturers, Messrs. Robbins, distinctly labelled and described as for local use. Dr. Richardson believes it to be perfectly clear that the death at Manchester was not produced by pure anhydrous ether but by syncope. It appears that the patient was much perturbed mentally, and that death resulted from failure of the heart. Dr. Richardson suggests that it is important not to employ the members of the amyl family until more is known about their physiological value, as they have as yet been systematically studied as general anæsthetics only by Dr. Richardson himself and by Dr. Snow, and their combined experience is against their employment.

AN investigation has been held at Castlebar into a complaint that a delirious small-pox patient had been allowed to leave the workhouse infirmary and attempt to get over the boundary wall of the grounds. It appeared that two nurses were in charge and a third within call, but were unable to prevent the man from leaving his bed, and the investigation resulted in a complete vindication of Dr. Jordan, the surgeon of the hospital. It is, of course, proper that such a matter should be inquired into, but it is to be regretted that the medical officer should be subjected to so much annoyance without sufficient cause.

ON the appointment of Dr. H. G. Croly to a Surgical Examinership in the Irish College of Surgeons and his consequent retirement from the Demonstratorship which he held, the following well-deserved and complimentary resolution was unanimously adopted by the Professors of the College:—

That the marked thanks of this Professorial meeting be given to Mr. Croly for his constant and untiring exertions in the School of the College, and that we heartily congratulate him on his appointment to the Court of Examiners.

(Signed) PHILIP BEVAN, Chairman.
19th May, 1875.

THE DEATH OF A BOY IN THE LIMERICK WORKHOUSE.

IN a recent allusion to the death of a boy in the Limerick Workhouse, we stated that the master was in custody for participation in the transaction. This statement, which was made by us on the faith of a report in a local paper, we are informed is not accurate, and we hasten to correct the error, lest it might do an injustice to an officer who was guiltless in the matter.

THE ARMY MEDICAL SERVICE—DEPUTATION OF THE IRISH COLLEGE OF SURGEONS.

MR. GATHORNE HARDY has named Thursday next to receive the President, Mr. Tufnell, the Vice-President, Mr. Edward Hamilton, and Dr. Macnamara, who have been deputed by the Council of the Irish College of Surgeons to represent the feelings of the College in reference to the grievances of Army Medical Officers. It is hoped that the Council of the Royal College of Surgeons of England will be prepared to join in representing to the Secretary for War the injustices under which the Military Medical Department suffer.

THE WITHDRAWAL OF IRISH COUNTY INFIRMARY GRANTS.

WE learn that the action of the Grand Jury of the Co. Mayo in reducing the grant to the Castlebar Infirmary to one-half its usual amount has been challenged on the ground of illegality before the Judges, who have apparently considered that the authority of the Grand Jury to withdraw the grant is open to doubt. They have accordingly ordered that the case shall be argued by counsel on Monday next. The decision which may be arrived at will be of supreme importance to the whole of the county infirmaries of Ireland.

WE have authority for stating that Dr. George H. Kidd, Obstetric Surgeon to the Combe Hospital, will seek the honour of the Vice-Presidency of the Royal College of Surgeons in Ireland for the year 1876-7.

THE IRISH PHARMACY BILL.

DEPUTATION TO THE CHIEF SECRETARY.

ON Thursday a deputation from the Pharmaceutical Society of Great Britain waited on Sir Michael Hicks-Beach on the subject of this Bill. The solicitor of the Society read a document in which the history of the Society was given. It proceeded as follows:—

The above-mentioned Society and the above-mentioned enactments operate within Great Britain only, and it appears that the limit has been of necessity, because there never has existed in Ireland a class of persons corresponding with the "chemists and druggists" of the said part of the United Kingdom.

The Irish Apothecaries' Acts have long been, and are now, in operation, so that all persons who in Ireland have kept open shop for the dispensing of medicines have been licentiates of the Irish Apothecaries' Company, and, virtually, medical practitioners.

In Ireland a system of local public dispensaries, conducted by medical practitioners, has existed; and there have been shops in which the sale of drugs and chemicals has been carried on in conjunction with the sale of groceries and other articles; but, in fact, the comparatively few shops in Ireland similar to the shops of the chemists and druggists in England have been conducted by licentiates of the Apothecaries' Company, or other medical practitioners, which facts would appear to give a reason for the absence of Irish co-operation in the foundation of, and progress of, the Pharmaceutical Society, and the limitation hitherto of that Society's sphere of operations to Great Britain.

In the Parliamentary session of 1874, a Bill brought in by members representing Irish constituencies was laid before Parliament, and having for its object the extension to Ireland of the Pharmaceutical Society's operations, was considered by the Pharmaceutical Society, and that Society laid evidence before a select committee, disclosing its readiness to acquiesce in the legislation thus proposed, and showing that no dissatisfaction whatever with the Society or its operations prevailed in Scotland, and also that the Society was preparing to open its doors and its funds freely to Ireland, and establish in Dublin an examining Board similar to that which had always been maintained in Edinburgh.

It was not and is not desired by the Pharmaceutical Society to establish a branch Society in Ireland, but on the contrary, that the Society's operations should be extended to Ireland, so that those resident in Ireland would be part of the general body and stand on a footing of perfect equality with those already within the Society and its operations.

There is no existing society or society machinery in

Ireland to be incorporated and utilised, but it would appear that the scheme of the Bill would introduce the novelty of creating by Act of Parliament a society, appointing the President and Vice-President (each for life) and organising a Board of Examiners.

The Bill does not disclose provision either present or future for the expenses of the Society, but contemplates provision for the expenses of examinations by way of fees payable by those who may be examined. The Bill then provides that all persons examined in Ireland (whether Irish or not) shall have the right of being placed on the existing registers of the Pharmaceutical Society of Great Britain, with a qualification to trade within Great Britain, and on such registration "shall be entitled to all the rights and privileges of pharmaceutical chemists under the existing Acts."

It appears a fair assumption that candidates drawn from the lesser area of Ireland will not provide funds adequate to the expenses of examinations in Ireland, and, therefore, that unless the expenses of the proposed Society in Ireland be thrown upon the National Revenue they will only be raised by a competition which shall induce the students of the other portion of the United Kingdom to pass their examinations in Dublin.

Thus the suggested reciprocity may assume the form of a competition in which the lesser body without traditions or resources may flood the proper area of operations of the older Society, and possibly destroy or hamper the important work of that Society.

Believing that the true mode of extending to Ireland the good which has been accomplished in Great Britain is to extend the operations of the existing body, and raise in Ireland the two grades, viz., pharmaceutical chemists and chemists and druggists, the Parliamentary Committee of the Society has passed in relation to the Bill resolutions as follows:—

1. That the Pharmaceutical Society of Great Britain regards as desirable an extension of the Pharmacy Acts to Ireland, so as to embrace Ireland within the operations of the Society, as Scotland has always been.
2. That the proposals made by the Pharmacy Bill now before Parliament for the establishment of a separate Society and examining body in Ireland, appears to be at variance with the policy of not multiplying examining bodies, and to be objectionable.
3. That the Society do oppose the principle of the present Bill.

This Society will prepare and submit for consideration a Bill, having for its object to provide one law for the whole kingdom, for regulating the trade of chemists and druggists, and the sale of poisons.

Sir MICHAEL HICKS-BEACH : Well, gentlemen, there is a very strong feeling in Ireland which was manifest in the Committee of last year, and of which I have had still further proof, that they would prefer a Pharmaceutical Society of their own, as they have a College of Surgeons, and a College of Physicians of their own, to any union, so to speak, with the Pharmaceutical Society of Great Britain. It is impossible for the Government or for Parliament, I think, to ignore that feeling, and therefore I have introduced this Bill to carry out the Report of the Committee of last year, and I think that so far as regards the formation of a separate Society, that is a point of principle which I can hardly depart from. Your ground appears to me to be this, that the formation of a separate Society may interfere with your position in Great Britain.

The VICE-PRESIDENT : Quite so.

Sir M. HICKS-BEACH : I should like to know precisely in what points it would do so. I see here you stated that the Bill provides that all persons examined in Ireland, whether Irish or not, should be allowed to be placed on the existing register, and shall be entitled to all the privileges and benefit attaching to pharmaceutical chemists under the existing Acts. If there is anything in the Bill which enables persons who may belong to an Irish Pharmaceutical Society to participate in your private funds

and the advantages which you derive from being members of this Society, I shall be very happy to amend it. That is one point, but that is rather of a private nature. The public matter is, of course, with regard to keeping open shop, and there I think reciprocity is desirable—it is almost essential in fact. But that of course ought to be guarded by providing, if possible, that the examinations in both countries should be as nearly as possible similar, at any rate that there should not be a danger, if we can guard against it, that either in London, in Edinburgh, or in Dublin any body should provide an examination of an inferior character, with a view to improve its own position by attracting candidates to pass its examinations; thus flooding other countries with inferior pharmacists. That is what you wish to guard against, I think?

The VICE-PRESIDENT : Quite so.

Sir M. HICKS-BEACH : In this Bill it is proposed by Clause 12 that all the regulations to be made by the Irish Pharmaceutical Society shall be subject to the approval of the Lord Lieutenant and the Privy Council in Ireland, and be laid before both Houses of Parliament. You are subject in the same way, are you not, to the English Privy Council?

Mr. FLUX : Yes; what we are desirous of is uniformity in the examinations, and we see great difficulties about that if there are examinations over which we have no control whatever. For the purpose of securing uniformity between England and Scotland within the past year the two Boards of Examiners have visited each other, and I believe that even the officials appointed by the Privy Council interchanged visits so as to see that perfect equality and fairness prevailed. It is thought to be almost impossible to create an examining body outside of these forces which should maintain the integrity of the examinations. Even the title of pharmaceutical chemist is regarded as the private property of this body, but the Irishmen are proposing to adopt our title: they are not content to go on as apothecaries or chemists and druggists, but want to be known by a name which we have created for ourselves.

Mr. WILLIAMS : The mere framing of regulations, unless the Society had a control over the appointment of members of the Board of Examiners, would, I fancy, be of very little service. It is necessary to have that controlling power as we have in Scotland. We are afraid—as he will possess the title of pharmaceutical chemist, which is our highest title, and is to be subject to only one examination, although that might contain all the points of our three—he would probably not be so efficiently examined as our present men are. Our system is to have three examinations, Preliminary, Minor, and Major.

Sir M. BEACH-HICKS : You are assuming, what I do not admit, that the Irish Pharmaceutical Society would institute a lower class of examinations than you have.

Mr. WILLIAMS : Our theory is that it would.

Sir M. HICKS-BEACH : To go back to the suggestion I have already made—supposing these rights and privileges so far as keeping open shop is concerned, were strictly extended to all persons belonging to the Societies, having passed an examination in either country, except in cases where it might be considered necessary that there should be a further examination by the Society of the country in which the person wished to practice, leaving you or the Pharmaceutical Society of Ireland, as might be, the power of requiring persons coming from the other side and desirous of keeping open shop to pass some fresh examination—would not that meet your objection?

THE SOLICITOR-GENERAL FOR IRELAND : I think you hardly realise the suggestion of the Chief Secretary as regards the *ad eundem* degree. It would be for the Pharmaceutical Society in England to settle in the first place the conditions of the *ad eundem* examination for persons coming from Ireland; in the same way in order to practise in Ireland the Irish Society would have to settle the conditions of it; but in each case it would be subject to the control of the Privy Council in either country. Therefore, it is not likely the English Council would frame

terms too easy for the Irish candidates, nor would this be likely to happen *vice versa*.

Mr. FLUX: In Scotland last year only six persons presented themselves as candidates for the higher degree, and this consideration arises out of the observation just made—that if you examine only for the higher degree you will defeat the object of the Bill altogether; because the higher degree as it exists in this country, and as appears to be contemplated in Ireland, involves a greater amount of skill in pharmacy and chemistry than is required by those bodies who examine in medicine. Now your deficiency in Ireland at this moment arises from the fact that you only allow licentiates of the Apothecaries' Company to carry on business as chemists and druggists. When I was in Dublin last year, a physician explained to me that the cause of the dearth of chemists and druggists in Ireland was that young men had to prepare for such a high examination in order to obtain the degree of a licentiate, that they preferred taking the little additional trouble which would secure to them a degree in medicine. But that trouble would not be equal to that necessary to pass our Major examination, and so acquire our degree of pharmaceutical chemist. Thus, if you only establish in Ireland, under this Bill, an examination which shall be stiffer than the existing examination in pharmacy and chemistry, you will provide no persons to carry on the business of chemist and druggist according to the necessity indicated in your preamble. If out of the whole of Scotland there were only six candidates you cannot expect any very considerable number in Ireland.

Mr. ROBBINS: We also think that a person who is sufficiently educated to practise as a chemist and druggist in England, ought to be considered sufficiently educated to practise in like manner in Ireland.

Sir M. HICKS-BEACH: Would you put that *vice versa*?

Mr. FLUX: Certainly; if the test be the same.

Mr. WILLIAMS: We are afraid that England will be swamped by an influx of cheap and inefficient pharmaceutical chemists from the sister country. That is why we come here in the interests of our own body to call your attention to the matter. We have no objection in the abstract to a pharmaceutical society for Ireland; on the contrary, we would support such a thing.

Sir M. HICKS-BEACH: You wish there should be some provision—that if Irish pharmaceutical chemists are allowed to practise as such in England, they should have passed a proper examination.

Mr. WILLIAMS: Exactly so.

Sir M. HICKS-BEACH: If that is secured in any way, it does not much matter to you whether the Bill would provide for Ireland a sufficient number of such chemists or not.

Mr. WILLIAMS: No.

Sir M. HICKS-BEACH: Well, gentlemen, I think perhaps the best plan will be for you to consider the suggestion I have made with regard to the *ad eundem* examinations, and that you should appoint, if you would, two or three of your body to see me again upon the subject. I can assure you I am only anxious that this Bill should benefit Ireland without interfering with you.

The PRESIDENT: We understand you will not bring forward the Bill for second reading until we have seen you again.

Sir M. HICKS-BEACH: Certainly. I shall not bring it forward on Monday next. But I shall be glad if you will see me again about it as soon as possible.

The deputation having thanked the Chief Secretary for his courtesy then withdrew.

Correspondence.

DUBLIN HOSPITAL SUNDAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—To my mind for a first attempt Hospital Sunday has been a success, but is far too limited. Why not extend the

system to the country? I am sure that the country clergymen of either persuasion would gladly contribute their mite towards such a good work. By kindly inserting this, and suggesting to those who have charge of the scheme to send notices of the same to be posted on the church gates in country towns, you will much oblige,

Yours, &c.,
HOSPITAL SUNDAY.

EXCLUSION OF IRISH PHYSICIANS AND SURGEONS FROM THE HONOURS OF THE BRITISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I think it but right, through the medium of your columns, to call the attention of the Irish members of the British Medical Association to the slight put on them by the exclusion of Irishmen from the list of honorary officers selected to preside at the forthcoming meeting of the Association to be held in Edinburgh in August next.

The Association numbers amongst its members many of the most distinguished Irish practitioners, yet not one has been selected to fill any of the numerous honorary offices. The selection of the honorary officers rests, we believe, with a local committee, of which Dr. Matthews Duncan is, we understand, the most active member, and to him, we presume, belongs mainly the honour! of having found out a new mode of showing contempt for Irish physicians and surgeons.

We think the Irish members of the British Medical Association should hesitate before they take part in the proceedings of the approaching Edinburgh meeting, when they find that they are thus slighted by their Scotch brethren.

I am, &c.,

A MEMBER OF THE BRITISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In a late issue you report where a medical man was returned for trial for manslaughter, although he had apparently acted right. May I ask, is a medical man liable to be tried for his practice in almost any case that may end fatally? Can he be tried for manslaughter where he has unintentionally acted wrong, or where he has made a false diagnosis, and on such given improper medicines? If so, a licensed practitioner seems in a worse position than anyone else. Is it not patent that every man is fallible, and liable to make a mistake? Have not the most eminent men been deceived, and a post-mortem alone revealed their error? Can you say have those who have often given wrong medicines on a prescription been prosecuted, as in their case there might seem to be more carelessness displayed? If a medical attendant is liable, are not those in charge of a sick person equally liable if his directions are not strictly carried out?

G. S.

FORTHCOMING ELECTION OF COUNCIL OF THE IRISH COLLEGE OF SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have just received a copy of the Annual Report of the College for the year ending April 5th, 1875, accompanied with a list of the present Members of Council, as also the names of several young men who are thus early aspirants to college honours.

At page 15 of the Report I read as follows: "At a meeting of Council held April 1st, 1875, it was resolved that the rule requiring the attendance of four Members of Council at each Licentiate Examination be rescinded, and that one Member of Council only shall in future be summoned, who shall *preside* and *superintend* each examination, *occupying the chair*, instead of the Senior Member of the Court, as heretofore."

Now, Sir, I observe, not without a little surprise, in the list of candidates for seats on the Council, the names of several very junior men, who, I understand, are occupied in the business of teaching (being commonly known as "grinders")—a very praiseworthy employment, it must be allowed—but I cannot imagine how they can flatter themselves with the notion that they would be suitable representatives of the College, composed as it now is of 414 Fellows and 2,635 Licentiates, to "preside," and "superintend," and "occupy the chair" at examinations, a position always sustained by independent Fellows of the College, of real professional status, gentlemen who could have had no possible interest in the passing or re-

jection of candidates. *O tempora! O mores!* When I look back on the days of Peile, Crampton, Todd, Colles, Carmichael, Wilmot, Cusack, Porter, Hutton, &c., lights and ornaments of the profession and our College, I grieve and blush to think that my alma mater, with which my early days were warmly associated, should be reduced to such a condition as now apprehended.

In addition to Fellows of the College of real position in Dublin, I should like to see the county infirmary surgeons of Ireland, who, as a rule, are first-class men, taking their place on the Council, our College being a grand national institution, which would indeed be but poorly represented if the class of men whom I refer to should be chosen as Members of Council.

A LOVER OF THE COLLEGE.

Medical News.

Royal College of Surgeons of England.—The following gentlemen, having passed the required examinations for the diploma, were duly admitted Members of the College at a meeting of the Court of Examiners on May 20th:—

Bevan, Adolphus, Peckham.
Cotton, Herbert, L.S.A., Ipswich.
Dixon, Thomas Arthur, Upleatham, Yorks.
Evans, David Thomas, L.S.A., Carmarthen.
Fisher, Stephen Henry, Tiverton.
Garlike, James Percie, Tulse Hill.
Hemming, William Douglas, Notting Hill.
Hitchings, Thomas John, Plymouth.
Hutchinson, Walter, Leominster.
Kelly, Augustin Bernard, Camden Road.
Massiah, Benjamin Jones, Clifton.
Matthews, Charles Edwin, Bristol.
Murrell, William, L.S.A., York Street.
Palmer, Thomas Hurlston, Warwick.
Prince, James Perrot, Boston, United States.
Sibbald, Thomas Martyn, Ontario, Canada.
Voelcker, George Henry, Kensington.
Williams, Austin Edward, L.K.Q.C.P. Irel., Liverpool.
Young, Edward William, Henley-on-Thames.

The following gentlemen passed the primary examination in Anatomy and Physiology on May 13th:—

J. C. Keer, T. Hammond, C. H. Keep, V. A. Jaynes, Guy's Hospital; T. Baker, H. Langton, T. G. Prosser, J. F. Woods, J. Russell, G. R. Maister, H. X. Browne, J. A. B. G. Messum, St. Bartholomew's Hospital; E. M. G. Whittle, Cambridge; G. S. Johnson and J. F. Grayling, King's College; John Kirkpatrick, Toronto and Westminster; A. Q. Silcock, University College; J. W. D. Dallaway, St. George's Hospital; and B. Fenwick, London Hospital.

The following gentlemen passed the first part of the professional examination for the Fellowship at meetings of the Court of Examiners on May 25th and 26th:—

N. C. Macnamara, King's College; G. Griffith, Liverpool and University College; F. R. Fisher, E. L. Robinson, and L. E. K. Shuttleworth, St. George's Hospital; B. May, Birmingham and Edinburgh; H. H. Clutton, Cambridge and St. Thomas's Hospital; L. H. Stevenson, Guy's Hospital; F. S. Eve, St. Bartholomew's Hospital; R. Atkinson, London Hospital; H. J. M. C. Todd, St. Thomas's Hospital; F. S. Edwards, W. Pye, and G. H. Cressey, St. Bartholomew's Hospital; C. F. Pickering and W. M. Evans, Guy's Hospital; W. P. Mears and W. R. Stewart, London Hospital; E. B. Turner, St. George's Hospital; G. C. Henderson, University College; F. A. Southam, Manchester; A. B. Barrow, King's College; C. E. Prouger, St. Thomas's Hospital.

The Coroners and the Magistracy of Middlesex.—At the May Sessions for the transaction of the county business, held at Clerkenwell on Friday last, Captain Morley, in presenting the Coroners' accounts for payment, reluctantly admitted "that they were more satisfactory than usual," inasmuch as less extravagance had been manifest in the Central District in the matter of post-mortems. Mr. Humphrey, he remarked, had ordered 37 inquests, as against Dr. Hardwicke's 65, Dr. Diplock's 40, and Mr. Bedford's 42; and the average cost of each inquest held by the various coroners was, Mr. Humphrey £1 14s. 7d., Dr. Hardwicke £2 6s. 8d.,

Dr. Diplock £2 9s. 10½d., Mr. Bedford £2 0s. 7d., thus showing the Central District Coroner presented a very fair average. Dr. Hardwicke had held a less number of inquests than his predecessor, Dr. Lankester, and as a cheese-paring policy is the order of the day with the Middlesex magistrates, they consider this far more praiseworthy than the safety of human life. The coroner and the medical profession know full well how extremely difficult, nay, generally impossible, it is to assign a true cause and conscientiously sign a certificate of one who has died a sudden or accidental death, without first making a post-mortem; nevertheless, as our sapient magistracy think more of saving a few pounds to the county than they do of public safety, the Coroner for the Central District must grin and bear their invidious remarks and harassing criticism while in the conscientious performance of his duty.

NOTICES TO CORRESPONDENTS.

SYPHILIS will be the subject of Prof. Lee's lectures at the Royal College of Surgeons, England, on the afternoons of Wednesday (to-day), Friday, Monday, and Wednesday, the 9th inst. Time of each lecture, 4 p.m.

DR. SAVAGE will resume the adjourned discussion "On Puerperal Fever" at the Obstetrical Society of London this evening at 8 p.m.

DUBLIN HOSPITAL SUNDAY.—Our correspondent is under a mistake; the 13th of June is fixed for the London collection. The period of that for Dublin is not named.

THE ABUSE OF MEDICAL CHARITY.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Attending, as a layman, the second annual meeting of the Temperance Hospital, held on the 26th May at the London Tavern, I was much impressed with the address given by the Rev. L. Bevan, of Tottenham Court Road Chapel. The rev. gentleman, speaking of the benefits conferred by the Temperance Hospital, pointed out one phase of its operation which appeared to me to merit a very wide circulation—viz., the little likelihood of the pauperising effects so much to be deplored by the indiscriminate treatment of patients which obtains in most, if not all, of the other hospitals and dispensaries. Mr. Bevan stated as a well-known fact that very many people availed themselves of the advantages of our hospitals who were in a position to pay for medical attendance, and for whom the hospitals were not originally intended. It was also beyond dispute that in too many instances the better classes who could well afford to attend to their servants when temporarily laid aside through indisposition, shifted the responsibility from their own shoulders in such a course by an annual subscription or a donation to the funds, thus very cheaply getting out of an imperative duty, and at the same time establishing for themselves a "charitable" reputation. It was (the rev. gentleman said) quite plain to him that where servants could be afforded something could also be afforded when times of sickness overtook them.

The Temperance Hospital, however, was in a fair way to remedy such a state of things, as the endeavour there is to make the institution as nearly self-supporting as may be, by impressing upon the patients themselves the necessity of contributing according to their ability; one of the regulations in Gower Street being that each patient should, if possible, pay a small sum towards the general fund, thus avoiding the pauperising effect of granting to all alike the benefits of medical attendance and advice.

With regard to the in-patients, the Second Annual Report says: "It has been the wish of the Board to render the in-patients' department partially self-supporting, by arranging for the reception of persons willing to pay a weekly sum proportioned to their means." Out-patients are attended to by a minimum payment of 1s. per visit, thus giving them a sense of independence, and at the same time assuring them of the best advice and aid. Surely, Sir, if no other good is effected by the Hospital in Gower Street, this one must be a step in the right direction; as medical men, especially young and unknown ones, are often placed at a great disadvantage by the abuse of charity, so often commented upon and lamented in the columns of the MEDICAL PRESS AND CIRCULAR.

I am, Sir, yours faithfully,

H. P. GIBSON.

MEDICAL ETHICS.

The question of medical advertising was brought forward by Mr. James Lane in January, 1875, at the Harveian Society. His address has been more than once adverted to in a noticeable manner in the medical journals, with allusion to the memorable resolution of the London College of Physicians of June 16th, 1873. Of this resolution it were bootless to speak further, unless to observe that it appears to have been framed in order to be conspicuously violated. As a sample, on Feb. 22nd, 1875, in the *Liverpool Daily Advertiser*, appear "Lectures on the Principles and Practice of Physic," 5th edition, by a late President of the College; on March 5th, 1875, in the *Times*, "Diseases of the Kidney and Urinary Derangements," by M. D. Cantab., F.R.C.P.; and as the acme, on March 5th, 1875, in the *Times*, "Royal College of Physicians, London—Second Lecture on Addison's Disease, this afternoon, &c., &c. By order of the President, Wm. Gurner, Bedell!" We find also in the *Times* of Oct. 19th, 1874, the Medical Society of London announcing an "Inaugural Address—Case of Ulcer of the Stomach—Diseases of the Testes, &c.," with the names of the honorary secretaries subscribed in large capitals. On Feb. 21st, 1874, in the *Telegraph*, we remarked "The Aylesbury Dairy Company (Limited)," with the name of a surgeon as medical and sanitary inspector, who is editor of a widely-circulated medical periodical which affects ultra-professional purity, and gravely condemns all oblique attempts at publicity. An

M.D. and Member of the College of Physicians, a zealous Fellow, and former President of the Obstetrical Society, advertises works on feminine ailments in the *Times*, which must excite the prurient of both sexes and shock the more fastidious and better-regulated minds of others. Another physician, who (to use his own words) "is attached to two of the London Hospitals," is continually informing us in the same paper that he receives SIX RESIDENT PATIENTS. A gentleman connected with one of the skin institutions already noticed has for some years persistently advertised a shilling *brochure* on a certain cuticular disease in the *Times*, *Telegraph*, and medical journals. To render this outlay remunerative this indefatigable perseverance, at the nominal price quoted, must have accomplished the sale of some thousands of copies—a sale so unprecedented in medical literature as either to cause astonishment at the popularity of the pamphlet or to suggest less charitable thoughts. But to return to Mr. Lane. It is plain from his remarks that he has never written a book. May it not be asserted that he would become an author did he feel the divine afflatus, and if an author that he would hold his tongue? His conduct irresistibly reminds one of Faulconbridge in "King John"—

"Well, whiles I am a beggar I will rail
And say—there is no sin but to be rich;
And being rich, my virtue then shall be
To say—there is no vice but beggary."

It is said that Messrs. Churchill and others publish medical works without the author's knowledge, sanction, wish, or acquiescence. It is admitted that advertisements in lay papers do not pay, and that authors advertise to attract the public by observing their name. This motive cannot actuate publishers, who have a keen appreciation of profit, if I may judge from my own experience as an author; and if the book does not pay *directly*, the publisher must be out of pocket, unless he advertises as agent, and the author pays the cost of the advertisements, i.e., unless the author—notwithstanding his disclaimer of vulgar appeal for patients—is the real instigator and author of the announcements as well as of the book. If the author (F.R.C.P.) object to lay advertising, why does he dispose (as it is feigned he does) of his copyright, when he is aware how venal publishers are? Moreover, how many authors have written books which pay directly from advertising, or which publishers will purchase of them, if we exclude the manuals and certain standard works which are not remunerative from secular sources? Perhaps this last statement requires qualification, when it is mentioned that a few months since a large poster at Westbourne Park Station displayed the contents of one of our immaculate weeklies (the editor and proprietor being a medical man), the first article of which was "Retention of Urine"!!

Half the journals are occupied with self-commendatory announcements, endeavouring to edify and astound our provincial brethren, or with papers on frivolous or hackneyed subjects by members of their staff; and the editorial *W.*, in Johnsonian periods, assumes the intimidating Titanism of a Nasmyth hammer, and is probably as automatic and as little controlled by intellectual consciousness. Is it requisite, for example, in the year of grace 1874, to enlighten the profession (not students) with a prolix clinical lecture on scabies, or to discuss a chill theory in connection with malaria? Refreshing evidences of reform dawn in the debates at one or two of our societies. Hitherto these societies have contributed less to the elucidation of clinical, pathological, and therapeutical problems than to the exaltation of a *clique*, so as to justify a variation of Horace Smith's definition of an opera-box—as places where doctors assemble once a fortnight for the pleasure of hearing themselves talk and seeing the proceedings.

An inter-professional feud has lately prevailed between M.D.'s and L.R.C.P.'s as to their respective right to call themselves doctors and physicians. To be brief, the combatants desire to purchase what they cannot pass, and the point would never have been mooted, but that men have bought licences and degrees, and therefore still want to buy them—to be, by the perpetration and perpetuation of abuse, as good, or rather as titular, as their predecessors who rushed in shoals to "Modern Athens," annis 1835-60. It is to be feared that M.D. or L.R.C.P. often proves a white elephant to its possessor by infecting him with extravagant notions of his honours and position; and the expenditure of energy on this controversy in copious assumption and reiteration might have been profitably utilised in advancing the status of the profession in a pecuniary direction.

Some invent a forceps or scarificator, or appear in the newspapers as certifying to the virtues of wine, beer, starch, and mustard. Of course considerable advances have been effected in various instrumental and mechanical appliances, as on the gorget and obstetric forceps; but are all the multitudinous bags, gags, and trags sterling improvements, or mostly media of puffery and notoriety?

Lastly, as exhibitions of individual petulance, the efficacy of the perchloride and the battle of the aspirator a short time since menaced to assume the proportions of a Lilliputian epic in our modern medical *Batrachomachia*.

The inevitable moral to be drawn from these scandals is, that the profession should manfully unite and reject unpaid appointments; insist on equitable remuneration; repudiate hollow and empty titles; avoid undignified intestine squabbles; scorn the blandishments of satulent vendors of alcohol, instruments, corn, and condiments; and, as an elevated priesthood of enlightenment and health, it would assuredly acquire greater and universal recognition and secure legitimate reward.

"Hereditary bondsmen! know ye not
Who would be free themselves must strike the blow!"

May, 1874.

THEMUS.

Dr. TILT, late President of the Obstetrical Society of London, has had the honour conferred upon him by the Italian Government of Knight of the Crown of Italy. Two of Dr. Tilt's best known works—"On Uterine Therapeutics," and "On the Change of Life," have recently been translated into Italian.

J. A. H., St. Leonards.—It is impossible to get your letter in its present form. As it is not on a subject of general professional interest you must reduce it to at least a quarter of its present length before we can find space in our columns.

Dr. ROBERTS is thanked.

Dr. J. F. C.—The work is in the reviewer's hands. We have also many notices of books in type waiting for space.

STODKKT.—Not suitable; the *Students' Journal* would be a much more appropriate medium.

VACANCIES.

Royal Hospital for Diseases of the Chest, City Road. Physician. Honorary. Applications to be forwarded to the Secretary. (See Adv.)
Royal Free Hospital. Surgeon. Applications, with testimonials, to be forwarded to Mr. Blyth, the Secretary. (See Adv.)
Dublin Fever Hospital. Physician for temporary duty during the absence of either of the staff. Particulars of Mr. Pike, at the Hospital, Cork Street. (See Adv.)
King's College, London. Professorship of Physiology. Applicants must address the Secretary.
London Temperance Hospital. Visiting Hospital Surgeon. Candidates must be total abstainers. Address the Secretary, 112 Gower Street, W.C.
Trinity College, Glenalmond, Perth. Medical Officer. Salary, £100 per annum, with furnished apartments. Applications to the Warden.
Bristol General Hospital. Physician's Assistant. Salary, £50, with board and lodging. Applications to the Secretary.

Deaths.

ASHTON.—On the 11th May, at Watton-le-Dale, Leicestershire, Henry Ashton, L.R.C.P. Ed., aged 62.
BARRES.—On the 7th May, at Clare, Suffolk, John Barnes, Surgeon, aged 72.
CRAVEN.—On the 18th May, at Worksop, Robert Craven, Surgeon, aged 68.
GREEN.—On the 11th May, at Norwich Road, Ipswich, W. Green, Surgeon, formerly of Ixworth, aged 83.
MAGRE.—On the 23rd May, at Malone Park, Belfast, Jane Eliza, widow of the late Samuel Magre, M.D., Keady, co. Armagh, aged 75.
NANCE.—On the 15th May, at Eccleshall, Staffordshire, James Nance, F.R.C.S.E., aged 34.
SMITH.—On the 23rd May, at Talbot Road, Dr. John Smith, late of Torquay and Calcutta, aged 69.
SPURGIN.—On the 7th May, at Ipswich, Chas. S. Spurgin, M.R.C.S.E., aged 78.
TRUMAN.—On the 12th May, at Aboretum Street, Nottingham, Becket Truman, M.R.C.E., aged 72.
TURNOCK.—On the 14th May, at Leek, Richard Turnock, M.R.C.S.E., aged 59.
WOAKES.—On the 9th May, at Luton, Edward Woakes, M.R.C.S.E., aged 73.

ADMIRALTY, MEDICAL DEPARTMENT OF THE NAVY.
9 New Street, Spring Gardens, S.W.
20th May, 1874.

NOTICE OF EXAMINATION OF CANDIDATES for the NAVAL MEDICAL SERVICE.—NOTICE is HEREBY GIVEN that a Competitive Examination of Candidates for admission into the Medical Service of the Royal Navy will take place at the University of London, Burlington Gardens, on MONDAY, 9th AUGUST, 1874, and following days, at 10 o'clock.

Candidates must present themselves at this Department for Physical Examination at 11 o'clock on THURSDAY, 5th AUGUST, 1874, when should they be found in all respects eligible, they will be permitted to appear for examination.

The necessary forms to be filled up by Candidates will be supplied on application to this Department. A. ARMSTRONG, Director-General

TO BE SOLD.—The Business of a Chemist and Druggist having a first-class Shipping connection, to which is attached a very remunerative Surgical Practice.—Address G. 27, office of the paper, 23 Ely Place, Dublin.

IRISH MEDICAL ASSOCIATION, ROYAL COLLEGE of SURGEONS.—NOTICE is HEREBY GIVEN that the 7th Annual Meeting of the Association will be held in Dublin at the Royal College of Surgeons on MONDAY, the 7th of JUNE next, at half-past Eleven o'clock a.m.
The President, Dr. HENRY J. SMITH, will give the Opening Address.

ACCIDENTS WILL HAPPEN!!

Provide against the Losses that follow by taking a Policy AGAINST ACCIDENTS OF ALL KINDS, of the RAILWAY PASSENGERS' ASSURANCE COMPANY, The Oldest and Largest ACCIDENTAL ASSURANCE COMPANY.

HON. A. KINNAIRD, M.P., Chairman.

PAID UP CAPITAL AND RESERVE FUND, £160,000. ANNUAL INCOME £180,000. COMPENSATION PAID, £215,000.

Bonus allowed to Insurers of Five-years' standing.

Apply to the Clerks at the Railway Stations, the Local Agents, or 64 CORNHILL, and 10 REGENT STREET, LONDON.

WILLIAM J. VIAN, Secretary.

DIGITALIS AND ERGOT AS VASO-CONTRACTORS IN LOCAL CONGESTIONS WITH AND WITHOUT RUPTURE OF VESSELS. (a)

By A. S. MYRTLE, M.D.,

Consulting Physician to the Harrogate Bath Hospital.

TILL very recently the therapeutic value and *modus operandi* of these drugs were unknown, and, like the ancient and handy cold door-key application for the cure of epistaxis, they had been resorted to empirically for ages—the former as a cardiac sedative or depressant and active diuretic, which it is not; the latter as a uterine stimulant during parturition. Not so many years have passed since French, German, and English practitioners began to note that digitalis possessed certain antiphlogistic properties, that it diminished febrile conditions, slowing the pulse, lowering the temperature, opening the pores when given in acute inflammations, like pneumonia and bronchitis—also that when applied in the form of infusion, or tincture locally to inflamed joints, glands, or surfaces, it speedily reduced swelling, diminished redness and pain, and prevented suppuration. More recently the researches of independent physicians at home and abroad as to its physiological action on the lower animals as well as man, clearly prove that it acts on the cardiac ganglia as a powerful stimulant, and thereby brings about a marked increase in the intensity and duration of the peristaltic movements of the muscular fibres of the heart, and that, when pushed too far, this contraction is so great as to render the ventricles incapable of distension, death being the result. It was also shown that when the tincture was applied to the web of a frog's foot, the immediate effect was contraction of the vessels to such an extent as to put a stop to the passage of the red corpuscles almost

entirely. Other observers discovered that ergot not only excited uterine contractions, but that it arrested uterine hæmorrhages, and that when given in other internal bleedings, from the bowel, bladder, lungs, it acted in the same way; also that it proved effectual in closing the open mouths of vessels when applied topically. Then some one, I forget whom, found out it exerted a perceptible influence in congestion of the spinal cord and its coverings, and produced a marked sedative action on the circulation generally. In *Virchow's Archives*, Dr. Klebe, of Berlin, publishes some cases of poisoning by carbonic oxide. His observations led him to ascribe the symptoms produced to dilatation of vessels from paralysis of their muscular fibres. From experiments with ergotin, he maintained it is the best antidote in such cases, restoring tone to the arteries, and he states that the stupor occasioned by the free inhalation of the gas passes off much more rapidly in cases where ergotin had been given than where it had not. Again, we find Dr. Dutoit, of Berne, treating cases of aneurism on the same principle, by subcutaneous injections of ergotin over the site of dilatation, and Dr. Vogt, of Berlin, treating cases of varix, varicocele, certain forms of nævus and hæmorrhoids successfully by the same means. These facts clearly exhibit the mode of action of digitalis and ergot, and ought to satisfy us as to their influence on the vaso-motor nerves, and the power they have through them of reducing the calibre of both arterioles and venules by causing contraction of their muscular fibres.

For several years I have been in the habit of using digitalis and ergot separately and combined in cases of passive hæmorrhage, and I can add that I have had much more satisfaction in their administration than I ever had in that of the ordinary vegetable and mineral astringents. To me they seemed not only to control the bleeding more readily (that is, with fewer doses), but more permanently, and they had another great recommendation—they did so without interfering with the routine performance of the bodily functions. Having found them so efficacious in congestions with hæmorrhage, it seems to me now almost unaccountable how I never thought of using them in cases of congestion without rupture of coats. As usual,

(a) Read before the Leeds and West Riding Medico-Chirurgical Society, April, 1875.

accident opened my eyes to their value here. Fortunately, one of my patients went mad; she had been hysterical all her life; latterly had been fitful—now in the highest glee—now in the blues; at one time displaying the greatest amount of bodily activity and endurance, at another just as indolent—liable to the most violent headaches, lasting for days, and generally ending in congestion of the liver with protracted bilious vomiting. The day on which her mind became unhinged, after showing much mental and bodily excitement, she suddenly became insensible, and fell on the floor, where I found her; she looked dead drunk, and her servants supposed that such was the case. On examining her, I found that it was not so. She was evidently suffering from active cerebral congestion, and I anticipated apoplexy. I had her removed to bed; applied the usual remedies. In the evening she was more conscious, but had a dazed look and was incoherent, her face greatly congested, her head hot and painful. Light could not be borne. She slept none that night; she sat up in bed, rocking herself to and fro, holding her head, and groaning, "Oh, my head!" Next morning she became violent and unmanageable. I tried large doses of the bromide and iodide of potassium, without result; morphia and antimony no good. Feeling there was something unusual in the case, before sending her to an asylum, I asked permission to consult an expert, and Dr. Crichton Browne was sent for. I shall not easily forget the clearness of his diagnosis, not as to the insanity, but as to its cause, any more than I shall the success of his treatment. He said: "The insanity, I believe, arises from excessive congestion of the vessels of the brain, and I would recommend you to try the effect of four doses of digitalis and ergot; if these fail in causing contraction of the vessels, there will be nothing for it but removal to an asylum." She was ordered twenty drops of tincture of digitalis and thirty of liquid extract of ergot every four hours. After the second dose the head symptoms were relieved, the patient rested quietly, the face was paler, head cooler, less photophobia; slept between the second and third and third and fourth doses. The following morning I found her calm and collected, perfectly rational, and complaining only of a sense of bodily weariness. I discontinued all treatment, and she made a rapid recovery. I often regretted I did not ask Dr. Browne why he limited the number of doses to four, and it only dawned on me recently why he did so. I confess, during all my medical experience, I have never seen such truly scientific treatment applied so perfectly as to meet the exact thing required; it was like a problem in Euclid with the Q. E. D. at the end of it.

A gentleman aged seventy, of corpulent habit, after eating a hearty dinner and drinking a glass or two of strong ale, suddenly fell from his chair. On lifting him up he became sick, and threw up all he had taken. The sickness continued to recur at short intervals, and brandy and ammonia had been given to relieve it. When I saw him he was pale, half conscious, pulse quick, intermitting, heart's action tumultuous, face very pale, complained of much sickness, and vomited the brandy and water he had just swallowed; immediately after he had a fit: his face and head, from being pale, became highly congested, the extensor muscles of the body and extremities were forcibly contracted, so that I had difficulty in keeping him in his chair. In an hour he had four of these attacks, each lasting from one to two minutes. On coming to himself he said, "What is it, have I been asleep?" There was no paralysis, but he complained of great coldness in the cardiac region and at the pit of the stomach, and of great heat and fulness in the head. I applied hot bottles to spine and pit of stomach, and prescribed digitalis and ergot. He was placed on a sofa in the room; for a time he was restless, but after the second dose he fell into a quiet sleep. The pulse was now soft and regular, the appearance of face natural. He awoke at 12 p.m., feeling able to go to his bed-room, and he walked upstairs with the assistance of his servant's arm.

Next morning I found him much better. I kept him in bed, and on the following day I examined him carefully. He could see only the half of my face. On looking at anything he always saw the figure of a man at his right side. Had forgotten names most familiar to him. Could write his name and see it all but one letter, the first of his surname; this he could neither see whilst writing it nor after it was written. Complained of nothing but a queer feeling at the top of his head, as if there was a plate on it, and of a sounding in his ears like the buzz of a bluebottle fly. On asking him to read from a well-printed book, he said, "How very strange, I can't read a word almost." On moving the book into odd positions he made out some words, but he could not make out others. Wherever the letters were tailed, like "g" or "y," he was puzzled, and try as he would, he could not read them. This imperfection most probably arose from rupture of a small vessel, and the presence of a very little clot pressing on the left optic nerve before it unites with the right in the commissure. In three days he returned to business, and the double vision is slowly disappearing. The action of the digitalis and ergot forcibly reminded me of one or two cases in my early practice, where I met the same symptoms by bleeding, with similar results, the difference being that where I bled my patients made a very slow recovery, and were weeks instead of days before they were fit for anything. Nothing would satisfy this gentleman but that there was something wrong with the eye itself, so he consulted Mr. Teale, who pronounced him perfectly free from disease, and diagnosed a small clot at base of brain, without knowing anything of the history of the case from me.

(To be continued.)

ON THE TREATMENT OF PULMONARY CAVITIES BY INJECTIONS.

(Translated for the MEDICAL PRESS AND CIRCULAR from *L'Union Médicale.*)

By JOSEPH DUGGAN, L.K.Q.C.P.I., Turloughmore, Co. Galway.

NOTWITHSTANDING the progress made by therapeutics in the treatment of pulmonary tuberculosis, medical science as yet is almost powerless in arresting the course of this dire disease; so it appears opportune to point out for the attention of physicians all the means which are indicated as essential to combat this formidable disease. Amongst them is one which appears worthy of being mentioned, though as yet experience has not pronounced for or against it—I mean by passing injections directly into the pulmonary cavities through the walls of the thorax. The idea of opening into the cavities of the lung by an incision of the thoracic walls dates at all events as far back as the time of Baglivi, if not earlier, but it is difficult to prove that the operation had been performed before Barry, in the last century, or more probably in the present century by Hastings and Storke. As to the treatment of pulmonary cavities by the aid of local applications passed directly through the walls of the chest, it was only within the last few years that such an operation was seriously contemplated. The experiments of Storke and Mosler proved the tolerance of pulmonic cavities, and into which can be introduced canulas and various injections without serious injury. Dr. William Pepper, Professor of Clinical Medicine to University of Pennsylvania (a), resolved on using medicated injections in the treatment of phthisical cavities of the lungs. Those which he treated had the cavities situated in the superior lobes of the lungs: the various injections had all been passed through the first, second, or third intercostal space, at the very spot where the cavity appeared most superficial. The punctures were generally made on a line with the nipple, although in two cases he was obliged to operate at an inch and a

(a) *The American Journal of Medical Science*, Oct., 1874.

half interior or exterior to that line. The instrument which he uses consists of a very fine hollow steel needle, three inches long, and capable of containing twenty-five drops of liquid. After having anaesthetised the region by the aid of cold, he introduces the needle to the depth of an inch and a half to two inches, according to circumstances. The operation is generally painless, and does not occupy more than about thirty seconds. In case a small filament of nerve is wounded, it then causes a slight pain for a few moments. The liquid injected by Dr. Pepper is a solution of iodine prepared with one part of Lugol's solution, and six or nine parts of warm water, injecting at each operation from 0.15 centigrammes to 1 gramme. From the complete absence of irritation we are authorised to infer that there can with impunity be introduced into the pulmonary cavities a more concentrated solution of iodine or other alterative solutions, astringents, or antiseptics, &c. At present the injections are used only once a month, and in the intervals the internal treatment is continued as usual, carefully attending to the hygiene and régime of the patients. Finally, the observations reported in the memoir of Dr. Pepper prove that the treatment of pulmonary cavities by injections introduced by the aid of delicate hollow needles cause neither pain, hæmorrhage, nor traumatic irritation, and does not exclude the use of internal medications, nor the employment of any hygienic measure. The cases best adapted for this local treatment are those where there is only one superficial cavity, and surrounded by healthy tissue. But much benefit may be derived by the use of injections, even when the rest of the lung is affected, or where the opposite one is diseased. In all the cases where the injections were employed there was noted an amelioration in the local and general state, and these medicated injections into pulmonary vomices appear to act for the most part in diminishing the production of pus and the chances of general infection.

Observations.—Where we are positively sure of the existence of a well-defined cavity of the lung, and by observing the precautions pointed out above, there cannot be the slightest objection to the use of these medicated injections. But there are other medicinal substances in solution which I think would be found as effectual as the iodine solution—viz., very dilute solutions of nitrate of silver, the various solutions of carbolic acid, and tinct. benzoin comp. It has struck me that these medicated injections would be more efficacious and attended with more success if injected in the form of spray; it is quite obvious the medicated mist would moisten the whole internal surface of the cavity, and instead of the danger of local irritation from concentration at one point, as might occur from the syringe, the spray would ensure the general application of the medicament, by bathing, as it were, the entire surface of the pulmonic cavity.—TRANSLATOR.

INDIAN MEDICAL NOTES.—XXXIX.

(FROM OUR SPECIAL CORRESPONDENT.)

MEERUT, April, 1875.

A DELICATE SUBJECT—SYPHILIS—RHEUMATISM—NATIVE POLLUTION—ADEN—GENERAL PRACTICE.

BEFORE marching to Delhi an enormous bubo was evacuated by the pneumatic aspirator—no poulticing, merely a pad of carbolised oil, bandage, rest, the result being no sinus—the mark of the needle scarcely recognisable. Setons and ordinary exploring needles have been tried again and again—indeed, in every way have buboes received treatment for many years, including the application of strong nitrate of silver, without any rapid improvement—so have mammary abscesses. Now the wish is to encounter many more for aspiration, but I should not be disposed to trust to the ordinary hypodermic syringe, even for the very smallest collection of pus. When the Contagious Diseases Acts are in full operation we shall

stamp out syphilis, which, although not nearly so heart-breaking as in former years, still gives a deal of trouble, besides wrecking constitutions; for instance, at Delhi a large number of men contracted disease from unregistered prostitutes. As a matter of expediency the registered prostitutes should be numerous, be kindly treated, be looked upon as the only horrible alternative against masturbation, adultery, or illicit connexion with women fearfully diseased. All for encouragement of field sports, active exercise, education, religious teaching, and temperance, very many are naturally opposed to the increase of that great evil, imprudent marriages, involving so much misery, discomfort and expense. The married man is not worth his keep sometimes, is difficult to move or to carry, does not show more zeal than the bachelor, who is *semper paratus*. It is only human nature—the instinct of every living thing—the wish to pair. The love of wife, children, and his own fireside is implanted universally. Ungratified passion also leads to dyspepsia, ill health, and with women to insanity, no practitioner can deny. We cannot understand the sexual furor roused in young blood. From the pulpit we are directed to restrain: yet the preacher, possibly a curate with a small income and an enormous family, is none the more efficient for tempting Providence by improvident marriage. As a rule, out here the registered prostitutes are very clean, healthy, quiet, well-behaved, who look upon medical examinations as a regular duty. When there are but very few near a camp there is unfortunately a rush of men. When there are none at all, the females, corresponding to Curragh wrens of former times, are sure to be lurking in the bush. Thus disease and death commence. Several experienced medical officers are in favour of reverting to the weekly inspection of men for the detection of venereal diseases, for to the end of time many will conceal or think nothing of the "bit of a chafe" until constitutionally shattered. This loathsome, disgusting, horrible subject is not pleasant to write about. Thus it is so many who believe in the efficacy of the Acts decline to enter into any controversy further than from years of experience pleading anxiously, honestly, earnestly in their favour. The treatment of syphilis includes the application of nitric acid to the early recognised sore, rest, lotion, good diet, blood depurants, tonics. When it is imperatively necessary to administer mercury, some give Plummer's pill, some order fumigation, others inunction—the number of non-mercurial practitioners on the increase. The experience of all is to dread syphilis worse than ever. The cases of cancer appear so frequently to occur amongst the better classes—generals, bishops, judges—the bite of a parrot recently assigned as a cause. From 1860 to 1869, in Bengal, European troops, 35,118 had primary syphilis, 10,317 had secondary syphilis, 78 died, 875 invalided; 315 had syphilitic iritis, 35,543 gonorrhœa, 13,267 bubo, 3,048 orchitis. Rheumatism occasioned 26,155 admissions, of whom 28 died, 1,870 were invalided. In the Meerut district 78.7 per 1,000 on the ten years' average suffered from rheumatism—1863 and 1867 heavy years—every month about the same numbers, July slightly in excess. Though a safe disease, killing but few, it is very painful, crippling many; so do sciatica, neuralgia, and scarlatina rheumatica, commonly called dengue—the blood permanently poisoned. In the month of January the thermometer registered 26° in the tent in the early morning, the ice soon dissolving at sunrise. The same accurate thermometer on another march last week noted 104°, which may possibly account for agonising cricks in the neck, facial neuralgia, sciatica, only to be treated by one remedy, quinine, which suits only a certain number of persons. The poorly-fed natives, half-naked, dwellers in damp and dirt, suffer from pains in the joints. The natives who can afford to live the best, eat the most of rice, unleavened bread, or clarified butter, to counteract the constant waste of tissue. Many are crowded in mud huts nine feet long, nine wide, seven high, say four in a family—the monthly earnings eight shillings a head. Disbelieving in sanitation, they accept epidemics as fate

inevitable. "Better to suffer the evils which we have than fly to others which we know not of," reason the natives, who prefer variola to vaccination, who dig holes or use old excavations for cesspools, who every day contaminate drinking-water, making a great merit of changing the wells after prolonged pestilence. On recovering from desquamative fevers the convalescents repair to the well to wash their clothes and bodies. At the well one man neatly clad in a postage-stamp is cleaning his teeth, another blesses the Duke of Argyle, two or three squatting round discuss village politics; one is slapping and banging his wet inexpressibles; another washes his feet. "It was my father's custom and so it shall be mine," reasons the native. The well is the village club. What matter if there be a percolation of sewage, if repairs never are undertaken, if the well be never cleaned out. All will be put right to-morrow. In England you ask for a cup of tea, and receive it. In India the person appealed to calls to some one else, who writes a letter on the subject to-morrow. Sleeping out of doors in the open air, the native escapes much sickness. So would the European, where the air and soil are dry. In certain places, from rise of subsoil water, the station is beautifully green, until the hot winds parch everything. "It is an ill wind"—how runs the proverb?—at all events, the hot blast at Meerut checks intermittent fever for three months. Fever, as said before, bursts out with great vigour after the rains, about August, and continues, people say, until Christmas. It continues, believe me (a doctor in harness), until the hot winds, about the middle of April. Remittent and enteric capriciously vary, according to season, meteorological conditions, individual constitutions, stations, daily occupations, barracks, food, water supply. The impression on my mind is that the poison is endemic in many stations, and the greatest care should be taken to steer the young fresh arrivals through the different grades towards acclimatisation. A young scrofulous lad should almost be wrapped in cotton-wool the first year. The second year is trying, but in the third he is seasoned. One objection to the hills is the tendency to become slack, to be idle slovens, who, when the heat comes round, again fall sick to sigh for the hills. In all stations there should be fair play given to each place by the rigid police system of sanitation. A certain sower went out to sow; and we know how the seed grew and multiplied on certain soil, yet withered away elsewhere. Let us call the seed pestilence, and for the harvest a certain cruel reaper is always ready. By post to-day comes a letter from an old comrade, now at Aden, apparently a very healthy place in his mind compared with Meerut. His men average 5 ft. 8 in., and 39 lb. in. round the chest, have been at Aden two years, and four years previously at Bombay, and out of 100 about 2 sick, the hospital closed sometimes for a fortnight, the barracks excellent, the food satisfactory. Nothing but roads of adamant hardness to travel on—not a scrap of turf, grass, or earth, and exercise mostly taken on bicycles, the thermometer for some time past ranging between 78° and 81° day and night. Officers have to pay 16s. a month for carriage of water. An acquaintance also who has most extraordinary chronic friction sounds of the chest, like the trituration of grindstones, hopes to improve in health at Aden. Just now it is my business to ride out ten miles to visit one patient, who, taken ill on a march, cannot be moved from the solitary hut. No nurse, scanty accommodation for husband, wife, and children. The case one of abortion, hæmorrhage, followed by metritis—very interesting, yet terribly anxious, and twenty miles' riding, hammer, hammer, along the hard highroad, relieved by mulberry trees black with fruit, is somewhat trying in the April sun. Doctors, however, exposed to all inclemencies of weather, to hurried meals, to broken rest, to often undeserved abuse, to the poison of every fever, do not complain of these things, because it is their business, as it is the stars to shine. But it is hard to read that a small clique in a certain station have petitioned for the removal of the civil surgeon because he stands up for the dignity of the profession

in the matter of fees. An overwhelming majority have issued a counterblast expressive of every sympathy, every confidence in their medical attendant. The Rajah of Puttiala has recently entertained the Viceroy and a distinguished party right hospitably, by all accounts. Formerly these native princes gave execrable wine, that is to say, they were robbed by their stewards, who calculated for every lady six bottles of champagne *per diem*, and two bottles of brandy for her to drink on the drive home. Just now we have several cases of whooping-cough, the type much milder than in England. A colleague states that when vaccination does not take, variola is meteorologically absent. Also in epidemic cholera, the first and the last cases recover, while the central group, as a rule, die. A man of tremendous experience, he is asked the question, what he knows about cholera after battling with so many epidemics, and he replies—"Nothing!"

Hospital Reports.

LONDON HOSPITAL.

(Under the care of Mr. RIVINGTON.)

Strangulated Left Femoral Hernia, at least Four Days' Strangulation, in a Patient of 65—Discolouration over the Tumour—Collapse—Operation—Sac Opened—Death Twenty-four hours afterwards.

DORCAS TURNER, 65, was admitted into the London Hospital on the 8th April, 1874. There was an ill-defined tumour on the right thigh not larger than a hen's egg. It yielded no impulse on coughing. The soft parts over it were discoloured. She had been under treatment outside the hospital, an erroneous diagnosis having been formed. The constitutional symptoms were—constant vomiting of a yellow, fecal fluid; constipation, which had lasted for some days; cold surface, clammy skin; small, quick pulse. She was almost in a state of collapse.

The patient had been seen by Mr. James Adams, who was in the hospital when she came in, and had been requested by the house-surgeon, as the case was urgent, to see the case. She was taken to the operating theatre, and Mr. Adams was about to operate when Mr. Rivington, who had been sent for, arrived. Mr. Adams availed himself of the opportunity of handing the case over to Mr. Rivington, who, therefore, operated in place of his colleague.

4.45 p.m.—Operation. Sac opened at once; found inflamed with lymph, effused externally, and more or less adherent to the intestine; omentum and intestine in the sac. The omentum was removed by simple tearing, so as to occlude the vessels. The intestine was very much congested, and covered with shreddy lymph. It was not perforated. The bowel became lax on division of Gimbernat's and Hey's ligaments, which no doubt originally constituted the stricture.

The patient recovered from her collapsed condition, but nevertheless she sank at the end of twenty-four hours after the operation.

Post-mortem Examination.—Intestine close to femoral ring. No perforation. Coats much thinned at the point corresponding to the seat of external constriction (Gimbernat's ligament). No peritonitis apparently. Intestine a good deal congested. Death from shock and exhaustion.

Strangulated Right Femoral Hernia in a Woman of 65—Forty-eight hours' Strangulation—Operation—Sac Opened—Death in Forty-eight hours.

Ann Snow, 65, was admitted into the London Hospital on the 5th of May, 1874. She had probably had a hernia for some time, but no connected history was obtained. On Sunday, the 3rd of May, the hernia came down. She was sick, and her bowels were constipated. She came to the hospital on Tuesday, May 7th. She had a warm bath. Taxis was tried, but failed, although she thought that the swelling

was smaller after taxis. There was a lump the size of about two hen's eggs extending below Poupart's ligament, and parallel to it. There was no impulse in it on coughing. She did not vomit after admission, but she had taken nothing, and she felt that if she did take anything she should be sick. She was put under ether, and taxis, tried for a short time, having failed, the usual operation was performed. After dividing the superficial fat, which was in strong force, access was obtained to a lebulated body covered by a smooth membrane, and evidently consisting of fat. This proved to be sub-peritoneal fat, covered by fascia propria. The finger could be introduced by the side of Gimbernat's ligament, and a small rounded body like a knuckle of bowel could be felt. This slipped up with the sudden release indicative of escaped bowel, and the ring having been found to be clear all round, the wound was sewn up, and the patient was sent to bed. She went on apparently well, taking milk and beef-tea. She was in excellent spirits, and joked freely with those about her, and seemed on the high road to recovery. The following morning, however, she was suddenly taken with collapse, and sank by 11 a.m., without any previous shivering or sickness, and but slight abdominal tenderness.

Post-mortem Examination, made by Mr. McCarthy, Mr. Rivington being present.—Very stout woman, with much increase of fat in all parts. Peritoneum intact. Two sacs existed: one old, and outside the other, next to the femoral vein, had contained at one time vermiform appendix, which was matted into a conical lump, had on it appendices epiploicæ, greatly hypertrophied, and bore the marks of one or two constrictions. The smaller sac, more recent, lay internally, next to Gimbernat's ligament, and had contained a piece of ileum about two feet from the cæcum. The ileum below it was contracted. There was "commencing peritonitis," that is to say, there was vascularity on the convexity of the coils. A piece of ileum near the abdominal ring was covered with lymph and adherent to the wall of the abdomen. Fatty liver; heart with dilated ventricles; atrophied brain; emphysema; a tumour, apparently cystic, the size of a walnut, situated on the anterior edge of the left hemisphere of the cerebellum; 7th nerve stretched over it, and 8th (auditory) also expanded by it; 5th adherent slightly. There was a large quantity of serum in the arachnoid.

TUESDAY, MAY 25TH.

SIR JAMES PAGET in the Chair.

ON THE TREATMENT OF NASAL LUPUS BY EXCISION.

By Mr. JOHN GAY.

THE author's object was to show that lupus exedens is a topically malignant form of ulceration; and that the alleged cures of this affection by constitutional means are probably due either to errors in diagnosis or to the inclusion under the generic term "lupus" of forms of disease with which, typically, it has no natural affinity or alliance. In its objective features it most resembles epithelioma and rodent ulcer. Mr. Hulke's investigations have shown that the latter affection is essentially a local disease, and can be eradicated by the knife; in this respect, and in the absence of glandular infection, lupus resembles it. But rodent ulcer is chiefly a disease of age, lupus of youth; and the attenuated edge of the rodent ulcer close to healthy skin offers a marked contrast with the thick everted edge of lupus, surrounded by its pink zone of vascular injection. From epithelioma lupus is distinguished histologically, as well as by the extent of the ulceration and the presence of lymphatic implication. The pathology of lupus consists in the infiltration of the corium with large oval or round nucleated cells, establishing a raw surface which is more or

less covered by the degraded epithelial elements; the subjacent fat, sweat- and hair-follicles are completely destroyed, so that the surface becomes depressed. Like rodent ulcer, essentially a local disease—for it can not only be completely eradicated by the knife, but its poison is only topically virulent, and lupoid sores are not met with at a distance from the primary ulceration—it may and certainly does occur in persons with some of the ordinary general systemic indications of struma, but not, so far as Mr. Gay has observed, with those of strumous joints or glands. The conclusion to which dermatologists have come with regard to the influence of systemic remedies is favourable to this view of its essential character, for they have been compelled consistently to deny to drugs any therapeutic influence over an established lupoid sore. The only principle upon which it can be successfully treated is that of eradication by topical means. Caustics, however, have repeatedly failed, apparently from a want of a definite aim in using them. There has been no clear mode laid down of ascertaining the depths to which the virus of lupus has penetrated from its ulcer surface, consequently the amount of tissue that has to be destroyed in order to ensure its perfect eradication has been a matter of conjecture; but the limits of the poisoned tissue may doubtless be satisfactorily determined, these not being so wide as to be beyond the reach of the destructive powers of caustic potash. These limits are especially marked by the pink vascular zone surrounding the thickened margin of the ulcer; and the caustic should be applied to destroy not only the base of the ulcer, but all the parts within this zone. The objection to caustics, however, and the great advantage of excision arise from the fact that, in "nasal lupus" especially, in which disfigurement follows in the event of its being removed by caustic, cicatrization, or an advance towards it, must be allowed to take place before any restorative operation of a plastic kind can be done—one of the most important objects in the treatment of cases of this kind. If the removal of the diseased parts be made by the knife, any such operation that may be deemed expedient may be simultaneously done, and thus tissue is saved, the loss of which would be incumbent on the use of caustic. The paper concluded by the relation of three cases in which this method of excision was adopted. The first was a young man in whom the ulcer had been unsuccessfully treated with pernitrate of mercury; excision was practised, and a plastic operation performed to make a new nose. The results of the plastic operation were marred by erysipelas, but the patient wears an artificial nose. The second case, also a male, aged 23, was one in which the ulceration had perforated the right ala of the nose, and had been apparently treated by caustics with success. The edges were cut away, and a flap of skin from the cheek brought over the raw surface. The last case was a most remarkable one; it was that of a young lady 27 years of age, who showed lupoid cicatrices in the neck; the tip of the nose, cartilaginous septum, and the alæ were destroyed by the disease, which invaded the contiguous mucous membranes. Mr. Gray removed the whole of the diseased surface to within a quarter of an inch of the nasal bone, and laterally to the naso-labial sulci, thus exposing a large triangular space, which was covered in by skin-flaps dissected from each cheek, the tip of the nose and septum being formed by a club-shaped portion of the centre of the upper lip. There was perfect union, and six months after operation there had been no return of the disease, the nose being, however, somewhat flattened.

Mr. MARNHALL spoke of the galvanic cautery, which he had himself used with tolerable success. Its great advantage was that the diseased structures, including the thickened margin, with its characteristic rosy halo, could be readily extirpated.

Dr. SPARKS advocated the employment of solid nitrate silver, which is readily bored into the diseased tissues, and does not injure the healthy parts. He believed that Hebræ now used this method solely, having given up potassa fusa and chloride of zinc.

CASE OF DOUBLE FACIAL PALSY, WITH LOSS OF TASTE IN THE FOREPART OF THE TONGUE.

By Dr. ROBERT M'DONNELL, of Dublin.

This case was of physiological interest, as tending to prove that the so-called "gustatory" nerve was a compound nerve endowed with the function of taste by fibres derived from the chorda tympani. The patient was a young healthy

man, of 24 years of age, in whom complete paralysis of the portio dura of the seventh pair of nerves followed exposure to cold and wet, the left nerve being first affected. There was no evidence of any central lesion of the brain, nor were any other cerebral nerves engaged. There was complete loss of the sense of taste in the forepart of the tongue, which the author attributed to paralysis of the chorda tympani. Tactile and thermic impressions were perceived in the forepart of the tongue quite as distinctly as in healthy persons. The defect in taste persisted longer than the motor paralysis. The secretion of saliva from the sublingual glands was not excited by irritants which produced copious flow in healthy persons. The case was chiefly of interest as supplementing one recorded by Dr. Althaus in vol. lii. of the "Medico-Chirurgical Transactions," in which there was paralysis of the fifth pair on both sides, and in which the sense of touch in the tongue was lost, that of taste persisting.

ON THE SO-CALLED PARTIAL DISLOCATION OF THE HUMERUS.

By EDMUND OWEN, F.R.C.S.

The author endeavoured to show by the aid of four recent dissections that the cases which have been recorded as examples of true partial dislocation of the humerus are due to the effects of disease rather than of accident. The case instanced by Sir Astley Cooper in his "Treatise on Fractures and Dislocations," and that described by Mr. John Soden in the "Transactions" of this Society, vol. xxv., 1841, which have hitherto been considered as evidence that this form of displacement may result from "injury," were especially referred to as lending support to the opinion advanced by the writer. The paper was illustrated by specimens.

Mr. GASCOTEN said that all these joints when examined showed evidence of chronic rheumatic inflammation; and other joints than the shoulder were in some cases found to be similarly affected. He concurred with Mr. Owen as to the non-existence of partial dislocation of the humerus from injury, for he was quite unable to see what forces could hold the bone in position when it was dislocated upwards.

Mr. GAY contended that the changes met with in these joints were secondary to the dislocation; and he had certainly met with cases in which partial dislocation had followed direct injury to the shoulder.

Mr. MARSH said that no doubt many of these cases were examples of chronic rheumatic arthritis following rupture of the long tendon of the biceps; but he fully believed in the existence of a partial dislocation of the humerus, and thought the bone would be held in position by the biceps tendon, which must be displaced when such dislocation occurs.

Mr. OWEN, in reply, said it was singular that he should have met with six cases (post-mortem) in two years, often with both shoulders dislocated, and in two with similar chronic inflammation of the knee. In four of his specimens the tendon of the biceps was ruptured.

CASE OF CONGENITAL DEFICIENCY OF THE PERITONEUM, RESULTING IN INTESTINAL OBSTRUCTION AND SIMULATING AN ABDOMINAL TUMOUR.

By LAWSON TAIT, F.R.C.S.

On the 21st of January of this year the author saw Miss M., in consultation with Dr. Hickinbotham and Mr. Pugh, of Neshells. She had been suffering for three weeks from severe symptoms of intestinal obstruction, for which no treatment gave any effectual relief. At no time had there been any symptoms of peritonitis. She was thin and of small size; the temperature was normal, and the pulse a little over 100. There was obstinate vomiting, and slight headache. A small tumour in the rectum was diagnosed as an ovarian cyst, which could have no influence in the production of the obstruction. A tumour existed in the left hypochondriac and lumbar regions, about the size and shape of a large lemon. It seemed to fluctuate obscurely. It was dull on percussion, and could not be moved freely. The patient died unrelieved on the 24th, and in the evening of the same day Mr. Pugh made a post-mortem examination in the presence of Dr. Hickinbotham and Mr. Tait. The note of the condition of the parts has the concurrence of all three. On making the usual median incision it was found that there was no appearance of an abdominal cavity, the tissue of the anterior wall seeming to run on to the stomach

and small intestines, and these latter lay matted together, looking exactly like the convolutions of the brain, only they were not covered with any glistening membrane. The coils were readily separable, and their union was due to an abundance of ordinary areolar tissue, identical with what is seen on separating fresh muscles by tearing. Nowhere was there any trace of inflammatory action, as everywhere the loose extensible tissue prevailed. The tumour in the left lumbar region was found to be composed of a number of knuckles of intestine, which were occupied by numerous nodules of hard fæces. The inability of the intestines to move these masses onward seemed to constitute the whole cause of the obstruction, as no actual constriction of the tube was found. In the pelvis none of the usual peritoneal limitations existed, so that it was impossible to identify the organs *in situ*, and it was only after very considerable dissection that the tumour, which had been diagnosed as ovarian, was found to be really so. The menstrual history of this patient was marked by no great abnormality, and there was no history of any peritonitis.

OBSTETRICAL SOCIETY OF LONDON.

ADJOURNED DISCUSSION ON THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND PYÆMIA.

AFTER the letter of Dr. Matthews Duncan was read, in the terms given in our last issue, the discussion was resumed by Dr. Barnes, who said he had heard the letter of Dr. Duncan with considerable satisfaction. It places the grave and great difficulty which oppresses medical practice before us in a very striking manner. If prosecutions are to go on as they are now doing, how will it be safe for anyone to practise at all. It is becoming a most serious matter. We are governed by the ignorance of the law and the ignorance of the judge. The public are taught improperly. The lawyers and the public must receive, or ought to receive, medical opinions from the medical profession, from experts, those who are skilled and know what they are talking about. It will be dangerous to the public at large unless this principle is carried out more fully than it is. With regard to the great question of puerperal fever, he said we cannot discard the term puerperal fever. The meaning attached to it is simply this: fever in a lying-in woman, the general term expressing a number of perfectly different conditions. Having admitted that simple meaning, fever in a lying-in woman, we may proceed to analyse it and to trace the different varieties. There is the form of fever in the lying-in woman which is the direct result of infection or contagion produced by some zymotic poison, as scarlet fever (perhaps the most common of all), or erysipelas, or measles, or typhoid. All these things we see and know, and we cannot for a moment dispute them. Well, then we have a large class of cases, perhaps the most numerous, which we may call heterogenetic, which have arisen outside the patient's body, and have been put into her. Then there is another class of cases, which may, perhaps, admit of more dispute—autogenetic—in which all the conditions of the fever exist or arise in the patient's system, with which infection or contagion from without has nothing to do. But the objection has been raised, and has occurred to most of us, how is it that lying-in women are especially prone to scarlet fever? Like other adult persons, the great majority of them have had scarlet fever at some previous period of their lives, and may be supposed to be more or less protected; and how is it that their protection all of a sudden breaks down under the trial of childbirth? It is said again that scarlet fever can give nothing but scarlet fever, just as an acorn can bring forth nothing but an oak. That may be true to a certain extent, but women in childbirth are in a peculiar state of susceptibility to any poison; and the specific course of scarlatina may be masked in them. Dr. Barnes said: I have seen cases traced to scarlatinal poison in which the usual symptoms of scarlet fever were absent—no particular sore-throat, no swelling of the glands, no rash—and yet the cases have gone on to a fatal issue. Then, if we go a little further, we see what was alluded to by Dr. Richardson—who was, I think, the only speaker at the last meeting who hit upon the right key. If we look at what a lying-in woman is, we there see a peculiar constitution ready to receive poisons, and ready for those poisons to ferment and go on to a disastrous issue; while in another case the poison has no such effect. Then there is a

peculiar condition following labour, where the system has been loaded with matter striving for excretion: there is the involution of the uterus, the discharge of superfluous blood, the milk process coming on—a state which is just treading on the verge of fever at any moment—the slightest excitement or the slightest noxious matter carried into the blood is ready to ferment and set up a fever. It does not matter what the poison is. I think that Semmelweis, in his investigations, showed that even a case of cancer in a ward was the starting-point of a series of puerperal cases. It may be said that a cancer-germ will produce nothing but cancer. It will produce fever in a lying-in woman. So will scarlet fever. This peculiar constitution is one which we may recognise in the range of surgery and medicine as well as obstetrics; although in obstetrics we get the most striking illustrations of this as of many other pathological forms. In surgical practice, for example, we may see sometimes persons, adults especially, who cannot be vaccinated with impunity. We all know cases of that kind. The blood is in a ferment at once. This simple, mild, laudable poison, as we may call it, vaccine lymph, will set up a ferment, and the patient may die. Sir Benj. Brodie used to tell us of a man who was killed by the sting of a bee, so great was the irritation set up by the poison; but that argued a peculiar state of the system. We know there are persons who cannot scratch themselves without a fester: all going wrong in a moment. Well, a similar condition exists in an exaggerated degree in the lying-in woman, no matter what the poison is—scarlet fever or measles, or anything else. In these, the heterogenous cases, the symptoms are manifested earlier than they are in the other class of cases where the poison arises in the patient's own system. The fever breaks out in twenty-four hours or in two or three days, whereas in the other cases it generally comes on later. With regard to scarlet fever, it is enough to set up any mischief in a lying-in woman, and produces all the mischiefs of any other form of poison. We all know that scarlet fever poison, whatever pathological change it produces in the woman herself, can propagate scarlet fever to others. Then I would pass to the autogenetic cases. These cases are as distinct in their origin as many cases of infection. For example, you see a woman in the country away from all sources of infection; a little bit of the placenta is retained, a clot of blood is there, or some change takes place in the uterus, and there is an element of infection; it runs along the veins or the lymphatics, is absorbed by the mucous membrane; then you get the blood tainted, and the slightest matter will set it going; the whole system is in a ferment, just as it was from the poison of scarlet fever or typhoid; you may call it pyæmia or septicæmia, the result is about the same. These cases come on a little later than those which have a zymotic origin, and they can often be arrested by washing out the uterus, and bringing away any superfluous matter there. Many women will succumb at once or rapidly to a single dose, no matter how small it may be, but others can resist to a certain extent; their excretory organs may be in good working order, and they may throw off a moderate dose or two moderate doses; but they cannot survive repeated doses. If you can wash out the uterus, you may prevent the renewal of the poison, and stop the disease. That principle has recently come into vogue again. It was practised and taught with success by Harvey, who, if he had not been the greatest of physiologists, would have been perhaps recognised as the foremost obstetrician in the world. This mode of infection is one of very great importance for us to consider. There was a case referred to by Dr. Huntley, who believed that infection was taken into the medical attendant's system, and might be given off by the skin. I believe it may be propagated by the breath of a medical attendant or a nurse. We must all be conscious sometimes of taking in poisons by coming into contact with poisonous patients. I have gone away from a craniotomy case, where the brain was foul, stinking of it, my breath smelling for a day or two. So with other diseases. So with dysentery, I had shivering, diarrhoea, and foul breath, from the odour of dysenteric stools, for two or three days after being in contact with a patient of that kind. A man may walk about charged with infectious disease, and those who are susceptible with whom he comes in contact may catch it; those who are not may perhaps have a little dose, which they can throw off, the system being in good working order, and there is an end of it. But a lying-in woman, with the blood ready to ferment, would be readily attacked. There is the secret of the differ-

ence. A medical man who has seen a case of scarlet fever comes in contact in the course of the day with twenty or thirty patients, and it is perhaps only the lying-in woman who takes the disease; not that he is necessarily longer with her, but there is a greater liability on her part. I had a letter this morning from the son of an old member of this Society—a former vice-president—who calls my attention to a work by his late father, Dr. Uvedale West. He gives one example which is instructive, and I thought you would like to hear it. He had an outbreak of puerperal fever in his practice; he had to deliver a woman to whom he went straight from a case of erysipelas, and this woman had erysipelas the next day; he went afterwards to another patient, whom he did not examine, and that woman escaped; the next day he went to another case, and the woman died. That is the history of a great many of the epidemics in the German lying-in hospitals, where they have the faculty, as it seems to me, of manufacturing puerperal fever on a large scale. Those women who are lucky enough (we should consider them unfortunate) to be confined in the streets, on their way to the hospital, escape puerperal fever; it is only those who are examined repeatedly that catch it. That has been observed over and over again. If I might be permitted a moment or two longer, I could give you the history of a series of cases occurring in the practice of one midwife in a short time, while all the surrounding neighbourhood was at the time pretty free. With regard to the question of bacteria, as I know nothing about it, I had better say nothing; but I may reserve my doubt, and wait till the bacteria doctrine is proved by those who understand it. With regard to the value of antiseptics in order to keep hospitals free, I think that to keep hospitals free from puerperal fever is an extremely difficult matter—more difficult than it is in a surgical hospital to keep it free from pyæmia. You cannot keep a series of patients in a hospital isolated, in the proper sense of the word. You have the same nurses going to them; you have a variety of influences acting upon one or two patients, and the consequences may be radiated to others. There is only one secret for safety, and that is to have the woman confined at her own house, where she can have her own nurse, who has not been in the way of infection, and her own medical attendant. Then the chances are that she will go on favourably and happily. Without that there is no security. A lying-in hospital is not now by any means so serious a danger as it used to be; still it is always like a volcano, which may explode at any moment.

Dr. SQUIRE could not support the idea as to the very febrile state of puerperal patients, and said: It may be one extreme of error to deny the existence of puerperal fever; it is certainly the other extreme to call every post-partum illness by that name. Almost any febrile attack in the puerperal state will cause suppression of the lochia, arrest of the lacteal secretion, and other common symptoms; so that we have to separate many febrile ailments, as well as what may happen from retained placenta, or other causes of metritis and phlebitis, from the disease under consideration. Our first duty in meeting with such cases is not to call them by the name of puerperal fever, but to diagnose their nature. Many of them we can soon relieve, and in all be sure of carrying no infection to others; while no case of puerperal fever is without this risk. I say that no form of puerperal fever is to be referred to attacks of the specific infective fevers, and assert that not only is puerperal fever not typhus, typhoid, small-pox, measles, diphtheria, nor even scarlatina, but that these diseases are little modified by the puerperal state and retain their distinctive characters, so as to be recognisable; they ought to be diagnosed under this, as under other conditions, and called by their own names, and not by that of puerperal fever. Moreover, though pregnancy and the puerperal fever may prejudice the prognosis in such complications, and abortion happens in some of them, yet the puerperal accidents are not always so grave as is supposed. Dr. Squire supported this view with quotations and cases, and then added: When we come to erysipelas, the case is very different. Dr. Rigby noticed that the children born during an epidemic of puerperal fever had erysipelas. I do not mean to say puerperal fever is erysipelas, but this shows its connection with that and hospitalism and purulent infection, and probably cancer. I believe we can connect this closely with that class of infectious diseases which the investigations of Billroth and Lister have not only enabled us to understand, but to control. I believe there is danger in those dissecting attending midwifery cases. I have seen a dissector suffer from peritonitis after operating on a bad part,

and I believe he might have been the means of conveying infection to those whom he attended.

Dr. BRUNTON: If the poison of contagious diseases is so productive of puerperal fever as it has been pronounced to be by many of the speakers in this assembly, I cannot help saying that in my own practice I have entirely failed to find it such. The reason for it is this. I come forward as a practical man. Theory is all very well, but when we come into general practice one must look at what is seen in every-day work. The first midwifery case I ever attended was in the small-pox ward of the Royal Infirmary, Glasgow. The patient was in the full bloom of small-pox, and aborted about the seventh month. She recovered without a puerperal symptom of any kind. The students at the University of Glasgow, during the time they are dissecting, are in the habit of attending midwifery cases. I did the same, and I know some gentlemen in the room who were fellow-students of mine who also did the same, and during the whole time of our practice we had no puerperal fever at all. Then I came to practise in London, and I went to see a lying-in woman who had two children lying ill with scarlet fever; she made a good recovery, with not the slightest feverish symptom whatever. Then, again, general practitioners are in the habit of making post-mortem examinations. They meet with cases of sudden death, and the coroner calls upon them to perform post-mortem examinations. I have done it over and over again. I have gone on with my obstetrical practice all the time, and not had in the whole course of my practice a single case of puerperal fever. I saw one case of scarlet fever many years ago where the patient went through the full course of the disease with very putrid discharges as offensive as could well be, and yet the patient recovered. The skin peeled off; she had the usual affection of the kidneys and so on, and yet did well. My evidence in this discussion is decidedly negative. It appears to me that if scarlet fever, typhus, measles, and small-pox are to be reckoned such very strong producers of puerperal fever, I ought to have had a great deal of it in my practice; but that has not been the case. Dr. Brunton had not found the febrile conditions spoken of by other speakers.

Dr. HUNTLEY (of Jarrow), after relating his own experience of an outbreak of the disease, said: I could not but consider it absurd in the extreme to think that for weeks, considering all the precautions which I took, frequent ablutions and change of clothes, I still kept the disease. It seemed to me then, and I have no reason to change my opinion now, that the disease was somehow or other reproduced, and the only source from which I thought it could be reproduced was from some poison generated in malassimilation, or in some defect in the secretory or excretory system. Arguing from analogy, I see no reason to doubt that many infectious diseases are propagated in this way, and not from clothing. Suppose a nurse is attending a case of scarlet fever for weeks, and does not have the germs of scarlatinal poison entering her system and being exhaled from it, we cannot suppose that the disease will be communicated. There is no proof at all that the clothes communicate the disease always. Perhaps there are instances in which they do; in the case of washerwomen it has been communicated in that way; but I think it is just as reasonable to suppose that vitalised material will be allied with the poison as unvitalised. He testified that he had never in his own practice been able to associate scarlatinal poison distinctly with puerperal fever.

Dr. BROWN: About six weeks ago I was engaged in attending a patient in her confinement. At that time a child in the house, her own house, was taken ill with a pretty severe attack of scarlet fever. She was under great apprehension at the time of her confinement, expecting daily that she would suffer from scarlet fever. About a fortnight after the rash came out on the child she was confined, and did perfectly well, without a bad symptom. The infant had no sign of scarlet fever. About ten days after that another child in the house had scarlet fever badly. I attended another similar case about two months ago. The patient had never had scarlet fever herself; she was quite positive of it. In another case I attended a woman with her own child ill with the scarlet fever in the house. For some days she was laid up for her confinement, and she got up without a bad symptom. She had never had scarlet fever. I may mention that I attend on an average three or four midwifery cases a week, and I have never had a case of scarlet fever in which I could say that I had conveyed the disease to the patient.

Dr. SWAINE (of Clifton): I think the letter read at the beginning of this meeting is calculated to do great good,

especially as regards the unfounded statement that appeared in *The Times* that medical men could retire from practice for two or three months. The statement has in some places created a panic that is becoming quite a nuisance. I will give an instance that occurred to myself. About the 16th of March last I consented reluctantly to see a bad case of puerperal fever. I listened to the solicitations of the husband, but I only saw the patient once. A gentleman whose wife I had engaged to attend at the beginning of this month happened to hear of it, and wrote to me requesting me to release him from the engagement, which, of course, I did. She is not yet confined. As to the mode in which the infection of puerperal fever is conveyed, I think it is generally conveyed by the person of the accoucheur more than by the clothes or any other way. Some men are peculiarly unfortunate in this respect. It is often observed that all the puerperal cases in a district are limited to a few practitioners. It is not only that they have the run of them at a particular time, but even after a long interval it is the same men who get them. Some men, I believe, have the power of absorbing and exhaling these poisons to a much greater extent than others; and from remarks I have made in my own experience, I am inclined to think that the poison is much more likely to be given off by the skin than by the breath of the practitioner. I have come to the conclusion that men who have very moist, perspirable skins, especially moist hands, are much more likely to exhale it than those whose hands are generally dry and cool, especially if they have to make frequent examinations during labour. With regard to the precautions to be taken to prevent the spread of puerperal fever, I cannot think that it is necessary for a medical man to exclude himself for more than a week at the outside from midwifery practice. If he is unfortunate enough to have a bad case, probably by that time the poison will have passed out of the system. He should also take the precaution of not wearing the same clothes. I am not aware of having conveyed anything of a puerperal kind to a patient except once. That was in a case of scarlet fever. As a general rule I now refuse to go to a case of scarlet fever, unless of course it should occur to a lying-in woman. I refuse to see children with scarlet fever on account of the danger of conveying it. Some years ago I did not do so. I was attending a child with scarlet fever, and I attended a lady at the same time. About a week afterwards the rash came out, with sore-throat; she did perfectly well, and did not show any symptoms of puerperal fever. But the worst case of scarlet fever I ever saw was in a lady who, about a week before her confinement, called at a house where the fever was; the children were ill, and she was afraid to go in; but most imprudently the mother came out directly from the sick room to report how they were going on, and she put her head into the carriage to talk to this lady. In that case the scarlet fever came on *pari passu* with the labour. I attended her about 10 o'clock at night. I observed that her face became red, and at the latter part of the labour the speech was rather muffled. The redness of the face did not excite particular attention, as it generally comes on at the second stage of labour. On the next day I found she had been delirious; she was covered with a thick rash, had a sore-throat, and died in two days. Immediately after seeing a case of puerperal fever I go home, and before going to bed take a warm bath and wash myself with carbolic soap; and on the next day I take a Turkish bath, which I think is an excellent way of eliminating the poison and cleansing the skin. I need hardly say that, with every accoucheur personal cleanliness is of the greatest possible importance. We know that cleanliness is next to godliness. We cannot be too particular about it, especially after seeing cases of this kind; and we should be very careful not to wear the same clothes. With these precautions in a very few days there will be little or no danger of conveying the poison from one patient to another.

Dr. GRAILY HEWITT next addressed the Society; but as we have already drawn attention to his views in a leader, we omit the report of his able speech, except the important statement he made to this effect—that concurrently with the commencement of the attack of puerperal pyæmia the uterus is found to be enlarged; in other words, in a state in which its involution is absolutely retarded. I have never seen a case of puerperal pyæmia in which this condition of the uterus was absent, and absent at the very commencement of the malady. It seems to me, if this is a fact, that it is an exceedingly important element in the explanation of cases of puerperal pyæmia, of whatever kind they may be. It has seemed to me, in endeavouring to carry out explanations of these cases,

that the thing which fails is the contraction of the uterus. That is where the break-down originally occurs.

Mr. CALLENDER thought it purely a matter of speculation (although there seems to be a common consensus that such is the case) that these affections are due to the influence of some septic matter or poison, and then beyond this it seemed quite a matter of speculation as to whence that poison is supposed to come. There are some who hold the idea that the poison is to be found in germs which come from without the patient; there are others who seem to hold the view that the septic poison is generated in the woman herself, as the result of the production of decomposition; and there are yet others who say that the septic material is due directly to the products of inflammation. All these are mere matters of speculation. He then said: There are certain points which have forced themselves on my attention—certain negative facts, such as these. I hold that in the treatment of patients in a hospital ward, the first point we have to attend to is that there must be no foulness about the wounds; the wounds must be absolutely clean. Directly we see anything unpleasant about them, we must take care to remove it. The point is that no foulness must be capable of being recognised. The wounds should be most carefully kept from any contamination from other wounds, both by nurses and dressers; and, in regard to sponges and such like materials, all possibility of contagion from this source should be avoided. This leads me to remark that in the treatment of wounds a patient will be tolerant enough of decomposition which may be set up in a wound on his own body, but will be intolerant of poison conveyed to him or her from any other wound. That is another point of which we must be extremely careful. It is a fact that is constantly forced upon one's notice, the possibility of a wound being contaminated from another wound. Then the patient should, as far as possible, be isolated. It is easy enough to do this in a surgical ward, where a case in which there is an open wound may be surrounded by cases not suffering from wounds, so that they can be for all practical purposes isolated. Then no discharge should be allowed to accumulate in a wound, not merely the discharge resulting as a consequence of the ordinary inflammatory process, but the discharge thrown out of the wound during the first few hours after it has been inflicted. I know nothing more irritating or acrid than the fluid in a wound immediately after an operation, if it is allowed to accumulate. Then, again (and I think this is another point of great negative moment), there should be no movement of the parts; the wound should be kept absolutely at rest, allowed to heal from the beginning, and not permitted by jars and jolts to reopen so as to create new wounds, through the cracks or fissures of which putrid or other foreign matters can enter. It is by such means as these that I have learned how to banish for all practical purposes such affections as those commonly called pyæmic (though I prefer the term septicæmic) from surgical wards, except now and then when we make errors, and trouble arises in consequence. No such thing as pyæmia exists in the hospital wards under my immediate care. By the experience we get from these facts we have some light thrown upon the worst of the suspicions that I spoke of—namely, the suspicion that these cases of septiciæmia are in some way connected with the presence of a poison. As to antiseptics, Mr. Callender said: I think they are of the very greatest possible use in surgical practice, and I take this opportunity, as it is a public one, of saying that although I may have seemed to differ very much from Mr. Lister with regard to carrying out his principles of antiseptic treatment, I am entirely at one with him as to that matter, and I fully acknowledge the great benefit he has conferred upon us by his advocacy of the antiseptic treatment. All I wish to show is that the treatment should be carried out on a more simple plan, without that elaborate attention to detail which Mr. Lister has thought necessary.

The discussion was again adjourned.

ARMY OFFICERS' GRIEVANCES.

AN important deputation from the Royal College of Surgeons in Ireland had an interview last Thursday afternoon with Mr. Hardy, Secretary of State for War, for the purpose of representing to that department the unfair treatment to which the medical officers of the army have for a long period been subjected. The deputationists comprised Mr. Jolliffe Tufnell, the President, Mr. E.

Hamilton, the Vice-President, Mr. Rawdon Macnamara, Member of the Council of the Royal College of Surgeons. Accompanying were the following members of Parliament:—Hon. D. Plunket, Sir P. O'Brien, E. Gibson, Dr. Lush, Dr. Brady, W. R. O'Byrne, Captain Nolan, W. Stacpoole, G. E. Browne, Sir A. Guinness, I. T. Hamilton, Dr. O'Leary, and some others. Sir W. Mure, Director-General of the Army Medical Department, was present, at the request of Mr. Hardy, and remained throughout the entire conference. Mr. Plunket, having introduced the deputation, Mr. J. Tufnell read the memorial of the President, Vice-President, and Council of the College. It stated that in pursuance of a Royal Charter they had faithfully discharged the duty of providing a sufficient number of properly educated surgeons for the service of the army and navy. Out of 938 medical officers of the army serving upon full pay on the 1st day of January, 1875, no fewer than 300 were licentiates of the Royal College of Surgeons in Ireland, while 412 possessed qualifications granted by one or other of the Universities or Colleges in Ireland. This willingness to take service has greatly diminished, and it arises from three causes:—General distrust of the permanency of warrants affecting the Army Medical Department, from a dislike to take service under the unification scheme as at present existing, and from the superior advantages offered by the Indian Medical Service. In reference to the former it is urged that a Royal Warrant once issued should be binding upon both sides, and that the signature of the Sovereign, when attached to a warrant, should be regarded in the same light as the signing of a contract in private life; that any so signed and published warrant cannot in equity be altered to the detriment of the licentiates of this or any other college taking service under it without adequate compensation being awarded to them for the loss actually sustained by the change. Without some substantial improvement the memorialists believe that surgeons of superior attainments will not in future be found willing to enter the army; nor do they think that they can reasonably be expected to do so. They have, further, consulted numerous medical officers of the army now serving with a view to ascertain the principal grievances under which they suffer, and the points they consider should be amended in order to restore the service to its former position in public favour. In advocating the claims of those members of the Royal College of Surgeons in Ireland now serving in the army, the President and Council feel that they are consulting the public welfare, and that they would be deficient in their duty to the Crown were they to allow her Majesty's Government to remain in ignorance of their views. They regard with apprehensions the aversion to the Army Medical Service, which has been steadily increasing for some time amongst Irish medical students, and they fear that unless active steps are taken to amend the present system serious public inconvenience may be felt in consequence of there being a deficiency of properly educated surgeons for the service of the army.

The President then submitted the following schedule, which he described as a fair and equitable summary of the requests which the army officers, and those who sympathised with them thought should be conceded:—

- 1st. The relative rank of medical officers to carry all allowances, which shall only bear one interpretation.
- 2nd. Every medical officer to be entitled to 61 days' leave in the year, on full pay and allowances; the arrangements for the performance of his duties to be made by the administration.
- 3rd. Medical officers requiring additional leave on urgent grounds, to be granted it on pay only, without allowances, as other officers.
- 4th. Medical officers to be placed on the same footing as officers of the rest of the army as regards sick leave.
- 5th. Exchange to be allowed, and to be "*bond fide*,"

the officer staying at home to take up the post vacated by the officer going abroad.

- 6th. Medical officers to be relieved of all the duties properly belonging to purveyors, and which do not in any way pertain to the profession in which they have been brought up.
- 7th. Promotion to the rank of surgeon-major to be fixed at twelve years of full pay service, if not previously obtained.
- 8th. Medical officers of field rank to be entitled to forage.
- 9th. Surgeons-major after twenty years' service to rank as lieutenant-colonels, deputy-surgeons general as colonels, and surgeons-general as major-generals, according to date of commission.
- 10th. The tenure of office for administrative ranks to be limited to five years in each grade, or ten years in the two; officers so retired to receive the maximum rate of half-pay.
- 11th. The retirement of officers of the administrative ranks to be obligatory at 60 years of age, but on corresponding liberal terms.
- 12th. An increase in the present rate of voluntary retirements after twenty years' full pay service, and voluntary retirement to be unconditionally permitted after twenty-five years' full pay service.
- 13th. Those medical officers who have lost the prices paid for exchanges, or otherwise suffered pecuniary loss by the unification scheme, to receive compensation according to each individual case.

Dr. Brady alluded to the great and growing discontent which prevailed among the army surgeons, and pointed out that their position was lower now than formerly. Not alone had they to work seven days in the week, but they were deprived of that sixty days' leave which the combatant officer enjoyed, unless they provided, and in many instances paid for, substitutes.

Mr. Hardy said that medical officers were quite as much entitled to their leave as the combatant officers.

Dr. O'Leary pointed out that providing substitutes and loss of pay constituted the difference.

Sir P. O'Brien said that the existing regulations lessened the *esprit de corps* that ought to exist between officers in the same regiment, and made medical men feel that they did not occupy the same position as the combatants.

Mr. Gibson recapitulated the various injustices which pressed down on the medical officers, and commented especially on the difficulties thrown in the way of exchanges.

Captain Stacpoole contended that army surgeons of all degrees should have the same facility for exchanging as any other officers.

Mr. Hardy denied that any right existed on the part of any officers to effect exchanges. He then asked was it as a purely educational body that the deputation appeared before him?

Mr. Tufnell, in reply, warmly but impressively told the War Secretary that neither he nor Sir William Muir had the most remote idea of the deep-seated and teeth-grinding chagrin with which the medical officers of the army viewed their position.

Dr. Lush, accepting Mr. Hardy's interrogation as a challenge, stated that the English and Scotch Universities were represented on that occasion, and the deputation should in every sense be considered as a representative one.

After some further conversation, in which Mr. Hamilton, Mr. Macnamara, and other gentlemen took part,

Mr. Hardy, in reply, said that last year he received a deputation from the British Medical Association, who brought before him in a different shape the alleged grievances of the medical officers of the army. Since that time the subject had never been absent from his consideration, and he had made numerous calculations with reference to it. With regard to the proposed retirement at sixty years of age, he found that so far from its being generally

advantageous, it would be extremely prejudicial to many officers, and the effect upon promotion would be very small. It often turned out on inquiry that remedies suggested from without would really be no remedies at all. The question of forage was not settled with reference to medical men only, and the regulations could not be altered without altering them far beyond the medical department. His predecessor supposed that by certain concessions that were made an equivalent was in reality given for what was taken away. Last year he was asked to make promotion at the end of fifteen years' full pay service; now he was asked to promote at the end of twelve years; so that if he had assented to the former proposal it appeared that the question would not have been settled. With regard to the unification system, there did not appear to be a general agreement among medical officers. On the whole, the communications which reached him in the shape of letters and pamphlets showed the prevailing opinion to be in favour of the system with certain modifications; and to return to the regimental system would be almost impossible. Such steps in advance had been taken under the new system, that it would be very costly to alter it; it would alter the position of medical men, which, as far as possible, had been regulated with a due regard to any interests they might have. Sir William Muir would confirm him in the statement that, as far as possible, the medical officers had been retained with the regiments. There was no desire to separate them from them; and in every respect his wish was that they should receive as full consideration as gentlemen of intelligence and education were entitled to, wherever they were placed. With regard to the question of relative rank, practically it was often only a question of choice of quarters, as to which it was almost impossible to lay down absolute rules. He had given directions that as far as possible the quarters of a medical officer should be marked peremptorily, so that he might be placed in the position best adapted to his duties; and that where they could not be so marked consideration should always be given to the peculiar character of the services to be rendered. He did not think it was possible to go beyond that. It would not be to the advantage of the service to lay down a hard-and-fast line. He was still giving his best attention to the question. He was sorry to be so long about it, but he had been endeavouring to ascertain what would really settle the question upon fair and reasonable terms, being sincerely anxious to leave no real grievance in the army, because he knew it was essential to get a good class of men to serve in it, and without fair terms they could not expect to obtain them.

Chloral in Tetanus.

In the treatment of traumatic tetanus by chloral, Dr. Gontier reaches the following conclusions. Chloral may render great service in the treatment of chronic or subacute tetanus, and is especially preferable to other drugs. It is completely inefficacious in acute tetanus, and only has a slight palliative action. It may be advantageously associated with tonics, diffusible stimulants, and diaphoretics. Intravenous injections of chloral are extremely dangerous, and should, in the present state of science, be reserved for exceptional cases only.

The Administration of Phosphates.

It is maintained by Samson, Dujardin-Beaumetz, and other leading French physicians, that the only way of administering phosphates is to employ those which Nature has already assimilated, bran bread, and beans of different kind. We never it has been wished to augment the dose of phosphate by adding soluble or insoluble phosphates to the food of animals, these phosphates have only passed through the economy without effecting any lodgment there. However, beneficial results seem to have been obtained from soluble phosphates in certain affections; and these successes M. Dujardin-Beaumetz explains by the precipitation of insoluble phosphates, as M. Mialhe demonstrated a long time since, and M. Cauler at a later period, and by the favourable action of hydrochloric and lactic acids on the digestion.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JUNE 9, 1875.

THE ELECTIONS AT THE IRISH COLLEGE OF SURGEONS.

On Monday last, the first Monday in June, the annual election of Council of the College took place. The attendance of Fellows was somewhat over the average, though not at all as large as that of last year, where the Vice-Presidency was hotly contested. The number of Fellows who voted on this occasion was 132. By the retirement of Mr. Stapleton and the election of Dr. Croly to the Court of Examiners, two vacancies in the ranks of the Council were made, and for a seat amongst its members there were as candidates—Dr. Mapother, Dr. Jacob, Mr. Corley, Dr. B. F. McDowell, Dr. Thornley Stoker, Dr. Wheeler, Dr. Kilgarriff, Dr. Montgomery Ward, and Dr. Fitzmaurice, of Tralee. The election resulted in the admission of Drs. Jacob and Mapother, Mr. Kirkpatrick being replaced by Dr. Wheeler.

MEDICAL EDUCATION IN THE UNITED STATES.

It has long been a very sore subject in the United States that European nations have regarded the education of the medical men of that grand Republic with feelings quite the reverse of complimentary. When human affairs are at their worst, however, it is clear that a change for the better must take place; and we have to notice that an association has lately been formed in the United States, entitled the Medical Editors' Association, and that the President, Dr. William Edgar, has given a very excellent address to his *confrères* on the whole question of degrees in medicine throughout the States. The address is printed in full in the *St. Louis Medical and Surgical Journal*, and is well worthy of the attention of all persons in England as well as in the United States.

According to Dr. Edgar, there is much more competition in the ranks of the profession in the States than in Europe. Hence, he estimates that the medical services rendered gratuitously by the members of the profession in the States doubtless amount to one-half of all the service rendered by

the profession to the public, the most of which, it must be conceded, is for advertisement one way or other. "Doubtless our numerous clinics and dispensaries," he says, "are so loosely conducted as to include thousands who are quite able to pay."

There is another kind of advertising which has reached a point in America which threatens the humiliation of the profession, almost without redemption, that is, the multiplication of medical schools. It is well known to the profession in America that many of these schools are organised solely to advertise the men composing the faculties. A dozen or twenty doctors, more or less, meet and organise themselves into a medical faculty, a charter is procured, and the chairs apportioned out among them, whilst circulars, scattered far and wide, herald the wonderful advantages of the new school. In this way some twenty or thirty doctors are advertised into practice over their neighbours, who are often their superiors. The worst effects of these colleges are that they send forth yearly, if not oftener, hundreds of young men certified by diploma to be competent to assume the responsibilities of medical and surgical practice, when they have not the first qualification for the duties of either.

It is a common saying in the States that "our medical schools are the curse of the profession." It is stated that there are from 90 to 100 medical schools in the United States, while a dozen would suffice for half a century to come. Germany has only 9 in an equal population. A large number of the thousand professors thus lifted into prominence, it must be conceded, rest entirely on the school advertisements for the prestige and practice they enjoy, while thousands in the profession, their superiors, remain in comparative obscurity; hence the growing opposition to the schools everywhere manifested among the profession. One of the medical journals remarks that, what with the regular colleges turning out yearly their hundreds of merely half-educated physicians, the irregular schools graduating anyone who can afford a fee, the independent candidates for professional fees who scorn a diploma, to say nothing of herb-doctors, Indian doctors, old women doctors, &c., it is believed that the lower stratum of medical practitioners in the States actually kill, or ignorantly allow to die, hundreds and thousands of the poorer and even of the richer classes. "Murder stalks in the guise of philanthropy through every by-way of our commonwealth, and enters not rarely even the palaces of the rich." The *Boston Medical Journal* of February 11th says that no one can deny that the States are fairly overrun with quacks *et hoc genus omne*.

Dr. Edgar says that some doctors profess to believe that as the masses improve so will the average doctor, and that the supply will meet the demand; but he asks in reply whether the average intelligence of the masses in the States is not more than equal to that of the masses in Europe? Yet the doctors of the States do not compare with those of European States in general culture or medical acquirements. In every country where the medical man stands high the entrance to the profession is guarded by a State board, not instituted to protect the doctor, but the community against quacks. One of the great evils in medical education in the States seems to be that students are admitted to the medical curriculum who are totally

ignorant of Latin, Greek, or the ordinary points requisite to form an average educated person. Hence, it is said by Dr. Edgar that America is fast becoming the promised land for the quacks and impostors in medicine throughout the world. The men who fail to pass the Government boards for licence either in Europe or South America flock to the United States for an open field. The schools cannot remedy the evil, because they never will act together, so that any of them which would gladly institute an entrance examination would simply drive away the incompetent without excluding them from the ranks of the profession. All this is plainly too true. Dr. Edgar, as a remedy for the great evils of which he complains, sees but one effective way, and that is, that a State board should be instituted, and that a law should be passed making it necessary for all to obtain licence to practise from this board. This would at once deter a large proportion of incompetent persons from selecting the profession of medicine for their life-business. A law to this effect exists in Germany, Austria, France, and nearly all the prominent countries in the world. From the report of examinations in Germany in the year of 1874 about 25 per cent. of the candidates were rejected, the total number graduating that year being 660. In that very same year no less than 3,000 persons graduated in the United States, with a population in both cases of some 42,000,000. He proposes that the State examining board shall examine candidates on anatomy, chemistry, physiology, surgery, materia medica, obstetrics, pathology, etiology, and diagnosis, and omit the customary examination on therapeutics or the *modus operandi* of medicines. All persons who may engage in the practice of medicine and surgery in violation of this act shall not be entitled to claim compensation in the law-courts for their services.

Dr. Edgar urges that schools should simply *teach*, and then the school most careful in preliminary education and most thorough in its method would be patronised by the best class of students. He believes that this method would meet with the universal approbation of all medical men as well as of the public. And then he adds: "That one board in a State is ample is demonstrated by the experience in Great Britain, where, heretofore, they have had in all nineteen boards; but now a law is pending, which all of the colleges concur in, recommending to substitute but one board for them all—having but one gateway to the profession—but one board commissioned to grant licences to practise medicine and surgery. If the British kingdom can do with one board, surely one in every State would serve us."

We may as well inform Dr. Edgar that *all* of the nineteen colleges by no means concur in desiring to have a Government board of examination as in Germany. Here, just as in the United States, our licensing bodies have grown up slowly; and if they are in future destined to be obliged to abandon their cherished privileges, it may be said that they will certainly not do so without a very severe struggle. But certainly nineteen examining bodies are very much to be preferred to one hundred. In this country of England, although of late years many changes have been made, we must remember that our social system has grown to its present condition slowly, and must therefore learn to deliberate, and then act. In the States, hitherto,

the wonderful power of acquiring wealth, which results from the acquisition of unbounded territory by the descendants of the most civilised members of the human race, has enabled society to get along well enough without that accuracy of scientific knowledge which is found absolutely necessary to enable nations like this, already long over-peopled, to cope with the terrible difficulties of human life, wherever the struggle for existence is well-marked, as it is here.

Dr. Edgar says, with much truth, that of course men would still persist in practising homœopathy and other special practices, even if medical men were better sifted; but he maintains that, with a better knowledge of the sciences, which they would feel themselves compelled to acquire, in order to pass the State examination, they would certainly do less harm with a partial or illogical theory than an ignoramus would with a good one, and possibly a less number of them would be found to embrace such "pathies." In the words of the *New York Tribune*, "Why should not the State, in the interest of the public health, require that all persons who practise medicine shall have a suitable medical education? Why hesitate to enforce a standard of qualification in all branches of medical learning about which doctors do not disagree, nor do laymen, as to the importance of requiring every practitioner of medicine to have a sufficient knowledge of anatomy, physiology, chemistry, surgery, obstetrics, materia medica, and pathology?"

We sincerely trust that the address we have referred to may prove the dawn of better days to the medical profession of the United States, and feel assured that the encouragement of a high standard of medical science is the chief way to educate a nation in all that is noble and good.

Notes on Current Topics.

The Arctic Expedition and Alcohol.

It has often been said that, whether at the Equator or at the Pole, it is always found that teetotallers get along better than moderate drinkers. This fact was alluded to in a debate on the value of alcohol as an article of diet, held at New York not long ago, by Dr. Willard Parker, and we believe that the fact is quite indisputable. It appears that among the crews of the Arctic expedition there are several mariners who have made several voyages to the regions of eternal snow without ever having broken the abstainer's pledge to refrain from the use of alcoholic drinks, and to encourage the same practice in others. Dr. Parker has called attention to the question of the spirit ration served out to the soldiers in the late Ashantee war, and has shown that many soldiers did admirably well without any alcoholic stimuli in that dangerous climate. Alcohol is well known from late researches to lower the temperature of the surface of the body, and hence it is of course likely to be quite contra-indicated in Arctic regions. And we hear that former expeditions have proved that it is quite impossible to keep up the normal temperature of the body if alcohol is taken, except in the very greatest moderation. Doubtless one of the results of the

present expedition will be more thoroughly to clear up this important point in diet and regimen.

Mr. Maunder on the Treatment of Fistula in Ano.

MR. MAUNDER read a paper on "A Case of Double Fistula" in the Clinical Society on May 28th. The patient, a woman, æt. 24, had a fistula on the right side of the anus, near buttocks, and twelve months afterwards a similar one on the left side. The two sinuses were very much alike. The right was laid open by the knife, and dressed with oiled lint; the left was treated with elastic ligature. There was much pain on the ligatured side, and hardly any on the other, as the wound healed rapidly. The ligature took nine days to come through. The wound left by the ligature had callous and prominent edges, and did not cicatrise for eight weeks after that produced by the knife, although in the latter case the lint had remained in forty-eight hours longer than usual. This case was strongly in favour of the knife in every way. Mr. Heath thought that in cases of fistulæ very far up it might be prudent to use the ligature in case of hæmorrhage. He would never use the ligature for the removal of tumours. Mr. Hutchinson confirmed the view that the healing after the ligature was very slow. Mr. Hulke also spoke of the painfulness of the ligature, and Mr. Thomas Smith said it was so painful that he would never again make use of it.

An Ardent Sanitary Officer.

At the last meeting of the Tullamore Guardians a report was read from the Sanitary Sub-officer of the Kilbeggan district, which gave rise to considerable merriment among the assembled guardians.

The Sub-officer in question reported Dr. Barry, sanitary officer of the district, for allowing a nuisance, highly dangerous to public health, to exist on his premises at Kilbeggan. The doctor was directed by the sub-sanitary and executive officers to abate the nuisance immediately, but instead of doing so he addressed a letter to the Guardians to show that the adjoining occupier, being the person in whose premises the defective sewer—which was the nuisance complained of—originated, should be called on to abate it.

The Guardians gave directions to the executive officer to order the immediate removal of the nuisance by perfecting the sewerage.

Scarlet Fever in Clerkenwell—Censure on the Medical Officer.

DR. HARDWICKE has been most unfortunate in his relations with the members of his profession at the inquests over which he has presided as coroner since his election to that office. Recently he deemed it necessary and consistent with his duty to severely reprimand the medical officer for inattention in two cases of sudden death. On Saturday last this unpleasant task was undertaken by the jury at an inquest held by Dr. Hardwicke respecting the death of Alice Dorrington, aged two years and eight months, of St. Helen's Place, Clerkenwell. The jury returned a verdict to the effect that the deceased died from

scarlet fever, having taken the disease from another child suffering from the disease being in the same room, and that had the child first attacked been removed the death of the child might not have taken place, and agreed to a resolution expressing their opinion that the sanitary officers of the parish, who had been examined, did not appear to have taken such measures as were desirable for checking the spread of scarlet fever, shown to be prevalent in the district, and that the chief medical officer (Dr. Griffiths) had not acted in a satisfactory manner.

Cattle Disease in Spain.

It is directed by an order in the *Dublin Gazette* that in consequence of infectious or contagious disease called sheep-pox having broken out in Spain, it shall not be lawful to import any sheep or lamb from any port or place in Spain into any port or place of Ireland.

Poly-pharmacy.

PROFESSOR DE MUSSY says, in his *Clinique Medicale* :—

"Because, in bygone times, the most heterogeneous mixtures were used, or rather abused, in medicine, some physicians cover with ridicule, and seek to crush under the nickname of poly-pharmacy, the combinations in a prescription of medicines not chemically incompatible, and tending to one end. This exclusiveness, now very prevalent in Paris, does not commend itself to my mind as logical. If you are experimenting on the action of a given remedy, isolate it by all means, as perfectly as possible; but if your object be to benefit your patient by using drugs whose action you believe you know, what possible objection can there be to combining them, if not chemically incompatible, and if the stomach will tolerate the compound? In a battle all sorts of weapons are used simultaneously, and their action is concentrated on the point judged most important. This pharmaceutical purism seems to me exaggerated; but I must not be understood as recommending mixtures when a single drug is sufficient, or as wishing to recur to the age of elixirs and electuaries. *In medio stat virtus.*"

Small-pox Inoculation in Ireland.

At Tobercurry, in the co. Sligo, a man named Charles Stenson was charged with the homicide of several children, by inoculation with variolous matter.

The informations of several persons were read, after which the parties were examined orally in support of the charges, which were brought to light under great difficulties. The Crown Solicitor called upon the Bench to send the accused for trial to the Assizes, which was done, bail being refused. There were other cases against the accused, in which deaths had not occurred, and the magistrates decided upon not adjudicating upon them until after the trial on the charge for which he was committed, and adjourned them for two months.

Memorial to the Inventor of Ovariectomy.

THE American Medical Association, at its recent annual meeting at Philadelphia, has resolved, on the motion of Dr. Marion Sims, to raise a great memorial to "The Father of Ovariectomy," Dr. Ephraim McDowell, of Kentucky. The following resolutions were adopted with acclamation :—

Whereas, it is universally acknowledged that the late Ephraim McDowell, of Kentucky, was the originator of the operation of ovariotomy; and,

Whereas, we believe that proper measures should be instituted to commemorate this great achievement and do appropriate honour to its author; therefore,

Resolved, That this Association recommend to each of its members and to the profession generally, to contribute annually such sums as they may think proper, until the amount of 10,000 dols. shall be accumulated, which shall be known as the McDowell Memorial Fund, the interest of which shall be devoted to the payment of prizes for the best essays relating to the diseases and surgery of the ovaries.

Upon the adoption of the report, Dr. Gross addressed a few remarks to the Convention pertinent to the matter. He said that in 1852, in conjunction with a number of physicians of Kentucky, he had investigated the claims of Dr. McDowell to the origination of the operation that has been of such incalculable good to mankind, and it was then established beyond all question that to him belonged all the honour of having first introduced the operation. He concluded his remarks by subscribing 100 dols. to the fund.

The Treatment of Saccharine Diabetes.

It is always useful to make known all therapeutic attempts of a serious nature undertaken with a view, if not of curing, at least of ameliorating the condition of a disease about which, until this date, we know of no positive treatment. If the different agents made use of to combat saccharine diabetes have all, in certain cases, given good results, this is because there is no unity in the disease. The pathological study of saccharine diabetes leaves yet much to be desired. It is clear that the separation of the different forms of the disease will be more complete when a regular therapeutic course shall have been pointed out. In this respect the works we are rapidly about to mention are a true progress.

Dr. E. Hartnack thinks he has shown that the quantity of sugar contained in the urine of a diabetic patient is directly proportional to the hydrocarbons taken into the body. If this first point were established it would tend to confirm the theory which says that diabetes depends on an arrest in the transformation of said hydrocarbons. If this first proposition be admitted nothing appears more rational to him than the treatment he employs; after the example of Schultze, he administers glycerine, but that author thought that glycerine transformed itself rapidly into sugar in the organism, and prevented thus a quantity of starchy matters from being eliminated in the condition of sugar.

Hartnack does not admit this interpretation. The following is his treatment: he gives 100 grammes of glycerine in the form of lemonade, and in these conditions he has never seen accidents take place. It is easy, according to him, to understand the action of this medicament: we must guard against two vices of nutrition which constitute the greatest danger of the disease—first, the loss of the materials of oxidation; secondly, the loss of water. Glycerine, which is oxidised in the economy, fulfils the first indication; the second requires, above all, abstinence from starchy foods. Hartnack does not hesitate to suppress the hydrocarbons, and the less so because for diabetics they are no longer a food. Glycerine, he says,

plays on the diabetic the part of starch foods on the healthy: among other advantages, it possesses that of diminishing the desire for starchy foods, which is so great in diabetic patients.

These two parts of the treatment are absolutely indispensable. Let us, indeed, suppose that we administer animal diet to a patient without glycerine: the quantity of sugar excreted diminishes notably, it is true, as well as that of the urine, but we do not supply the loss produced by combustion; the weakness persists, and the patient succumbs to progressive consumption. It is only after the administration of glycerine that his general health improves and his flesh returns. If we give, on the other hand, glycerine, without suppressing the starchy food, the quantity of urine remains the same, and consequently exhaustion continues to progress.

Kussmaul, in common with Hartnack, has treated diabetics by glycerine, but has not obtained the same favourable results; however, he had taken care to associate glycerine with nitrogenised diet. He thinks that meat alone has better effects than when it is allied with glycerine.

He has besides employed injections of diastase into the cellular tissue and into the veins. This treatment has given the following results: first, from 10 to 20 centigrammes of diastase dissolved in water injected on several occasions into the cellular tissue of a diabetic patient had no effect on the quantity of sugar passed by the patient; secondly, 10 centigrammes of diastase injected into the large veins diminished the quantity of sugar passed.

Balfour treated diabetics by different methods. In fat patients he associated the nitrogenised diet with koumiss and a large dose of lactic acid. He relates seven severe cases treated by this method, and in which he obtained true successes, in some cases considerable amelioration, in others, at any rate, temporary cure. In diabetics with phthisis this treatment is of no value, and in these latter cases he would not be disinclined to try phenic acid.

The Demise of the "Irish Hospital Gazette."

OUR contemporary the *Irish Hospital Gazette* has ceased to appear. The fact, even if personally uninteresting, would require notice in our columns, and we record it without exultation as a proof, once again repeated, that a periodical published at frequent intervals, and being purely Irish, and wholly scientific, must, if maintained at all, be maintained at a monetary loss for collateral objects. The *Irish Hospital Gazette* was the third effort to supply some fancied want which a politico-scientific journal like the *MEDICAL PRESS AND CIRCULAR* is—upon unknown data—supposed to be incapable of satisfying. It was started with exceptionally encouraging commercial advantages at its back, for its finances were in the hands of the first money-making newspaper staff in Ireland, and its typography was assumed to have been provided for upon the easiest terms. Its literary department was in the hands of a gentleman who, while entirely competent, most energetic, and decidedly popular, was—if we may be permitted to conjecture—placed in circumstances such as to render him superior to any passing financial necessities.

So far as the advantages to which we have referred could go—and we can state that they are far from insignificant—the *Irish Hospital Gazette* ought to have com-

manded success. It has not done so. To those who think that journalism is child's play we say that the hint given them this week ought to be sufficient.

We part from the *Irish Hospital Gazette* almost with sorrow. Its editor has not played at journalism without advantage, for he has shown himself a gentleman—industrious, conciliatory, and intelligent, and it is really a subject for regret that his identity should be merged in that of our esteemed mensal contemporary the *Dublin Journal of Medical Science*; but the lesson will not be amiss if it satisfies those who are ambitious of newspaper honours that journalism is “not so easy as it looks.”

The Rotundo Lying-in Hospital.

A DECISION has been arrived at by the Irish Law Courts which seriously affects the finances of one of the best medical institutions in the three kingdoms. The Rotundo Lying-in Hospital, in Dublin, was, as all know, built and founded by Bartholomew Moss. His endowment was insignificant, but for a long time the charity lived—and lived well—by the letting of its public concert rooms, and by a certain tax upon the householders of Rutland Square, in which it is situated, which was presumed to be legal, and was never disputed. Within a few years past the finances of the institution have fallen into unmerited decay, inasmuch as other buildings have sprung up which provide superior accommodation for public performances, and the Governors of the Rotundo have had no funds to make the disposable part of the institution attractive. To make matters worse, the legality of the tax imposed upon the inhabitants of the square has been challenged by a local limb of the law, and the Governors have been beaten. It seems that in the “good old times” the square was lighted with oil-lamps, of which an occasional specimen—smoking and dismal—depended from a string across the street. For this illumination the then Governors charged each house, or each lamp—we forget which—3s. a year. But oil went out, and gas came in, and, nevertheless, the Governors continued to levy the lamp-tax as before, to which the inhabitants now emphatically object. The limb of the law aforesaid has recently joined issue, and the result is the disendowment of the hospital.

We very much regret that so fine and ancient an institution should be thus hampered in its usefulness, but we have every confidence that a little energetic mendicancy will supply the void. No institution in Dublin ought to beg with as much success, or command as much sympathy, and we have, therefore, no fear for the ultimate prosperity of the Rotundo Hospital.

Dr. Lyon Playfair on Vivisection.

At the distribution of prizes to the successful students at King's College, on Thursday last, Dr. Playfair took occasion to refer to this subject, with which his name has been so frequently associated. He said that he had communicated with Messrs. Darwin, Huxley, Burdon-Sanderson, and others with the view of framing a code of morals which might be accepted by physiologists as an example of the manner in which such experiments should be conducted, for he fully recognised the fact that the law would be powerless to restrain such operations if it were so se-

vere or unreasonable as to drive the operators to perform them in private. If the law for the restraint of cruelty was to be operative it must be so fair and reasonable as to enlist the sympathies and co-operation of humane men of science. A reasonable law would find ready acceptance. He did not agree with those who would prohibit vivisection even for the purposes of scientific investigation. Above all sciences medicine required a close questioning of nature, and it would be most disastrous if physiologists were restricted in the science of anatomy. He expressed his satisfaction that such a man as Lord Cardwell had been appointed President of the Royal Commission to inquire into vivisection.

The Irish County Infirmaries.

A POLICY initiated some years ago under the régime of Sir Robert Peel, to do away with the Irish County Infirmaries, continues, we regret to observe, to bear its fruit at the present time. In several counties the Grand Juries have withdrawn the grants in aid of these institutions, or have threatened to do so, and though in other places the efficiency of administration of the infirmaries has protected them from such a proposition, yet the feeling seems to be gradually spreading that the workhouse hospital serves all the purposes for which the infirmary was intended, and that a separate institution is not needed. This opinion arises from ignorance of the feelings of the poor and of the wants of the country, and we have frequently contested it in our columns. We observe that a proposal of the Mayo Grand Jury to close the Castlebar Infirmary has excited just indignation amongst the people, and on the motion of the Chairman of the Swinford Sessions a resolution has been adopted which must have the approval of anyone who knows the facts of the case. He said that that was the time for the cesspayers and sessions to express an opinion respecting the proposition of the Grand Jury of last Assizes to do away with the Co. Infirmary. His own opinion was that the poorhouses were not adapted to the wants of the classes who sought medical aid or ease in the County Infirmary. He thought in their present condition it would be a great hardship to send respectable peasant families, small farmers, artisans, and others, to the workhouses to be degraded to associations which the very word pauper conveys in all its repugnance to the feelings of decent and self-reliant people. The present state of the law forbade such persons from seeking admission to the workhouse—for great as the hardship might appear when one attempted to associate these places with charity, all who claimed Poor-law relief would have their names recorded on the list of paupers, and would be for ever after disfranchised as an elector for the county. These were all very weighty considerations. The whole grant out of the public cess came to little if any over a halfpenny in the pound. These hospitals did a great deal of good in the country, for they were administered under a humane law that offered no degradation to feelings or citizenship of persons who sought medical cures in the hospitals. The Co. Infirmary is the oldest institution in the county—it is much approved of by the people. The workhouses were neither suited nor acceptable, nor were they a fair or equitable substitute or compensation for the county infirmaries, the abolition of which was manifestly

premature. This opinion was but the generally expressed opinion of all those having knowledge of the cesspayers on the subject, and being assembled there to-day in large numbers, it was fair they should express their feelings.

Resolved,—“That, seeing at the last meeting of the Grand Jury of this county it was proposed that the County Infirmary be reduced at each Assizes, and thereby close the institution, it being alleged that the workhouse infirmaries were sufficient for all purposes, and that the baronies distant from the Co. Infirmary did not benefit by it in proportion with the barony in which it is situate, we desire to express our opinion that to deprive the county of an institution of which persons of all classes can avail themselves, thereby compelling respectable persons to resort to the workhouses, is most objectionable. That the workhouse infirmaries are not constituted in a way to allow separation for patients from the ordinary inmates. That to compel the class of patients who go for treatment to the Co. Infirmary to associate with the inmates of a workhouse is repugnant to the feelings of the people. That we consider the saving in the cess of a farthing in the pound, the amount of the present grant of the Co. Infirmary, would not compensate the ratepayers for the expenses that should be thrown on the rates in providing adequate accommodation and treatment for the infirmary cases, a class of persons which the workhouse was never intended for.”

The resolution was carried amidst acclamation and cries of “No poorhouse, no poorhouse.”

The Puerperal Fever Debate.

THE discussion on Puerperal Fever was renewed on Wednesday last at the Obstetrical Society. There was a large attendance of members. Dr. Arthur Farre was the opener of the debate, and he gave an outline of the views of Kirtland on the subject, written a hundred years ago. That author considered childbed fever to be merely a name which included all the varieties of fever met with in childbed. In the nomenclature of the disease proposed by the Royal College of Physicians of England, it was placed near pyæmia, and far removed from specific fevers. He knew of no form of contagious puerperal fever distinctly caused by a morbid poison. He would rather speak of puerperal fevers, and thought them divisible into—(1) simple irritation without blood infection; (2) a fever not specific in its origin, and with an incubative period, and which runs an indefinite course; (3) where specific blood infection exists. The two first varieties are strictly puerperal, but all three might be included under the term post-partum. Dr. Savage thought that the septicæmic process was at the root of all cases of puerperal fever. Dr. Wynn Williams also thought that all cases of puerperal fever were from septic influences, depending on decomposition of clots, or injuries to soft parts. Hence he recommended the use of iodine both as an intra-uterine remedy and as a means of disinfecting the medical attendant. He thought that bacteria were only the result of putrefaction. Dr. Playfair also denied the specificity of puerperal fever, and said it arose from the contact with septic material. Dr. Tilt thought the influence of zymotic diseases in the causation of puerperal fever had been over-rated, and too little attention had been given to the production of this disease through autogenetic influences.

Drainage of Brighton.

It seems that several of the houses of the western

suburb of Brighton are still unconnected with the main drains. Cesspools seem to be still common in Hove. Now, notwithstanding the occasional causation of typhoid fever from water or from milk, it cannot, we think, be doubted that one of the commonest causes of that disease is the occurrence of fœtid exhalations from badly constructed drains. That is the true reason, we opine, why typhoid fever is so prevalent in Paris as compared with London. The fœtid smells in Paris, Rome, and most Continental cities will be remembered with loathing by all travellers, and the chief mark of English civilisation is, we think, to be seen in the rapid strides our cities are making in obtaining pure air in the houses of the poorest citizens.

The River Cam.

THE river Cam, at Cambridge, has always been noted as rather an unwholesome stream. Latterly it has been especially fœtid in its exhalations, and it is high time that the municipality should bestir itself to remedy the nuisance so bitterly complained of by some dwellers in Cambridge.

The College of Surgeons of England.

WE hear that Mr. Prescott Hewett will offer himself for re-election at the next ballot at the College for Members of Council, so will Mr. Birkett and Mr. Spencer Smith, and Mr. Cooper Forster will come forward as an aspirant to a seat on the Council. Mr. Smee and Mr. Hussey, of Oxford, will also come forward as candidates.

Captain Boyton's Feat.

GREAT enthusiasm has been excited in all quarters by the successful termination of Captain Boyton's essay at crossing the Straits of Dover. We doubt not that during the present summer or autumn some brave English or French swimmers will try to follow the splendid lead set by the daring American. Captain Boyton does not seem to have suffered in health in the least by his long stay in the sea, although he was 23½ hours in making the passage. Probably this *hardness* of constitution arose from the fact that he had been training for the feat, and had been living chiefly on eggs and beefsteak. We should like to have heard whether he took alcoholic drink during the passage or not, but suppose that this was not the case, as he is reported to have drank some strong green tea to refresh him, and keep off a feeling of somnolency, which seems to have tormented him not a little.

Brompton Consumption Hospital.

LORD DERBY presided lately at the annual meeting of the Hospital for Consumption and Diseases of the Chest. It was reported that 15,500 out-patients had been under the care of the medical staff. The total receipts were some £17,000, and expenditure £16,000. There are at present 257 beds available for patients. Dr. Cotton and Dr. Quain have been made consultants. Not long ago a lady left the hospital £100,000.

THE amended Public Health Bill passed the Committee of the House of Commons on Thursday last with loud cheering.

Plague in Asia.

A VILLAGE on the frontier of Turkey and Persia is said lately to have had 100 deaths from "plague" in a population of 1,500. Was this Asiatic plague or typhus?

Examination for the F.R.C.S.

THE examination for the diploma of Fellow of the Royal College of Surgeons of England seems now to be a reasonably good and searching test of a man's abilities. In the last half-yearly examination, which terminated on Saturday week last, only 13 out of 24 candidates passed that examination. Of these 7 candidates were rejected for the first time, 3 for the second time, and 1 for the fifth time. The election of Members of Council of the College takes place on Thursday, 1st July.

Vaccination in St. Pancras.

THE Vaccination Acts are at present, it appears, well carried out in the parish of St. Pancras, London. It is stated that in one quarter's returns there were but two defaulters to be mentioned. In the four months which ended September, 1874, there were 2,637 children born in the parish, and of these 1,474 were left unvaccinated within the legal period. Official notice was sent to the parents, and 947 more were vaccinated, after which it was found that of the remaining 527, 192 cases had removed from the district, 227 were dead, and only 64 cases were contumacious. The parents of the latter obstinate babies had received fourteen days' notice to comply immediately with the Act, under penalties in case of refusal.

The Sewage of the Thames.

As a result of the increasing attention to cleanliness and good drainage which characterises the present epoch, we have to mention the fact that the towns of Staines, Wallingford, Henley, Marlow, Egham, and Lechlade no longer allow their sewage to flow into the river Thames, but have constructed intercepting cesspools. The Maidenhead sewage is put on the land. Oxford, Reading, and Windsor are imitating these good deeds, and Chertsey and Slough likewise.

The Limerick Workhouse again.

ANOTHER and a serious item is added to the notoriety which the Union Workhouse of the Limerick Union has attained. In this instance the facts, as well as we can glean them, are as follows: Matthew Brennan, aged 16 years, the son of a respectable farmer, was brought into the fever hospital about 7.30 p.m. on Saturday evening in high fever. He was seen that evening by the resident medical officer. The Master gave directions to the day nurse that she should remain up beyond her usual time for leaving, in the fever ward, and assist the paid nurse. The day nurse is said to have remained in and about the ward till 3 o'clock a.m., when she retired to rest. The pay nurse asserts that she saw the patient frequently during the night. About 5.30 a.m. the patient was missed from his bed, and was found at 6.30 a.m., an hour after he was missed from his bed, lying on the ground beneath a window of the ward in which he was seen at 5.30 a.m.; a rug and blanket were about him, and he was raving. The

window is 28 feet from the ground. An iron cross-bar appears to have been removed from the window, and placed on the window sill, as if done with coolness and deliberation; but there is no saying when or how the iron bar was removed. As to whether or not there were such marks on the body as would be produced by a fall of 28 feet, the rumours are contradictory. It would seem to us to be altogether impossible for a patient or a person in his perfect health and senses to come down from a height of 28 feet without broken bones or serious abrasions and bruises; and how he could have got on the ground otherwise is a mystery which can only be solved in one way, that the doors were open, but by what means, or how they were open, if they really were, remains to be seen. The patient lived for twenty-four hours after he was removed to the hospital.

State Medicine at Cambridge.

THE University of Cambridge has completed the regulations for the examination in State Medicine, which is to take place in October next. A Syndicate has been appointed to make the arrangements. Regulations have been issued and suggestions have been drawn up as some guide to candidates preparing for the examination. The Regius Professor of Physic (Dr. Paget), Dr. A. W. Barclay, of St. George's Hospital, London, Dr. Parkes, and the newly-elected Jacksonian Professor (Mr. J. Dewar), have been appointed examiners. A better board of examiners, one more calculated to inspire confidence in the examination, could scarcely have been selected. The examination will be open to all registered practitioners, whether they be members of the University or not.

Cholera in India.

In a private letter from India, dated May 14th, our correspondent does not draw a very enticing picture of present probabilities. He says: "Cholera is breaking out in all directions, so one must make up one's mind to face it; it is our daily bread and business, and doctors die like other people. If health permits, I have much interesting material to furnish for your columns; but this cursed climate plays the very devil with one; some grow lean, some grow fat, all grow lazy; all have livers like portmanteaus; and not a few get so cranky and irritable as to be intolerable to those about them. There are many things I want from England, but must wait till this cholera business is over; there is more yet undeveloped. In India the ranks close very rapidly: you die to-day, are buried to-morrow morning, and forgotten by dinner-time. The next day your things are sold—often at an alarming sacrifice."

Metropolitan Hospital Sunday.

THE Council of the Metropolitan Hospital Sunday Fund met on Thursday last to elect the Distribution Committee for the Fund about to be collected on Sunday next. The members selected were—Lord Ashley, Sir Sidney Waterlow, M.P., Thomson Hankey, Esq., M.P., Samuel Morley, Esq., M.P., Alderman McArthur, M.P., W. G. Callender, Esq., F.R.S., Thomas Turner, Esq., Treasurer of Guy's Hospital, Jervoise Smith, Esq., and

Dr. Sedgwick Saunders. The Lord Mayor, the Sheriffs and Members of the Courts of Aldermen and Common Council will attend Divine service at St. Paul's Cathedral in the morning, and Westminster Abbey in the afternoon, as in former years. The sermons at St. Paul's will be preached by the Rev. Canon Miller and Bishop Claughton; at Westminster Abbey, by the Rev. Canon Puckle, Vicar of Dover, and the Archbishop of York; at the Chapel Royal, Whitehall, by the Bishop of Ely; at the Savoy, by the Bishop of Bangor. The Lord Mayor, in a letter to a morning contemporary, put the Hospital Sunday Fund in an excellent way before the public, and hoped, as all differences of opinion had been fairly adjusted, this collection might prove more beneficial for the hospitals of the metropolis than that of previous years.

Cremation in Switzerland.

THE *Continental Herald* says the Executive Council of Zurich had refused to give their consent to the statutes of the Cremation Society, under the plea that so sweeping a change in the method of disposing of the dead should, in the first instance, be approved of or admitted by a special law.

Filtration of Air.

IN House of Commons Lord H. Lennox, in answer to Mr. Cawley, said the experiments made by Dr. Percy in the filtration of the air introduced into the House through cotton wool had been attended with great success. Of course there was no objection to applying this system of filtration to the House if it was thought necessary; but at present the air entering the House was filtered through the finest cambric, with almost the same effect as passing it through cotton wool. The cost of adopting the system for the two Houses would be a first outlay of about £200, and an annual outlay of between £50 and £100 for labour and material.

The Transmission of Syphilis.

MR. BERKELEY HILL analyses in the pages of the *Medical Record* a case quoted from Dr. Lewin, in which a woman with a child at the breast suckled a syphilitic infant, and then infected her husband and child. The husband died of syphilitic brain disease. The woman then married again, and the second husband escaped syphilis, although the wife had frequent syphilitic affections of the pharynx and larynx. The woman had two children by the second marriage. The child of the first marriage was treated by mercury, and its symptoms disappeared; but when examined it was found to have adhesions of the soft palate and a notch on the epiglottis, and also had suffered from her sixteenth year from lupus of the thigh and periostitis of the os frontis and tibia, which relapsed. At seventeen this child married a man not previously syphilitic, who died a year and a half subsequently from tubercular meningitis. A premature child was born, which lived fourteen days. Two years after this she married, and has now a child seventeen months old, with scrofulous lichen and gummy ulcer of the thigh. As to the mother, one of her children by her second marriage died at five and a half months; the other, a girl aged thirteen, was healthy until

her sixth year, and then syphilitic eruptions appeared which lasted for five years. "This family," says Mr. B. Hill, "is an example of the long duration of the syphilitic poison, and how deeply it penetrates the organism. Further, one of these cases shows that a child may inherit syphilis which will not become apparent for several years after its birth. Probably many cases of ulcerating skin disease, especially lupus, are really manifestations of syphilis. Lastly, that hereditary syphilis can be derived solely from the mother is also clearly shown by these histories."

IN Guernsey it appears that etherised vapour is used to tame vicious horses during the operation of shoeing, and with favourable results.

OF the Fellows elected at the annual meeting of the Royal Society of Great Britain last week, one only was from the ranks of the profession, viz., Dr. Risdon Bennett, the representative of the Royal College of Physicians of London at the Medical Council.

THE *Gazette de Pharmacologie* is good enough to inform us that M. Haydach has analysed orthoamidotoluene-sulphonic acid and diacorthoamido-paratoluene-sulphonic acid; and also affirms that the action of pewter and hydrochloric acid on nitrobromacetanilide produces hydrochloride of ethenylbromophenylenediamine.—*London Medical Record.*

IN the mountainous parts of North Italy the chestnut forests have been attacked with disease; the roots are first destroyed, and then the trees decay and topple. As chestnuts are a staple food of the inhabitants the Government has hastened to appoint a committee of scientists to examine into the disease, and apply remedies if possible.

A GRAND fancy bazaar, under the patronage of three Princesses and other notables, will be held in the Duke of Wellington's Riding School on Wednesday, Thursday, and Friday, next week, in aid of the National Hospital for Consumption, Ventnor, Isle of Wight.

PROF. GROSS, of Philadelphia, on the eve of his departure from Louisville, after attending the meeting of the American Medical Association, was the recipient of a handsome team of Kentucky horses, the gift of his medical friends and citizens of Louisville. Dr. Gross for many years was Professor of Surgery in the Louisville University, and during that time made hosts of friends among his medical brethren and the citizens. The team is valued at \$800.

ON Monday week last Dr. Cuppage, of Silverwood, about half a mile from Lurgan, was found dead in his bed. The deceased gentleman had gone to his bed the night before in his usual health and strength, and on the following morning the inmates of his mother's house, suspecting that he had slept too long, went to awaken him, but, as they thought, finding him in a sound sleep, they did not like to disturb him. During the forenoon they repeated the visit twice or three times, and at last, having become

suspicious, they went to rouse him, when it was found life was extinct.

THE *Shanghai Gazette*, alluding to the death of the late Emperor of China, conveys the information that shortly before the Emperor's death a gigantic image, the Goddess of Small-pox, was paraded round the city of Peking in solemn procession, and then taken into the very bedroom of the dying youth, where it was worshipped and honoured with many propitiatory offerings. As, however, the goddess continued obdurate, she was subjected to a severe thrashing and other insults, and finally burnt. The fatal result of the attack was, we suppose, her revenge for the mal-treatment.

"We are happy to hear that Dr. Prosser James has so much recovered from a severe attack of rheumatic arthritis as to have been able to commence a summer course of *Materia Medica* and Therapeutics at the London Hospital. The introductory lecture was very interesting, as, instead of plunging *in medias res* on the business of the drugs and their applications, he drew a bold sketch as Cox would have done of the picture which has to be filled up; but when we allude to Cox we do not mean to infer that the Professor's bold outline was at all watery, on the contrary, it was distinct and graphic, sometimes drawing attention to circumstances which the student will recollect in the future courses. Amongst the visitors to welcome the lecturer was the veteran London Hospital Professor Dr. Billing, now considerably over four-score years, looking hale and hearty, and withal delighted to see his patient back again in his accustomed chair, which we hope he may live long to fill."—*Students' Journal*.

THE Adulteration of Food and Drugs Bill passed the second reading in the House of Lords yesterday.

THE annual meeting of the Irish Medical Association took place on Monday last, and of the proceedings we give, in another part of our issue, as much as the lateness of the hour of meeting permits. The occasion derived especial interest from the fact that it was the first meeting of the Association since its reorganisation, and those who are interested in its welfare have every reason to be satisfied with its success. It was largely attended by the leading provincial and metropolitan surgeons of Ireland, and the speeches which were made evidenced an earnest interest on the part of the profession in the advancement of the objects to which the Association is devoted. The administration of the organisation has fallen into energetic hands, and it will, without doubt, be found to deserve the best support and influence of the medical men of Ireland, and especially of the Poor-law medical officers. The opportunity is now presented to join in one earnest movement for their own and the public advantage, and if the present effort at building up the Association as an influential organisation should fall to the ground the provincial medical men of Ireland will deserve to occupy the unsatisfactory position in which they have so long stood, and to labour still under their unredressed grievances.

Literature.

ON THE PSORIASIS OR LEPROA. (a)

THE preface of this book informs us "Erasmus Wilson has given us a work on eczema, as it seems to me well inspired, and not without advantage to science, and the same I would attempt with psoriasis—a disease which has something of the picturesque." We cannot fully appreciate the "picturesque" element in psoriasis, but well remember an old pupil who, when under examination at the College of Surgeons, was so delighted at his own descriptive powers that on rejoining his companions he said, "Boys, didn't I give them a beautiful *landscape* of delirium tremens." So, perhaps after all, there may be picturesque elements even in disease. It is unfortunate for the execution of Mr. Gaskoin's designs that the two eruptions, eczema and psoriasis, differ widely, that the writers on them are also different, and we fear as a result the two works produced will be found hardly of equal value, regarded either in a scientific or a practical point of view.

There are scattered through Mr. Gaskoin's pages several fragments of old lore and quaint research in the half-forgotten histories of the past. We are reminded how Themison, of Alexandria, first distinguished gout from rheumatism (p. 57); Nicholas Massa is appealed to in relation to the tendency of psoriasis palmaris to recur after months or years of apparent cure (p. 89); and there are some interesting observations made in the appendix relating to the administration of arsenic internally, in which the claims of Dr. George Pearson to be considered the introducer of the liquid commonly known as "Pearson's solution" are discussed; whilst Girdlestone's paper, published in the year 1806, receives due attention, and his successful case of lepra cured by arsenic is referred to.

Mr. Gaskoin's estimate of the value of arsenic in psoriasis is shown by his statement in page 139: "In short, to deal ably with psoriasis it is necessary in the first place to know all about arsenic, and indeed, to make a particular study of this drug." His views as to the best mode of exhibiting it and its dose are summarised at p. 151: "Arsenic should be given in full doses at first, and afterwards in decreasing doses. This is a rule which is well stated by Hunt should be rarely departed from."

The following extract will be novel to many. We believe there are few who have tried carbolic acid for psoriasis, or are likely to give it a trial unless more detailed information is forthcoming as to its positive advantages. Half-a-dozen selected cases cured by its administration, and succinctly told, would deserve letters of gold, and obtain more favour than a volume of assertions:—

"The use of carbolic acid has been pretty successful in my hands, though I deem it far inferior to arsenic in efficacy. The dose is generally about five grains. I have prescribed it in the form of glycerinum acidi carbolicum of the British Pharmacopœia, and have given pretty large doses of it. Of this I find two scruples, or half a drachm, to be a full dose, but sometimes I have even used a drachm, and continued its use with benefit for several weeks; but this dose I consider too high. It is apt to produce a sense of fulness and pain in the head and stomach, with a general discomfort."

In writing of the action of cantharides we have a fair sample of the present work, and extract the entire paragraph:—

"*Cantharides, or Lytta*.—I have frequently tested the efficacy of this remedy by giving it internally, unassisted by any local application. It is recommended in sluggish leucophlegmatic temperaments, and in these I have found it of no doubtful efficacy; but its action does not seem to be entirely confined to these. I believe it to have a great power over psoriasis, especially in conditions of debility;

(a) "On the Psoriasis or Leprosy." By George Gaskoin, Surgeon to the British Hospital for Diseases of the Skin. London: J. and A. Churchill. 1875.

but I have refrained perhaps with too much scruple from the use of it, through an impression made on me a long time since by the case of a gentleman who was a victim of its employment. Nevertheless, I have given it sometimes in pretty full doses without ever having met with such a result. The dose of cantharides scrupulously given is from eight to ten minims two or three times a day; or a drop may be given for every two years of a boy's age till ten or twelve drops is attained, and fifteen drops I have seldom overpassed. For the cure of dropsy I have been accustomed to see much larger doses prescribed. This medicine, recommended by Dr. Mead, was also much employed by Bielt, and after him by Devergie. It is perhaps not so generally known in the profession that it has been highly praised in veterinary medicine for the cure of glanders and farcy. It is certainly a strong stimulant and stomachic, and wonderfully improves the appetite for food. By some the medicinal power of cantharides is wholly attributed to the stimulus it bestows on the stomach. Its use in medicine owes much to a surgeon of the name of Robertson, who published some excellent practical works on the subject in the beginning of the century. It was by him chiefly recommended for the cure of leucorrhœa and affections of the mucous membrane of the urethra, and, moreover, for ulcers of the skin, wherein I have also prescribed it, I believe, with advantage. It would appear that all forms of complaint for which lytta has been successfully prescribed are more or less conditions of debility."

We have abstracted the above quotation in its entirety, though unable to see what connection there exists between psoriasis and glanders or farcy, or why these diseases are dragged in at all; at all events, if cantharides are of as little use in psoriasis as they are in either glanders or farcy, we fancy the profession will not regret their ignorance of the praises foolishly bestowed on them by veterinary practitioners.

We have found this work unusually hard to read; its author's modes of expression are often novel, and his sentences not very lucid in their construction. We have learned a good deal about the history and literature of the disease—little of real practical importance. Nor for this can we blame the writer; so far as others have gone he has gone, and no farther; the object of his ambition is laudable; and he who succeeds in obtaining a decided and tangible advance in the curing of psoriasis will hereafter rank in physic high amongst its illustrious benefactors. Beyond the administration of arsenic internally, the facts of which are to be found in every elementary work either on cutaneous diseases, or of pharmacy and therapeutics, and which, alas! too often fails to cure even in most careful hands, and our knowledge of tarry applications, of which Hebra is our best and most reliable exponent, we fear that psoriasis must still remain to some extent an opprobrium of our art, and we will gladly hail any increased information which may enable us to do what Dr. Gaskoin's work certainly does not accomplish—cure it more rapidly, better, or more certainly than before.

EXPERIMENTAL CHEMISTRY. (a)

THIS little book consists of a short series of lectures on chemistry introductory to the general course. They are not, therefore, by any means exhaustive in the treatment of the special points of the course, inasmuch as they are intended, not as a course of lectures on chemistry complete in themselves, but as preparing the way for the reception by the student of the facts and principles taught in a more extended course of lectures on the subject.

(a) "Six Short Lectures on Experimental Chemistry, introductory to the General Course." By J. Emerson Reynolds, F.C.S., M.R. Coll. Physicians, Dublin and Edinburgh; M.R. Coll. Surgeons, &c.; Professor of Chemistry to the Royal College of Surgeons in Ireland; Professor of Analytical Chemistry, and Keeper of the Minerals, Royal Dublin Society; Examiner in Medical Jurisprudence and Toxicology in the Queen's University, &c. Dublin: Hodges, Foster, and Co. 1874.

Professor Reynolds's aim in this course is to make the student familiar with experiments from the first moment of his commencing the study of chemistry, and by means of experiment and reasoning illustrate the method of study which is most suitable in chemistry. He thinks that without some such elementary training the study of chemistry is rendered unnecessarily difficult, and thinks it desirable that this instruction should be given to the student after he has some acquaintance with elementary physics, and before he proceeds to the systematic study of the elements as given in the ordinary text-books. Mr. Reynolds also endeavours, by making quantitative experiments, and thus connecting the idea of QUANTITY with the chemical changes occurring, to lead the student to the discovery of some of the primary laws of chemistry, and to aid him to appreciate the mode of derivation, meaning, and utility of the modern table of atomic weights of the chemical elements. We commend the book to the attention of teachers of chemistry.

POLARIZED LIGHT. (a)

THIS is a volume of "Nature Series," published by Messrs. Macmillan and Co., a series which includes Mr. Mivart's work on "The Common Frog," and Sir John Lubbock's "Origin and Metamorphoses of Insects," and also his treatise "On British Wild Flowers considered in relation to Insects," which latter volume was recently reviewed in these columns. We believe that most, if not all, of these volumes are reprints from *Nature*. The shape and size of these volumes render them very convenient to hold without tiring the hand, and the type is very clear. The get-up of the volumes, as a whole, is indeed excellent. They would have been a little easier reading if the measure of the page had been a little narrower.

The present volume contains the substance of lectures delivered by Mr. Spottiswoode to his workpeople, and he claims that they "constitute a talk rather than a treatise" on the subject of the polarization of light, and says that if a perusal of these pages "should induce some to read, and others to write, more fully on the subject, this provisional sketch will have answered its purpose." Mr. Spottiswoode has done his best to render this abstruse branch of optics as plain as possible, but it is to be questioned whether he has succeeded so well as might have been expected. We think that he has attempted too much within the limits of this small volume, and that if he had confined himself more strictly to the ground he has chosen he would have been able to elucidate it more fully. If "brevity is the soul of wit," nothing is certainly gained in a scientific treatise by attempting too much within a given space. We hope to meet Mr. Spottiswoode again on more congenial ground.

NOTICES TO CORRESPONDENTS.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a distinctive signature or initials, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£1 2s. 6d., at the offices in London, Dublin, or Edinburgh.

THE FORTHCOMING MEETING OF THE BRITISH MEDICAL ASSOCIATION AT EDINBURGH.

To the Editor of the MEDICAL PRESS AND CIRCULATOR.

SIR,—The anonymous letter to you from "A Member of the British Medical Association," which I have just read in your yesterday's issue, has caused me pain which is very little relieved by the knowledge that the charge made against me is utterly groundless. I am also sure it will cause pain to its writer, for I cannot believe that, when he knows the truth, he will leave his letter as it stands. It is bad enough to have carelessly made the charge.

I have no authority or responsibility whatever in connection with

(a) "Polarization of Light." By William Spottiswoode, M.A. LL.D., F.R.S., &c. London: Macmillan and Co. 1874.

the appointments which your correspondent represents me as making with an evil purpose.

I have never felt, far less expressed, anything but respect for my Irish medical brethren, and I have never in return experienced anything but kindness from them. This is the best of my recollection; but I have actual knowledge of many cherished Irish medical friendships.

June 3rd, 1875.

I am, Sir, your obedient servant,
J. MATTHEWS DUNCAN.

EXCLUSION OF IRISH PHYSICIANS AND SURGEONS FROM THE HONOURS OF THE BRITISH MEDICAL ASSOCIATION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me to reply to the insinuations contained in a letter which appeared under the above title in your issue of 2nd June. There are no members of society who tend more to disturb it than those who, actuated by a vanity which springs from concealed weakness or irritability, are ever ready to resist imaginary insults.

No one who is acquainted with the sentiments of Dr. Matthews Duncan, or with the warm feeling which men of the Edinburgh school have ever entertained for their Dublin *compatriotes* will for a moment believe that either coldness or insult is implied in the omission of Irish names from the list of office-bearers of the British Medical Association at the Edinburgh meeting.

The omission, which is, I grant, a little unfortunate, may have been due to inadvertency, but even that should not be charged against the Edinburgh men, who had little to do in selecting the office-bearers of the different sections.

Whenever the Association visits a city possessed of a large medical school, it is difficult to find poets of honour to satisfy those who rightly think themselves entitled to consideration and respect, and this difficulty has, I know, been strongly felt in the case of Edinburgh.

There are, no doubt, several men of very high position and very great merit in Edinburgh itself, who might feel hurt at not having been chosen to preside over sections or to deliver addresses.

Let us trust that such men will, no less than the representative physicians and surgeons of Ireland, be magnanimous enough to believe that the omission of their names implies no coldness or slight, but that it is due to the fact that in arranging the details of such a meeting as that of the British Medical Association it is impossible to please everybody.

Although the British Medical Association is daily becoming more and more imperial and less purely English and provincial, yet when it meets in the capitals of the great divisions of the United Kingdom, it is perhaps well that it should be officered by local men, so that the independent member of the Association may have the opportunity of studying the English, the Irish, and the Scotch aspects of the medical profession.

Were I not intimately acquainted with the men who, like Dr. Matthews Duncan, are giving much of their valuable time to the organising of the August meeting of the Association, and were I not thoroughly persuaded how unjust are the insinuations of your correspondent, I might have refrained from replying to a communication which could only have been prompted by a motive to excite or embitter professional animosities.

June 6, 1875.

I remain, Sir, yours, &c.,
F. R. S.

AFTER-DINNER WIT.—Last month the large and flourishing State of California held its annual Medical Congress, which appears to have been in every way a success. America, like this country, must perform wind up with a dinner, and we learn from one of our exchanges that "in the course of an hour, the viands having been complemented by a hearty attack upon the varied dishes, toasting and speech-making broke in upon the social chat and merry laugh." To the toast of "The Asylums of California" Dr. Shurtleff, resident Physician to the Insane Asylum, responded, and in the course of his remarks said, that of the 1,800 patients only two were doctors, whereupon a voice gravely interrupted with the question, "Are you sure they have diplomas?" Of course such a query was open to more than one construction, and the august assembly, after a moment's solemn consideration, broke out into roars of hearty and continued laughter.

THE BRITISH MEDICAL DEFENCE ASSOCIATION.—In our last we gave a brief outline of the objects of this Association, and wished it every success in its mission. Our contemporary, the *Lancet*, also patted it on the back a day or two previously, and in its following number (June 5) expressed satisfaction that the Association could not do much "without incurring bankruptcy." What has the Association done within the limited space of seven days to incur the ire of Bedford Street?

Dr. JOHN TATHAM, Salford, is thanked for his communication.

Dr. CARPENTER, Croydon.—We shall be glad to witness the results of your sewage experiments, if nothing transpires to prevent our acceptance of your invitation.

Dr. BOYD MUSHETT will receive a private note.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. F. J. FAIRIE, Royal College of Physicians. Mr. ERASMUS WILSON, London. Dr. PLYATER, Toronto. Dr. TILT, London. Dr. PRICE ROBERTS, Shyl. Dr. CHURCHILL, London. Dr. BOYD MUSHETT, Birkenhead. Dr. HARDING, London. Dr. ALFRED CARPENTER, Croydon. Mr. JABEZ HOGG, London. Dr. BAYES, London. Dr. R. F. WEIR, New York. Dr. JOHN TATHAM, Salford. Surgeon-Major STAFFORD, Portsmouth Garrison Hospital. Dr. KELTY, Walsall. Mr. E. LEONARD, Sheffield. Dr. CAMPBELL BLACK, Oban. Mr. FRANCIS VACHER, Birkenhead. Dr. TUTTLETT, Isle of Wight. Dr. HALTON, Kells. Dr. DOBELL, London. Mr. BLYTH, London. Mr. BUCKLEY, High Wycombe. Mr. J. ALTON HATCHARD, St. Leonards. Dr. PEARSON, Scarborough. Dr. CAMERON, Dublin. Mr. ASHENDEN, Hastings. Mr. BLYTH, Royal Free Hospital. Mr. SQUIRE, London. Dr. MATTHEWS DUNCAN, Edinburgh. Mr. G. BROWN, Ben Rhydding. Dr. LANGLEY, London. Dr. BALTHAZAR FOSTER, Birmingham. Mr. BENNETT, London. Mr. FLEMING, Chatham. Dr. KENNEDY, Dublin. Dr. PEELE, Dublin. Dr. HOWES, Dunlavin. Dr. GAVIN, Boston. Dr. SWAN, Bourne-mouth. Dr. KAVANAGH, Limerick. Dr. GRAHAM, Dublin. Dr. HANE, Crumlin. Dr. O'KELLY, Celbridge. Dr. DUDLEY, Kinnetty. Dr. PETIT, Dublin. Dr. SHARP, Cootehill. Dr. SCOTT, Easky. Dr. YEO, Dublin. Dr. FLEMING, Omagh. Dr. WESTROPP, Limerick. Dr. HEENEY, Belfast. Dr. KANNY, Killeshandra. Professor GANGE, Manchester.

Dr. MORGAN, Dublin. Dr. SUTTON, the London Hospital. Dr. FRANCIS R. HOGG, Meerut, India. Dr. MYRTLE, Harrogate. Dr. KENNEDY, Dublin. Dr. ANDREW CLARK, London, &c., &c.

VACANCIES.

Royal Hospital for Diseases of the Chest, City Road. Physician. Honorary. Applications to be forwarded to the Secretary. (See Advt.)
Royal Free Hospital. Surgeon. Applications, with testimonials, to be forwarded to Mr. Blyth, the Secretary. (See Advt.)
King's College, London. Professorship of Physiology. Applicants must address the Secretary.
Bristol General Hospital. Physician's Assistant. Salary, £50, with board and lodging. Applications to the Secretary.
Hospital for Women, London. Physician. Particulars of the Secretary.
Hospital for Sick Children, London. House Surgeon. Salary, £80 per annum, with board and apartments. Address the Secretary.
St. Pancras Dispensary. Resident Medical Officer. Salary, £100. Testimonials to the Hon. Sec., 30 Gordon Street, W.C.
Kensington Dispensary. Resident Medical Officer. Salary, £150. Particulars of the Hon. Sec.

APPOINTMENTS.

ABBOTT, C. E., M.R.C.S., a House Physician to the Royal Infirmary, Liverpool.
ANDREW, G., L.R.C.P.L., M.R.C.S.E., a Resident Surgeon to the Birmingham General Dispensary.
BIRT, E., M.R.C.S.E., Assistant Medical Officer to the Salop and Montgomery Counties Lunatic Asylum, Bicton, near Shrewsbury.
BOND, G. W., M.R.C.S., House Surgeon to the Great Yarmouth Hospital.
CLUTTON, H. B., B.A., M.R.C.S., a House Surgeon to St. Thomas's Hospital.
COLLINS, E. W., M.D., L.K.Q.C.P.I., L.R.C.S.I., a Surgeon to the Jervis Street Hospital, Dublin.
CRITCHETT, G. A., B.A., M.R.C.S.E., a Clinical Assistant to the Royal London Ophthalmic Hospital.
ELLIOTT, F. H., M.B., House Surgeon to the Scarborough Dispensary.
FROGSON, D., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the Darwen District of the Machynlleth Union.
GRAY, F. A., L.R.C.P.L., M.R.C.S.E., Medical Officer and Public Vaccinator for No. 4 District of the Honiton Union.
HARRISON, H. B., M.R.C.S.E., Assistant House Surgeon to the Metropolitan Free Hospital.
HAYWARD, W. J., L.K.Q.C.P.I., a House Surgeon to the Royal Infirmary, Liverpool.
HEFFERNAN, W. K., L.K.Q.C.P.I., L.R.C.S.I., House Surgeon to the Memorial Hospital, Jarroon-on-Tyne.
HETLEY, H., M.R.C.S.E., Resident Clinical Assistant to St. Luke's Hospital for Lunatics.
JOHN, W., M.R.C.S.E., L.M., Medical Officer of Health for the Haverfordwest Urban Sanitary District.
KILGABRIFF, M. J., L.K.Q.C.P.I., F.R.C.S.I., a Surgeon to the Jervis Street Hospital, Dublin.
LOWNDES, F. W., M.R.C.S.E., L.M., Surgeon to the Liverpool Royal Infirmary Lock Hospital.
LOWNE, B. T., F.R.C.S., a Surgeon to the Great Northern Hospital; also a Clinical Assistant to the Royal London Ophthalmic Hospital.
LUCK, J. J., M.D., Medical Officer to the Alveston District of the Stratford-on-Avon Union, Warwickshire.
MOIR, A., L.R.C.P.Ed., L.R.C.S.Ed., L.M., Medical Officer to the City Parish Dispensary, Edinburgh.
MOORE, A., L.K.Q.C.P.I., L.M., L.R.C.S.I., Medical Officer for the Collooney Dispensary District of the Sligo Union.
PACKER, H., L.S.A., Resident Obstetric Officer to Charing Cross Hospital.
PAUL, F. T., L.R.C.P.L., M.R.C.S., Resident Medical Officer to the Royal Infirmary, Liverpool.
PHILPOT, J. H., M.B., Physician to the St. Pancras Dispensary.
POTTER, H. P., M.R.C.S., a House Surgeon to St. Thomas's Hospital.
PUOBE, R. N., M.R.C.S., a House Physician to the Royal Infirmary, Liverpool.

Marriages.

AMBROSE—AMBROSE.—At the Roman Catholic Church, Newcastle West, co. Limerick, John M. Ambrose, M.D., Coroner, Newcastle West.
GRIMSHAW—HAMILTON.—On the 2nd inst., at St. Stephen's Church, Dublin, Wrigley Grimshaw, F.R.C.S.I., to Elizabeth Dorothea, eldest daughter of the late Rev. Richard Hamilton, Vicar of Kilmersdon, Somersetshire.
LYONS—CORMACK.—On the 25th ult., at the British Embassy, Paris, Richard T. Lyons, Surgeon-Major 28th Regiment Bengal Infantry, to Eliza Grace, third daughter of Sir John Rose Cormack, M.D.
SMITH—MEADEN.—On the 27th ult., at St. Saviour's Church, Bath, Francis Wm. Smith, M.B., M.C., &c., of Westbury, Wilts, to Clara, second daughter of Martin Meaden, 25 Grosvenor, Bath.

Deaths.

CARDELL.—On the 2nd June, at Wincanton, after a short illness, Geo. Cardell, M.R.C.S., and late Assistant-Surgeon Army Medical Staff, aged 41.
CHAPMAN.—On the 30th May, at Devon House, Ialworth, H. W. Chapman, F.R.C.S.E., aged 67.
HAINSWORTH.—On the 25th May, at Bradford, Yorkshire, Joseph Hainsworth, M.R.C.S.E., aged 40.
MURPHY.—On the 25th May, at his residence, Walter William Murphy, M.D., Resident Medical Superintendent Lunatic Asylum, Killylarry.

METROPOLITAN HOSPITAL SUNDAY FUND.

PATRON—HER MAJESTY THE QUEEN.
The **TREASURERS** and **GOVERNORS** of 1 HOSPITALS and DISPENSARIES within the Metropolitan area who desire that their Institutions shall participate in this year's DISTRIBUTION are hereby requested to send in their applications to Mr. HENRY N. CUSTANCE, Secretary to the Hospital Sunday Fund, at the Mansion House, on or before the 12th day of June.

On receipt of applications to participate, the Committee of Distribution will send out Forms to the Secretaries of Institutions, which must be returned, fully and correctly filled up, to Mr. CUSTANCE, at his office, not later than Saturday, the 26th day of June, 1875.

A copy of the last published Report, with the Accounts and Balance Sheet of each Institution for the past year, must accompany all applications to participate, otherwise no notice will be taken of the application.

Any Hospital or Dispensary that did not participate in the Distribution for the year 1874 must forward the Reports and Accounts for the last three years.

By order of the Committee of Distribution,
HENRY N. CUSTANCE, Secretary.
Mansion House, June 8th, 1875.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

The next PROFESSIONAL EXAMINATION for the MEMBERSHIP will commence on THURSDAY, JULY 22nd.

Candidates are required to give fourteen days' notice in writing to the Registrar of the College, with whom all Certificates and Testimonials required by the By-laws are to be left at the same time.

Full Mail East. **HENRY A. PITMAN, M.D., Registrar.**

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

FIRST or PRIMARY PROFESSIONAL EXAMINATION for the LICENSE.—The next Examination will commence on MONDAY, JULY 5th. Students are admitted to this Examination after the termination of the Second Winter Session of Professional Study at a recognised Medical School.

SECOND or PASS EXAMINATION for the LICENSE.—The next Examination will commence on MONDAY, JULY 12th. Gentlemen who have completed four years of Professional Study according to the College Regulations are eligible for admission to this Examination.

Registered Medical Practitioners qualified before January, 1861, are admitted to Examination under special By-laws.

Candidates are required to give fourteen days' notice in writing to the Registrar of the College, with whom all Certificates and Testimonials required by the By-laws are to be left at the same time.

The License of this College is a qualification to practise Medicine, Surgery and Midwifery, and is recognised by the Poor-law Board as a qualification in Surgery as well as in Medicine.

Full Mail East. **HENRY A. PITMAN, M.D., Registrar.**

THE SOCIETY OF APOTHECARIES OF LONDON

Give Notice, that the FIFTH of a Course of Six Lectures on STATE MEDICINE will be delivered at their HALL in BLACK-FRIARS, by Surgeon-Major F. DE CHAUMONT, Assistant-Professor of Hygiene in the Army Medical School at Netley, on SATURDAY, the 12th JUNE, at Three p.m. These Lectures are open to all registered practitioners.

Subjects of the Lecture.—Food and Beverages—Adulteration—Relation of Food to Work—Exercise—Limitation of Work through State Interference, according to age, sex, &c.

LONDON HOSPITAL MEDICAL COLLEGE.

ENTRANCE SCHOLARSHIPS IN NATURAL SCIENCE.—Two Scholarships, of the value of £60 and £40 respectively, will be offered for competition at the end of September, 1875. The Subjects will be the same as for the Preliminary Scientific Examination at the University of London. Further particulars may be obtained on application to the Vice-Dean, at the College, Turner Street, Mile End, E.

DUBLIN INFIRMARY for DISEASES of the EYE and EAR, Ely Place.

Ophthalmic and Aural Surgeon:
ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S., Ex-Ophthalmic and Aural Surgeon to the City of Dublin Hospital.

Consulting Physician:
EVORY KENNEDY, M.D. (Hon. Cau.) T.C.D. and Edin., Fellow and Ex-President King and Queen's College of Physicians.

Consulting Surgeon:
GEORGE H. PORTER, F.R.C.S.I.; M.Ch. T.C.D. (Hon. Cau.), Surgeon in Ordinary to Her Majesty the Queen in Ireland; Fellow and Ex-President, R.C.S.I.; Senior Surgeon to the Meath Hospital.

Obstetric Physician:
JOHN CRONYN, M.D., F.R.C.S., Professor of Midwifery, Roy. Col. Surgeons; Ex-Assistant Physician Rotunda Hospital.

Work, Income, and Expenditure for Twelve Months

Annual number of Dispensary patients	729
Number of visits paid by such patients	5,847
Number of patients within the Infirmary	124
Number of operations performed	163
Total gross expenditure per bed per annum	£27 15 0
Average expenditure per intern patient	1 10 6

The Infirmary is wholly dependent on private benefactions, and is in debt to the Medical Officer. SUBSCRIPTIONS ARE EARNESTLY SOLICITED

ROYAL FREE HOSPITAL. Gray's Inn Road.—There is a VACANCY for a SURGEON in the Medical Staff of this Hospital, in consequence of the death of Mr. John D. Hill. The hospital contains upwards of 100 beds, 60 of which are appropriated to Surgical cases, and the Committee contemplate increasing the number. Candidates must be Fellows of the Royal College of Surgeons of England. The election rests solely with the General Committee of Management. Applications, with Testimonials, to be forwarded to the Secretary, at the Hospital, on or before Monday, the 28th of JUNE.

JAMES S. BLYTH, Secretary.

TO INVALIDS, PARENTS, &c.—In September next a Medical Gentleman, accompanied by his wife, proposes starting by steamer for Melbourne, in charge of a Party, consisting of persons in delicate health, wishing to avoid the ensuing winter, or of those whose health might demand some period of relaxation in a genial climate.

Upon the arrival of the Party in Melbourne, a short stay would be made at an hotel previously engaged, preparatory to their departure on a nomadic tour up the Bush, through the delightful and interesting mountain region of Gippsland, where the pleasures of Hunting, Riding, Shooting, Fishing, Botany, &c., could be pursued, associated with the luxuries and appliances of civilised life.

The Party would return to England in the following May or commencement of June.

For particulars and terms, apply by letter to "G. W." care of J. Baxter Langley, Esq., 50 Lincoln's Inn Fields, W.C.

TO BE SOLD.—The Business of a Chemist and Druggist having a first-class shipping connection, to which is attached a very remunerative Surgical Practice.—Address G. 27, office of this paper, 23 Ely Place, Dublin.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £40 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote. Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well-organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,
W. O'NEILL, Secretary.

COUNTY DOWN INFIRMARY.

THE GOVERNORS OF THE COUNTY DOWN INFIRMARY will, at a Meeting, to be held at Twelve o'clock on the 15th day of July, proceed to elect a duly qualified gentleman to fill the office of ASSISTANT-SURGEON and REGISTRAR to the Institution. Salary—Sixty Guineas per annum, with Board, Apartments, and Washing.

Diplomas and Testimonials to be sent to me, on or before Eleven o'clock on that day, when the personal attendance of Candidates will be required. (By order)

J. K. MACONCHY, Surgeon.

Board-room, Infirmary, June 4, 1875.

ACCIDENTS WILL HAPPEN!!

Provide against the Losses that follow by taking a Policy AGAINST ACCIDENTS OF ALL KINDS, of the **RAILWAY PASSENGERS' ASSURANCE COMPANY,** The Oldest and Largest ACCIDENTAL ASSURANCE COMPANY.

HON. A. KINNAIRD, M.P., Chairman.

PAID UP CAPITAL AND RESERVE FUND, £160,000. ANNUAL INCOME £180,000. COMPENSATION PAID, £215,000
Bonus allowed to Insurers of Five-years' standing.

Apply to the Clerks at the Railway Stations, the Local Agents, at **64 CORNHILL, and 10 REGENT STREET, LONDON.**

WILLIAM J. VIAN, Secretary.

BUTLER'S MEDICAL HALL

53 & 54 LOWER SACKVILLE STREET,

DUBLIN.

ESTABLISHED A.D. 1817,

For Compounding Prescriptions and Supplying Genuine Medicines, is conducted, as formerly, under the careful superintendance of

WILLIAM STARKEY, M.D.,

Licentiate Apothecary.

The Medical Press & Circular.

DIGITALIS AND ERGOT AS VASO-CONTRACTORS IN LOCAL CONGESTIONS WITH AND WITHOUT RUPTURE OF VESSELS. (a)

By A. S. MYRTLE, M.D.,

Consulting Physician to the Harrogate Bath Hospital.

(Continued from page 494.)

A LADY, æt. 61, after great anxiety and worry, complained of feeling unable to continue any train of thought for long without painful effort. One morning she came down to breakfast, and instead of making the tea as usual, she appeared confused, and left the table twice or thrice; finally, she went to her room, and was found there, having let a washhand-basin fall; she was standing on the broken fragments, quite unconscious. Her attendants put her to bed at 10 a.m. She remained unconscious till 6.30, when I saw her. She was lying on her back, breathing gently, pulse full and regular, face and neck crimson, head hot, and, from her contracted brow, and always putting her hand to it, evidently painful. Could not get a word out of her. When lifted up to the sitting posture she vomited, and put her hands to her mouth to catch the vomit; no paralysis; extremities warm. I knew she had been for months subjected to great mental strain and annoyance, and I was quite prepared to find her in the state she was. Looking upon the marked fullness of the vessels of the head, as the most prominent symptom, I resolved to try the effect of digitalis and ergot. Shortly after the first dose the patient got very excited, got out of bed, and required two strong girls to master her. After the second she was quieter. Two hours after she had the third I saw her: face and neck no longer congested; rather pale; pain of head evidently relieved. She had taken some tea and

bread. There was a gentle perspiration over the whole surface; mind still paralysed; knew nothing that was said to her, but took anything that was given. Digitalis and ergot discontinued. Next day better. When asked to put tongue out, would say, "Better, much better—think you better." This kept on for two days, then it was, "Am really better—think you much worse;" but knew nobody, and could not recognise the suggestive act of shaking hands in saying "Good-bye." Fourth day answered in French when spoken to in French. A little excitement in cerebral vessels again occurred, when I resumed the treatment, and combined it with iodide of potassium, with marked benefit. The sixth day improved; saw Mr. Atkinson with me; evidently had a glimmer of who he was, and that he had come to see her, but answers similar to those above. On the eighth day asked, "What has happened? What made him ill? Is he better—really, truly better?" Put out her tongue when asked, and shook hands, saying "Good-bye."

Slowly the power of co-ordination of ideas returned but for days and weeks, every now and again, she lost the thought current, and picked up a fresh idea—for example, she would say to me when I went in, "Oh, how do you do?—I must get up and shake hands. How very clever of you—I am sure a hundred hundreds of pounds you deserve. Are they gone home? Don't you think it too soon? I don't quite understand, 'tis so funny—do you? Are you really, truly better?—quite sure?" In this case I doubt very much if there was any effusion or permanent pressure exerted on any portion of the brain; I rather look upon the symptoms as similar to those produced by concussion, and caused by the temporary pressure arising from a turgid state of vessels, not of a part, but of the whole encephalon. In the previous case, as well as in this, I can detect no cardiac disease, and, judging from the arterial recoil in those arteries I have examined, I do not suppose there is any, or, if any, but slight degeneration of their walls.

An unmarried lady, æt. 37, of nervous temperament, after being irregular for two or three months, complained of a sense of fullness in the head, as if it would burst, ringing in the ears, and dimness of sight; she had a dull

(a) Read before the Leeds and West Riding Medico-Chirurgical Society, April, 1875.

heavy pain at the back of the head. I had tried to establish her menses, unsuccessfully, by means of aperients and emmenagogues, and finally, without thinking of her head symptoms, prescribed ergot. After the second dose all these unpleasant feelings disappeared, and since then she has repeatedly found the most perfect relief from its use, although there has been no return of catamenia. About three months ago she applied to me on account of a sharp attack of erythema nodosum affecting both legs. She had on two previous occasions suffered from similar attacks, and several of the patches supplicated, and proved tedious in healing. I painted the spots morning and evening with tincture of digitalis, and the inflammation completely subsided in 48 hours. I have tried the same plan in another case of erythema nodosum, without any other treatment, with the same result.

A lady, *æt.* 36, came under my care last year suffering from a fibrous tumour of the uterus. For eighteen months she had been drained of blood by attacks of menorrhagia. She was blanched, and had all the wretched symptoms of *anæmia*, with constant palpitation as the most prominent of her troubles. One night I was hurriedly sent for, and found her in a state of syncope from loss of blood. She had taken ammonia and brandy in full doses, and ice had been applied to the lower spine and between thighs. The room was crowded and hot. Dismissing all the would-be nurses but one, I opened the windows and doors, and administered half a drachm of tincture of digitalis and same of liquid ergot. In an hour I repeated the dose, on which all bleeding ceased. I could not feel satisfied that the arrest of hæmorrhage was due to the action of the remedy employed, as so much had been done before my arrival, and so much blood had been lost, that there must have been little left. During the following three weeks she picked up rapidly, and I told her whenever bleeding set in to apply at once to the ergot and digitalis, and use no other remedy, either general or local. When her monthly time came round, flooding again set in, but was held in check by the very first dose, and could be regulated by amount taken with the greatest ease. Since that time every month she has gone through the same ordeal with the same result, and now she is able to walk about, and no longer presents the *anæmic* look she had. This is a common enough case, and scarcely worth taking notice of, except inasmuch as previous to coming under me her medical attendants had trusted to gallic acid, alum, and iron, without making any impression on uterine vessels.

In the last number of the *British Medical Journal* a case of hæmorrhage from carcinoma uteri is recorded where the hypodermic injection of one-third of a grain of ergotin in the forearm arrested the flux entirely in half an hour. Plugs saturated with perchloride of iron and ice had been used with a reasonable amount of success; but with an elevation of temperature to 103.5 deg. the ergotin proved much more rapid in its action, and did not cause the slightest inconvenience or elevation of temperature. In the same number there is an extract from an article by Prof. Bernheim, showing the power digitalis possesses in lowering the temperature and slowing the pulse in typhoid fever, the reduction in both taking place at the same time. I have little doubt but that we are fast approaching the time when more attention will be paid to the regulation of the temperature in the treatment of diseases of an acute character by the means of heat and cold, and also that by the exhibition of remedies known to act as dilators or contractors of blood-vessels we shall be able to correct and modify many abnormal conditions depending on a disturbed state of the circulation of the system at large or any of its parts. One fact we must bear in mind—medicines which act through the vaso-motors show their influence after a very few doses; not only so, I question if their action can be prolonged for any great length of time, for we find under any circumstances, whether produced artificially or occurring spontaneously, dilated vessels after the lapse of a certain period have a tendency to contract, and contracted, to dilate. Hence no good need be looked

for by the long-continued exhibition of such remedies; hence Dr. Crichton Browne's limitation to four doses. The effect produced by digitalis and ergot appears to me identical with that of bloodletting; they are true antiphlogistics; they remove in such cases as I have brought before you to-night the immediate cause of danger; or, if unequal to this, they certainly diminish the extent of local mischief without exhausting the vitality of our patients, and thereby place them and ourselves in a more favourable position than we should have been for future treatment.

MERCER'S HOSPITAL, DUBLIN.

AN ANALYSIS OF 2,000 CASES FALLING UNDER OBSERVATION WITHIN A TERM OF SIX MONTHS.

By THOMAS LAMBERT, late Resident Pupils.

(Continued from page 461.)

IX.—*Alcoholism.*

THE evil effects of alcohol on the urinary tract make it the imperative duty of the "Resident" to caution every patient who is liable to attacks of retention of urine to strictly avoid the use of stimulants, especially porter, as experience proves that it is the most active agent in inducing it. In every case of suspected exaggerated alcoholic poisoning a most careful diagnosis requires to be made. Apart from the fact that the patient *may* be drunk, in the absence of any history to the contrary, he may have received a fall that stunned him. Here it is that the "Resident" must exercise his own judgment, and if he acts aright, he will at once admit such a case, thus removing a certain amount of responsibility should the case terminate fatally.

X.—*Convulsions.*

There were eight cases of this affection, occurring in children between the ages of 2 and 7 years, the majority being females. The convulsions in nearly every case were due to teething or to gastro-intestinal disturbance; and the treatment carried out was to give the patient a hot bath, with a dose of castor-oil or a grain of calomel. All the cases speedily recovered without any relapses.

XI.—*Fractures.*

The total number of fractures entered was 120, comprising humerus 12, put up in straight or scored wooden splints; ulna 9, anterior and posterior splints; radius 42, Nelaton's (?) splint; fibula 15, Dupuytren's splint; tibia and fibula 3, put up in a carefully padded box-splint; nasal bones 3, support the bones by plugging the anterior nares with lint; thumb 3, wooden, scored, or gutta-percha splints; thigh 11, Liston's long splint, or thigh box-splint; fingers and toes 5, light side-splints and a bandage; ribs 26, transverse strips of plaster, to steady ribs; clavicle 7, pad in axilla, and figure-of-eight bandage; skull 1—a young child who got a fall, and received a dinge, or green-stick fracture, if it could be so called, over the right parietal bone.

In order of frequency, Collis's fracture ranked first, being the most common of all, fracture of the ribs and of the fibula coming next.

The symptoms relied upon in the diagnosis of these cases were crepitus, deformity, unnatural mobility, and the history of the case. Crepitus (an infallible sign) was elicited in 92 cases, and in 3 it was doubtful whether the crepitus was muscular or not.

CASE 46.—Mc—, *æt.* 45, admitted, suffering from an injury to the left shoulder, caused by falling on it out of bed. On examination a comminuted fracture of the middle third of the clavicle was discovered, a sharp spicula of bone being easily felt moving about under the skin. Considerable difficulty was experienced, by the fact that a small vein was caught between the fragments

of bone; it was at once disengaged, the bones brought into apposition, and the figure-of-eight bandage applied.

The patient recovered without much deformity.

CASE 36.—W— P—, æt. 6, was brought to hospital by his mother, who stated that three months previous he received a fall on the right arm, and that she brought him to a doctor in Dublin, who told her there was nothing wrong with it. On examination now, it was found that the radius was united almost at an obtuse angle, causing a great deal of deformity that might have been avoided, had a little care and intelligence been exercised at first.

CASE 12.—J— M—, a strong, healthy-looking man, came to the hospital, stating that a very heavy trap-door had fallen on his left thumb. It was found that the ungual phalanx was fractured, and dislocated through a wound on the anterior portion of the thumb. The bone was reduced and placed in proper apposition, some lint dipped in the blood being placed round the wound, after the manner of Sir A. Cooper. A neatly prepared scored splint was now applied, and after a tedious convalescence the man recovered with a very useful thumb.

CASE 1,862.—E— M— came to the extern department, having fallen down a steep stairs (a height of about ten feet). Examination proved that he had sustained a fracture of the radius and ulna about three inches from the wrist-joint, the radius being comminuted about an inch higher up; the crepitus in this case was most distinct. The fingers were bandaged up separately, and a pad of lint placed along the anterior and posterior aspects of the limb, to avoid obliteration of the interosseous space. Two straight splints were then applied, and neatly bandaged up, the arm being placed in a sling. The case is still under treatment, and progressing favourably. (a)

CASE 1,802.—E— F—, æt. 50, came to hospital, having received a blow on the top of the shoulder, caused by a basket of coals falling on it. On comparing the two joints, and examining the injured one, it was discovered that there was a comminuted fracture of the right clavicle, with dislocation forwards, of the sternal end. Placing my knee between the scapula, and drawing the shoulders back, I succeeded in bringing the bones into apposition and partially reducing the luxation. A pad was placed in the axilla and over the seat of fracture, followed by a figure of eight bandage. I have only seen the woman once since; but the bone has united, with slight deformity. As far as I am aware, the case is an exceedingly rare one, and I think it is absolutely impossible to get union without deformity. I may mention that this poor woman has been most unfortunate, as four months ago she fractured her left humerus, and now I learn it is broken a second time.

CASE 1,776.—J— Mc—, a very worn-out and cachectic-looking man, was admitted, having received an injury to the left arm, caused by falling to the ground in a scuffle. There was an oblique fracture of the lower third of the humerus. The bones were brought into position, a scored splint being applied, and the arm bandaged. Union was effected without any deformity.

CASE 972.—M— M—, æt. 20, during a fit of epilepsy, knocked her right arm against a wall. When seen, the elbow very much inflamed and painful, and it was found that the outer condyle of the humerus was fractured. The limb was put up in a flexed position, and kept so by means of an angular splint. Passive motion was set up in twenty-one days, and the arm was quite well in a month.

CASE 570.—P— N—, being slightly intoxicated, while walking on the curbstone, turned on his foot; he lay for some time unable to move, when he was brought to hospital, and there it was found that he had received an oblique fracture of the fibula, three inches from the mal-

leolus, with dislocation of the tibia forwards and outwards. The leg was extended and placed in a neatly padded box-splint, and kept there for three weeks, at the end of which time it was found that union had taken place; a starch bandage was put on, and the patient discharged in a week after.

CASE 184.—P— C—, æt. 30, a shoemaker by trade, was admitted, having fallen down stairs. He stated that when very young he received a hurt on the left leg, and that since then it has been wasted, and about three inches shorter than the other. Placing the two legs together it was found that the left was six inches shorter than the right, pain being referred to the hip. An examination was made, and it was found that there was an oblique fracture of the shaft of the femur, below the great trochanter. A Liston's splint was applied in the usual manner, extension being made by means of tapes at the bottom, and counter-extension by the perineal band. At the end of six weeks the patient was discharged without any deformity, except what he had before the present accident occurred.

CASE 14.—Mrs. J—, a woman æt. 50, was admitted to hospital, having received an injury to the left hip, caused by being knocked down in the street. An examination being made, no contusion could be observed, nor was there any evidence of a fracture, the limb lying in a perfectly natural position. No crepitus could be detected. The injured limb was laid on a pillow and a hot stupe put over the hip-joint. On examination next day, sixteen hours after the injury occurred, the appearances were as follows:—The patient lay in bed in great pain, and unable to lift up the leg, or move it in any way; it was slightly abducted, the heel lying in the hollow between the internal malleolus and the os calcis of the sound limb. Just below the greater trochanter a slight tumour was visible, painful to the touch. Manipulation immediately elicited crepitus, thus beyond a doubt establishing the fact that there was a fracture, although the symptoms did not appear for a long time. This can be easily explained by saying that shortening did not take place till the muscles had regained their tone. The fracture was at once put up in a Liston's splint, and the woman made a good recovery.

XII.—Brought in Dead.

Two cases were recorded as above; both of them dropped down suddenly in the street, and died on the way to the hospital.

In one case I made a post-mortem examination, assisted by George Harvey and P. J. Healy. The body was very well nourished, and it was evident that the deceased was one who "took uncommon good care of himself," as he had on several shirts and a chest-protector. On opening the thorax it was found that the lungs were fairly healthy, but slightly congested posteriorly. The pericardium was found to be completely covered with fat, and on being slit open, contained about the usual quantity of fluid (if anything there was an excess).

The heart itself was slightly enlarged, weak and friable, the valves, and indeed the whole surface of the heart, was studded over with cartilaginous-looking tubercles. The head, which was bald, bore evidences of an old ulceration (probably of a specific nature), and on removing the calvarium the bone was found to be partially necrosed, being in some places perfectly diaphanous.

The brain was examined, and found enormously congested throughout its structure as well as superficially.

The abdominal or urinary organs were not examined.

(To be continued.)

Sulphate of Cadmium in Gonorrhœa.

DR. GAZEAU has employed with much success in the acute stage of urethral blennorrhœas a solution of the sulphate of cadmium, one grain to two, three, or four ounces of water, used every two hours.

(a) Seen last on May 14th; doing well.

INDIAN MEDICAL NOTES.—XL.

(FROM OUR SPECIAL CORRESPONDENT.)

MEERUT, April, 1875.

A SUNDAY OUT.

QUITE recently a lady up from Madras alluded to Dr. Druitt, whose return to India will be greatly welcomed, by all accounts, by very many. This is Sunday; but the bells ring in vain for one black sheep, professionally engaged. Prayers by the yard are offered up for every official, when one thinks of Dean Ramsay—"Now, my friends, having prayed for everybody, let us pray for the devil—no one ever has a good kind word for the poor old devil." Nor is church attractive—no pretty decorations or fine altar, no dear little boys in white surplices, no pretty girls raising their trained sweet voices as the pealing organ sounds the note of praise, no wave of melody or elaborate anthem, no stirring sermon; nor are we played out by the exquisite performance of any gem from Rossini or Mozart. Melter Moss loves music, specially Handel, so do many others, but in this land of change, where the ranks close in so rapidly, where people sigh for England, for the hills, for those who are absent, there's no settling down in the plains, and though the natural expectation would be to find the glorious Liturgy conducted to the best of ability, our interests are elsewhere. We each worship in our own fashion, for the promised land is just as near, wherever we are. In India the habit is too common of publishing worries, and there are a number of little petty vexations and annoyances which, in the aggregate, hang too heavily around the necks of the sensitive, who become ill, despondent, morose, or selfish—the pachydermatous man winning in the race. As some one said, our hearts are but clay, like the rest of our bodies, and are apt to become hardened in the kiln of adversity. In a station where fever constantly fills the hospitals, and the same influences equally affect the doctor as the patient, the eternal battle with disease becomes at times terribly monotonous, and although Æsculapius may have endless resources at command, perhaps he has no energy to use such advantages. In the hot weather the natives huddle themselves away; not a soul will be seen, excepting an occasional doctor, or a stray official, the ubiquitous engineer driving through the hot winds as through a blast furnace. No laughter or gossip in the bazaars, the boys cease to fly kites or play tip-cat, not a sound heard excepting the dismal funereal chant of the bullock-driver directing his miserable beasts to run down hill, then to run up again, drawing water from the well. The birds who condescend to stay use frightful language, especially the panting crows, with their beaks gasping, and as a merciful man is merciful to his beast, each pet dog is sent to the hills, there to make fresh acquaintances, to acquire bad gambolling habits, and to forget his old master grilling in the plains. Neither Scripture nor Shakespeare agree with Sir Walter Scott in praising the dog, whose only faults consist in the absence of modesty, the disregard for art, science, and literature. A rigid abstainer, a believer in Sir Wilfred Lawson, still the spaniel escapes neither abscess of the liver nor symptoms allied to sunstroke. In certain parts of India—why not in all?—the horses protected about the head, neck, and spine, do not suffer much from paralysis. Here enteric fever, colic, enteritis, obstinate skin diseases greatly engage the attention of the veterinary surgeons. Concerning disease in India, for years past there have flourished very general loose assertions, which now are crumbling away. Said an amusing writer, ridiculing those who disbelieve in the contagion of virulent fevers—it is a loose assertion to deny that cows are not subject to gout, nor geese to hysterics, that herrings are exempt from small-pox, and oysters from toothache, because there are no pathological proofs. It has been stated that in certain places fever was always ushered in by the death of the rats, by the migration of birds, and the appearance of

certain insects and fungi—facts denied by others. Many of the ailments of horses, rinderpest, foot-and-mouth, hoven quarter ill, pleuro-pneumonia, diarrhoea, cystic disease, throat swelling, and ulceration are difficult to treat. Over-distension of the first stomach, through surfeit on young vegetables, the presence of *Tamias medicanellata* may induce dysentery, debilitating fever, diphtheritic ulceration of the mouth, skin eruption, the crisis in ten, convalescence in twenty days, sometimes. Congestion, extravasation, ulceration, not unfrequently found in the third, and especially the fourth stomach. Always on the look-out for any new facts about enteric fever. The following circumstances are curious: A party of the 85th Regiment, marching from Futtyghur to Meerut, in the month of October, halted near a village where typhomalarial fever was raging, and after an incubation of three weeks one man after another developed enteric fever—twenty-one cases, four deaths. The relieving party of soldiers of the same regiment, proceeding from Meerut to Futtyghur, suffered also, in a milder degree. The deaths and cases of fever gradually grew fewer in this village, and another party of soldiers passing through about Christmas escaped entirely without enteric. Surgeon-Major Skeen, who took the trouble to hunt up mortuary registers to track the cases, until he actually examined the natives stricken with enteric, doubtless will publish his interesting researches. The regiment has been some time in the country; the men were not so particularly young: nor can we be certain on the point of age, the statements so frequently being false. In justice to those who state that this fever is comparatively new, the natives themselves appear puzzled with the symptoms as well as the severity of the type. I am rather inclined to believe in the abortive treatment of enteric fever, unless the patient be young, weakly, scrofulous, debilitated by previous sickness in the hottest months, when the poison is as dangerous as a spark in a magazine of gunpowder. A case could here be quoted, were not this letter penned in a solitary little rest-house, forty miles from Meerut, on the rail, the train not returning until evening. The critical patient and family requiring all the indoor space, it is necessary to sit for hours either under a tree or out in the doorway; for what is the use of walking along the flat, dusty road? Blazing hot is the day, conducive to agonising headache or acute pain in the neck, or over the temples; but the despatch-box contains the *Medical Times*, the *Lancet*, the note-book, and writing materials. The patient, thank God, is out of danger; the husband will not be left alone, nor the several children motherless: so with a mind at ease, at all events to-day, let me read or write according to one's own sweet will. In a previous paper allusions were made to the wonderful weavers of Dacca, one of whom was chastised for allowing his cow to eat up a piece of muslin spread and left on the grass, the texture so fine that the animal could not see it on the herbage. It appears, also, that when the Emperor Aurungzebe, of Delhi boil celebrity, was angry with his lovely daughter for showing her beautiful skin through her clothes, the pretty princess retorted that she had seven suits on of priceless muslin. In 1789 a medical correspondent at Calcutta recommended rosy port in generous doses for influenza; another writer alludes to a lady in private theatricals as magnificently decorated by art and more beautifully adorned by Nature: the extravagances of the amorous Sultan seemed justified by her charms. The thermometer on May 3rd, 1795, in the shade, with tatties in the rooms before it, stood at 5 o'clock p.m. at 96°. On the 8th of April, 1794, the first intimation reached India of the public execution of Queen Marie Antoinette, which took place October 16th previously. In 1794 garden seeds from Lisbon included cauliflowers, cabbages, celery, cucumbers, parsley, turnip, radishes, leeks, parsnips, carrots, spinach, beet, asparagus, peas, and beans of sort; whether they flourished deponent knoweth not. Pale ale 14, London porter, 16, English claret 32, French brandy 24, Madeira 32 shillings a dozen at the sales, where green tea costs 7 shillings a pound. At

the subscription balls (entrance tickets two guineas) ladies would be taken out to dance minuets according to their husband's rank, but draw lots for country dances. No hookahs allowed, excepting in the supper and card-rooms. Dancing commenced at nine, supper at twelve; dancing recommenced at one. A flattering obituary of a much-esteemed gentleman closes with the information that he left behind him a widow of good morals and three helpless children. Thomas Martin, assistant-surgeon at Fort William in 1789, rushes into print to "frustrate the designs of a gentleman who, being ignorant of the profession, has been led away by the effusion of all self-sufficiency to depreciate a young professor who has hitherto made medicine his constant study." It appears a certain corporal had fever, which, treated by ipecacuanha, salines, venesection (5 oz.), bark, vegetable acids, cathartics, blisters, stimulants, epispastics, sinapisms, ran on to fatal delirium, all the more vexatious for poor Dr. Martin, who writes that he was "indefatigably zealous, attentive, and vigilant." Law, physic, divinity, all professions, squabble worse than ever, specially physic, thanks to the crowded competition and to the system of washing soiled linen in public.

Foreign Medical Literature.

M. TRELAT ON PRIMARY AND SECONDARY UNION OF WOUNDS.

(Translated from *Le Progrès Médical* by FRANCIS M. LUTHER, M.D.)

GENTLEMEN,—Before the close of our clinical course I wish to lay before you the opinions I profess on a subject interesting in many respects—the *primary and secondary union of wounds*. But this study is so vast that I can only, since time presses, indicate the principal points; so I shall be brief, and will give you a rapid review of the history of the question. I have, moreover, treated it more in detail last year in my course of lectures at the School of Medicine.

Primary union for a very long time remained unknown to surgeons; they must, doubtless, have at times witnessed such cicatrizations, but they did not seek for them. It is only in the last century that we find this mode of cure considered by them and methodically applied. The Academy of Surgery then investigated the subject, and clearly defined its meaning; still, even then we see a much-to-be-regretted source of confusion arise, and which later on will become a cause for discussion and error: the idea of *suture* is so intimately connected with that of *primary union* that the result is confounded with the means employed to obtain it. This abuse of language crops up again at the commencement of this century, as anyone may satisfy himself by consulting Lombard on "Recent Wounds."

At this period the partisans for and against it take opposite sides. Primary union is proposed by some, violently attacked by others; and whilst it counts in England numerous defenders, it is in France, particularly in Paris, systematically prohibited. Do we not even see Roux in the year 1840 defend it much and practise it little? But if the Academy of Surgery is unanimous in preferring secondary union by granulation of the opposing surfaces, at Montpellier, they were less exclusive.

In the two camps arguments of incontestable value were elicited. The partisans of primary union hold very seductive language: To obtain prompt cicatrization it is not to suppress all accidents?—to escape all the dangers inherent to long suppuration, and the weakness consecutive upon long fevers? No more erysipelas, no more purulent infection. But, it is asked, do you obtain this beautiful result? Your cicatrizations are incomplete; the deeper parts are not united; you have then gaping of temporarily united surfaces, sinuses, fistulas, retention of septic matters, which become foci of infection, while all the time, because of the

superficial union obtained, you are lulled into a false security. Is it not better to leave the wound open, to cleanse its surfaces, and survey carefully the progress of the fleshy granulations? Our method is slow, but sure. The question threatened to prolong itself *ad infinitum*; but there was a common ground where the two schools met. Must it not be acknowledged that primary union was indispensable in autoplastics, an operation accepted and practised by all surgeons? They had thus more frequent examples of primary union, its advantages could be better appreciated, and agreement on the subject became more easy.

It must not be supposed, however, that those discussions were barren; their result was to provoke useful researches. Each individual perfected his method and added to it useful improvements. The one side selected and pared their flaps with more care, watched over their nutrition, and secured their exact apposition by multiplying sutures. The others sought out the best dressings, and diminished suppuration by a judicious choice of topical applications and apparatus. They studied the diseases of granulations, and especially how to prevent them. These considerations led to the use of alcoholic dressings, carbolic acid, glycerine, occluding and sticking-plasters, and in those latter days M. A. Guérin's wadding-dressings, which have rendered such great services to surgery.

All the world profited by those experiences; it was acknowledged in presence of those successive ameliorations that both methods might, according to the case, give good results. My firm belief is, gentlemen, that *we should chiefly look for primary union*. We must not, however, employ it blindly; it has, like every surgical method, indications and contra-indications which must be determined with care.

Who, for example, would venture to propose primary union for a contused wound caused by the splinter of a shell? Would it not be absurd? In the ablation of voluminous tumours, carcinomata of the bosom, where one has to follow their multiple prolongations and to create anfractuous wounds, can primary union be effected? No, certainly. You could not place in apposition the deeper parts; the union would be only superficial, and consequently you would have accumulations of pus. This is, then, a formal contra-indication, and in such cases primary union itself be rejected.

Supposing even that this agglutination is possible, are all the conditions fulfilled? No; you must still examine to see if there be any foreign body in your wound, of whatsoever nature. Now, extravasated blood is a foreign body, which must, in order to be eliminated, undergo retrograde metamorphosis; consequently, union is contra-indicated, unless the arrest of hæmorrhage is complete, if clots accumulate under the flaps. Tendons and aponeuroses, osseous surfaces laid bare, mortify; muscular fibres deprived of their nutrient vessels sphacelate; fatty masses, bony projections in amputations, all those bodies have become foreign to the organism, and as such are condemned to be eliminated. The same considerations will hold good if the wound contain bullets, splinters, bits of cloth, or simply the threads used for ligatures. The surgeon must calculate the chances of life of the tissues which constitute his flap; he must judge of its vascularity, its vitality, and only decide after mature consideration. It is here that art really steps in; it is no longer a question of mere book-learning or of doctrine!

Still it must be confessed that, in spite of an exact appreciation of the indications, when you fancy you have counted up all the chances of success, an accident may occur to compromise the result of the operation. One cannot foresee everything—a hæmorrhage *en nappe* which may take place in the depth of the tissues, or secondary rupture of larger arteries. Blood escapes between the flaps, unseals the lips of the wound, and the cure is necessarily compromised.

Should one not even count on the want of discipline of the patient, who by un-reasonable movements may displace the apparatus and destroy adhesions in process of

formation? But particular attention should be bestowed on the general state of the patient. Too much emphasis cannot be laid on this point: a well-conducted operation will fail miserably with a feeble individual, who, during the progress of cicatrization, is more exposed than another to morbid influences. Do you remember the little patient lying in No. 5 of the women's wards, who was operated on for incomplete hare-lip? Union appeared to progress fairly, when we saw the child sicken, get diarrhoea and cough. Nutrition being imperfect, we only obtained a partial cicatrization. Accordingly you saw me waiting for a complete restoration of strength before essaying the operation anew. So in like manner you will see after an amputation the periosteum ulcerate and the bone mortify in anæmic or cachectic individuals.

You see, gentlemen, there are certain cases where the indications are delicate and difficult to seize; it is by remembering facts already observed that you arrive at rules for your guidance, which become, so to speak, a *résumé* of practical surgery. But, nevertheless, it is established that the method to be chosen is, generally speaking, to be submitted to indications and counter-indications which have to be sought after.

If the patient is weak, if primary or secondary hæmorrhage is threatening, still more if a foreign body exists, if the wound is anfractuons, if apposition is impossible, if the flaps non-vascular, poorly nourished, are ready to mortify—in those cases one can only at best try partial union at a circumscribed point of the wound.

But you must not forget that the process you employ is of incontestable importance. The mode of incision, for example, the form of the flap, its relations with the corresponding flap, may alone determine primary union. Is not that what Von Graefe did—and it is his highest title to merit—in his operations on the cornea? Is it not what is sought after in all the methods called linear? Here, by their situation, even the lips of the wound are in exact apposition, and you know, gentlemen, that this point is most important. You have frequently during this session seen me operate for phymosis, and you remember with what care I brought together the mucous membrane and the skin. For greater security I always take charge of this part of the operation myself, confiding to my assistants the application of *serre-fines*.

If I were to make a *résumé* in a few words of the indications for primary union I would say to you, *try it always whenever the close apposition of the deeper parts is possible; it is an indispensable condition, without which all your efforts will fail.*

And, moreover, this reunion of the deeper parts may be obtained more frequently than is supposed. In a discussion of the Society of Surgery I related two cases of excision of lipomas as big as the fist, and I astonished my colleagues by telling them that I had tried with success primary union. Now I owe this happy result to the method that I always employ in these conditions, and which I cannot too much commend to you:—

I make the deeper parts to meet exactly, sometimes even sacrificing the regularity of the superficial union—that is how you recently saw me proceed in removing a little tumour from the arm-pit—then I maintain the parts in contact with pieces of amadou, which exercise an elastic compression, sufficiently effective, too, to keep them in apposition; I then seek to procure the greatest immobility for the part—its absolute repose is, in fact, an important element. Recently M. Houzé de l'Aulnoit exhibited before the Surgical Society a certain number of amputations that he had practised with success: he attributed this success to the care that he took in covering the end of the bone with a flap of periosteum. Ought he not rather to have attributed it to the perfect immobility in which he maintained the limb?

Accordingly, gentlemen, you will be entitled to hope for a speedy cure as often as you ensure the conditions which I consider as indispensable—the maintaining of the deeper parts in the most perfect contact, a slight elastic

compression, and immobility. It was those principles that guided me in a recent autoplasmic operation. The case was a large canceroid of the cheek and ala of the nose; the loss of substance was considerable; it had to be filled up by a very extensive flap. After assuring myself that all effusion of blood had ceased, after having cleansed the surfaces, I carefully confronted the tissues, multiplying the points of suture so as to avoid all dragging.

You saw me then superpose along the sutures strips of amadou, with the double object of maintaining the apposition of the parts and exercising methodical compression.

After the first day or two we were able to show that adhesion was secured, and that without fever, almost without redness or swelling, that there existed nowhere any retention of pus, and that a cure was near at hand in spite of the advanced age of the patient. Is it not to the precautions taken that so fortunate a result is due?

Gentlemen, the hour is getting late, and I am far from having exhausted the subject which occupies us. Many points remain in obscurity which merited long developments; many details have been omitted which would not be without utility. I cannot finish to-day, but I shall doubtless have, either at the bedside or in the clinical lectures, which I shall resume next session, an opportunity of completing those remarks and of again pleading before you the cause of primary union.

Transactions of Societies.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JUNE 2ND, 1875.

W. O. PRIESTLEY, M.D., F.R.C.P., President, in the Chair.

THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND TO PYÆMIA.

DR. ARTHUR FARRE resumed the debate on this subject. He cited the writings of Dr. Kirtland, and entered into an explanation as to the classification of the "Nomenclature of Diseases" published by the College of Physicians. He then proceeded to notice each of the three questions submitted by Mr. S. Wells in the following terms: "The first, as you well know, relates to this—Whether there is any form of continued fever communicated by actual contagion or infection, in connection with childbirth, which is distinctly caused by a special morbid poison, and as definite in its progress as the diseases which are taken in illustration. To that question I can return a very plain answer, and say that I am not aware of any form of contagious or infectious fever connected with childbirth which is distinctly caused by a special morbid poison (if by that be intended a specific virus), and which has a definite progress. I am not acquainted with such a disease. The next question and the following one must, I think, be taken together. 'May all forms of puerperal fever be referred to attacks of some infective continued fever—as scarlet fever or measles—occurring in connection with childbirth, on the one hand; or, on the other, to some form of surgical fever, or to erysipelas, caused by or associated with changes in the uterus and neighbouring parts following the process of childbirth?' I am unwilling to give an answer to this question, because I wish to keep open another subject, which seems to be closed by the question which follows it. If I were to give an answer to that question, I should be shut out entirely by the form that is laid before us from giving a satisfactory reply to the third, which is this: 'If all cases of contagious and infectious diseases which occur under other conditions than that of childbirth are set aside, does there remain any such disease as puerperal fever?' Now, it is to the form of this question that I wish to take exception; because it appears to me that, in this question, the several infectious and contagious diseases are treated as if they occurred in the body of a man, a non-parturient woman, or a child; whereas I wish to keep together the connection which associates them with the act of parturition, and shows them as occurring in the parturient woman; and I think it is the separation of these two conditions that occasions the difficulty I

now encounter. I cannot, consistently with my experience, agree to consider these diseases as one and the same when they occur to the non-parturient woman and the parturient woman. I think here there are several circumstances that have to be taken into account. In the first place, when any of these attack a parturient woman, she is not in the same condition as a healthy person whom they may attack. Scarlatina, measles, and the like, occurring to healthy persons, do not enter the bodies of those individuals in the same conditions as they enter the body of a parturient woman. Let us remember, in the first instance, she has been in some degree weakened by the previous confinement. It may be said, 'Well, but in some cases we have a parallel—cases in which the diseases here mentioned follow after an operation.' But I will go further. We have two processes going on in the body of the lying-in woman naturally, which do not occur in the person of one ordinarily struck down by one of these diseases. First, I refer to the milk-process, the milk-secretion, and to that attendant disturbance of the constitution which we term milk-fever. That is one element to be taken into consideration, and one disturbing force. And there is another and a much more important one, and that is the change which goes on in the uterus, and which we all know as the involution process. Nothing of this kind occurs in the body of an ordinary recipient of those diseases. This natural process, as we know, goes on in the body of the woman at a time when she is most likely to be attacked with the diseases that we have met to consider; and when any of these diseases attack a parturient woman, this process is materially interrupted. Now we know that when this process is interrupted, there is an arrest of all that eliminative action which that involution process implies; and we may fairly conclude that, in consequence of this arrest, there is some accumulation in the body of those effete matters which ought to be expelled from the system; and this, added to the already existing blood-dyscrasia, must very much aggravate the disease. Nor is it quite certain that this may not add a new form of sepsis to that which is already in the blood. Before admitting, therefore, that there is no such thing as puerperal fever, I would say that all these things ought to be taken into account. It has been thought by some that such a thing as a pure and independent puerperal fever may be found. I should be sorry to shut out that idea altogether as one that is impracticable, and not to be entertained. I think it is very easy to see where we shall find a puerperal fever, if we are to look for it at all. I mean a fever not caused by any of the circumstances here suggested to us; it is quite plain that we must look for it here, in the arrest of some of these processes that I have been referring to. If we are to look for a puerperal fever at all, one that can be properly so called, a disease which is *sui generis*, we shall probably find it in the interruption of these healthy processes. Then, if I am not trespassing too long upon your attention, I should like to express a little more nearly my own views with regard to puerperal fever. I very much regret now that, when we were framing this definition, it did not occur to me to suggest that the term 'puerperal fever' should be rendered 'puerperal fevers;' and that a note should be placed to the effect that, under this name, is intended to be comprehended a class of continued fevers communicable by contagion occurring in connection with childbirth, and so on. I think we should have got over a good deal of the objection taken to this word if we had considered this not as a special form of fever, as it appears to be when it occurs in the 'Nomenclature,' but as a group of fevers connected with the act of childbirth. If I were asked how I would classify the diseases that we have been in the habit of grouping together under the name of puerperal fever, I would divide them into these three, as it appears to me, very natural classes. We have to look at this matter in a practical light, and see how we shall consider this subject, not by the teachings of the dissecting-room, but as we see it in the lying-in chamber, when asked, as we constantly are, to determine the nature of the disease that we are called in to examine and advise upon. I have been in the habit of dividing all cases that can in any shape be termed puerperal fevers into three classes. First, there are those simple fevers which may, for the want of a better term, be called irritative fevers; and under that name I would class that febrile action which results from simple mammary irritation, and is known as milk-fever; those simple febrile consequences of a traumatic origin which result from slight injuries to the soft parts, laceration, and

the like, though these are of rare occurrence; and those pyrexial states which are of a fugitive and transient nature (I think, in a second catalogue in the 'Nomenclature,' we call them puerperal ephemera). First, then, we have those irritative fevers arising from some local irritation, and not implying blood-infection of any kind. In the second class, I would place those infective fevers which are not of a specific origin, and in which the poison or sepsis does not undergo a distinct period of incubation, though I have no doubt there is a poison conveyed into the blood, in what way it is not necessary now to consider. Under the name, then, of the milder forms of infective fevers, I would class all those in which the infection is not of a specific nature, in which the process does not undergo a period of evolution, a period of development, and in which the consequences follow no definite order. Then, in the third class, I would include eruptive fevers, and those which depend upon a blood infection, the poison following a specific course, having a regular period of incubation, and terminating in those several diseases, eruptive fevers and the like, which occur, of course, to the lying-in woman in common with others. These I do not consider as in any way taking any part in the puerperal fever. The only fevers that I would acknowledge as in any connected with the puerperal state are the first two. I would entirely exclude the others from the catalogue; but, in the present imperfect state of our knowledge on these questions, I would like to retain these diseases under some name corresponding to that under which we now group them together. If I proposed any alternative I would change the name. One that I am in the habit of employing is *post-partum* fevers. I have long discarded the name puerperal fever, and have used the term *post-partum* fevers, which implies no theory at all, but simply expresses the fact that they occur to women after delivery. I think that under that head we might include all these three forms of fever. If, for the purposes of statistical registration, it were desired to know how these names should be registered, I would suggest that those cases should be registered under a separate head in connection with childbirth, never mind in what relation they stand. I would place, for instance, 'scarlatina' and 'scarlatina in the puerperal form' in parallel columns; 'erysipelas' and 'erysipelas in the puerperal form.' In this way we should satisfy the requirements of the Nomenclature Committee, and not foreclose that most important question that we have now under discussion. I dare not trespass longer upon your time; I cannot venture to offer any farther observations upon this subject; but I may at some future time, if you please, further develop my ideas, and particularly call the attention of the Society to this circumstance, which appears to me to have been left too much out of consideration—it seems to me that, in considering the pathology of these cases, we have given too much attention to the influence of a blood-poison, and have lost sight of that intermediate condition—or, rather, we have not attempted to determine it—which intervenes between the entrance of the poison into the blood and the development of it in the various ways and forms which give significant names to the diseases under which they are classed. I think we have too much left out of consideration the influence of the nervous system, the influence of these poisons upon the nervous centres; and I think if we were to direct our attention further to this particular, we should be able to throw a great deal more light upon these diseases, and, perhaps, get over some of the difficulties that now surround us."

Dr. SAVAGE, having referred to some previous statements in the debate, said: Now, is this fever in any sense of the word? First, we have decided that it is utterly distinct from such things as we have called fever. Is it fever? We all agree that there must be some heat of the skin, some elevation of the temperature in anything that you can call fever. Now, I know that you may have many of these fatal cases of septicaemia in a parturient woman running their course in eight days, without any elevation of temperature from first to last. Or it happens that there is an elevation on the second day after you discover the presence of the poison. I agree with Dr. Farre, that a great deal may happen before you discover the presence of the poison. It is not impossible that, if we kept our eyes open and watched, we might anticipate the effect of the poison; but it is seldom done—we see the cases late, and they are generally fatal. In the matter of temperature, then, I think it is clear that the disease should not be called fever at all. Then, the next point is, whether it is septicaemia peculiar to a parturient woman, not like any other septicaemia. I have seen septicaemia from operations on silly

women who are not intended to have a family, who are intended to be barren; septicæmia from the introduction of that most treacherous of all things, the uterine stem; septicæmia from legitimate operations upon the uterus; septicæmia after ovarian operations. I have seen all these, and I have also seen (but I am no authority on that point) surgical septicæmia in wards, and I can distinguish no difference between it and septicæmia in parturient women. I think it is a simple septicæmia—that is, a disease which you must set apart from every other sort of disease likely to occur in parturient women, such as the disease you call fever in connection with the secretion of milk, and other fevers. It stands quite apart and alone, and I think it of great importance that we should consider it as such. I think, if we do not, we shall be likely to overlook it in our patients; and, instead of applying, as we might with some effect at an early date, some remedy, we may let the case go on until it is past hope. Now, do we know anything of the poison? Have any of us seen or touched or felt it? Mr. Wells will tell you by-and-by, if he please, that in the course of ovarian septicæmia he sometimes taps the peritoneum with great effect, and lets out a great quantity of it. There must be poison in or about it, because the woman is better when it is let out, is worse again when it accumulates, and again better when it is let out. Then, there are the processes, which it would take too long to enter into, such as washing the peritoneum and the like. If the case be taken in time, the woman recovers. Evidently, in such a case, we are dealing with a poison in some shape or other. Is the whole fluid poisonous, or is there something special in it? Our German *confères* have helped us a good deal in this way, in a negative sense. The ordinary results of putrefactive changes in dead matter should be carefully distinguished from the changes which occur in fermentation; they are two different things, but are often confounded. We have sulphuretted hydrogen, sulphuret of ammonium, and butyric acid; there are other things, no doubt, but these have been discovered. I am referring to the experiments of Billroth and Weber. They take a solution of each of these things and throw it into the cellular tissue of dogs and horses, and produce in each instance septicæmia, the animals dying. You could not tell whether they had chills or not; still they died, and it was clear that they were killed through septicæmia. I must not forget to say that sometimes the severity of the symptoms did accord with the offensiveness of the liquid. I have had my fingers in the liquid, and could not eat any dinner for a week or two; and I have no doubt that if I had attended a parturient woman with my fingers in that state she would have had septicæmia. In the case of the peritoneum, it is clear that this question can be answered. What are the channels for the introduction of this fluid into the system? Unless the peritoneum be inflamed in the small vessels, it is clear it must be through the absorbents. There is an instructive experiment by Dr. Sanderson, in his beautiful book lately published, in which he shows that liquids may possibly enter the system through the vessels, but what he calls particulate poisons cannot—they must enter in by the absorbents. I do not know what he alludes to by those poisons, but I refer gentlemen who wish to know more about it to the book itself. It is quite clear, then, that in the case of the peritoneum the poison must enter in through the absorbents—that is, if it be particulate, because it is asserted by the more recent pathologists that all septic matter is particulate, which, I think, is a mistake. I am sure one of Billroth's experiments shows that it is a mistake, because a solution of sulphuretted hydrogen cannot be particulate. Let us apply this to the uterus. We are first in some difficulty unless you acknowledge the existence of absorbents such as you have them in the peritoneum. I think these absorbents are denied by some authorities. They are denied in a recent communication to our "Transactions." Still, they do exist. I make this remark the more, because there was a theory started by Dr. Graily Hewitt the other day (as I saw by the report), about what he called the burglar theory; that is, he said he had no doubt that in the majority of instances there was an imperfect contraction of the uterus, a clot within it and clots within the veins; and the locks being taken off the doors, and the doors thrown wide open, the thief stepped in. In the first place, I can scarcely imagine such a state of the uterus without considerable hæmorrhage. He also spoke of sinuses of the uterus. Now, there are no sinuses of the uterus in my opinion. I do not know of any open sinuses after parturition at all. I know it is exceedingly difficult in the dead subject to separate the placenta from the uterus without tearing into the veins. Nothing is so easy as to

separate the placenta, *e.g.*, in placenta prævia; you come into contact with one of the large veins, and you feel the small arteries, veins, and absorbents yielding; you separate the whole, and there is the uterus in a dilated state, and no hæmorrhage. That could not be if there were open sinuses. Even if you have clots in the veins, it is a matter of demonstration, since Virchow's discovery of the true mechanism of embolæ, that clots in the veins do not get into the circulation by themselves—they never break up. That was the old opinion of Dr. Lee, whose name has not been sufficiently mentioned except by Mr. Hutchinson. Dr. Lee showed incontrovertibly that one of the concomitants of this disease, septicæmia, was a clogging of the veins; but it was Virchow who demonstrated (it was quite a demonstration) that the clots will not break up; that is not the way that the clots pass in and disappear. Books on pathology, especially German books, describe how the veins empty themselves, but time will not permit me to refer to that. We have arrived at this, that you cannot get the poison through the veins. We have, then, to do with another channel—the lymphatics. Now, the lymphatics have been shown by Lee to be very peculiar in the mucous membrane of the uterus. The surface is highly absorbent, and the small vessels of the uterus are invaginated in these lymphatics. It is a very curious arrangement shown in Leopold's book. I fancy I have seen them. I do not say anything as to the microscope, since I find a power of fifty talked of, whereas I found a power of twelve difficult to manage. It seems to me, then, that as a matter of demonstration we have brought it down to this—that we have seen the septic matter, we have touched it, and smelled it; I have mentioned experiments in regard to the composition of it; and we now can have no difficulty in believing that some septic stuff will accumulate in the interior of the uterus and enter the circulation, as it did in the case of the peritoneum. Now we come to the difficulty about the fingers. I said that if I attended a woman in her confinement with my fingers in that state I had no doubt she would have septicæmia, and I really have no doubt of it. You remember that we had some painful statements from a gentleman in the country who seemed to have had his fingers in that condition, and who lost case after case, and was obliged to give up his practice. I know it is difficult for most of us to comprehend how it is that the mere approximation of a finger should set going this curious septic thing. Now, every old woman will tell you that, if she puts a piece of fetid meat in the cupboard, though it does not touch the rest, all will be turned in the morning. The other day, when passing a butcher's shop in a large district, I found him hard at work with all his men. Having these perplexing questions in my mind, I walked in to hear what sort of disinfectant he used, and he said, "I use no disinfectant; I wash everything with soap and water every night, hooks, cleavers, knives, and everything, then I admit the meat; if I did not, it would all be turned towards the morning." I do not myself profess to understand or explain how it is that the approximation of bad meat to good will turn the good bad; but so it is, and we can apply that fact, though I have no explanation of it, to show how contact with a fetid finger would lead to septicæmia in a woman. Then we come to the question of pyæmia and bacteria. Now, the question of bacteria has occupied the minds of leading members of our profession during six hours, at three meetings, in a sister institution, where they all contradicted one another, and arrived at no conclusion, but made shipwreck of the whole affair. Nevertheless, we have to entertain it. Why did Mr. Wells tell us of pyæmia? What is pyæmia? A woman after her confinement has a pain in the upper part of the thigh, and there is a little swelling; you think there must be an abscess; you open it, you open it, you let out a pint of matter. In a week's time there is a similar swelling in the calf of the leg; you open that, and there is half a pint of matter; and then she does well. Another woman with septic symptoms dies suddenly with clots in the heart, and numerous abscesses in the lung. Another has not only clots in the lung, but has pus in the kidneys, a breaking down of the spleen, and concretions on the valves of the heart. Now, Cruveilhier long ago injected quicksilver into the medullary cavities of dogs, and they died with all the symptoms of septicæmia; then he found numerous abscesses in the body, and in the centre of each a small globule of mercury. I mention these facts in relation to the question of pyæmia. I should like to know which you call pyæmia and which you do not. In the case of a woman with an abscess in the calf of her leg, you would call it pyæmia; but, if you have any septicæmia with

it, you would call it septicæmia; yet, the source of the pus is the same in every case. I am inclined to dismiss pyæmia, as I would puerperal fever, entirely from the catalogue; and I believe that Mr. Callender, whom we heard the other night, has the same feeling. He seemed to me to hesitate very much as to the term pyæmia.

[Pressure on our space compels us to postpone till next week the other speeches].

WEDNESDAY, JUNE 16, 1875.

DR. LYON PLAYFAIR ON PUBLIC MEDICINE.

DR. PLAYFAIR always speaks to the point, and his addresses are replete with useful hints. On the occasion of a public ceremony in King's College, London, last week, he spoke of the great advance of the science and art of medicine in modern times. He described the scene round the death-bed of Charles II., a period rendered illustrious by the life of Sydenham, when fourteen physicians signed a prescription for the dying king, recommending the actual cautery to be applied to his head, and the administration of a preparation from human skulls. When a boy, he recollected that a regular character in almost every play was the pompous physician with his gold-headed cane. This grotesque representation of the medical man had faded away, and was gone for ever. Science has now cast her mantle over the physician, and clothed him with honour. There is not a single branch of medicine that is not now under the dominion of science—in fact, he knew of no class of men and no profession of more catholic kind of education than medical students. They are now obliged to show that they have received a liberal education, by an examination, before commencing their professional studies, and then a curriculum of abstract and applied science, the fault of which consists not in its narrowness, but possibly in its too great breadth. A medical man of the present generation cannot be a narrow man; his profession is too varied to render it possible for any member of it to see society through monochromatic spectacles. And this renders the medical man both a power and a danger to society at large.

Dr. Playfair remarks that the medical man is gradually

becoming more a confidant of the inner circle than even the priest. His wide education and general knowledge often makes him a valuable counsellor, when the judgment becomes weakened by disease. A reaction against the medical man naturally arises, both in the discharge of his public and his private duties. The patient, who must passively obey when ill, is apt to resent this when he is well. Hence a positive dislike to medical interference in political life, for the public officer of health has to deal with the body politic, just as the private physician has to do with the individual body. In private, he has to consider the hereditary condition of the patient, and to study his surroundings; whilst, as a public officer of health, he has to look at all the conditions affecting the life of the community. In a state, the death of one individual and the birth of another are strictly analogous to the waste and restoration of particles in individuals. The public officer of health comes in contact with the aggregate suspicion and resentment of the community; but he cannot now be treated with ridicule. Thus, in the House of Commons, every Bill relating to sanitary matters more and more throws power and responsibility on the public officers of health.

In the late Bill for the Dwellings of the Poor he is made the moving power of the whole measure. But if we were to believe the speeches that are made, medical men, instead of being the saviours of the race, are the enemies of mankind. The country is determined not to be ruled by them, and yet it keeps continually giving them new powers. This means that communities are acting like individual patients in this matter. They try to resist the admission that they are in a state requiring an abnegation of their own will and a submission to their medical advisers. They yield, however, whilst they are remonstrating. And thus everywhere all communities are appointing their own public doctors, which will in future lead to a fine field for medical men educated up to this end. The education of a private practitioner, however, requires to be supplemented by further knowledge for the performance of public duties, because these require a special knowledge, which is gradually methodising itself into a special part of medical practice. Can there be an example of more unselfish labour than the effort of a medical man to extirpate disease, on the existence of which his daily bread depends?

Referring to the causation of epidemics, Dr. Playfair showed how Sydenham, sagacious as he was, did not look around him, but beneath him, for the origin of epidemics. He thought these originated from the bowels of the earth. Now we have learned to find their origin in our immediate surroundings. The physician has to cure his patient, trace the origin of disease, and prevent its recurrence. In the performance of such noble duties there will disappear those relics of prejudice against the medical profession still lingering in society.

On the burning question of vivisection Dr. Playfair said many wise things. He admitted that there has been much unnecessary indifference to suffering in experiments made on living animals, especially in foreign countries. This truth justifies attempts at legislation, so that experiments may be conducted with the view of obtaining the scientific object in view in the most humane

manner. In concert with Mr. Darwin, Mr. Huxley, and Dr. Burdon Sanderson, he tried to frame a code of morals which might be accepted by physiologists as an example of the manner in which such experiments ought to be conducted, for he fully recognised the fact that the law would be powerless to restrain such operations if it were so severe and unreasonable as to drive the operators to perform them in secret. No system of registration, and no inspection, would enable the law to discover individual experiments performed in private, if it were the interest of the experimenter to conceal them. To be operative the law must enlist the sympathies of scientific men on its side. Unless this were the case, it were as well to expect an experimentalist to publish the contortions of a frog as to expect a keen fisherman to tell the Society for the Prevention of Cruelty to Animals how a frog writhed on the hook when used to angle for pike. A reasonable law will find co-operators among scientific men, who would accept it as a guide, and as it would not obstruct science, but only obstruct cruelty, all nations would adopt it.

The very power, says Dr. Lyon Playfair, which we possess over the lower animals involves a responsibility in its exercise. It is no justification of voluntary infliction of animal suffering that Nature herself is cruel, and that the support of life is incident to death and suffering. If Nature were far more red-handed than she is, if the suffering we are compelled to inflict on animals daily and hourly were, as it probably is, a hundred or a thousand times greater than the physiologist ever perpetrates, this does not lessen his responsibility to avoid the deliberate infliction of pain in the prosecution of his ends. His knowledge of the structure of animals is an additional reason for applying his skill to avoid the unnecessary production of pain by all means which science can suggest. With respect to the views of those who would prohibit vivisection, even for physiological research, he, however, thoroughly disagreed with them. The investigation of vital phenomena by observation and experiment is making medicine a science, which, like all other sciences, requires a direct and careful questioning of Nature. It would be disastrous to the progress of medicine if we were to restrict the means of research in the sciences of anatomy, physiology, or even chemistry, by refusing to discoverers in these sciences the power to test their discoveries on living organisms. It is a mean view of scientific progress always to put the *cui bono* test to every experiment, though every discovery, however remote may appear its practical application, becomes ultimately beneficial to man.

Harvey had higher objects than the practice of medicine in discovering the circulation of the blood. Haller inquired into the nervous system, not with a view to the mere cure of disease, and was followed by Bell, Marshall Hall, Weber, Brown-Séguard, and many other physiologists, in a spirit of abstract physiological inquiry, though all their experiments have, like the sacrifices of old, brought collateral benefits to humanity.

This temperate and able defence of vivisection shows that the medical profession has in Dr. Lyon Playfair a most useful ally in carrying out the ideas of the scientific portion of its ranks in the House of Commons. We

doubt if any member of the House is equally imbued with the spirit of devotion to the physical sciences with Dr. Playfair.

THE PECULIAR PEOPLE.

NATURALLY the medical world has been greatly interested in the recent trials of some members of a sect which styles itself the "Peculiar People." It seems that a member of this curious sect, named John Robert Downes, surrendered last week to take his trial at the Central Criminal Court for the manslaughter by criminal neglect of his son, a child aged two years. The child is reported to have had pneumonia and pleurisy, and the parent did not obtain any medical assistance, but had it treated in accordance with the tenets of his fellow-religionists—*i.e.*, by anointing with oil and laying on of hands and prayer. The father, however, is stated to have given the child port-wine and nourishing food. The jury in this case found the prisoner guilty, but added that they considered that he was acting for the best, according to his theological beliefs, and that what he did was intended for the benefit of his child. The jury added, too, that their opinion was that the law ought to compel persons to obtain medical advice for their children when ill. The Judge (Mr. Justice Blackburn) delayed judgment in order that the Court of Criminal Appeal might consider the question of law as to the obligation to obtain medical advice, allowing the prisoner to go at large on bail in the meantime.

The question raised by this case is one of great and grave importance. It will at once be clear that in certain cases the consequence of such an act on the part of a parent would be the destruction of the child. Supposing that a child have dislocation or fracture, no one would for a moment urge that an ignorant father or mother should be allowed to have it treated by prayer and supplication, nor would it be justifiable for one moment for any parent to treat a rupture of an artery or a gun-shot wound by the simple laying-on of hands. Even in the matter of vaccination we no longer permit parents to refuse to give their children the benefit of that great boon, because, forsooth, it may counteract the will of what they are pleased to style Providence. Nay, in Prussia and elsewhere compulsory education of children is considered to be one of the duties of the State.

Taking all these things into consideration, it may be asked—Is it not equally clear that parents should always be compelled to seek medical advice whenever their children are seriously ill? This is by no means a question which admits of a very clear solution. The art of medicine, although enormously advanced in modern times, is as yet by no means a certain one; and hence it may be that in many instances the calling-in of a medical practitioner may not prove of any very signal service,—nay, it is quite possible that a medical man, even of great ability, may occasionally do harm instead of good. Thus, the excessive blood-letting of former days and the excessive stimulation of very recent times may often have done much to hasten the fatal result in patients affected with some dangerous affection; and hence we ought not too hastily to stretch the analogy of cases where diagnosis and treatment are so obvious, as are most of the surgical class, to the obscure-

and more abstruse points which call for the discrimination of the physician.

For instance, is it not clear to most of us that in calling in the assistance of a homœopathic practitioner the patient is doing very like the parent in this case? In so far as the disciples of Hahnemann follow out the precepts of their master and prescribe infinitesimal doses of drugs, what difference is there between that faith and that of the Peculiar People, but one of degree? Can anyone contend that the millionth of a grain of *pulsatella* is more efficacious than the laying-on of the hands of the elders, or than the anointing with oil? If so, he is a daring man. Well, there is in England a very large number of persons, not belonging to the sect of Peculiar People, who call in the assistance of homœopathic practitioners, whatever be the disease they are labouring under. Nor must we forget that judges on the Bench and all sorts of high dignitaries in this country and in America are of the homœopathic persuasion. And yet no one has suggested that the parents of children treated by homœopaths should be prosecuted if the children die.

Again, it is well known that any person in this country has a right to practise medicine. Bone-setters seem even yet in England to be largely employed; and in London we have heard of at least one such person who, without any diploma, was driving a good business. And in a country where so much of the doctoring of the children of the poor is done by chemists over the counter, it does seem anomalous to say that the law should compel a parent to call in a practitioner of medicine when his child is ill. As Lord Dundreary is reported to have said, this is a question which no person can understand. What between old-women doctors, midwives, and homœopaths, not to speak of dispensing and prescribing druggists, we cannot see how the public are to be compelled to call in a medical practitioner of the orthodox school, save in the very rarest exigencies.

It may be rejoined that in the case of homœopathic practitioners, the patient, at any rate, calls in a legally-qualified practitioner of medicine; but does that much alter the question? Is it not quite well known that the majority of orthodox practitioners will not meet a homœopathic practitioner in consultation? This shows that they are considered by such persons to be quite as dangerous to their patients as if totally unqualified by law.

Summing up the arguments on both sides, it may be said, we opine, that the present state of the law is perhaps the only tenable one until medical science shall have become still further advanced and more accurate than it can at present pretend to be. The rule of *caveat emptor* must be left to apply to most of the cases which occur in life. If a patient is either too stupid or too ignorant to know how to find out an able medical practitioner, we must even let him alone. There are cases, however, in which this would be absurd, and such are those of vaccination. It is, we think, now agreed upon by the whole of the medical body throughout Europe that vaccination of children is of immense importance; and as the majority must rule, it is perfectly right that all children should receive the benefit of a practice upon which there is so little doubt of the immense advantages as is the case in vaccination. In the case of fevers, pleurisies, or diseases

of the internal organs, the treatment is as yet too uncertain to admit of the majority trying to lay down any fixed laws; and hence parents ought not to be prosecuted if they omit to call in a doctor, however foolish they may be in not doing so. In surgical cases, again, there are many instances where the omission to call in skilled aid would prove fatal; and here possibly the law might force the parent to call in legal medical assistance.

The Peculiar People are doing good service to the discussion of this knotty question by affording so frequently as they are doing at present cases for the consideration of judges and juries. It is not for us to insist upon making our services obligatory on our fellow-citizens. The business of the medical man is to make himself so thoroughly acquainted with the mysteries of Nature that he shall become necessary to the well-being of the laity without force, but merely because it becomes as clear as the sun at noonday that those who neglect to call in medical aid are injuring themselves.

THE IRISH PHARMACY BILL.

THIS Bill, which has been twice postponed, was down for second reading on last Monday. On that evening Dr. Lyon Playfair had given notice that he would ask the Chief Secretary for Ireland the following questions:—(1) How many licentiates are there of the Apothecaries' Hall in Ireland who restrict themselves to pharmacy; that is, who do not at the same time practise medicine or surgery? (2) And is there any other class of chemists and druggists in Ireland who can legally dispense medicines according to prescriptions? And Mr. Salt had announced that he would move that the Bill be read a second time that day three months.

Meanwhile the English Pharmaceutical Society has been in motion. It has addressed a letter to the President of the Medical Council, in which it claims the assistance of the Council on the sole ground that the principle of separate controlling bodies for England and Ireland is at variance with the idea of uniformity of education to which the Society seems to think the Council has pledged itself. The Council has done nothing of the sort, but has expressly sanctioned the formation of a separate conjoint examination board for each division of the kingdom, and if, therefore, it is to act upon its expressed opinions, the Council must refuse its aid to the Pharmaceutical Society in the effort to centralise the entire control of British pharmacy in London. As might be anticipated, the Society has effectually frightened a crowd of its licentiates through England by crying "mad dog!" against Irish apothecaries, and of course the crowd have petitioned for protection of themselves from anything like trade competition; but we imagine such petitions will receive little consideration from Parliament. Sir M. H. Beach has accepted the principle of complete reciprocity, and desires, while making the Irish examinations and fees perfectly conformable with those of England, to accord similar privileges to the licentiates of each country. The English Society does not pledge itself to any detail whatever, but goes simply for securing the control of Irish pharmacy for themselves. Meanwhile the Irish Colleges of Surgeons and Physicians have adopted the

Chief Secretary's Bill, and petitioned in favour of its principles. In Ireland there is a unanimity of opinion throughout the entire profession in favour of the measure, while in England even the Council of the Pharmaceutical Society itself is the arena of intestine war in reference to the subject. Mr. Schacht, Mr. Sandford, and others of the most influential representatives of the pharmaceutical chemists are vehemently opposed to the proposition to extend the operations of the English Society to Ireland, and in a stormy debate on the subject in the Council on the 2nd of June, Mr. Schacht said that "there were not the materials in Ireland to carry on a society that there were in England or Scotland, and therefore to pledge themselves to at once extend the operations of this Act was a step he could not sanction for a moment. The Committee had not contented itself with opposing what was wrong, but it had proceeded to enunciate not only for itself, but for the whole body, which for the moment it was supposed to represent, sentiments which had never been fully discussed in the Council or elsewhere, and certainly had never been adopted. He had heard two or three discussions upon this subject, which had always run in this direction, that if the Irish pharmacists were anxious that the provisions of the Act should extend to that country, then the Society was willing to discuss the question with them."

The *Globe*, an influential Conservative paper, has taken up the question, and writes as follows:—

"Some years ago the directors of the Irish Apothecaries' Company conceived the idea of converting the pharmacy licence into a medical degree, and thereupon imposed on its licentiates a varied and comprehensive curriculum in anatomy, surgery, midwifery, and similar purely medical subjects. The effect of this policy has been practically to prohibit those who might desire to practise pharmacy from doing so, they being deterred by the expenses connected with fees to professors, and by the necessity of devoting time to the mastery of subjects which were not likely to be of practical value in their calling. Accordingly, the demand for the licences of the Irish Apothecaries' Hall has dwindled down from year to year until the point has been arrived at when the gross earnings of the corporation from that source fell to £10 yearly. *Pari passu* with this diminution of the demand the supply of competent pharmacutists for Ireland became manifest, and deplorably inadequate. To meet this deficiency, which was every day becoming more urgent, the Apothecaries' Company promoted a bill to enable them—while they still retained their licence as a medical degree—to create a new and subordinate class of licentiates. This proposition was vehemently resisted by the Irish College of Physicians, and by the chemists and druggists, who in a great measure supplied the want of qualified apothecaries, and the solution of the difficulty was placed last year by the House of Commons in the hands of a select committee. This committee advised that a pharmaceutical society for Ireland should be created, to whom might be confided the examination of Irish pharmacutists and the general supervision of pharmacy in that part of the kingdom. The Chief Secretary for Ireland has embodied this recommendation in his Bill now before the House. The Pharmaceutical Society of England have opposed

this measure, on the ground that the standard of qualification in this country might be lowered, inasmuch as equal privileges of practice are conceded to the licentiates of either society. The objection is not without weight, and the framers of the Bill have amply provided for it, Sir M. Hicks-Beach having not only secured as far as possible equality of educational requirement, but having suggested an *ad eundem* examination might be made a condition precedent to being admitted to practise in England. The high rank sustained by the Irish schools of medicine and surgery is well recognised in this country, and as the Colleges of both Physicians and Surgeons have pronounced themselves strongly in favour of the measure, their verdict upon it must carry considerable weight.

Notes on Current Topics.

The General Medical Council.

THE Medical Council opens its session to-morrow (Thursday) at 2 o'clock. Mr. Rolleson will take his seat as representative of the University of Cambridge, and the Executive Committee will then present its report as to the Bills before Parliament relative to registration of foreign degrees, and relative to the College of Surgeons of England. The next business will be the hearing of any further remarks of members on the reports of the visitors of the examinations of the licensing bodies which were visited in last year,—viz., the Colleges of Physicians and Surgeons of Edinburgh, the Faculty of Physicians and the University of Glasgow, the College of Surgeons and Queen's University in Ireland. The reports of visitors of examinations on the Universities of Oxford, Cambridge, Dublin, Durham, Aberdeen, and St. Andrews, and on the Colleges of Physicians and Surgeons of England, and the College of Physicians and Apothecaries' Hall of Ireland will be presented.

The question as to whether or not diplomas in State medicine are to be placed on the Register will also come under the consideration of the Council; and a communication from the Committee of Reference as to the Conjoint Examination Scheme for England will be laid before them.

It is probable that this business will more than occupy the first day's sitting; but there is other important matter for discussion.

Miss Greenstreet, who, as our readers will recollect, obtained the midwife and nurse's diploma from the Irish College of Physicians, has applied to the Council to register it as a diploma in midwifery; and Mr. Macnamara has two important motions in hand which he has given notice that he will bring under consideration. The first is a proposal "That all examinations on anatomy should, so far as practicable, include the performance, by each candidate, of actual dissections; and that all those on surgery should include the performance by each candidate of two or more operations on the dead subject;" and the second is, "That the Executive Committee, in their future selection, shall arrange that, so far as practicable, visitors shall not be called upon to report upon examina-

tions held in that division of the kingdom in which the visitors themselves may be resident."

Mr. Hardy and the Profession.

THE reply of the Secretary at War to the influential deputation of the Irish College of Surgeons which waited upon him at the War Office contained, it appears to us, little more than the usual official excuses for non-compliance with what we think to be the fair and reasonable requests made on the behalf of the 938 medical officers of the army, no less than 412 of whom possess qualifications granted by one or other of the Universities or Colleges of Ireland.

In October, 1858, clause 17 of a Royal Warrant directed that the relative rank of medical officer should "carry with it all precedence and advantages attaching to the rank with which it corresponds (except as regards the precedence of courts-martial, where our will and pleasure, wrote the Sovereign, is that the senior combatant officer be always president), and shall regulate the choice of quarters, rates of lodging, money, servants, forage, fuel, and light, or allowances in their stead, detention, and prize-money. But where a medical officer is serving with a regiment or detachment, the officer commanding, though he be junior in rank to such medical officer, is entitled to preference in choice of quarters." In effect, the deputation of the Royal College of Surgeons in Ireland was asking for little more than the restoration of a former right enjoyed by the service from the close of the Crimean war until the disastrous Warrant of 1873—the compulsory retirement of the higher ranks in order that the prizes of the profession might be open to the junior officers before they would be compelled to retire, and an increase in the voluntary rate of ineffective pay, absolutely necessary as an inducement to the senior officers to leave the service and relieve the present plethora which exists and bars all hope of promotion. It seems to us that these points are of far more importance than any question of organisation. We have always thought this, and regret that differences as to relative advantages of the staff and regimental system should have been laid hold of as an excuse for a do-nothing policy on the part of the Government. Dr. Lush will again raise the whole matter on Friday in the House of Commons, and as the question is to a very great extent an Irish one, we hope that those of our readers who have Parliamentary influence will ask their friends to be present to support the honourable member in demanding for our profession the restoration of its former privileges, a definite guarantee of promotion, better terms of retirement, and a proportionate share in the good things of the service, now almost exclusively held by combatant officers.

The Council of the Irish Medical Association.

AMONGST the reasons alleged against the Irish Medical Association by the promoters of a rival organisation was the statement that the Council of the Association was a conclave of Dublin surgeons, and did not represent the Poor-law medical officers of Ireland. This charge never had any real foundation in fact, and is now totally untrue. On

examination of the list of the thirty-nine officers of the Association recently appointed at the general meeting, we find that twenty-six of them (including the president, four vice-presidents, secretary, and twenty councillors) belong to the Poor-law and Medical Charities Services, and four others have held Poor-law appointments, from which they have retired. It cannot be said that the provinces are not adequately represented, inasmuch as twenty-six of the thirty-nine officers are provincial, and thirteen metropolitan. It is right and reasonable that this numerical predominance of the country men should exist to neutralise in some respect the difficulty which they experience in attending the Council. They may aid the Association and maintain their influence in its management by communicating their views and keeping the Council fully informed by letter of the feelings and necessities of their provincial brethren, and the Council will look to them to adopt this course if it be impossible for them to be present at its meetings in person.

Vesico-Vaginal Fistula Cases by Professor Deroubaix.

THE *Presse Méd. Belge* of the 16th May contains a case of vesico-vaginal fistula operated on by Professor Deroubaix. As this is a very important operation we make the following notes from the report:—

Thérèse M., of Hal, a strong woman, aged 31, was confined seven months ago. Labour lasted for two days, and immediately after the birth of the child the urine came away by the vagina. Since that date micturition was no longer performed.

The orifice, which communicated between the bladder and vagina, was very small; it was situated in the middle line, and behind the neck of the bladder. The patient, who entered into hospital on the 24th March, 1874, was operated on on the 30th. The paring of the fistula was made circularly, and as widely and carefully as if the orifice were more considerable. Eight points of metallic suture completed the operation, which lasted only twenty minutes.

No catheter was kept in, but one was passed every three hours. The diet and regimen was that recommended for women in such a condition. Constipation was carefully kept up. The patient did not complain of anything: the appetite remained good, she slept well, and there was not the slightest reaction. The threads were removed on the 9th April, when the cure was found to be complete. The constipation was kept up until the 12th, and on that day an oily enema was administered and the bowels opened. Patient quitted hospital on the 14th.

Unregistered Ship-surgeons.

ON the motion of Captain Pim, a return has just been presented to the House of Commons "of the names, ages, and nationalities of persons who have served in the British Merchant Service during the last two years as surgeons whose names do not appear in the Medical Register." The intention of the hon. member in asking this information was obviously to expose the gross abuse which is prevalent of sending crews to sea without any competent provision for their medical care in case of illness. If this be Captain

Pim's object the return before us not only justifies him in asking for the information, but establishes beyond a doubt the fact that a most scandalous state of things exists in regard to the medical service of the Merchant Navy, and that an illicit practice is carried on under the guardianship of the law at the expense of our seamen, and under circumstances which leave them altogether without protection against incompetency of the *soi-disant* ship-surgeons.

It appears from the return that there are as many as 228 unregistered persons acting as ship-surgeons in our Merchant Service. It does not, of course, follow that because they are unregistered they must be unqualified. The office of ship-surgeon is not one of those which the Medical Act prohibits an unregistered person from holding, and, if it were, the Medical Council is sufficiently negligent in enforcing registration to allow of many unregistered practitioners holding public medical offices contrary to the law. The ages of the ship-surgeons in Captain Pim's return show, however, that in many instances registration is impossible, and it may fairly be assumed that in the great majority the persons who, being unregistered, take medical charge of ships, are not registered because—being unable to obtain any legal qualification—they are driven to accept the only medical responsibility which the law permits him to hold. Of the 228 names in the list 77 are of persons who state their ages under 25, and 16 of ages under 20. It is not improbable that such persons rather overstate their years in making such returns, and it may therefore be reasonably concluded from these figures that the charge of our merchant seamen is to a great extent in the hands of unqualified and semi-competent men. If we had a tribunal with any earnest disposition to adjust the affairs of the profession which require their interference, we might hope that this state of things would be speedily remedied. Having only the Medical Council or the Board of Trade to look to, we assume that nothing will be done.

Fatty Heart.

At a meeting of the New York Pathological Society, on April 14th, Dr. Delafield presented a specimen of fatty degeneration of the heart from a patient, a gentleman *æt.* 71, who had led a very healthy life, and been in a very healthy condition. About a year ago, when travelling in California, and walking up and down hills, he noticed that he was short-winded. This, which was only a temporary feeling, did not give him any anxiety. About five weeks ago, whilst driving, he partially lost consciousness, but found his way home by aid of a neighbour. At the autopsy it was noticed that the skin was of unnatural whiteness. The lungs were œdematous. The heart was not enlarged, but was very pale and flabby. It was very evident on looking at the left ventricle that it was fatty, and a microscopic examination confirmed this conclusion in regard to the pathological condition alluded to. On the inner side of the left ventricle the markings of the muscular tissue were entirely gone, but on the periphery of the heart the muscular tissue was less fatty. The interest of the case was connected with the existence of fatty degeneration of the heart of a well-marked character, and yet without any prominent symptoms during life. Dr. Loomis remarked that the size of the heart's cavities had a great deal to do with the cause

of death. When there was a great deal of dilatation a very small amount of fatty degeneration might be a sufficient cause of death, and *vice versâ*. Whenever there was a feeble action of the heart, and indistinct first sound, indistinct apex beat, with increased area of dullness, the prognosis was apt to be unfavourable, but when there was no evidence of dilatation the chances of living were good.—*New York Med. Record.*

Dr. Armor on Tuberculosis.

DR. ARMOR, in a clinical lecture at Long Island College Hospital, reported in the *Medical and Surgical Reporter* of May 8th, says that the relation of scrofula to tuberculosis has recently been invested with peculiar interest; therefore the views of Laennec prevailed—*viz.*, that "phthisis always depended upon tubercle." Laennec regarded tubercle as a primary neoplasm, *i.e.*, a new formation of a peculiar character, and utterly denied that tubercular matter ever had its origin in inflammation. Laennec had, and has to-day, many followers.

More recently, however, we have the new views of the German school, who teach that in many cases the disease is local, *i.e.*, due to causes acting directly upon the lungs, or to morbid conditions seated in these organs, and to this view, although educated in the Laennec school, every-day clinical observation more and more inclines him. To Niemeyer, as a representative of German thought, we are indebted for the fact that tuberculous disease is seen in persons whose lungs or other organs contain old caseous deposits, the deposit of tubercle being a secondary condition. In comparatively rare cases, however, he confesses that tubercle may proceed from other causes, of whose nature we are ignorant. At the present time, therefore, according to the German school of pathology, tubercle is represented in two typical modes of appearance—one local and inflammatory, the other disseminated and constitutional.

In the case before us you notice a tendency to enlargement of the lymphatic glands. This irritable condition of the glands often escapes observation; it appears to come on spontaneously; it is often attributed to colds; whereas in the background, if we carefully study the case, we shall detect the true scrofulous diathesis. It may first manifest itself in non-inflammatory engorgement of the lymphatic glands, in enlarged tonsils, eruptions on the face, otorrhœa, conjunctivitis, ulceration of the cornea, and tendencies to croup; all such conditions in childhood tend in the direction of pulmonary phthisis in more advanced life. I do not mean to say that the scrofulous diathesis depends upon scrofulous material in the blood. This view is almost universally abandoned, and I think justly so. The alterations that take place are evidently of an inflammatory nature; we have a low grade of inflammation in a peculiar diathesis; there is a constitutional tendency to glandular enlargement from profuse cell formation, known by the modern name "cellular hyperplasia." The tendency of this cellular hyperplasia occurring in scrofulous constitutions is in the direction of cheesy degeneration, which degenerate material, when softened, is taken up by the absorbents and capillaries, carried to the lungs, and there deposited in the form of capillary emboli, and around these emboli tubercular

matter is deposited. In some forms of pneumonia, especially chronic catarrhal pneumonia occurring in the scrofulous constitution, the same results take place.

Now, it may be asked, What good is to be derived from the change in views of the pathology of consumption? I answer that good things may be expected to follow true things. Let us seek for truth and trust to the practical application that may result therefrom. If we clearly recognise a consumptive diathesis, an underlying scrofulous inflammation that gives rise to the infiltrated granular tuberculosis of the older pathologists, it at once invests the disease with a larger element of hope. It puts us in the way of adopting a more rational prophylaxis. It suggests the importance of regulating all the agencies by which we live, such as diet, muscular exercise in the open air, sunlight, and such medicinal substances as strengthen and build up the nutrition. With children showing a tendency to scrofula in early life, a rational and efficient hygienic influence should be insisted on, and carried out to the fullest extent. The "new views" stimulate us to new endeavours to devise means for the arrest of this fearful malady; whereas, according to the old view, it is useless to attempt, even in the early stage of the disease, any rational therapeutics, as the lungs are the seat of a neoplastic deposit, the structural changes are beyond the reach of art, the result is merely a question of time. For the patient before us we shall prescribe fresh air, out-of-door life, warm clothing, good nourishing food, with cod-liver oil and hypophosphates.

We fail to see in what way the treatment recommended by Dr. Armor differs from that of the disciples of Laennec. It is confessed by all persons who have seen much of phthisis that cases of this disease occasionally recover, when the patient is carefully treated and in good hygienic circumstances. Neither Dr. Armor nor any other physician can, we assume, promise more than this. Hence, although the views of Niemeyer may seem more hopeful to Dr. Armor, they must, after all, be judged not by this standard, but by their accordance with clinical observation. And there is already a reaction against the "new views," both in England and in France and Germany.

The International Medical Congress.

THIS body meets the present year in Brussels, September 19th. The following are the questions to be discussed:—

1. On the Prophylaxis of Cholera.
2. On Alcohol in Medicine.
3. The Inoculability of Tuberculosis.
4. Anæsthesia in Surgery.
5. The Dressing of Wounds after Operations.
6. On Lying-in Institutions.
7. The Vaso-motor Nervous System.
8. The Value of Experiments on Artificial Circulation.
9. The Prophylaxis of Phosphorus Poisoning in the Arts.
10. The Organisation of Sanitary Bodies.
11. The Brewing of Beer.
12. The Military Relations of Optical Defects.
13. The Means of Measuring the Acuteness of Hearing.
14. The Military Relations of Aural Defects.

15. The Universal Pharmacopœia.

16. Is it Desirable to extend the Use of Chemical Radicals in Therapeutics?

New Books in Medicine, Surgery, and Science.

A Hint to Ophthalmologists.

A YOUNG man, named Doyle, lately brought suit, in New York, against the Eye and Ear Infirmary and Dr. R. Derby, to recover 100,000 dols. for the loss of his sight.

The complainant charged that Dr. Derby had applied a brush to his eyes that contained pus from the eyes of a patient suffering with malignant ophthalmia, thereby causing his blindness. He testified that he saw Dr. Derby use the same brush on a number of patients.

The defence testified that there was no such case of ophthalmia as was mentioned in Doyle's testimony in the infirmary, from which purulent matter of the kind described could be obtained; and if there had been, and had that matter been on the brush with which Doyle was treated, the solution of nitrate of silver which was applied to Doyle's eyes would have killed the virulent properties of the pus.

The judge reviewed the whole testimony on both sides thoroughly, and then said that the question for the jury to decide was, whether Dr. Derby, in his treatment of Doyle, on the 12th of February, used a brush that he knew had been used on another patient, and that he knew had been inoculated with purulent matter, without cleansing it. If they thought he did, the verdict would be for the plaintiff. If there was any doubt, then Dr. Derby was entitled to a verdict.

The jury were out only ten minutes. Then they returned with a verdict for the defence.

College of Surgeons of England.

PROFESSOR TURNER'S lectures on the Comparative Anatomy of the Placenta were commenced on Monday. The syllabus of his course comprehends: 1. Development, Form, and Structure of the Chorion; Structure of the Mucous Membrane of the Unimpregnated Uterus. 2. Changes which occur in the Uterine Mucous Membrane during Pregnancy; Structure of the Diffused Placenta; Structure of the Polycotyledonary Placenta. 3. Structure of the Zonular Placenta.

At the preliminary examinations for the diplomas of Fellow and Member of the College, commenced on Tuesday week, at Burlington House, by the Members of the College of Preceptors, no less than 312 candidates presented themselves for examination, of whom 85 for the Fellowship and 227 for Membership.

The Peculiar People.

THE Peculiar People, several of whose members are now awaiting trial on a commitment for manslaughter for not calling in medical aid when members of their body were sick, have resolved boldly to put to practical test the question as to whether medical aid is really a necessity or whether prayer alone is not sufficiently efficacious in all cases of sickness. For some time past a large twenty-roomed house, situated in Tower Street, on the north-east side of London Fields, formerly used as a homœopathic hospital, has been let: much excitement has been caused in the neighbourhood by the appearance outside the house of a huge board bearing the following inscription:—

"HOUSE OF FAITH
FOR THE
RECEPTION OF SUCH SICK
AS ARE
CONSIDERED HOPELESS INCURABLE
TO BE
HEALED BY THE PRAYER OF FAITH."

This inscription is followed by numerous texts of Scripture.

DR. R. P. COTTON and Dr. R. Quain have been made Consultant-Physicians to the Brompton Consumption Hospital.

DR. MARION SIMS will preside at the next annual meeting of the American Medical Association at Philadelphia.

DR. ROBERT J. LEE has been elected by the Board of the London Temperance Hospital one of the Visiting Medical Officers of that institution.

PROFESSOR GROSS, at a recent meeting of the American Medical Association, read a paper recommending the revival of blood-letting. As yet, no one seems inclined to take up the idea.

THE 26th annual meeting of the Dutch Association for the Promotion of Medical Knowledge will be held on the 22nd June, at Utrecht. Papers will be read on the 23rd and 24th.

MR. CHRISTOPHER HEATH has succeeded Professor Erichsen as Holme Professor of Clinical Surgery in University College, than which no better or more popular appointment could have been made.

THE annual distribution of prizes at St. Mary's Hospital Medical School will take place in the board-room of the Hospital on Wednesday, June 23rd, at 3 p.m. Mr. Grant Duff, M.P., will preside.

IN London last week there were 1,323 deaths registered, about 63 below the average in the corresponding week of the last ten years respectively.

PROFESSOR FLOWER had a large gathering of professional men and ladies at the College of Surgeons in Lin-

coln's Inn Fields on Wednesday last. The museum of the College is now most worthy of the attention of all persons, whether medical or merely amateurs in physiology and anatomy.

NOTWITHSTANDING the unpopularity of the London Hospital Saturday movement last year, a committee has been formed to arrange and carry out a collection on a similar basis to that of 1874. We hope this year the committee will not consider it necessary to spend twenty-five per cent. of the money upon expenses.

AN appeal for £20,000 was recently made for the erection of a new County Hospital at Lincoln. This appeal has been so far successful, that the amount asked for has been slightly exceeded by the munificent donation of £1,000 from Mrs. Clayton, of Lincoln. The event was celebrated by the ringing of the cathedral bells.

IN the House of Commons on Friday night Mr. Kirk directed attention to the Registrar-General's reports of deaths from small-pox in Ireland, in which it was stated that out of 123 deaths in Ulster 109 were attributed to emigration from Scotland. Mr. McLaren said that the charge of importing the disease from Scotland should be supported by the names of the boards of guardians in fault. Sir M. H. Beach said that no doubt the reports were true, but he was unable to give any further information on the subject.

THE terrible epidemic of measles reported in the Fiji Islands is another instance of the dangers which arise to virgin people when some new disease is introduced into their midst. The way in which small-pox has decimated the Indian tribes, the history of the introduction of syphilis into Europe in 1492, and many other similar cases, might be cited as instances of the law that hereditary influences modify the severity of diseases very greatly. Probably the reason why the English people suffer at present so comparatively little from measles and from syphilis is that so many of their ancestors have suffered from these diseases.

THE UTILISATION OF SEWAGE.

It is generally admitted that the sewage question is one, if not the most difficult problem of the day. Experiments have multiplied, companies formed, and millions of money spent in endeavours to arrive at some satisfactory conclusion, with what result our readers are well cognisant. Next to our food supply, there is not a subject which so immediately concerns each individual member of the community, and medical men in particular, as this great social enigma. One sanitarian will tell you there is no method under the sun equal to the treatment of sewage by precipitation; the next finds out that your former adviser is connected with large chemical works, and advises irrigation. You are then met with the formidable obstacle that this latter process can only be carried out upon a dead level. Another advises the A B C process, because a certain company is making a good percentage on its invested capital, and therefore must be a satisfactory one. Finally, some enthusiast would tunnel the length of the country, and discharge the sewage of our millions from one gigantic mouth into the ocean. For

ourselves, we were never more strongly impressed with the value of filtration and irrigation than on Saturday last, when, in response to an invitation from Dr. Alfred Carpenter, Chairman of Committee of the Croydon Local Board of Health, we, in company with some sixty or seventy members of Parliament, members of the medical and other learned professions, inspected the Croydon Sewage Farm, which is situated at Beddington, about a mile distant. Among those present we noticed Earl Fortescue, Mr. J. Watney, and Mr. W. Grantham, the members for East Surrey; Mr. J. G. MacCarthy, M.P. for Mallow; Mr. MacLagan, M.P., Professor Voelcker, Dr. Bristoe, Dr. Gibbon, Mr. Ernest Hart, Dr. Russell, Mr. Henry Lee, Mr. Jabez Hogg, Mr. Carr Jackson, Dr. Fothergill, Dr. Gilbert, Mr. Cuthbert Johnston, Mr. Baldwin Latham, C.E., Mr. Simson, Mr. J. S. Wright, Mr. Howard Martin, &c., &c., together with many local magnates. The objects for which the inspection was invited, as Dr. Carpenter, in an admirable and very lucid manner explained to his guests, were:—

“To show that a sewage farm is not a swamp or marsh; that it does not injure the health of a neighbourhood; that it does not damage residential property, except from the ideal point of view; that it turns poor land into land capable of producing luxuriant crops; that its produce is beneficial to cattle; that cattle fed upon sewage produce are themselves healthy; that the food produced is fit for human consumption; that a large farm cannot be farmed successfully, except a large capital be invested in it; that the experience of sewage irrigation on the same land for fifteen years will justify the capitalist in putting capital into sewage agriculture.”

Now, although the weather proved to be most unpropitious, for the wind and rain together, almost before the inspection began, demolished the tent in which the visitors were expected to taste the produce of the farm, the fields were not converted into “a swamp or marsh,” nor were the roads through them very much the worse for the soaking.

Dr. Carpenter, having placed a plan of the farm in the hands of his friends, then proceeded to conduct them first to the filter, or straining-house.

The filter house is on the site of the old filtering tanks, which were immense nuisances to the neighbourhood; it is now the dust yard of a portion of the parish. By a very clever contrivance the crude sewage as it comes from the town sewers passes through one of Latham's strainers. The extraneous matters which are removed (*i. e.* lumps of *feces*, rags, paper, &c.) are mixed with dry straw and garden refuse, collected from the dust-bins of the town. The compost is thus rendered comparatively inoffensive, and is partly used on the farm and partly sold to market gardeners in the neighbourhood. The machine is self-acting, the sewage itself being the moving power. From the filters the visitors were taken to the main open sewer, and here the crude sewage was seen as it passes on to the fields. The sewage is perfectly fresh, about three hours being occupied in its transit from the most distant part of the district to the filter house.

On passing the main sewer the water makes its way to the fields, which are under cultivation, growing wheat, oats, rye-grass, potatoes, &c., in luxurious abundance. The second crop of rye-grass this year was then being cut, standing almost two feet high, and the land was shown by Dr. Carpenter to be capable of producing six crops in the year.

One field after another appeared to have been equally well farmed by the manager, Mr. Horsely. One piece of ground has been cultivated for market garden crops without other manure than sewage for three years, producing magnificent crops, the roots of grass, plants, &c., having by their chemical or vital affinity the power of attracting all the solid particles of sewage for their own fertilisation. In a meadow were seen some 100 head of cattle belonging to the Local Board, including calves, yearlings, and heifers. All the younger stock has been produced on the farm, and fed entirely on sewage produce.

Specimens of the effluent water as it passed into the river Wandle were exhibited. The analyses of Drs. Frankland and Hassall prove that this water, when it reaches the Wandle, is quite harmless, as further proved by the presence of fish, it being so clear and tasteless that many gentlemen drank of it.

A sumptuous and enjoyable luncheon, which was served in the barn, hastily provided for the purpose, consisted of—Bread and pastry from wheat grown upon the farm; beef and veal from animals bred on the farm; vegetables, salad, &c., grown on the farm; trout en *Mayonnaise*, obtained from the river Wandle, into which the effluent water passes; confectionery, made with milk, cream, &c., also from the farm. The luncheon over, a few appropriate speeches followed from the Chairman, Earl Fortescue, Mr. Grantham, and others, who all agreed that, although a farm under the management of a Local Board may not exhibit high class farming, model stock, or produce above the average in excellence, and for a good reason, because the ratepayers would not allow the expenditure of money for æsthetical purposes, common necessity alone being recognised as an excuse for the expenditure of capital, it is quite evident from what is doing at Beddington that, by the proper utilisation of sewage, our rivers may be kept from contamination and the health of the population increased, and that in that direction at least parochial boards may decrease the rates and confer a great benefit upon the community at large.

Literature.

FORTY YEARS OF AMERICAN LIFE. (a)

WE have lately had brought before us rather forcibly by the American Medical Association the condition of the profession in the United States. The picture is not altogether such as we could wish it; but those who were fortunate enough to be familiar with the writings of Dr. Nichols will not have been surprised at the revelations lately made. The first edition of the work before us was published in 1864 in two large volumes. The present edition is in a single volume, partly re-written, and with a few additions and corrections.

Dr. Nichols came to England in the first year of the great Civil War. His sympathies were all Southern. Nevertheless he was sufficiently impartial in his judgments to instruct as well as amuse the large circle of English readers which his forcible and elegant style attracted. During his residence in England, Dr. Nichols has contributed to our periodical literature, and has been the regular correspondent of a leading New York journal, and he announces that he intends to publish a companion volume to the one before us, to be entitled "Twelve Years of English Life, with Insular and Continental Explorations," which we have no doubt will be full of interest.

All who wish for information respecting America and its people may safely consult Dr. Nichols. We must, however, confine our own observations to his account of our own profession. He tells us that—

"The medical profession in America bears the evils of haste and irregularity incident to so many of its institutions. It is a country of many and violent diseases. . . . So, among a population of more than forty millions, there is work for a vast number of physicians. And the Americans, who do everything in a hurry, educate their doctors in their usual fashion. Nominally, it is required that the student shall read three years under some regular physician, during which time he must have attended two courses of medical lectures. If, however, he pay his fees, exhibit a certificate as to the time he has studied, or pretended to

(a) "Forty Years of American Life." Second edition. By T. L. Nichols, M.D. London: Longmans and Co.

study, and pass a hasty examination, made by professors who are very anxious that he should pass, he gets a diploma of *Medicina Doctor*. He has full authority to bleed and blister, set broken bones, and cut off limbs. But in most of the States there is no need of even this authorization. Anyone may practise medicine who chooses to set about it. No diploma is needed, and no licence required. This is the American idea of 'free trade and no monopoly.'

English medical reformers who advocate the one-faculty system, and those who despise specialities, may be surprised to learn that—

"There are no medical men, as distinguished from doctors; and also, as a rule, there is no distinction between physicians and surgeons. All practise medicine, surgery, and midwifery. This is necessary in a sparsely populated country; and though there are in the large towns physicians who have adopted some speciality, and surgeons of noted skill, the general practice is as I have stated it."

All the pathies flourish in America. All the thirty-seven States charter colleges and schools, and the result is that thousands of young men are dubbed doctors whose general and professional education are both lamentably defective. The profession is, then, at a very low ebb in the States, and sanitary science seems to have no place, except in the great cities. We are ourselves backward enough in this matter, but even before our recent legislation we were far ahead of America. There can be no great sanitary work without legislation—a fact clearly perceived by our author, who says:—

"Physicians are as benevolent and disinterested as men of any other profession; but it is still the evident fact that they do not devote themselves to the prevention of disease. It is not their business; and, what is more, it never will be, until they are paid for keeping the community in health."

Although we have not space to enter into other subjects, we may assure our readers that they are all treated in a manner which makes Dr. Nichols's book as readable as a popular novel.

DOBELL ON DIET. (a)

DR. DOBELL'S book on diet having reached a sixth edition, requires little notice at our hand. He intends it as one from which a medical man may refresh his memory, or which he may safely place in the hands of a patient. Its style is, therefore, popular, and the author includes much which in a book for medical men alone would be naturally omitted. Among the fresh matter in this edition we notice some remarks on smoking, extracted from the *Social Science Review*; a condemnation of the afternoon tea, which is becoming so fashionable; some remarks on the wholesomeness and digestibility of various articles of food; on getting thin and getting fat; on fat and starch in the nutrition of children; and on acid gout and rheumatism from fermented liquors.

Part II. of the work, "On the Interdependence and Prevention of Diseases, and the Diminution of their Vitality," is an abstract of some lectures delivered by the author at the Royal Hospital for Diseases of the Chest.

THE INDIAN ARMY (b).

"THIS short brochure," according to its author, "is devoted to a subject which is of the deepest interest, not only to all Anglo-Indians, but to all who have a regard for the stability of the Anglo-Indian Empire." These we find further on to be those minor reforms of a medical and

(a) "On Diet and Regimen in Sickness and Health." By Horace Dobell, M.D. Sixth edition. London: H. K. Lewis. 1875.

(b) "The Indian Army: Actual Defects and Proposed Remedies." By C. J. McNally, M.D., C.M., Surgeon Madras Army. Higginbotham and Co., Madras. 1875.

sanitary nature affecting the native army of Madras, with especial reference to the clothing, food, marriage, hospitals, diseases, and barracks of the sepoy, many improvements in which are suggested. The author points out that the loose and sensible dress of the native has given place to a uniform which makes the sepoy "little better than a caricature of the British soldier," and which gives us "the coat, but not the man." Foot-soreness is common, owing to roughly-made boots, worn without stockings, necessitating the frequent excusing of the men from wearing boots in quarters. Were it not for this, the author thinks that foot-sores would, at a moderate computation, increase the average daily sick by fully 0.3 per cent. Sandals were found scarcely less objectionable, owing to the difficulty of doubling with them, and to particles of gravel causing frequent annoyance and injury to the feet. By improvements in the cut and shape of the boot, the author thinks the difficulty might be got over, and the substitution of either stout canvas or a more pliant leather for the uppers. The trousers he thinks unsuited to the native habit of sitting on the haunches, and believes that a light zouave trousers terminating in a short canvas or leather gaiter, buttoned at the side, and fitting over the boot, would be much better. The tunic is stated to rarely fit the sepoy, and even when it does it is found to impede the free motion of the limbs. A Jersey vest and light zouave jacket would be an improvement, and not be open to any objections, "military, financial, or sanitary." An improved basket-work *topi* and the "realise equipment" are also advocated as substitutes for the present headdress and accoutrements. The diet is deficient in albuminates, and hence the poorly-nourished muscles and tissues of the native soldier. An increase in the quantity of meat, or of dhál, or some other leguminous grain, is recommended. Early marriages are shown in this little pamphlet to lead to many evils, among others the one of reducing many sepoys to a state of semi-starvation, owing to the demands of a large family. Restriction in the numbers allowed to marry is the remedy proposed. Our author advocates the re-appointment of an apothecary (European or Eurasian) to each native regiment, as being more competent than the ordinary hospital assistant to treat cases of emergency in the absence of the surgeon. The author thinks that the system as at present existing of the men dieting themselves in hospital is open to grave objection, and that owing to the scattered nature of Indian military cantonments, it would be extremely inconvenient to introduce the brigade, or division hospital system, now the subject of so much controversy at home.

Ague, which appears to be very prevalent, the author thinks might be reduced in frequency by better drainage of quarters, and more attention being given to water-supply, food, and clothing, ill-clad and under-fed individuals being naturally prone to chills and miasmatic influences. This little *brochure* concludes with some sensible remarks on climate, Guinea-worm, venereal diseases, &c., which are well worth perusing by those interested in the sanitary welfare of our sepoy army.

Correspondence.

QUESTIONS OF AURAL SURGERY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Under the heading of "Contributions to Aural Surgery," in the *Lancet* of May 29, Mr. Dalby coincides in the opinion held by successive generations of writers on aural surgery, that the most usual accident occurring in the ear is that of rupture of the membrane of the tympanum, and he gives the well-known causes which are the most frequent producers of this injury. But out of the twenty-two cases he details, he states that in ten the perforation did not heal. Now this is an unusually large proportion, and the question naturally arises if this was not due to the over-zealous attention of the surgeon. The less the interference in these cases,

the more certain will Nature prove all sufficient in the repair of the injury. But the examples given by Mr. Dalby of the loss of continuity in the membrane co-existing with defective hearing power, and not unreasonable to suppose influenced by such a condition of parts, will, I trust, be another plea in favour of the non-mutilation of the membrana tympani for the experimental treatment of deafness. Introduced by an eminent surgeon of this city, the hobby was ridden to death, and its—to use the mildest term—uselessness in ninety-nine cases out of a hundred induced Sir A. Cooper to abandon it. But of late years it has been revived, its most apparent and practical object being the opportunity it affords for extracting an operating fee from the patient. I cannot help thinking that Mr. Dalby arrives at a rather illogical conclusion from the deductions to be gathered from the cases he quotes; he states—and it is no doubt borne out by many authentic cases—that oftentimes the hearing capacity of an ear in which the membrane of the drum has been ruptured, and a perforation remains, is greater than in a similar injury where the membrane heals. But it by no means follows from this that the loss of hearing power is due to nervous shock. To quote Mr. Dalby's own words, "from the time of the occurrence of these accidents the hearing never varied;" in fact, instantaneous with the injury came the loss of hearing power. Now if this deterioration was due to nervous shock, it cannot be supposed but that the nerve would to a certain extent recover; other nerves would—why not the nerve of hearing? How are these conclusions arrived at? By the application of a tuning-fork to the cranial bones, the result being that the vibrations were less distinguishable on the side on which the membrane was injured. Mr. Dalby then says: "In fact, the perception to sound was affected, while the conduction through the tympanum was not." I confess I feel great difficulty in following this line of reasoning. It cannot be asserted that the vibrations of a tuning-fork arouse the action of the sense by the irritation of its centre? Then how does it act? Unquestionably in the most powerful degree by the same means that the undulations of sound waves produce hearing by the vibrations of the membranes communicated by their attachments to the bony parietes through which the vibrations of the tuning-fork are transmitted. The mere fact of the hearing power being less impaired where an aperture exists in the membrane than where it has healed is no guide to the diagnosis of the extent and complication of the injury. The extent and situation of the rupture may have been much more injurious in one case than in the other, and I have long come to the conclusion that it is in by far the majority of these injuries the transmittory gear has suffered, not the nerve, which is so wondrously protected. It is a very doubtful point that the deafness arising from a blow on the ear, or the effects of a loud explosion, with the consequent powerful agitation of the sonorous impulses, is dependent on injury sustained by the nerve. When we remember that it is by the chain of ossicles that the contents of the labyrinth is set to work, that from the impaction or loss of the stapes hearing is lost, is it unreasonable to suppose that the force with which the membrane is assaulted in either of these cases is sufficient so to derange the ossicular chain to which it has such intimate attachment as in some cases to depress the power of the sense and in others to annihilate its action? In cases where suppuration takes place in the tympanum, we have here a foreign body interfering with the ingress of sound waves by the natural channel; but the application of a vibrating tuning-fork to the vertex is communicated to the fluid in the tympanic cavity, which tends to intensify the vibrations, not to speak of the hyper-sensibility of a part in a condition of acute or subacute inflammation. The strongest argument in the cases given by Mr. Dalby against his opinion that when rupture occurs in the membrane of the tympanum followed by deafness, that it arose from nervous shock, is that the deafness never varied in any of these cases. The subject is one of considerable interest and of much practical utility, but its elucidation is surrounded with difficulty.

I am, Sir, yours obediently,

J. P. PENNEFATHER.

Harley Street, June 1st, 1875.

THE EXCLUSION OF IRISH MEDICAL MEN FROM THE HONORARY OFFICES OF THE BRITISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I hasten to express my regret that, misled by the

report that Dr. Matthews Duncan had taken an active part in organising the arrangements made for the forthcoming meeting of the British Medical Association, I charged him with being a party to, if not the main cause of, the slight put upon the Irish members of the Association. Dr. Matthews Duncan states that he has "no authority or responsibility whatever in connection with these appointments." Of course, therefore, he is not a member of the committee, on whom devolved the task of making the necessary arrangements. Although I was, I freely admit, wrong in attributing blame to Dr. Matthews Duncan, the fact remains that not one of the numerous members of the Association resident in Ireland have been deemed worthy of filling any of the honorary offices—thirty in number—which are comprised in the various sections.

Your correspondent "F.R.S." does not mend matters much. He insinuates that, "actuated by a vanity which springs from concealed weakness," I have "disturbed" "society." I beg to inform him that I merely stated what everyone spoke of here—namely, that a slight had been put upon Irish physicians and surgeons. He admits that what he calls the "omission" was "a little unfortunate," and that it "may" have been due to inadvertency. Such is not possible. He evidently speaks with a full knowledge of how the matter should be arranged, and that "inadvertency" is impossible. The Society is British, and the rule acted on hitherto was to have three divisions of the kingdom represented on some of the sections. Of course "it is impossible to please everybody," and I am not advocating the claim of one individual in preference to that of another. I merely advocate the claim of the Irish School of Medicine to be represented at our annual meetings, and I indignantly repudiate the imputation of having been prompted to take the course I have adopted from "a motive to excite or embitter professional animosity."

I am, &c.,

A MEMBER OF THE BRITISH MEDICAL ASSOCIATION.

Medical News.

Royal College of Surgeons of England.—The following members, having passed the required examinations were duly admitted Fellows of the College at a meeting of the Council held on the 10th inst. :—

Brietzcke, Henry, L.R.C.P. Lond., H.M. Prison, Millbank.

Chicken, Rupert Cecil, L.R.C.P. Lond., Nottingham.

Cripps, William Harrison, Pall Mall, S.W.

Doran, Alban Hy. Griffith, L.S.A., Lansdowne Rd., W.

Eastes, Thomas, L.S.A., Folkestone.

Green, Frederick King, L.S.A., West Dulwich.

Herman, George Ernest, L.S.A., Bethnal Green.

Ley, John William, L.S.A., Poplar Hospital.

Lowe, Walter G., M.B., L.R.C.P. Lond., Burton-on-Trent.

Macnamara, Nottidge Chas., Medical College, Calcutta.

Pye-Smith, Rutherford J., L.R.C.P. Lond., Guy's Hosp.

Repe, Henry John, Blaxhall, near Wickham Market.

Walsham, Wm. Johnson, M.B., C.M. Aberd., Camden Road, N.W.

London Hospital Sunday Fund.—Up to the time of our going to press between £5,000 and £6,000 had been received at the Mansion House, which is considered satisfactory, as there were still over a thousand places of worship from which the collections had to come in.

The Apothecaries' Hall (Ireland).—In the House of Commons last evening Sir M. Beach, in reply to Dr. Lyon Playfair, said there were very few licentiates of the Apothecaries' Hall in Ireland who restricted themselves to pharmacy, and who did not at the same time practise medicine or surgery, and there was no other class of chemists and druggists in Ireland who could legally dispense medicines.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a distinctive signature or initials, and

avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1874—£12s. 6d., at the offices in London, Dublin, or Edinburgh.

COLLEGE OF SURGEONS OF IRELAND ELECTION.—By a typographical error in a portion of our last edition the number of candidates given was 80; it should have read—"There were as candidates," &c.

J. ALTON HATCHARD.—The points you raise are most important to the health of so large a residential community, and also to the visitors, of whom, as you rightly observe, there are a large number of invalids. We shall not fail to keep the matter under notice, and should occasion arise—we trust it will not—we shall not hesitate to express an opinion upon the subject *pro bono publico*.

The following specimen of poetical effort of a druggist in England, who has stimulated his trade by the publication of an idyll called "The Poetry of Health," is quoted by the *Chemist and Druggist* in its last issue :—

If you are troubled with a cough,
And thick phlegm your throat does stuff:
Take some squills, Ipecacuanha,
And nitre in a regular manner.

When infants' eyes and nose drizzles
With red rash—oft have the measles;
Keep them warm, give saffron tea,
And a powder—soon well they'll be.

When you have an attack of bile,
Out-pour a dose of castor-oil;
If of plethoric habit—ought
To take a blue bill and black draught.

DR. GARRETT AND "PUBLIC OPINION."—Dr. Garrett has written a book on "The Human Voice: its Anatomy, Physiology, and Ailments." Dr. Garrett (or the publisher, Churhill) sends the work to *Public Opinion* for review. The reviewer criticises the work and its author thus :—

"Our little friend cuts but a sorry figure in the literary world. Did he only explain whether this is a popular or a medical work we might know better how to deal with him. Is it not slightly dangerous most learned doctor, to advise non-professional people to take such drugs as prussic acid, hemlock, &c., for a sore-throat? All this is doubtless very beautiful in the author's eyes," &c., &c.

To begin with, Dr. Garrett is not a little friend of anybody's; he is a man beyond the average size, and wears large spectacles. Moreover, he has seen this criticism in the paper called *Public Opinion*, and strongly objects thereto. Dr. Garrett's letter is too long for us to quote at length but the following extracts will explain his feelings as expressed in the offending journal of June 5th :—

"The law assumes that every published work is public property, and amenable to just and fair criticism. The law, at the same time, gives protection to authors against the reckless scribbler—the pseudo-critic, who, under pretence of reviewing your work, labels your professional reputation, falsifies fact, suppresses truth, and indulges in a simian grin of satire at a few fragments which he selects for his purpose, and fully suppressing the context, and wholly ignoring the subject-matter of the book. Now, Sir, I charge your reviewer of my treatise with all these acts of misconduct, and further with having garbled and mutilated the extracts he has quoted so as to make them perfectly incomprehensible nonsense."

Further on our author says, "Let us proceed with this contemptible review, *pauca majora canamus*," and winds up with the following advice to the editor :—

"I have now proved every charge I set out with, and I advise you, Sir, to employ for the future men competent to deal with scientific subjects, and to discharge their duties with fairness, honesty, and courtesy."

This comes of submitting medical works to lay criticism. Dr. Garrett has lost his temper, which is unwise. Dr. Garrett would have shown better judgment not to have sent his book in the first instance, but when sent, should have submitted to the criticism its editor deemed the work deserving of. *Public Opinion* is neither a medical nor a scientific journal, and does not pretend to be.

VACANCIES.

Royal Free Hospital. Surgeon. Applications, with testimonials, to be forwarded to Mr. Blyth, the Secretary. (See Advt.)

Limerick Union. Resident Medical Officer. Salary, £50 per annum, with rations. (See Advt.)

Hospital for Consumption, Brompton. Resident Medical Officer. Salary, £200 per annum, with board and residence. Applications, with testimonials, to Mr. Henry Dobbin, at the Hospital.

County Down Infirmary. Assistant Surgeon and Registrar. Salary, 60 guineas, with board and apartments. (See Advt.)

Kenington Dispensary. Resident Medical Officer. Salary, £150. Particulars of the Hon. Sec.

Hospital for Women, London. Physician. Particulars of the Secretary.

Hospital for Sick Children, London. House Surgeon. Salary, £80 per annum, with board and apartments. Address the Secretary.

St. George's Hospital Medical School. Teacher of Physiological Chemistry. Applicants must address the Dean.

Westminster Hospital Medical School. Lectureship on Materia Medica. Particulars of the Dean.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION. SESSION 1875.

In presenting our readers, according to our annual custom, with a detailed, though necessarily abbreviated report of the proceedings of this august body, we would crave the indulgence of its members by anticipation for any errors which may occur. The faulty acoustical properties of the theatre in which the meetings take place must be held responsible for our shortcomings.

THURSDAY, JUNE 17th.

Present—Dr. Ackland, President, in the chair; Dr. Bennett, Mr. Quain, Mr. Bradford, Dr. Humphry, Dr. Pyle, Dr. Storrar, Dr. Andrew Wood, Dr. Fleming, Mr. Turner, Dr. Thomson, Dr. A. Smith, Dr. Leet, Dr. Apjohn, Sir D. Corrigan, Bart., Dr. Sharpey, Dr. Parkes, Dr. Quain, Sir W. Gull, Bart., M.D. Dr. Stokes, Dr. Francis Hawkins, Registrar.

PRESIDENT'S ADDRESS.

At the last session of the Medical Council a review of the work of the Council was made by our late President. The absence of Dr. Paget from the chair and from the Council is felt by all of us as a grave loss. There was something in the gentle wisdom of that sterling man which gave us the confidence we feel when crossing slippery paths with a sure-footed mountain guide. Only one change has taken place in the Council since we parted. Oxford sends us no stranger in one who brings from the sister Univer-

sity to that which Paget adorns mature experience for our common duties.

Only a third of the members of the Council who formed it in 1858 remain. Not half, therefore, know how great is the change which has come over the opinions of the medical profession since eighteen representatives of nineteen universities and corporations, all distinct, some in admitted rivalry, met six nominees of the Crown as representatives of the public at large, and proceeded to construct a sound and uniform system of medical education, general, scientific, and professional. It is well known in the Council how rapidly, though silently, the promotion of the general good superseded solicitude for particular interests, and how soon the arduous task of harmonising diversities in national sentiment, of seeking the good in every existing system, of purging the evil from every usage, however time-honoured, became the aim of every member of the Council. It would ill become me to dwell on this topic, or even to have touched on it, but for the purpose of our strengthening each other's hands in the discharge of our complex duties.

The construction of the Register, the removal of offenders from it, the completion of the Pharmacopœia, the visitation of old institutions, and freely reporting on them—all, a few years since, arduous tasks in prospect—seem now to us a matter of course and a page in history. What the old universities would have thought twenty-five years ago of giving up their examination papers to strangers without resistance it is not easy to realise. They now heartily recognise our endeavours, and aid in promoting our success.

I am far from wishing to be understood as implying that our work is nearly done. That is not my opinion. On the contrary, it would seem we have only lately made our tools, and sharpened them for their work. A glance at the subjects to which the attention of the Executive Committee has been drawn during the recess, and at the programme of business, will show this.

The Committee has had a correspondence with the Registrar-General, on his invitation, as to the working of the certificates of death under the new Act. The machinery of the Council, and your individual care and atten-

tion, enabled the President to forward a final answer, which was the result of much thought by representatives of opinion all over the country, without the labour to you of a meeting of the Council.

The Committee has had occasion to address the Home Office on the subject of legal proceedings for offences under the Medical Act. They hope that the letter sent on behalf of the Council will meet your approval.

They have also been compelled to draw the attention of the Local Government Board to Art. 178 of the General Consolidated Order of the Poor-law Board, which is contrary to the spirit of the Medical Act. It excludes from certain important professional duties all surgeons not being members of the College of Surgeons of London. The Board have undertaken to reconsider the clause.

The various letters thus addressed will be laid before you.

It is within the knowledge of the Council that the Executive Committee was summoned in April last to consider the effect of two Bills, brought in by private members, for the amendment of the Medical Act.

First, the Bill of Sir John Lubbock, to enable the College of Surgeons of London to take part in the Conjoint Scheme of Examination in England, was to be opposed by Mr. Stansfeld, in order, if we are to believe report, to make it compulsory on that College, or on the Conjoint Scheme, to admit women to their examinations. Whatever may be the merits of this real or supposed act of justice to women, it could not receive your sanction or approval, that a Conjoint Scheme—an admitted good for England—should be impossible, except under a condition to which many entertain the strongest objection.

His Grace the President of the Council, having received the Executive Committee, clearly appreciated the force and the fairness of this view, and promised the fullest attention of the Government.

The second Bill, that of Mr. Cowper Temple, to compel the Council to register degrees granted to women by certain foreign Universities, was open to still graver objection on grounds of public policy. The effect of this Bill would be fatal to two principles of the Medical Act of 1858. That Act makes the Medical Council responsible for the courses of study and examination undergone by all persons placed on the Register. It is clear they could not, without much diplomatic negotiation and great expense of visitations, if at all, be responsible for foreign degrees; and, secondly, it would be impossible to refuse to men so dangerous a privilege if it were accorded to women. His Grace the President of the Privy Council, and Lord Sandon, the Vice-President, considered with courtesy and prolonged attention this subject also. They undertook to lay the matter before the Cabinet. They further assured your Committee they no steps would be taken in respect of medical legislation except after the fullest communication with the Medical Council.

To the subject of these Bills we shall have to return.

Since we parted, medical and surgical examinations in the Universities of Oxford, Cambridge, Durham, Edinburgh, Aberdeen, St. Andrews, Dublin, and examinations in the College of Physicians and College of Surgeons in London, and the College of Physicians, the College of Surgeons, and the Society of Apothecaries in Dublin, have been visited. The reports on them have, for the most part, been circulated among you, and will all shortly be laid on the table. We have to thank the visitors, both those of the Council and those appointed by the Council, for their cordial co-operation. When all the arrangements are complete the matter seems simple enough, but the Council owes a debt of gratitude to Dr. Quain and Dr. Bennett, for the pains they have bestowed on the work assigned by you to the Executive Committee.

It has been truly said that the Medical Council is limited in its powers. It is no doubt bound, and happily, within the four corners of the Medical Act. Nevertheless, the functions which have to be discharged by the Council are wide enough, as the various subjects already

enumerated show, heavily to tax our time and attention. Yet these subjects imperfectly represent what is still before us. When I said just now that we had been much employed in making tools, implying that much work had still to be done, I had in my mind many other things which will come before the Council, as year by year it considers what it is the public want from the medical profession, and lays down the conditions under which the profession can fulfil the just expectations of cultivated men. We have only to take three instances from progressive subjects before Parliament—the duties of officers of health, the qualifications of analysts, the medical duties of women.

It may be reckoned as certain that the eminent and experienced persons who from all the seats of medical study come to sit round this Council-table, will sooner or later have to consider the due qualification of all these persons, under their several heads. For, first, as to the highest sanitary officers; are they to be all on the Register, all debarred from practice, all equally experts? and, if so, how educated, examined, and certificated? Secondly, are analysts, who are to arbitrate in doubtful cases of chemical analysis, to adjudicate without appeal on what is and what is not injurious to health?—a subject on which we have certainly much yet to learn in this country; or are they to judge only of the purely chemical question of adulteration? Thirdly, are midwives to be licensed? if so, by whom, how educated, how examined, how certificated?

The Council will not fail to remember that these questions have been the subjects of special reports by committees of the Council. The report on Public Health, 1869, the report on the Medical Education of Women, 1873, and the report with reference to Public Analysts, 1874, show that the Council is not unprepared whenever public opinion or Government inquiry calls upon it for advice.

Such reports, however, and such visitations are but the framework, or mould, or machinery by which our work is to be proved. They are not the work. When once the public is satisfied that the preliminary and most obvious end has been gained, of securing perfectly righteous examination, then, indeed, two difficult problems still remain—how to secure good teaching, and what to teach.

Unjust, indeed, would it be to say that the question of teaching, as far as professional subjects are concerned, has not been handled. The report of 1869 on professional education, condensing the reflections of no less than 131 teachers of experience, has laid down certain definite principles from which few bodies dissent, and, on the whole, few schools depart. The consequence is that teaching, though not perhaps uniform throughout the country, is without doubt greatly improved, and the results obtained most encouraging. For many deficiencies that captious critics might point out, for usages prior to 1858, and for the transitional character of the age we live in, neither the medical profession nor the Medical Council is responsible. The State has endowed no medical schools, and but very few medical teachers. It has maintained no medical colleges. All has been done by voluntary and unconnected effort. Hence our freedom and our success, but also the cause of our failings.

When, however, the testing machinery, for which the Council is responsible, is in perfect order, there will be much need of sober thought as to the period, quality, plans, and extent of literary, scientific, and professional instruction to be absolutely required of all youths destined for the medical profession. Not seldom is there a tendency to require too much of youth. We see clearly what is needed in the profession as a whole; we ought not to expect that whole to be found in every unit of it. The method of optional subjects is becoming urgent. In the optional subjects limitation of range is every year more necessary, although we must not forget that the average children of modern educated races acquire the higher knowledge more readily than the children of the past.

When the Council, now sixteen years ago, decided to leave the education in arts to the national educating institutions—i.e., mainly the universities—it did so in the conviction that they would represent the full experience

and wisdom of the age. Yet opinion is by no means settled even in the universities as to the basis on which the scientific mind should be moulded. Neither the opponents nor the disciples of Bentham, Mill, Darwin, or Herbert Spencer have said their last word on the whole theory of human existence and human aims. When men are divided on the fundamental conception of humanity, they will not be agreed on the objects of practical life in the world. And yet we here have to fit men for some of the most practical, most necessary, most human, most beneficent work, for every climate, for every race—as well for the millions of all castes in India and the protected negroes of Africa, as for our own poor, our own nobles, and our toilers and defenders by sea and by land. While educational theories are being discussed, we have to act.

I have touched upon these topics, however slightly, because a motion will be brought before you referring to the whole of the reports upon education: and because the Council has from the first emphatically laid stress on the supreme importance of general education, has delegated in full confidence to the national educational bodies the charge of that education, and has maintained its right to inquire into the mode in which that education is carried on.

It were not to be desired that we should, with all our other duties, be needlessly entangled in this thorny path; but once the professional examinations arranged, their extent and their method happily agreed upon in the three branches of the kingdom, this fundamental work may not be forgotten. The general, nay the scientific education of the lower and the middle classes is making enormous strides. For the sake of our successors in our profession, we must not use the standard of our younger days as the touchstone for their attainments in general culture; not if we mean them to keep their place in the brotherhood of true and thoughtful men.

The withdrawal of Lord Ripon's Bill in 1870, however necessary that withdrawal was, under circumstances which accidentally complicated it, has no doubt delayed the consideration of several important subjects. Perhaps no real harm has ensued. Time is an element in all healthy growth. The progress which has been made since the Reports to the Council on Professional Study in 1869 is shown by the Report of 1873 to have been great indeed. The papers which will be laid before you, together with your own opinions, as expressed up to last year (1874), and the Reports of your Committees on Education in 1869, 1870, 1871, 1872, may be brought by a committee into a condition for your full discussion, and indeed form a very complete statement as to the present condition of the attainments of the medical students in this country. Nor, I am convinced, need you shrink from the survey. I wish I could say that I am as convinced that the energy, knowledge, high character, and opportunities of our staff of teachers were arranged with the least loss to the students or waste of power to the teachers. The observations of the Teachers' Association in Appendix II. of the Report of 1869 will partly illustrate this.

I return now, as I promised, to the subject of two Bills at present before Parliament—viz., Sir John Lubbock's and Mr. Cowper Temple's Bills. It was important that you should meet in time to express an opinion, should you desire it, on these Bills. These Bills touch the very eye of the Medical Act.

Sir John's Bill, if passed, will make at length possible the combination of all the licensing bodies in England. There may then be one pass examination uniform for all England. If defeated, it would be defeated, so report says, because it does not enter into the question of the registration of women, which it leaves unaltered. Your Executive Committee had reason to hope that the Government would not permit so important a measure to fall on a collateral issue. I am happy to say that the Bill passed through Committee on Tuesday night last, the Vice-President of the Privy Council having satisfied Mr. Stansfeld with respect to the intentions and effects of the Bill.

The effects of Mr. Cowper Temple's Bill have been already described. A letter bearing upon it, written by direction of the Lord President of the Privy Council, will be laid before you. His Grace requests that at this meeting of the Council the Bill shall be brought under consideration, and that the Council will make to him their observations upon it. He is of opinion that Mr. Cowper Temple's Bill, though limited in its direct scope, can hardly fail to raise in Parliament the general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood; and, as Government may have to express an opinion on this general question—with regard, on the one hand, to women who desire to obtain legal status as medical practitioners in this country, and, on the other hand, to the examination, rules, or other conditions which prevent them from accomplishing their wish—he desires that our observations should not be restricted to the particular proposal of Mr. Cowper Temple's Bill, but should discuss as fully as you may see fit the object to which that proposal would contribute.

One more topic—that of the public health—must be noticed. On no question of first-class social importance has the public mind changed more in the memory of most of us than on this. The prevention of diseases as a subject of common national interest, strange as it now may seem to us, is but of comparatively recent growth, except as regards our prisons, our armies, and our fleets. Foresight would have prevented evils which have grown up unnoticed, both in our villages and in our towns, and are now causing great labour in the removal, as well as greater trouble in the prevention in future. The prevention of disease has become a great branch of our profession. The Universities have taken the matter up as well as the profession and the public at large. Education, certificates of qualification to practise, and diplomas already exist in Dublin, Edinburgh, London, and Cambridge, and are in preparation at Oxford. I forbear to dwell on this topic any further than to say that it may be a question whether the Council should ask for power to regulate this education and enter these diplomas or certificates on the Register. The desirability of conjoint boards of examination in this branch of knowledge may also demand consideration.

And now I have performed, as simply as I am able, the honourable task which you have in your goodness imposed on me, of opening a new session of the Medical Council. I ask of you that which you will certainly grant, your support, as I endeavour to second your efforts. Our hope is, by the agency of ancient and progressive institutions, to make medical education uniformly adequate through the whole kingdom; to bring former experience into harmony with the lessons of true culture and modern science; and to provide, as far as human agency can provide, a constant supply of persons qualified to promote the individual and the public health in a nation, whose destiny calls her children to every form of human labour, in all climates, and every condition of human life.

Professor Rolleston, M.D., who has recently been elected the representative on the Council for the University of Oxford, vice Dr. Acland, promoted to the Presidency, was then formally introduced by Dr. Sharpey. It was then decided that the address of the President, on the motion of Dr. Andrew Wood, seconded by Dr. Bennett, should be entered on the minutes.

The following Business Committee was then formed, consisting of—Dr. Andrew Wood (Chairman), Drs. A. Smith, Leet, Haldane, and Pyle;

The Finance Committee being—Dr. Quain (Chairman), Drs. Bennett, Sharpey, A. Smith, Fleming, and Mr. Quain.

These preliminaries over, the following official communications, made by the Executive Committee to the Registrar-General, to the office of the Secretary of State

for the Home Department, and the Local Government Board, were read, and ordered to be inserted on the minutes.

The first was "On the Registration of Births and Deaths," from the Registrar-General:—

GENERAL REGISTER OFFICE,
SOMERSET HOUSE,
October 14th, 1874.

SIR,—When the Act for Civil Registration of Births and Deaths came into operation in 1837, the Registrar-General derived the greatest assistance from the kind co-operation of the President of the Royal College of Physicians, the President of the Royal College of Surgeons, and the Master of the Society of Apothecaries, who "pledged themselves to give, in every instance which might fall under their care, an authentic name of the fatal disease."

They also entreated all authorised practitioners throughout the country to follow their example; thus the important object of procuring a good registration of the causes of death might be attained.

Since the year 1845 I have supplied all authorised practitioners with copies of blank forms of certificates; and it is gratifying to me to be able to say that the medical practitioners throughout the country have supplied those certificates in a great majority of cases; so that, including the causes of death returned by coroners after inquests have been held, in only 5 or 6 per cent. of the deaths annually registered the fatal disease recorded is uncertified by medical authority.

By the statute which comes into operation on 1st January, 1875, the Legislature has sanctioned the course I had adopted, directing me to supply blank certificates to every registered medical practitioner; and it is enacted that the medical attendant of a person deceased shall supply a certificate of the cause of death duly filled up.

This duty is enforced by penalty; I therefore propose to slightly modify the form of certificate, so as to remove some difficulties which have occurred to some minds, and thus facilitate the operation of the measure, preserving all the essential features of the old form of certificate, which has been in operation nearly thirty years.

A few years ago the College of Physicians appointed a committee which published a "Nomenclature of Disease," which work, by direction of Her Majesty's Government, I distributed to every authorised practitioner in England and Wales.

I avail myself of this opportunity of printing in the new book of forms of certificates, a list of the names of fatal diseases as sanctioned by the Committee of the Royal College of Physicians.

I venture to take the liberty to submit to you the new form of certificate which I propose to issue, the introduction, and the list of sanctioned names, hoping that you will favour me with any suggestions that may occur to you as likely to render it more useful to science, and more acceptable to the medical profession.

I have the honour to be, Sir,
Your faithful servant,

GEORGE GRAHAM,

To the President,
General Council of Medical Education.

To which the following is the President's reply:—

MEDICAL COUNCIL OFFICE,
315 OXFORD STREET, LONDON,
October 29th, 1874.

SIR,—I have the honour to inform you that one of the proof copies of the book of forms, with which you were so good as to supply the Medical Council, in answer to my application, has been forwarded to every member of the Council.

In the communications which I have received from each, there is a general recognition of the great value of the course which you propose to take.

There is, indeed, so much general approval of the Book of Forms, that I have few suggestions, such as you invite, to make on the part of members of Council.

Your attention may, nevertheless, be drawn to the follow-

ing particulars, which are noted in the correspondence with the Council, and which appear to deserve consideration before a final decision is taken on so important a step as a new Form of Certificate of Death, although probably several have been already maturely considered by you:—

It is objectionable that medical men should be required by law to give information which they do not possess from personal information.

The words "as I am informed" should be printed in the body of the certificate after the word "died."

The marginal note should then stand thus:—Should the medical attendant feel justified in taking upon himself the responsibility of certifying the fact of death, he may strike out the words "as I am informed."

The medical attendant ought not to have the duty imposed upon him of sending to the registrar or to anyone else. The registrar should apply to him.

In Scotland, the registrar forwards to the medical attendant a certificate, with the blanks filled up as far as possible, with a stamped envelope addressed to himself (the registrar), if the certificate has not been forwarded by the attendant within ten days. This plan works admirably.

In the form of death-certificate, the words "whose apparent age was" should be substituted for "whose age was stated to be."

In case of alleged irregularities or frauds in respect of certificates, the Registrar-General or the magistrates, and not the Medical Council, should be prosecutors.

In the column "the duration of disease," there should be four divisions, for years, months, days, and hours, as in the Scotch certificate.

The Registrar-General's abstracts should be gratuitously sent, as formerly was the case, to many registered medical practitioners—to all, indeed, who annually apply for them. Every health officer, at the least, should have them officially. They should be kept at the office of every sanitary authority. Nor is there any reasonable doubt that statistical and sanitary science, as well as the progress of accurate medical knowledge, would be thus greatly promoted at a comparatively trifling cost to the public funds. The services of those who supply the basis of the registration returns would also be gracefully acknowledged. A precedent may be found in Scotland and Ireland and, formerly, in England.

I have to observe that this was a question for which it seemed to me undesirable to summon a special meeting of the Council, which you are aware is attended with considerable expense. But if any fresh circumstances should arise which require a reconsideration of that conclusion, I shall be ready to give the fullest attention to them.

Meanwhile, on behalf of the Medical Council, I have to thank you for enabling its members to consider a subject to which you have given so much consideration, and for which your office has done so great service to the science of vital statistics.

I have the honour to be, Sir,

Your obedient servant,

HENRY W. ACLAND,

President of the Medical Council.

To the Registrar-General, Somerset House.

PROSECUTIONS UNDER THE MEDICAL ACT.

The following letter was addressed by the President to the Secretary of State on this subject:—

MEDICAL COUNCIL OFFICE,
315 OXFORD STREET,
November 13th, 1874.

SIR,—I have been requested, as President of the General Medical Council, to draw your attention to a subject adverted to in a letter of the 26th of September, addressed to the Secretary of the Medical Council by the Under-Secretary of State for the Home Department.

The question of the General Medical Council undertaking to prosecute in the case of offences under the Medical Act of 1858, was brought before the Council in 1859, on a complaint made to the then Secretary of State. The subject was fully considered, and the opinion which the Council then formed was to the following effect, viz:—

"That it is legally no part of the functions of the Council,

according to the Medical Act, to institute proceedings at large for offences against the Act."

"That the funds at the disposal of the Council were quite inadequate for the purpose."

Experience since 1859 has shown that these offences, unfortunately, are not infrequent, and that they occur in all parts of the United Kingdom. It is obvious, even if it were otherwise desirable, that it would occasion very serious expense if the Council were to act as public prosecutors, and to employ solicitors in every locality where an offence occurred to get up the evidence for the prosecution; and that, in any case, the funds raised by the Council entirely from the medical profession could not in fairness be applied to purposes strictly within the province of public justice.

In Scotland and in Ireland the difficulty has been supposed to be met. But, in point of fact, though there is a public prosecutor in each of these branches of the kingdom, there has been found practically to be as great a difficulty as in England.

In the case of many offences under the Medical Act, they are rather offences against the Commonwealth than against individuals; as, for instance, in the case of fraudulent death certificates, and indeed in the case brought before you by the Coroner of Ellesmere, it is obvious that the offender ought to be prosecuted for forgery—his offence under the Medical Act being merely punishable by fine.

There is, however, another reason why the Council should not be required to undertake duties of this kind, viz.: The time of the Medical Council is, by its constitution, very valuable, its members being summoned at considerable expense from various parts of the United Kingdom. Any criminal investigation or procedure would be attended with much difficulty, and distract the Council from other important duties assigned by the Act.

Under these circumstances I am justified, I hope, in requesting you to take into your consideration this subject, which the Council considers one of great public importance, adding the assurance that the Council will be ready to give the utmost consideration to any further point which you may do them the honour to bring before them.

I have the honour to be, Sir,

Your obedient servant,

HENRY W. ACLAND,

President of the Gen. Med. Council.

To the Right Hon. the Secretary of State
for the Home Department.

THE DISTINCTION BETWEEN QUALIFIED AND REGISTERED PRACTITIONERS.

MEDICAL COUNCIL OFFICE,

315 OXFORD STREET,

November 13th, 1874.

SIR,—I have been requested, as President of the General Council of Medical Education and Registration of the United Kingdom, to draw your attention to the subject adverted to in a letter, of the 19th August last, addressed to the Registrar of the Medical Council by the Secretary of the Local Government Board.

In that letter it was stated that whenever the Board revised the Consolidated Order, which they will probably do before long, they will take care that the point raised by the Registrar of the Medical Council, in his letter of the 1st August, shall be duly considered.

With a view to that consideration, I would take leave to point out that the policy of the Medical Act (1858) was to abolish any distinction between qualified and registered practitioners within her Majesty's dominions; and accordingly by Sect. 31, "Every person registered under this Act shall be entitled, according to his qualification or qualifications, to practise medicine or surgery, or medicine and surgery as the case may be, in any part of her Majesty's dominions."

It seems, therefore, contrary to the spirit of the Act to stipulate that certificates, required by Article 178 of the General Consolidated Order, should be received only from members of the Royal College of Surgeons of England.

On these grounds I would venture to urge that the Consolidated Order should be amended so as to include all registered practitioners.

In every case a medical officer under the Local Government

Board should make such selection of a registered practitioner for consultation as he judges to be best. But the central authority can only, by an oversight, seek to impose a restriction on their selection, which it was part of the intention of the Medical Act (1858) to remove, and which it is the special province of the Medical Council, by constant labour, to make unnecessary, viz., the preference of one legal qualification before another on account of more or less supposed value in such qualifications.

I have the honour to be, Sir,

Your obedient servant,

HENRY W. ACLAND,

President of the Medical Council.

To the President of the Local Government Board,
Whitehall.

It was then moved by Dr. Andrew Wood, seconded by Mr. Quain, and agreed to:—

"That the table of results of professional examinations for degrees, diplomas, and licences, granted in 1874 by the bodies in Schedule (A) to the Medical Act, be received and entered on the minutes."

An analysis of this table shows that during the past year for the Primary and Final Examinations at the—

Royal College of Physicians of London—For the Licence 14 were rejected, 85 passed. For the Membership 3 were rejected, 21 passed.

Royal College of Surgeons of England—For the Membership 129 were rejected, 349 passed. For the Fellowship 19 were rejected, 10 passed.

Society of Apothecaries of London—For the Licence 15 were rejected, 190 passed.

University of Oxford—For the M.B. 1 passed. For the M.D. none presented themselves.

University of Cambridge—For the M.B. 13 passed. For the M.D. 3 passed.

University of Durham—For the L.M. 2 passed. For the M.B. 2 passed. For the M.D. 1 passed.

University of London—For the 2nd. M.B. 6 were rejected, 19 passed. For the M.D. 5 were rejected, 14 passed. For the B.S. 5 passed.

Royal College of Physicians of Edinburgh—For the Licence 42 were rejected, 129 passed.

Royal College of Surgeons of Edinburgh—For the Licence 13 were rejected, 37 passed.

Faculty of Physicians and Surgeons, Glasgow—For the Licence 10 were rejected, 15 passed.

Royal College of Physicians and Royal College of Surgeons of Edinburgh—For the Licence in Medicine and Surgery 44 were rejected, 84 passed.

Royal College of Physicians of Edinburgh and Faculty of Physicians and Surgeons of Glasgow—For the Licence in Medicine and Surgery 16 were rejected, 23 passed.

University of Aberdeen—For the M.D. 26 passed by promotion. For the M.B. and M.C. 9 were rejected, 54 passed.

University of Edinburgh—For the M.B., M.B. and M.C. 14 were rejected, 88 passed. For the M.D. 3 were rejected, 20 passed.

University of Glasgow—For the M.B. and M.C. 10 were rejected, 47 passed. For the M.D. 3 were rejected, 18 passed.

University of St. Andrew's—For the M.D. 10 passed.

King and Queen's College of Physicians in Ireland—For the Licence in Medicine 15 were rejected, 90 passed. For the Licence in Midwifery 16 were rejected, 52 passed.

Royal College of Surgeons in Ireland—For the Licence 23 were rejected, 91 passed. For the Licence in Midwifery 1 was rejected, 36 passed. For the Fellowship 1 was rejected, 52 passed.

Apothecaries' Hall, Dublin—For the Licence 3 were rejected, 27 passed.

University of Dublin—For the M.B. 4 were rejected, 49 passed. For the M.C. 2 were rejected, 18 passed. For the M.D. none presented themselves.

Queen's University in Ireland—For the M.D. 20 were rejected and 4 others withdrew, 44 passed. For the M.C. 27 were rejected and 4 others withdrew, 30 passed.

A letter and petition from Matthew Bass Smith were read, requesting that he might register his name as a qualified practitioner. It may be remembered that Bass Smith was struck off the Register, but his name was not erased by the

examining bodies from which he had received his diplomas. He now petitioned that he was entitled to register the qualifications which he still held.

Some discussion ensued, in which Sir William Gull, Dr. Quain, Dr. Bennett, and Sir Dominic Corrigan took part.

Sir William Gull said that, without referring to the case immediately under consideration, the circumstances of which he did not recollect, it became the Council to consider whether, if a name were erased from the Register, they had the power to replace it, and if they had the power, under what circumstances and for what reasons a name which had been erased should be restored.

Dr. Bennett suggested that each case might be considered on its own merits, and that it would be quite impossible to frame rules applicable to every case, though it might be desirable to have an understanding in reference to some few points.

Sir Dominic Corrigan remarked that it was in the power of the Council to restore a name once erased, and that they had already done so. But in that instance it was found that the evidence on which the individual was convicted was imperfect.

It was moved by Dr. Andrew Wood, seconded by Sir Dominic Corrigan, and agreed to :

"That the Council decline to restore to the Register the name of Matthew Bass Smith."

THE CASE OF MEEHAN AND SHEEDY.

The following certificate was read :—

County of Limerick to wit.

Search being made amongst the Records of the Office of the Clerk of the Crown for the County of Limerick, I certify that James Meehan, M.D., and Michael M. Sheedy were at a General Assizes and General Gaol delivery duly holden at Limerick, in and for the county of Limerick, on the 10th day of July, in the year of our Lord one thousand eight hundred and seventy-four, indicted, tried, and convicted on an indictment charging them with a general conspiracy to defraud the New York Life Insurance Company, established for the insurance of lives, and carrying on the business at Kilmallock, by false and fraudulent representations as to the health and habits of persons proposed to be insured. And the indictment charged several overt acts. And having been convicted of the said offence, the said James Meehan and the said Michael M. Sheedy were sentenced by the Court to be imprisoned in the county gaol of Limerick for twelve calendar months each.

Dated this 27th day of July, 1874.

(Signed) WILLIAM SMARTT,
Deputy Clerk of the Crown for the
County of Limerick.

Moved by Dr. A. Smith, seconded by Sir D. Corrigan, and agreed to :

"That the names of James Meehan, M.D., and Michael M. Sheedy be removed from the Medical Register in accordance with powers devolved on the Council by Clause 29 of the Medical Act."

A letter was read from Mr. Geo. R. Rickard's counsel to the Speaker, written under the direction of the Statute Law Revision Committee.

The letter requested the opinion of the Council in reference to the repeal of all such acts and parts of acts as are either spent or expired, or have in any manner become unnecessary, or have ceased to be in force otherwise than by express repeal.

The letter was referred to a committee, consisting of Sir Dominic Corrigan, Dr. Haldane, and Dr. Storrar.

A committee, consisting of Dr. Andrew Wood, Dr. Fleming, Sir Dominic Corrigan, Dr. Arjohn, Mr. Quain, Dr. Humphry, Dr. Parkes, and Dr. Thompson, was formed to consider the recommendations with regard to education and examination which had been issued from time to time by the General Medical Council, to inquire into their practical working, and to report as to the expediency of modifying or amending them.

The following letter, written by direction of the Lord President of the Privy Council by Mr. Simon, was then read :

MEDICAL DEPARTMENT, PRIVY COUNCIL OFFICE,

8th June, 1875.

SIR,—I am directed by the Lord President to request that, at the meeting now shortly to be held of the General Medical Council, you will have the goodness to bring under the consideration of that body the Bill which has been introduced in the House of Commons by Mr. Cowper-Temple "to amend the Medical Act, 1858, so far as relates to the Registration of Women who have taken the Degree of Doctor of Medicine in a Foreign University," and that you will move the Medical Council to favour his Grace with their observations upon it.

It appears to the Lord President that Mr. Cowper-Temple's Bill, though very limited in its direct scope, can hardly fail to raise in Parliament the general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood. And I am to say that, as Government may have to express an opinion on this general question, with regard, on the one hand, to women who desire to obtain legal status as medical practitioners in this country, and, on the other hand, to the examination rules, or conditions, which prevent them from accomplishing their wish, his Grace would be glad that the observations with which the Medical Council may favour him should not be restricted to the particular proposal of Mr. Cowper-Temple's Bill, but should discuss, as fully as the Medical Council may see fit, the object to which that proposal would contribute.

I am, Sir, your obedient servant,
(Signed) JOHN SIMON.

Dr. Acland, F.R.S., Oxford.

The foregoing letter was referred to a committee to report on at an early meeting of the Council.

An application was read from Miss Ellen M. Greenstreet, requesting that a licence, which she had obtained from the King and Queen's College of Physicians in Ireland, might be registered as a Licence in Midwifery.

The matter was referred to Mr. Ouvry, the solicitor of the Council, for his opinion.

FRIDAY, JUNE 18TH.

Present—Dr. Acland, President, in the chair; Dr. Bennett, Mr. Quain, Mr. Bradford, Dr. Rolleston, Dr. Humphry, Dr. Pyle, Dr. Storrar, Dr. Haldane, Dr. Andrew Wood, Dr. Fleming, Mr. Turner, Dr. Thomson, Dr. A. Smith, Mr. Macnamara, Dr. Leet, Dr. Arjohn, Sir D. Corrigan, Bart., Dr. Sharpey, Dr. Parkes, Dr. Quain, Sir W. Gull, Bart., Dr. Begbie, Dr. Stokes, Dr. Francis Hawkins, Registrar.

Dr. Parkes moved, and Dr. Quain seconded—

"That a committee be appointed to consider the reports of the visitations which have been submitted to the Council, and sent down to the Licensing Bodies, and of the remarks of the Licensing Bodies upon them, and to draw up a report for the present meeting of the Council."

The opinion of the Solicitor to the Council in the matter of Dr. Mackern against Mr. Fant was read.

The charges preferred against Mr. Fant by Dr. Mackern were two—

1st. That he allowed a brass plate, with his name, to be affixed to a house occupied by a Mr. Carr, an unqualified person, under colour of which plate Carr practised as a surgeon.

2nd. That a similar plate appeared on the door of a house in Derby (where Fant practised), occupied by a Mr. Giabourne, an unqualified person.

On being written to Fant pretended that these persons were his assistants, but upon its being represented to him that his explanation was wholly unsatisfactory, further correspondence took place. The correspondence was of considerable length, and ended in a letter from Mr. Briggs, the solicitor of Mr. Fant, in which he stated that, while denying any legal offence, he had advised Mr. Fant, in order to avoid any conflict with the Council, or even with any of his professional brethren, to remove the objectionable plates, and discontinue the connection with Mr. Carr, which had been done.

The Solicitor advised that, under the circumstances, the Council should not take action against Fant under the 29th

section of the Medical Act, but suggested that a copy of this report should be forwarded to Dr. Mackern, not, of course, for publication, but that he might be able to inform the Council if Mr. Fant should offend in the same direction in future.

The Council adopted the course recommended by the solicitor.

The Council resolved itself into a committee of the whole Council, for the consideration of the reports of visitations of examinations, which were taken as read.

Moved by Dr. Bennett, seconded by Dr. Quain, and agreed to:—

“That a copy of the report of the visitors of the examinations of the University of Aberdeen be forwarded to that University for their consideration and remarks.”

The consideration of the report on the University of Edinburgh was adjourned on the motion of Mr. Turner.

It was moved by Mr. Turner, seconded by Dr. Fleming, and agreed to:—

“That a copy of the report of the visitors of the examinations of the University of Oxford be forwarded to that University for their consideration and remarks.”

Previously to the passing of this resolution, a long discussion took place upon various points in the Visitors' Report, principally with reference to the desirability of compelling candidates for the pass examinations to undergo a practical examination in dissection in the presence of the examiners. Upon this question, Dr. Humphrey remarked that when visiting the Queen's University in Ireland, he was so much impressed with the practical and thorough nature of its examination upon practical anatomy, than which he conceived nothing could be more perfect, that immediately on his return to Cambridge he sought to introduce the same system there, and he would desire to see it made compulsory, that all candidates should be required to undergo a test examination upon the dead subject.

Dr. Bennett would also like to see a compulsory clause introduced, if it could be found workable. He was also much impressed with the excellence of the examination upon the dead subject at the Queen's University, and would like to see a similar one generally adopted.

Dr. Storrar remarked that an examination in practical anatomy had been carried out in the University of London for the last seven years, but he thought it would be injudicious that the Council should hold that examinations on the dead were indispensable, however desirable they might be.

Dr. Andrew Wood was of opinion that if the Council ventured to impose such a clause upon the various examining bodies, it would be impossible to carry it out. No one appreciated the necessity of a practical knowledge of dissection more than he; but how was it possible to find subjects sufficient for dissection for a hundred men at a time? It might perhaps be well to have a discretionary clause in case of very dull students, that they might be so examined, but he begged the Council not to commit themselves by imposing restrictions which could not possibly be carried out.

The President was much impressed with the value of these visitations of examinations, particularly when they produced discussions of such practical importance as the present.

Professors Turner, Rolleston, and Thompson also spoke upon the point, the points raised ultimately resolving themselves into a decision to refer the report to the University of Oxford for their consideration and remarks.

The Visitors' Report on the visitation of examinations of the University of Cambridge was also referred in a similar manner; it did not, however, produce any discussion.

The same remarks apply to the report on the University of Aberdeen; but that on the University of Edinburgh was not so easily disposed of, its consideration being adjourned until Saturday.

SATURDAY, JUNE 19TH.

After the usual preliminaries, the Council proceeded with the adjourned discussion on the visitations of examinations at the University of Edinburgh, opinions of a very opposite character being expressed upon the nature of the examinations—whether teachers should be allowed in any case to examine their pupils? and whether assessors were

ex officio examiners, and had any influence upon the examinations which they attended, or were only lookers-on? Ultimately the report was remitted to the University in a similar manner to the preceding ones.

The report on the visitation of examinations at St. Andrews University gave the Council full scope for merriment, Sir Dominic gravely suggesting that it should be wiped out from the book of the living. Reading from the report, he said there is a professor of anatomy, but no students, no dissecting-room, and no chemical laboratory. He deemed it a perfect farce that such a university should have the power to grant medical degrees, and thought that it would redound much to the credit and honesty of the authorities if they did as was done in the case of the Archbishop of Canterbury's degrees—close the business at once.

Dr. Fleming was much annoyed at Sir Dominic's remarks. It was true St. Andrews had no medical students, but inasmuch as the Commissioners some time since took away from this University the power to grant more than ten degrees annually, it was hard that it should not possess the power to confer these hon. degrees, inasmuch as they were invariably conferred upon members of the profession who were already over forty years of age, and who by their present position amongst their brethren were considered worthy of such an honour, and should not be necessitated to undergo further examinations.

Dr. Sharpey referred not so much to the University as to the reports, in giving it as his opinion that, inasmuch as St. Andrews had the power of conferring these degrees without examination, it was a useless waste of the time and money of the Council to supervise their examinations.

The reports of the visitors on the Royal College of Physicians of London gave rise to a discussion of some importance. It was carried that the remarks of the visitors should be referred to the Royal College of Physicians.

Dr. Bennett referred to the statements in the reports that the practical examination of nine candidates had been held by one examiner only, and to the imperfect examination on the subject of jurisprudence. He excused the one on the ground that it was an accident, and the other on the ground that it was incorporated in other subjects.

Sir William Gull considered that the Council should declare the opinion that such an examination was a great mistake. He considered it a very serious matter. These men were going to practise medicine, and that very part of the examination which was most important was most neglected. He proposed as a rider that special consideration should be requested to such parts of the reports as refer to clinical instruction and to forensic medicine.

A long discussion, occupying thirty-five minutes, next took place upon the question whether or not the rider should be allowed to go to the College.

Sir Dominic Corrigan supported Sir William, considering that it was an expression of good feeling, and not a censure.

Dr. A. Wood agreed with Sir William, for he could not think it satisfactory that nine men should be allowed to enter the profession, as Dr. Bennett had admitted—to use his own words—by accident. But on looking further into the reports he found the same accident had occurred again at a practical or clinical examination held by the College of Physicians at St. Mary's Hospital, only the error was not so apparent, because the candidates were less in number.

Dr. A. Smith would support the rider, for he thought that, coming as it did from one who occupies the position in the College of Physicians that Sir William occupies, it could not be looked upon as an unnecessary censure.

Dr. Quain, Dr. Fleming, and Dr. Macnamara spoke in favour of withdrawing the rider and trusting to the representative of the College of Physicians seeing that the points at issue were brought before the notice of the College.

At the division Dr. Bennett called for the names.

In favour of Sir William Gull's addition—Sir William Gull, Dr. Stokes, Dr. Rolleston, Dr. Haldane, Dr. A. Wood, Dr. A. Smith, Dr. Lest, Dr. Apjohn, Sir Dominic Corrigan, Dr. Sharpey, and Dr. Parkes.

Against—Dr. Bennett, Mr. Quain, Dr. Humphry, Dr. Pyle, Dr. Storrar, Dr. Fleming, Dr. Thompson, Dr. Baggie, Dr. Macnamara, and Dr. Quain.

Mr. Turner did not vote, as he was absent from the room during a part of the discussion.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

Mr. Quain, on the part of the College of Surgeons, gave an explanation upon the reports of the visitors, which were to the effect that the examination was insufficient upon chemistry, materia medica, and physiology, and that it would be advisable to introduce some questions on surgical anatomy into the final examination. Mr. Quain said that with regard to chemistry, the College recommends that students should take up that subject before commencing their medical studies, and therefore does not examine in chemistry, but it requires a practical course of chemistry at the Medical School. With regard to physiology, he considered that if a candidate could answer the two usually searching questions which were given, he must have a fair knowledge of the subject. As to materia medica, the College expected that candidates would go elsewhere for a medical diploma; but in order that no one should practise having only a surgical diploma, candidates who possessed no medical qualification were subjected by able physicians to a fair examination in medicine and materia medica. Mr. Quain had no doubt that the suggestion with regard to surgical anatomy would be carried out.

Sir Wm. Gull wished to know why these subjects were allowed to remain on the list of subjects on which the College examined. Certainly the College required certificates of having attended lectures on these several subjects, but without an examination such certificates were absolutely valueless. It ought to be openly stated by the College that the examination was testing only upon certain subjects. The public ought not to be made to understand, as was now the case, that those who had obtained the diploma of the College of Surgeons had received a testing examination upon the long list of subjects now upon the College programme. Sir William wished also to know the precise character of the clinical examination. He understood that surgical cases were brought into the room, and he considered this an unsatisfactory clinical examination. It might be called to an extent practical, but it certainly was not clinical.

MONDAY, JUNE 21ST.

Dr. Storrar believed that there had been a tacit understanding between the Hall and College. The general term was the double diploma; what the one examined in the other did not. The Act of 1853 gave members of the College the right to practise medicine. This was no fault of the College. They had, however, since that time, examined in medicine. Should the Bill for the Conjoint Examination pass, the defect in the examination of the other subjects would be remedied.

Mr. Quain replied: The physiological question is now actually under consideration. With regard to clinical examination in the wards, that was carried out for the diploma of Fellow, but not for the Membership, for the real surgery of this country was in the hands of the Fellows. That examination was more comprehensive, and also went over the other subjects *de novo*.

Dr. Humphrey remarked that surgery was certainly not in the hands of the Fellows only. The great mass of the members were precluded by certain regulations from taking the Fellowship, and he earnestly hoped that a change in those regulations would soon be made.

Sir Wm. Gull considered the handiwork of surgery was not so much the true work of the Fellows as the science of surgery. He knew that a great deal of the real surgery was in the hands of the members, and he was astonished at the skill and ability shown by members in remote parts of the country. It was the duty of the Council to see that in future members should be clinically instructed and qualified. The education would be according to the examination, and so in proportion would the knowledge of surgery become increased throughout the country. He should move that, in referring the Visitors' Report to the College, "attention be drawn to the incompleteness of the examination in physiology, to the deficiency of the clinical examination for the membership, and also to the total want of an examination in chemistry and materia medica, though these subjects are mentioned in the curriculum."

Dr. Parkes would vote against the addition, because they had been told that the examination in physiology would be remedied. The clinical examination he did not consider inferior. He had seen some sixteen or twenty cases brought in for examination; and the chemistry and materia medica ex-

aminations would be remedied if the Conjoint Scheme came into operation.

Professor Sharpey would not support the addition, and he was guided to a great extent by what one of the visitors, Dr. Parkes, had said.

Dr. A. Smith would support the addition, for he considered that the Council had no right to leave such matters in the hands of the representatives of the various examining bodies. It was the duty of the Council to ascertain when the examinations were deficient, and to give notice to the examining bodies.

Sir Wm. Gull's rider was lost by a large majority.

Dr. Thompson gave notice that at the meeting of Council (to receive the report of the Council in Committee) he should move that the corresponding resolution referring to the College of Physicians be rescinded.

The Report on the Visitation of Examinations at the King and Queen's College of Physicians in Ireland was next on the list. Dr. Aquilla Smith, as the representative of this College on the Council, said he had no comments to make on the report, beyond that in one or two instances it contained some slight ambiguities; otherwise it was an impartial and valuable document.

Dr. Bennett then proposed, and Mr. Quain seconded, that the report be sent to the College for its consideration and remarks. This carried, the Council suspended its deliberations for a few minutes.

[We shall give the remainder of Monday's proceedings in our next. There are some important motions on the Agenda which are likely to produce interesting discussion. The motion on dissections by Professor Macnamara has unfortunately been somewhat anticipated by the discussion which resulted on the Visitations Report, referred to elsewhere. Miss Greenstreet's case and the question of the admissibility of women to the profession is sure to cause an animated debate.]

The Asylums Board and Hampstead Hospital Committee.—On Saturday last, at the fortnightly meeting of the Metropolitan Asylums Board, Dr. Brewer in the chair, it was resolved that, having regard to the fact that a motion had been carried in the House of Commons for the appointment of a committee to investigate the question, the further consideration of the plans be postponed, and that it be referred to the general purposes committee to employ counsel, and take such other measures as may be deemed necessary to bring the whole case of the managers in reference to the reconstruction of the Hampstead Hospital before the Parliamentary Committee.

The Middlesex Coroner and Unnecessary Inquests.—On Saturday last Dr. Hardwicke held an inquest at 48 Maida Vale, on the body of Thomas Sutton Briggs, a gentleman residing at the above address, who died in bed very suddenly on Friday morning at six o'clock. Deceased, who was 76 years of age, was a member of the Marylebone vestry, and was in his place at the last meeting of that board on Thursday last. After the vestry meeting deceased went home and complained of being very tired. On the following morning he was taken suddenly ill and died before medical aid could be secured.—Dr. F. H. Webb believed that death was caused by a fit of apoplexy.—A jurymen asked whether this was not an unnecessary inquest. Could not Dr. Webb have given a certificate of the cause of death as just stated? Deceased was well known, and there was no necessity for the inquiry.—Dr. Webb said as he had not attended deceased recently he was unable to give a certificate of death on the regular form prescribed by law. The registrar required a certificate stating that deceased had been attended recently by the doctor who signed it.—The Coroner said this was a case like that of Sir Charles Lyell, about which he was so much blamed. He was of opinion that all uncertified deaths should be inquired into by means of a coroner's inquest, because many of them were of a very suspicious character; and he intended, in the interests of the public, to fight for that principle. After considerable discussion the jury returned a verdict of Death from Natural Causes, thus endorsing the opinion of Dr. Webb.

INDIAN MEDICAL NOTES.—XLI.

(FROM OUR SPECIAL CORRESPONDENT.)

MEERUT, April, 1875.

DYSENTERY.

DURING the spring of 1307, King Edward the First, aged 68, enfeebled, anxious, fatigued, whilst marching through swamps and forests, contracted malarial dysentery, which, somewhat subsiding in July, induced him gratefully to offer up the ambulance litter in Carlisle Cathedral, and, mounting a horse, he started on an expedition into Scotland. But the effort was too much; so giving directions that his bones should be carried at the head of the army, to encourage the troops, the greatest of English monarchs, turning his face to the wall, went to sleep. Besieged, badly provisioned cities, retreating armies deprived of rest, food, bedding, and clothes, or shelter, or on board old dirty crowded ships, compelled to drink thick, muddy, stagnant water, long kept shut up from the air in rotten, wooden casks, favourable to animalculæ, such were conditions conducive to dysentery; other things help—sour bread, tough meat, stale beer, salt provisions, no vegetables, over-crowding, defective ventilation, sewage air, sewage drinking-water, low marshy localities, scurvy, too fluid a diet, foolish exposure to heat or cold, to night chills, to damp air, or to air wonderfully dry, to chill of any description. Thanks to drainage and the introduction of the potato, this disease has been almost expelled from our native shores. Out here, dysentery, somewhat corresponding, yet much more dangerous than bronchitis in England, is a very serious, deadly disease, allied, or co-existent with typhus, remittent, relapsing, enteric, and scarlet fevers, with diarrhœa, rheumatism, or variola, with cerebral and pulmonary mischief, and worst of all, with suppurative phlebitis of portal veins, ending in multiple abscesses of the liver, beyond all hope of cure. May be acute, chronic, scorbutic, or complicated, a disease of the unacclimatised, fatal in first year, specially to men over twenty-five, the intemperate, the reckless, who, partial to trashy food, unripe cucumbers, offal-fed, cyst-infected pork, exposed their sweating bowels, unprotected by flannel, to the keen night air, or the influences of chill. Blows on the head, or attacks of sunstroke, are alleged causes. May start *de novo* from the inhalation of garden manure, may extend by the inhalation of dysenteric excreta, from the drinking of sewage or grave-yard water. Total abstainers, unfortunately, appear susceptible, if enfeebled by climate, syphilis, scrofula, malarial or mercurial cachexia. Constipated women, on first arrival, though protected by menstruation, do not escape. My experience includes several attacked during pregnancy, when two lives were at stake; also, after delivery, the results so far satisfactory, excepting that the infants were miserable specimens. Some women incline to abort, others suffer from pro-lapsus ani, the majority very exhausting, unreasonable, unruly, craving for beer, herrings, sausages, pork chops, anything deleterious—preferring death to perseverance with ipecacuanha. Valuable beyond conception as the remedy proves, the intolerable nausea, conducive to uterine displacement, the violent retchings, in spite of every arrangement of sinapisms, opiates, dry diet, are very vexatious; but what are these objections compared to risk of life, the frightful hæmorrhages, the intestinal gangrene impending?

One class of sufferers from scorbutic dysentery are women, pinched, half-starved by drunken husbands, and who sacrifice everything, including bedding, to the children. Two men were trumpeters, one a middle-aged Frenchman, an old scamp, long in India, a glutton and a wine-bibber; the other, a steady-going married man, formerly quartered at Secunderabad, of dysenteric notoriety, who chose at Delhi to sleep in a canteen tent, the sides closed all round at night, inhaling the aroma of beer-casks. Secunderabad is now a very popular station,

but formerly the water, percolating through a grave-yard, contained 119 grains per gallon of solids, and from 8 to 30 grains of organic matter. A weakly, temperate, black-complexioned, religious, eccentric old bachelor, aged 39, had suffered from sunstroke in previous Indian service, besides ague, dyspepsia, and diarrhœa. A slightly built man, with a very narrow chest, died of dysentery in October last, after seventeen days' treatment, the constant straining, the look of agony, the brown-black tongue, the mucous, frothy, bloody, horrible, putrid-smelling stools, dry skin, burning thirst, great prostration, thready pulse, painful micturition, the desire ever to be on the bed-pan to get rid of the red hot ball (as it feels) pitifully characteristic: the cadaverous face grew more pinched and sallow, the black sordes covered the mouth, the eyes became lustreless, a pleasing delirium induced the poor fellow to say that he was better, comfortable, free from pain, and so he died. There was no tympanitis, and although we were crowded with patients (in the worst month except for epidemics), the horrible smell started no other cases this time. After death, excessive rigor mortis, great atrophy of the yellow body, no abdominal distension noticed; the brain, 3½ pounds, uniformly congested, the convolutions very soft, extravasation at the base; lungs collapsed; heart small, the walls and valves of left ventricle remarkably thickened, the right ventricle containing recent clots; stomach and bladder healthy; kidneys shrivelled, pale; spleen pale, twelve ounces; liver pale, 6 lb. 2 oz., containing a number of small abscesses, the largest the size of a walnut, specially noticed in left lobe posteriorly, apparently pyæmic points resulting from hepatic absorption of the specific dysenteric poison, setting up destructive suppurative inflammation; the intestines shrivelled, shrunken, pale, and from the cæcum to the rectum a closely-linked chain of ulcers raised, oval, recent, none green, black, or gangrenous. A live, red, round worm, eight inches long, was found in the basin, doubtless from the small intestine dislodged. This account is very meagre; but at the time very busy, worried, distressed to lose a man greatly liked. I was not in trim that blazing hot October afternoon in the dead-house; nor do I intend to enter into minute details of dysentery until the valuable works of Maclean, Parkes, and the last edition of Aitken are at one's elbow for reference on certain points, Parke's "Hygiene," fortunately two copies, never to be lent, are on the book-shelves overhead. The exhaustive works of Dr. Aitken should be the first selected for purchase, also everything written by Martin, Morehead, Annesley, Pringle, Moore, and Ewart, should be available for reference when medical libraries will be established in Indian stations, for doctors cannot drag many books about all over the country, and it would be very easy to start a medical society with books, journals, periodicals, reviews, to tell us everything going on in the professional world. Nothing would please me more than to compile a little manual; but where are the books, where are the brains to pick? In ten years in Bengal the admissions for dysentery of European troops were about 18,000, deaths about 1000; also 712 invalided. At Meerut 45 of these deaths, the months of September and October the most fatal, the month of March the least dangerous, the admissions high in August, lowest in February; the ratio per 1000 of admissions 48; the deaths 2; about 7 per cent. of cases treated die. In 1872, in India, generally, out of 2,588 admissions for dysentery, about 90 died. Variations in temperature checked perspiration, vitiated secretions, internal congestions, the influence of the hot winds, the rainy season, the chills when tatties, punkahs, and thermantidotes are put up, or floors are washed, the relaxing influences of September, the hot days, the cold nights of October, the presence of intestinal worms, all must be considered as conditions favourable to disease. People in England have no conception of the deadly nature or the permanent constitutional damage certain tropical diseases entail, for instance, dysentery, which may cause irretrievable damage, unless promptly treated according to Docker by large and repeated doses,

up to a drachm of ipecacuanha, by the mouth. Annesley rather liked this remedy; so did Pringle and Twining in scruple doses; so did Dr. Piso, from the Brazils, for a son of Louis XV. was saved by the treatment. Somehow ipecacuanha fell into the ordinary ruck of remedies, until promoted by selection to the highest rank by Dr. Docker, and there it stands to-day. The old treatment included castor-oil in large doses, warm bath, scruple doses of calomel, bleeding from the arm, venesection, emetics, warm-water enemata, jalap, jalap again, more jalap, anodyne enemata, Dover's powder, camphor, dilute nitric acid, and opium, camphor in mucilage or pill, or by the rectum, injections of lime-water and calomel, hot fomentations, sinapisms, calomel and opium, nitro-hydrochloric acid baths, blisters, and lotions, tinct. ferri, and, as said before, ipecacuanha—all figure in the weapons at various stages used by the grand old master Annesley, whose two enormous volumes, published ever so long ago, and now out of print, are antiquarian treasures to be sought for. Let us drink his health in solemn silence. The days of excessive depletion of calomel until further orders are gone, never to return; but we use modifications of all the medicaments just now enumerated—chloroform, belladonna, American hellebore, nitrate of silver, the Bael fruit, enemata of charcoal or carbolic acid, and the entire army of astringents have been vaunted; also shoals of suggestions, wonderful cures, are as the rocket and the stick. So long as ipecacuanha, opium, belladonna, iron, quinine, the Bael fruit, and mustard are procurable, the other thousand and one recipes may be thrown to the dogs; at the same time, in the acute form of disease, affecting the strong new comer, a few leeches and mercurial inunction may be required. Find out your patient's medical history from childhood, take into consideration the gravest of all his antecedents, for if an old soldier who has suffered before, has lived hard, or is saturated with malaria, and as the case runs on and the tongue is suddenly black, then suspect hepatic complication; all the greater reason for the ipecacuanha, which, resembling chloride of ammonium, has some "marvellous power in preventing abscesses of the liver." In the language of the talented physician and surgeon who writes in the *Medical Times* from Madras, ipecacuanha is revulsive, evacuant, antispasmodic, sedative, febrifuge. The mucous membrane of the upper half of the alimentary canal is disorged, its contents are discharged, and with this the spasm and irritation of the lower half with the straining and scanty and slimy stools are relieved. Bear in mind this disease is treacherously insidious, running on as the hidden fire in a coal-pit. No local tenderness was there this morning in a mild case, which might have run on to extensive ulceration unchecked, did not other symptoms put the practitioner on his guard. Bear in mind also the rapid emaciation, the shock to system, the possibly permanent constitutional damage, the liability to relapse, to become incurably chronic—the patient, eager to escape from the depressing influences of hospital, to return to duty if a good man, to drink and debauchery if a bad one, to his own little home and the wife's cooking if a married man, or else he may be very urgently required for some particular work, when all are pressed. You are a kind, obliging young doctor, anxious to do a good turn and please everybody: the sick-list heavy, the wards crowded, but for all that, bear in mind how, in the old days, dysenteric patients discharged too soon were eventually carried back to die in hospital. Read a grand paper by Dr. Cameron, in the *Lancet* for last year, page 7. If sea voyage, change of air or climate be out of the question, build up the patient by rest, care, and judicious food, the diet milk (iced), no stimulants at first, creep on to corn-flour, rice, egg-flip, isinglass, fish, game, meat-juice, vegetables, mutton. At the commencement of treatment, what with dry diet, opiate, abdominal sinapisms, the ipecacuanha may be tolerated; if not, then implore and coax the patient to persevere night and day, for enemata are not to be compared in value with administration by the mouth. Warm baths, belladonna supposi-

ories, enemata of iron, opium, and ipecacuanha, draughts containing chloral or chlorodyne, all in their proper places recommended, and eventually cod-liver oil, iron, quinine, strychnine, and phosphorus. Our old enemy, the sun, with "meteor eyes and burning plumes outspread," must not be defied. Just now the days are growing hotter and hotter; one longs for the rain or a good honest black cloud:

"I bind the sun's throne with a burning zone,
And the moon with a girdle of pearl,
The volcanoes are dim, and the stars reel and swim
When the whirlwinds my banners unfurl."

Transactions of Societies.

THE STATISTICAL SOCIETY OF LONDON.

TUESDAY, JUNE 15, 1875.

ON THE EFFECT OF MIGRATIONS UPON DEATH RATES.

By Mr. T. A. WELTON.

THE author some time since read a paper before the Institute of Acturics, in which he showed, from the statistics of the years 1851-60, that the mortality amongst females resident in London aged 10 to 35 years was exceedingly low, whilst that in the rural districts around London, to the distance of about seventy miles, was at the same ages exceptionally high. He divided these rural districts into an inner ring and an outer ring, and subdivided these rings into thirteen parts, and finding a great degree of regularity in the phenomena, was led to attribute them to some cause likely to operate over the entire area. This cause in his opinion, was the undisputed presence of vast numbers of country girls in London, principally in domestic service, and the probable circumstance that these, in case of serious illness, would in most cases return to the homes of their parents in the country, and there die. He found similar but much less striking phenomena in the case of males, and this he supposed might arise from the greater independence of that sex, who, soon after their settlement in London, are likely to form a domestic establishment, however humble, of their own.

A recent suggestion by Mr. N. A. Humphreys, that the more probable explanation of the facts was that women in service in London enjoy more favourable conditions as to health than if resident in humble rural homes, led Mr. Welton to place the leading results of his investigation before the Statistical Society, and to support them by fresh calculations based upon the statistics of 1861-70.

He showed, for instance, that the death-rates amongst young women aged 15-25 and resident in the worst districts of London, such as Whitechapel and St. Giles's, were considerably below the national average. He also showed that whilst tubercular consumption was not particularly fatal in London to persons of either sex aged 15-25, this disease carried off a very large number of women between those ages in the surrounding rural districts.

The average mortality of females in the ten years 1861-70 in London and in Suffolk served to confirm the figures for the earlier decade, being as under:—

Death Rate per Thousand Living at the following Ages.

	In London.	In Suffolk.
0-5.....	76.6	45.4
10-15.....	4.1	4.8
15-20.....	5.1	7.6
20-25.....	6.2	9.2
25-35.....	8.8	10.0
55-65.....	33.6	21.1
65-75.....	67.6	47.0

And similar facts were shown to be derivable from the statistics of seven other counties.

Under these circumstances, Mr. Welton suggested two inquiries: one as to the birthplaces of those dying in London

and the other as to the history of those who die between the ages of 15 and 25 in a few selected rural registration districts. Such inquiries, if made, would effectually resolve the question at issue.

Another aspect of the matter was shown to be the great disparity between male and female death-rates at the ages 15—25, according to the locality under observation, towns showing low female death-rates and rural districts high ones. In London, at the ages 15—20, the average death-rates for 1861-70 were males 5.8, females 5.1 per thousand; but in Suffolk the figures were males 5.7, females 7.6 per thousand; in Oxfordshire—males 4.4, females 6.3 per thousand, and in other rural districts the results were similar.

A very interesting discussion followed the reading of the paper: it was participated in by Mr. N. A. Humphreys, of the General Register Office, Dr. Lethby, Mr. R. Rawlinson, C.B., Mr. Lumley, Q.C., Rev. Wyat-Edgell, Mr. Bourne, Dr. Farr, Dr. Mounat, Dr. Rankin, General Babbage, and Mr. W. B. Hodges.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JUNE 2ND, 1875.

W. O. PRIESTLEY, M.D., F.R.C.P., President, in the Chair.

THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND TO PYÆMIA—(continued).

Dr. WYNN WILLIAMS did not believe that the disease is due to any special morbid poison, but was decidedly of opinion that puerperal fever cannot be referred to any special disease, although the existing cause of puerperal disease may arise during the progress of any one of the diseases alluded to, and many others—that is, should they happen to be accompanied by any gangrenous or suppurating wound. Women are often confined with the diseases mentioned in the same room with them, and derive no injurious effects therefrom. Again, puerperal women exposed to those diseases, and who have not been previously attacked with them, will take them, as other persons, without any special action on the uterine organs. He held that every case of so-called puerperal fever is due to septicæmia, to septic contamination of the blood; and its injurious effects are first and most severely recognised in the wearied and bruised uterine organs and surrounding parts. The disease, then, is purely septicæmic. It is not pyæmia, and calling it so has led to erroneous doctrines. In the case of most intensity, the poison enters the system in a state of solution: in the more chronic cases it enters as vapour. In the first case there is a breach of surface, generally in the vagina; in the other there is no breach of surface. Where there is a breach of surface, the septic poison comes immediately in contact with the fresh wound, and a dose sufficient to knock the patient down at once is taken into the circulation; in the other case, a mass of putrid matter—it may be decomposing blood—is pent up in the uterus or vagina, and penetrates the mucous membranes and deeper tissues more slowly: in fact, it is a case of continuous poisoning. This form frequently terminates in puerperal mania. There is, then, he repeated, no such disease as puerperal fever; it is nothing more nor less than septicæmia, and is always due to the presence of putrid animal matter. Now, this putrefaction may be caused in three ways: by retention of portions of the placenta or blood-clots long enough for them to undergo decomposition; by the bruising and sloughing of vaginal mucous membrane; and, thirdly, where the septic poison is conveyed to the discharges of the patient, and by its presence sets up rapid putrefaction in the lochia—so rapid that, when once the fermentation is set up, the whole of the lochia appears to become putrid at once, like the action of yeast, or wort, or dough. The first is to be prevented by not leaving any portion of the placenta or of blood-clot (as far as practicable) in the uterus or vagina. It must not be overlooked that certain conditions of the atmosphere also tend very materially to promote this putrefactive fermentation. This has been described by Sir J. Paget, who has pointed out that at times the wounds of patients not only in hospital but outside take on an unhealthy character and become gangrenous. Of course, should any portion of placenta or blood-clot be present, your first care will be to remove them, and wash out the vagina, and, when necessary, the cavity of the uterus, with some antiseptic fluid. You must not be satisfied with telling the

nurse to do it, you must see her do it, or (as I generally do) do it yourself the first time. The treatment of the second form, when you have a slough, is the same—to syringe out frequently with some antiseptic fluid. To prevent the third cause, every care must be taken to prevent any septic or putrid poison from coming into contact with the lochia. I have not time to point out how this may be best attained; neither is it necessary, as you have already heard all that can be said on the subject, as to isolation, ventilation, and the like. No method, however, has been pointed out, or even alluded to, in the course of the discussion, by which the septic poison could be got rid of should it have attached itself in any way to the body or dress of the accoucheur or nurse. We have more than one substance—one in particular, iodine—that will not tolerate the presence of putrid animal matter or septic poison. Let any one who has been in attendance on any case, whether a parturient female or any other, where there is any putrid emanation, wash his hands in water into which he has poured tincture of iodine, and I will answer for it he has no septic matter under his finger-nails. Again, if he fancy that his clothes, hair, and skin are saturated with it, let him go into the water-closet (I mention that as the smallest room in the house), place a few scales of iodine on a plate and put a spirit-lamp under it, and he will soon find himself surrounded by a violet vapour, which will fall upon him in a shower of minute scales, from which he has only to protect his eyes. If he then carry with him any of the puerperal poison, my whole theory of the disease must be wrong. One thing I can assert, that in my own practice I have never had a case of fatal puerperal septicæmia since I first used iodine as an antiseptic, now more than twenty years ago. Iodine is equally efficacious in warding off septicæmia in other surgical diseases. I have injected solutions of septic poison under the skin of guinea-pigs, and produced death by septicæmia. I have also injected some of the same solutions, into which I had dropped a few drops of the tincture of iodine, without producing any ill effects. It is needless to observe that the prevention and the cure of this disease go hand in hand together. Should any septic poison be present in the puerperal woman, wash her out again and again with solution of iodine, until the solution comes back the same colour as it was thrown up. The temperature of the patient will probably be 103° or 104°, and it will go down in a very short time to 98°. This I have witnessed since the present discussion began. The fifth question is as to bacteria—a delusion and a snare. It is possible that the septic poison may be conveyed by them as by any other substance floating in the air that is called harmless: that is all the harm they can do, as I take it; they live on this putrid matter as mites and maggots on cheese, or vibrios on decayed potatoes during an epidemic of potato-disease: in fact, I am inclined to think that they are present for the purpose of removing the poison, not of generating it.

Dr. PLAYFAIR said, if there is one fact to be gathered from this discussion, I think it is that we have remarkably little reliable knowledge about the subject on which we are talking. It seems to me that it is a lesson really of the greatest importance, because I cannot but fancy that a great part of the almost unmistakable confusion that surrounds the whole matter has arisen from the non-recognition of that fact, from the circumstance that systematic writers upon the subject have thought it necessary to give a complete and fully rounded history of puerperal fever without recognising, as I hope they will do after this discussion, that we are only at the threshold of the inquiry, and that we have to build up all our knowledge by unprejudiced and patient clinical investigation. After saying this, I shall not err in the same way by talking too dogmatically in the few observations I have to make, and I will confine myself as much as possible to one question only which Mr. Wells has brought before us, and which has been talked a great deal of to-night—that is the relation of the specific zymotic diseases to the so-called puerperal fever, a relation which, to my mind, is, in spite of what has been said about it, one of the most obscure subjects connected with puerperal fever. My belief about puerperal fever is very much what I understand to be that of several other speakers. I do not believe that there is any specific condition justifying the name of puerperal fever; nor do I believe that there is any special miasm arising from the puerperal patient capable of being conveyed to another patient; nor do I think that there is any evidence whatever to show that there has been an epidemic of puerperal fever in the strict sense of that word, although we all know how fatally endemic it has been in our

large lying-in hospitals. In the second place, I believe that the theory which considers so-called puerperal fever to be practically the same disease as surgical septicæmia or pyæmia, or whatever we choose to call it, is the one which is most consonant with the facts of the case; that it arises from the contact of septic matter with lesions of continuity in the generative track, such as exist in every parturient woman; that there are channels of diffusion through the lymphatics, or possibly the veins; and that there are after that, just as there is in surgical pyæmia, general and local results of great consequence, rendered in the puerperal patient particularly intense and virulent, on account of the particular condition existing after delivery, which was so graphically described at the first meeting by Dr. Richardson. But, sir, the moment that that theory is stated, I think a great number of difficulties and objections naturally present themselves; and amongst these I know none more difficult to resolve than that connected with zymotic disease. It has long been a recognised axiom amongst British obstetricians of the highest eminence, and I think I may venture to include Dr. Farre amongst them after what has fallen from him to-day, that the puerperal patient to whom the poison of some specific zymotic disease, such as scarlet fever, is brought, may be attacked with an intense form of the disease, which does not show the specific characters of the disease that produced the contagion, and which is practically undistinguishable from the ordinary puerperal fever. I know that that view has been strongly controverted. It has been controverted by Dr. Savage, in his somewhat caustic remarks. It was controverted at the last meeting by my friend Dr. Brunton, who brought forward a great many practical facts of great value, as all the facts that he brings before us are; but I think that Dr. Brunton fell into the common error—he argued from negative observations. I believe that no number of negative observations can outweigh even one single positive fact carefully observed. Dr. Brunton's argument reminds me of those fortunate gentlemen that I occasionally hear of from patients who tell me, "Dr. So-and-so has attended a thousand, or fifteen hundred, or two thousand cases of labour, and has never lost a patient." Now I do not doubt the fact, and I congratulate the gentleman on his good fortune; but I must say that that fact does not, to my mind, vitiate the returns of the Registrar-General, or make me disbelieve the puerperal mortality throughout the whole of Great Britain and Ireland. So I think the facts in regard to these zymotic diseases are really beyond question. There is no one of the diseases about which strong evidence could not be brought forward. With regard to erysipelas, the fact is scarcely questioned at all. We all know how erysipelas is interchangeable in lying-in hospitals with puerperal fever; we had, as you will remember, at King's College Hospital, frequent opportunities of observing that at the time when we had a lying-in ward there. Then, with regard to scarlet fever, about which Dr. Savage has particularly spoken, I need only refer to Dr. Braxton Hicks's most valuable paper. There are in that paper no fewer than seventeen examples, if I remember rightly, of women who had a disease which presented no symptoms of scarlet fever, and which was clearly due to the contagium of scarlet fever. We all know that there is not, perhaps, in the room, a more careful observer than Dr. Hicks, and any man who can read that paper over without a preconceived judgment, and who does not agree with it, has a mind which I believe to be not open to conviction. Then there is diphtheria; we do not see so many cases of diphtheria,, so that we cannot judge of it, but I may remind you that the most brand new theory of puerperal fever, that of Dr. Martin, is that puerperal fever and diphtheria are the same thing. I saw, within the last few months, a case remarkably illustrative of the influence of diphtheria in producing a disease which I was unable to distinguish from puerperal septicæmia. The arguments on the other hand are unquestionably of considerable force. There is one that Dr. Savage dwelt upon, namely, that patients have these diseases in the puerperal state typically developed and running a favourable course. I am well aware of that; there are many examples of that kind on record, and that is just one of the great puzzles which I hope time will explain to us, but which we cannot explain satisfactorily now. My own idea about that is—and I merely suggest it as an idea, which further clinical investigation of the matter may prove to be correct or not—that in the one case possibly the contagious poison was brought immediately into contact with solutions of continuity in the generative track, and therefore produced an intense form of septicæmia, and in the other case the

poison may have been absorbed by the more ordinary channels. I think that is a sufficiently reasonable hypothesis, but one which, of course, we cannot prove. Then there is another argument, also of some consequence; that is to say, if puerperal fever be pyæmia, and if the poison of zymotic diseases can produce a condition which is not to be distinguished from pyæmia under certain circumstances, should it not be the case that, after surgical operations, these zymotic poisons should act in the same way? The whole subject of surgical pyæmia, especially the contagious qualities of it, has been so little worked at, that I do not think any surgeons would be justified in saying that zymotic poisons would not act in that way. It is practically impossible, whatever we may think, to give up attending together zymotic disease and fever; nor indeed, do I think that it is at all necessary. I am quite at one with what Dr. Matthews Duncan has said in the letter that has been read here: that, if proper antiseptic precautions be taken, any risk from this source might be eliminated, whether we use iodine or any other disinfectant that we like. I have no doubt that danger from this source might be obviated; but at the same time I think it quite consistent with common good sense that, instead of blindly shutting our eyes to facts, however unpalatable these facts may be—and no one considers them more unpalatable than I do—we should look them fully in the face. I believe the risk is not from the facts themselves so much as from ignoring the facts and refusing to take the proper precautions which they would naturally suggest.

On the first night of the discussion, Dr. Braxton Hicks attributed puerperal fever to zymotic influence in three-fourths of his cases. I was most interested with his paper; it certainly is a most valuable one; but, then, I found that he put down as cases of puerperal fever due to scarlet fever all those cases that he could trace as having been brought in anyhow into connection with scarlet fever; and whereas the paper contains twenty cases in which puerperal fever was said to have been caused by scarlet fever in which there was a rash, which we should all admit, there were fifteen cases in which there was no rash; that seems to me a very large proportion of exceptional cases, and I should say that in all probability many of those cases were cases of puerperal fever arising from other causes, certainly not from zymotic influence. If the zymotic influence is to have such an extraordinary effect in the production of puerperal fever, scarcely a puerperal woman could escape in the densely populated parts of a metropolis like London, where zymotic influences, call them scarlet fever, measles, typhoid fever, or anything else, are crossing and recrossing themselves with a frequency with which we medical men are fully acquainted. I am not alone in opposing this, which I call an extravagant view of the power of zymotic influence in the production of puerperal fever, for Dr. Robertson of Glasgow, who is at the head of a Maternity Hospital, immediately after the discussion, wrote to say that he did not at all participate in the opinion expressed. Several gentlemen who spoke at the last meeting controverted the opinion, and several general practitioners from the country protested against it; so that, I think, allowing full power to zymotic influence in the aggravation or production of puerperal fever, the theory was pushed a great deal too far on the first night of this discussion. With regard to the germ-theory of puerperal fever, I will say just two words. I think the Pathological Society has been kind enough to settle the question for us up to the present time. With reference to bacteria as a post-mortem phenomenon, it is quite an exceptional case. While Heiberg at Christiania was relating in an interesting paper that he had found an enormous quantity of bacteria in the lymphatics of those who died during an epidemic of puerperal fever, other practitioners in Paris were making similar minute microscopic examinations in various hospitals, and found no trace of bacteria. It is one of those exceptional facts that you meet with in all puerperal epidemics; sometimes one condition will be found and sometimes another; sometimes pus in the veins, sometimes pus in the lymphatics, sometimes a brown sanious fluid in the lymphatics similar to what is found in the wound; and I think, if too much importance has been attached to zymotic influence as a cause of puerperal fever, too little has been attached in this discussion to what I should call the autogenesis of puerperal fever, until it was so strongly and ably advocated by Dr. Wynn Williams. I think that, if a woman be sometimes poisoned by others, she most frequently poisons herself, and I do not see how you can find a better arrangement for poisoning a human

body than you would find in the womb if once you admit that the womb contains a fœtid fluid. You have a large bag, a spongy bag, partly bruised, sometimes torn; you have lymphatics abundant, lymphatics enlarged by the gravid process; you have lymphatics whose duty it is to absorb more speedily than at any other time; they are bent upon absorption; if you have a putrid fluid, I was going to say it must be absorbed, and, if it be absorbed, it goes into the lymphatics, and, if it go into the lymphatics, we must admit now that it goes into the peritoneum, because it is clearly made out that the lymphatics open into the peritoneum. Here, then, you have not only the lymphatics, but you have the peritoneum liable to be inflamed; and, being inflamed, and inflamed early, from the fourth or the sixth day, that is what has been observed. Peritonitis has been grouped with cellulitis and other things as sequelæ, but it ought to be considered as something more than that; or, if it be a sequela at all, it is exceedingly near the beginning of the disease, and is quite sufficient to produce fever. I have shown the ichor of the fœtid lochia passing from the lymphatics into the blood—blood which is in a peculiar state. Then, this poison may pass into the lymphatics without inflaming them as others do—syphilitic poisons do so. There are numerous cases in which a woman has died of puerperal fever, in whom nothing has been found in them but a sanious brown fœtid fluid similar to what is found in the womb. In other cases they may be, of course, inflamed. With regard to zymotic influence, no practitioner can deny its importance, and it acts in this way. We know that all zymotic diseases—take scarlatina for instance—cause the secretions of the human body to tend towards decomposition. When a puerperal woman is submitted to the influence of scarlet fever, scarlet fever renders fœtid secretions which would not otherwise be so; so, if they be already rendered fœtid by a portion of placenta, or blood-clot, or membrane of the womb, it renders them doubly fœtid, it renders the poison more virulent, and that sufficiently explains the importance of the case. If medical men will be on the look-out for fœtid lochia, I believe they will find them a great deal more frequently than they do. I believe that medical men in this room will bear me out that they have not unfrequently been struck with the fact that some accoucheurs, and, still more, some nurses, are not gifted with the sense of smell. When we are ushered into a room to consult about a puerperal case, we are often struck with the offensiveness of the atmosphere, which has not struck them. Then it strikes me that, if anything seem wrong, medical men should not trust to the testimony of the nurse, as we too often do, and as I myself have too often done; we should examine and ascertain with our own fingers whether the lochia be fœtid or not. If they be, I think we ought not to be contented with vaginal injections, but ought to resort to intrauterine injections. I was talking a few weeks ago to Professor Stoltz, formerly of Strasburg, whom I met at the President's house, and he was saying that, for fourteen years he had been in the habit of making intrauterine injections when the lochia were putrid, and with the best results. There is concurrent testimony in favour of their value, not only amongst ourselves in this country, but in foreign countries; and not only that: there are many instances of the sudden utility of antiseptic intrauterine injections; I mean the sudden abatement of the worst symptoms of puerperal fever, when the womb was washed out twice a day with disinfecting fluid. I know that there are objections made to intrauterine injections. An interesting pamphlet, which may have been sent to you as well as to me, has been published by an American physician in Pennsylvania, who states that these injections are unnecessary, because no fœtid lochia can occur. He says, if you let the patient use the usual utensil, and let it be emptied four times a day, that will be sufficient to prevent fœtid lochia. That is an interesting fact which would require to be confirmed by our own experience. Then there are two more important objections: one is, that the nozzle of the instrument that we should use would be itself a medium of infection. Of course, if it were carelessly used and improperly cleaned, one could understand it; but we all use powerful means of disinfection. If the nozzle were steeped in a strong solution, I cannot understand how that objection would hold ground. The assertion is contrary to our European experience. Then there is another objection: the fear that the fluid injected should pass through the Fallopian tubes into the peritoneum. I can only say that strong alcoholic solutions of carbolic acid, of tincture of iodine, have been, during

the past few years, injected hundreds of times in the Paris hospitals, and I ascertained the other day from a friend of mine that they did not know of any case in which passage into the peritoneum had occurred.

Dr. BRAXTON HICKS said his paper had been misinterpreted. It was a communication with regard to cases of puerperal disease, not specially stating any particular point, but taking all the surroundings of the patients, and, out of those eighty-nine cases mentioned, nearly half were associated with scarlet fever; erysipelas, diphtheria, mental emotions, did the same thing. He added: I stated that erysipelas in lying-in hospitals was most common, perhaps more common than scarlatina. I left it as a clinical point not yet cleared up to explain why and how this came about. That it is associated with the production of what we are accustomed to call puerperal fever, I think there can be no doubt.

The discussion was again adjourned.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JUNE 23, 1875.

DR. ACLAND AT THE GENERAL MEDICAL COUNCIL.

DR. ACLAND has obtained a reputation for philosophical acumen, and his addresses are never wanting in logical accuracy. It is, then, with satisfaction that we hear from him that the changes already wrought by the General Medical Council have been considerable. Britons have an hereditary right to indulge in grumbling, and the medical profession has indulged itself in that luxury, with regard to the proceedings of that august body, the General Medical Council, to the fullest extent. Many have, indeed, said that the Council had accomplished just nothing at all, that it was merely a talking body, and that we were as far off from any attempt at unification of the various medical corporations as ever.

Dr. Acland has a very different tale to tell. It appears from his address, which will be found in another column, that only one-third of the members of the Council who were on it in 1858 now remain. Not half, therefore, know how great is the change which has come over the opinions of the medical profession, since eighteen representatives of nineteen universities and corporations, all distinct, some in admitted rivalry, met six nominees of the Crown, as representatives of the public at large, and proceeded to

construct a sound and uniform system of medical education, general, scientific, and professional. It is well known in the Council, says Dr. Acland, how rapidly, though silently, the promotion of the general good superseded solicitude for particular interests, and how soon the arduous task of harmonising diversities in national sentiment, of seeking the good in every existing system, of purging the evil from every usage, however time-honoured, became the aim of every member of the Council.

Dr. Acland points to the construction of the Register, the visitation of old institutions, the completion of the Pharmacopœia, the removal of offenders from the "Register"—all of which are now matters of history. He remarks that the old universities would probably have been indignant, if, twenty-five years ago, they had been asked to give up their examination papers for perusal by strangers; but now they heartily concur in the system. He then calls attention to the new form of death-certificate now supplied, and which was due to the suggestion of the Council, to the Registrar-General, as also to the question of legal proceedings for offences under the Medical Act, which has called forth a letter from the Council. The Council has had to remonstrate with the Local Government Board on account of Article 178 of the General Consolidated Order of the Poor-law Board, which is contrary to the spirit of the Medical Act, in that it excludes from certain important professional duties all surgeons who are not members of the College of Surgeons of England.

The important subject of the Bills at present before Parliament is then glanced at. The Bill of Sir John Lubbock, to enable the College of Surgeons of England to take part in the Conjoint Scheme of Examination in England, was to be opposed by Mr. Stansfeld, in order to make it compulsory on that College, or on the Conjoint Scheme, to admit women to their examinations. Dr. Acland says that whatever may be the merits of the real or supposed act of justice towards women, it could not receive the sanction of Council that a Conjoint Scheme—an admitted good for England—should be rendered impossible, except under a condition to which many entertain the strongest objections.

Mr. Cowper-Temple's Bill, to compel the Council to register degrees granted to women by certain foreign universities, was open to still graver objections on grounds of public policy, for it would be fatal to two principles in the Act of 1858. That Act makes the Medical Council responsible for the courses of study and examination undergone by all persons placed on the Register, and it is clear that they could not, without much diplomatic negotiations and great expense of visitations, if at all, be responsible for foreign degrees; whilst, again, it would be impossible to refuse to men so dangerous a privilege, if it were accorded to women.

Medical and surgical examinations in the Universities of Oxford, Cambridge, Durham, Edinburgh, Aberdeen, St. Andrews, and Dublin, and examinations in the Colleges of Physicians and Surgeons in London, and of the same institutions in Dublin have been visited since the last meeting of the Council. The President expressed his gratitude to Dr. Quain and Dr. Bennett for the pains they have taken in this important work.

With regard to the question of the qualifications of

public health officers, Dr. Acland asks first of all whether these are to be all on the Register, and all debarred from practice, and, if so, how are they to be examined and certificated? Again, are analysts who are to arbitrate in doubtful cases of chemical analysis to adjudicate without appeal on what is and what is not injurious to health? And next, are midwives to be licensed, and if so, by whom are they to be educated and examined, and how are they to be certified?

The teaching of medicine is now greatly improved, and, although not quite uniform throughout the country, the results obtained are most encouraging. The State has endowed no medical schools, and but very few medical teachers; it has maintained no medical colleges. All has been done by voluntary effort, which is the cause of our freedom and success, as well as the cause of our failings. There is a tendency to require too much knowledge from young men entering the profession. We clearly see what is needed in the profession as a whole; says Dr. Acland, we ought not to expect the whole to be found in every unit of it. When the Council, about sixteen years ago, left the education in arts to the national educating institutions, i.e., mainly to the Universities it did so in the conviction that they would represent the full experience and wisdom of the age. Yet, as he truly says, opinion is by no means settled, even in the Universities, as to the basis on which scientific minds should be moulded. Neither the opponents nor the disciples of Bentham, Mill, Darwin, or Herbert Spencer have said their last word on the whole theory of human existence and human aims, and when men are divided in the fundamental conception of humanity, they will not be agreed on the objects of practical life in the world. Whilst educational theories are being discussed, the Council has to act.

On this point there is, no doubt, great difficulty. The scientific world is, as Dr. Acland says, deeply divided at this moment into opposing and hostile camps. The strife is not likely to be abated at this moment; and it will be a difficulty in the path of the Medical Council, as well as of all other bodies of medical men for many a day.

The withdrawal of Lord Ripon's Bill of 1870 was, according to Dr. Acland, perhaps of no real harm, because it gave time for the fuller discussion of the question.

Sir John Lubbock's Bill, if passed, will make the combination of all the licensing bodies in England possible at last. There may then be one pass examination which will be uniform for all England. This Bill lately passed through committee, the Vice-President of the Privy Council having satisfied Mr. Stansfeld with respect to the intentions and effects of the Bill with regard to female education in medicine. The Lord President of the Privy Council has indited a letter to the General Medical Council on the subject of Mr. Cowper-Temple's Bill. He is of opinion that the Bill, although limited in its direct scope, cannot fail to raise in Parliament the general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood; and, as Government may have to express an opinion on this general question, with regard, on the one hand, to women who desire to obtain legal status

as medical practitioners in this country, and, on the other hand, to the examination, rules, or other conditions which prevent them from accomplishing their wish, he desires that the observations of the Council should not be restricted to the particular proposal of Mr. Cowper-Temple's Bill, but that it should discuss as fully as possible the object to which that proposal would contribute.

The prevention of disease, says Dr. Acland, has become a great branch of our profession. The Universities have taken the matter up, as well as the profession and the public at large. Education, certificates of qualification to practise, and diplomas, already exist in Dublin, Edinburgh, London, and Cambridge, and are in preparation at Oxford.

Such is an analysis of the very able speech of Dr. Acland. The hope of the profession is, as he says, that by the agency of ancient and progressive institutions, medical education may be made uniformly adequate through the whole kingdom, former experience may be brought into harmony with the lessons of true culture and modern science, and that a constant supply may be provided of persons qualified to promote the individual and public health in this nation, the destiny of which calls her children to every form of human labour, in all climates, and in every condition of human life.

THE IRISH PHARMACY BILL.

THIS Bill, although for the third time set down for a second reading last Monday, has not yet surmounted the stage in which its principle is enunciated. Sir Michael Hicks-Beach, we believe, will stand by his measure in its integrity, and is determined to make law of it this session, even if he shall have to make it one of those inevitable bills which Mr. Disraeli has threatened to pass even if Parliament must be kept sitting in the dog days. There is, indeed, no serious opposition to it, except that of the English Pharmaceutical Society, and that opposition being an emanation of the narrowest and most selfish trades-unionism, will, we are confident, not recommend itself to the judgment of the Irish Chief Secretary. The English Society objects to the "reciprocity" clause of the Bill, which gives to the licentiates in pharmacy of either country free and reciprocal privileges in the other, and it pretends to great alarm at the prospect of half-educated Irish pharmacutists being admitted to competition with their English brethren; in other words, the London Society is very ready to grasp the government of pharmacy in Ireland, but has not the least idea of admitting Irish licentiates to compete with them in trade. No apprehension of an underselling competition by the Irish dispensers can really exist in the mind of anyone who puts an honest interpretation on the words of the Bill, for it expressly and most carefully provides that the Irish examination and the Irish fee shall be the same as that requisite for the licence of the English Society, and thus ensures, as far as legislation can, that there shall be uniformity of education and qualification, and that the English pharmacutists shall not be flooded with men of inferior attainments. The 15th clause of the Bill provides that "All persons desiring to be registered as pharmaceutical chemists under this Act may at any such examination present themselves for examination, and

they shall be examined with respect to their knowledge of the Latin and English languages, of arithmetic, of botany, of materia medica, of pharmaceutical and general chemistry, of practical pharmacy, of the British Pharmacopœia, and of such other subjects as may from time to time be prescribed by any regulations made in pursuance of this Act." The 17th clause also says, "For every examination, licence, and registration, such reasonable fees or charges shall be paid as shall from time to time be fixed and determined by any regulation or regulations to be made by the said council in pursuance of this Act; provided always, that such fees or charges shall at all times be equal, as nearly as may be, to the fees fixed and determined for like purposes by any bye-law or bye-laws made by the Pharmaceutical Society of Great Britain, and such fees shall be paid to the treasurer, and shall by him be applied to the purposes of this Act in manner prescribed by such regulations."

The English Pharmaceutical Society have no justification whatever for the apprehension they express that the Irish body will be less careful to maintain the standard of pharmaceutical education than themselves. The class of men to whom the control of Irish pharmacy is to be entrusted are, we venture to say, rather above than below the level of the Council of the London Society, and it should be remembered that those who have had hitherto the control of Irish pharmacy have evinced a desire to keep the standard of education ridiculously high rather than to underbid the licensing bodies of any other country.

The audacious policy of aggrandisement enunciated by the English Society has a plain-spoken advocate in the *Chemist and Druggist* of the 15th inst. The editor complains that under the Bill pharmacutists "may pass their examination in Dublin, an examination over which nobody in the rest of the kingdom will have any control whatever, then come over here, and by payment of a small sum of money to the English Society, claim the right of commencing business in this part of the Empire as a pharmacist of the highest rank."

It is true that no one will exercise any control over the Irish examination but the Irish Society, but it is not true that such examination will be uncontrolled, for it has already been tied up by the clauses of the Bill which we have quoted above. Does it occur to our contemporary that his argument cuts both ways, and that it would be just as unfair that Irish pharmacy should be flooded with semi-educated English chemists as that the reverse should occur? On what principle, then, does he claim the right of English pharmacutists to "pass an examination in London, over which nobody in Ireland has any control whatever, and then go over to Ireland and claim the right of commencing business in that part of the Empire as a pharmacist of the highest rank?" The *Chemist and Druggist* only makes its thunder ridiculous when it proceeds to claim for the English Society a trade-mark property in the title of "Pharmaceutical Chemist." "The Government," it says, "has no more moral right to take hold of the title 'Pharmaceutical Chemist,' which is the peculiar and special possession of the Pharmaceutical Society of Great Britain, and present it to a certain number of people desirous of having it in Ireland, than it would

have to take the private estates of Sir Michael Hicks-Beach himself and parcel them out among a select group of Irish gentlemen with no estates themselves."

A cause sustained by such puerile special pleading as this will not receive much consideration from a Minister so clear-headed and decisive as Sir Michael Beach has shown himself. As well might the London College of Surgeons claim a vested right in the title of "Surgeon," an assumption which the *Chemist and Druggist* would be the first to denounce.

We may, however, be satisfied with affairs as they stand, and give such arguments as these the little attention they deserve, for we believe that the Bill will pass without much trouble.

Every party in Ireland who are interested in the matter (except perhaps the "stupid" party of the Apothecaries' Hall) are unanimous in its favour—a fact which is more to the point than any quantity of selfish declamation.

Notes on Current Topics.

The Medical Benevolent College and Charity Voting.

UPWARDS of two thousand of the governors and subscribers of the Medical Benevolent College have now signified their wish for a change in the present mode of electing the pensioners and foundation scholars. This is not all, for daily adhesions to the prayer of the *Memorial* presented last month continue to come in and swell the list, and it is manifestly impossible to believe that the Council can believe their resolution to remove the names of those who feel dissatisfied to a *separate or special list* can meet with approval, or stay the chorus of dissatisfaction expressed by those who clearly understand the needless suffering, suspense, and anxiety, to say nothing of the woeful waste of time, inflicted upon the unsuccessful applicants for the few vacancies, which are certain to be filled by those having the largest number of friends, and not by the most necessitous and deserving among the candidates.

It is nothing short of a refinement of cruelty to admit a larger number of candidates than can by any possibility be elected. Nevertheless, eighth-tenths among the present list have only a very remote chance of success. Every year also, very many of the candidates whose friends have wasted considerable sums of money are struck off from being over the age prescribed by the by-laws.

Mr. Charles Hood, who has constituted himself the champion of the voting charities, in a pamphlet just issued, impugns the motives of the Charity Voting Reform Association in this good work, and professes to believe that many persons who have signed the Memorial addressed to the Medical Benevolent College, and similar ones from similar other charities, have "been misled" into so doing, as "the wishes of the *responsible managers of the charities*" have not been consulted in the matter. The voting charities, he says, are more successful in obtaining money from the pockets of a benevolent public than non-voting

and non-canvassing, and this is undoubted evidence that change is not needed. The income of those institutions in which the non-voting system prevails is as nothing compared to the thirty-nine who still adhere to a system that enables "responsible managers" to dispense £177,876 in their own way, and too often among their own friends.

The charity known as the "Corporation of the Sons of the Clergy" is especially selected for animadversion, and this gentleman describes it as an example of failure, because it "excludes its subscribers from any share in the selection of the recipients of its bounty." Yet what do we find with regard to the doings of this charity? That at the meeting on Saturday last, at which the Archbishop of Canterbury presided, the committee first proceeded to distribute the Midsummer benefactions to clergymen with small means, and the sum of £1,683 was given away in this manner to 103 recipients. Then followed the important work of making grants for apprenticing fees, for education, and outfits for clergy children, which absorbed another £320. The next was the usual monthly work of taking into consideration applications on behalf of clergymen's children, and for the relief of urgent cases of distress among the families of the clergy, and benefactions to incumbents of small livings and curates; and lastly, 38 widows and aged single daughters of clergymen were awarded pensions of £20 per annum to fill vacancies which had occurred in the Society. In this way 712 widows and unsuccessful candidates received £1,100. If such an amount of good work can be called a failure we are at a loss to know where Mr. Hood will find an instance of successful management; certainly not among the voting charities.

Metropolitan Hospital Sunday Fund.

WE believe that up to the time of our going to press upwards of £20,000 have been paid into the Hospital Sunday Fund at the Mansion House. This sum quite equals that of the two previous years, and with a larger number of collections yet to come in. We hope that the amount collected this year will exceed that of 1874 by several thousands.

The "Reciprocity" Clause of the Irish Pharmacy Bill.

"We are glad," says the *Pharmaceutical Journal*, "to be able to state that within the last few days some disposition to compromise has been manifested on the part of the Government, and, as we are informed, the withdrawal of the reciprocity clause (18) has been suggested in consideration of a withdrawal of the Society's opposition to the Bill. So far as we can judge an arrangement of this kind, if thoroughly carried out, might be satisfactory to all parties, and leave our Irish neighbours free to establish an entirely independent pharmaceutical society adapted to their own ideas and requirements."

This feeler is ingeniously put, but we must be excused for asking by whom has the compromise been "suggested?" Not, we venture to say, by Sir M. H. Beach, who has deliberately and decisively expressed his determination to make the Bill, as far as possible, cosmopolitan, not local. Irish chemists would, we believe, readily assent to a proposal to settle their own affairs and keep their business

to themselves, but the public vehemently object to separate legislation for the two countries except the circumstances urgently require it.

Lunatic Hospitals in the States.

THE *Boston Medical and Surgical Journal* of May 27 mentions that the Butler Hospital, Providence, the noble gift of Alexander Duncan, Esq., contains 127 patients, and there is a ward for dipsomaniacs who voluntarily seek treatment, although these patients are received with reluctance. With regard to the causes of insanity in the Minnesota Hospital, where the number is 381 cases, under the charge of two physicians only, there is a list of the usual kind, made up from the answers on the certificates filled out by chance physicians or at the dictation of friends whose ideas on the subject are limited to the latest source of excitement or vagary of the patient's mind. Of 681 cases where any cause was assigned, 210 were attributed to so-called moral influences. Here two-thirds of the alleged causes are physical, while at the Worcester Hospital four-fifths are found in this class. Only seven are classed as hereditary, and at least one-half, on due inquiry, would have been found to be cases of hereditary transmission.

Out of 1,000 cases, more than one-half were found to be married, widowed, or divorced persons. Most statisticians have shown that marriage is conducive to sanity and life. Herbert Spencer, indeed, has objected that marriage does not necessarily conduce to longevity, since more of the stronger individuals of the race marry, being better able to endure the cares and duties of matrimony than their weaker brethren. Thus the insane temperament, he urges, tends to keep single many who would otherwise swell the proportion of the married class. Dr. Bertellori's statistics show the fallacy of Spencer's view, since widowers are most prone of all to early death.

Ilkley Wells House, Wharfedale, Yorkshire.

We have much pleasure in calling attention to this excellent sanatorium, which has lately been thoroughly reorganised and placed under the supervision of Dr. Leeson. This gentleman is well known in Yorkshire as a highly educated and experienced practitioner, and the medical profession may confidently refer their patients to him without any fear that they will be perverted by any of the heretical "pathies" which so often deter orthodox practitioners from availing themselves of the advantages offered by similar establishments.

Ilkley Wells is 500 feet above the level of the sea, and the sanatorium is admirably situated in all respects. Every kind of bath can be had on the premises, including a swimming-bath, the compressed air-bath, the flowing sitz, and the "electro-chemical." A skating-rink, which is such an attraction to the rising generation, has also been recently added to the establishment.

The valley of the Wharf has long been justly celebrated for its beauty; "Bolton's sacred pile" is within easy reach; and the pedestrian may wander along the banks of the impetuous Strid without "let or hindrance," though we should not advise him to emulate the example

of young Romillè, whose fatal leap has been so charmingly described. Fountain's Abbey, Harrogate, and many other interesting places are quite accessible.

Whether for health or pleasure—that is, healthy pleasure—we know of no institution more worthy of the support and confidence of the profession.

Dr. Susan Dimock.

FROM an obituary notice by Dr. Mary Putnam-Jacobi, in the *New York Medical Record*, we extract the following notice of Miss Dimock, who unhappily perished in the *Schiller* :—

"Dr. Dimock graduated with honours at Zurich, after the prescribed four years' term of study. Her thesis was written on the cases of puerperal fever she had had an opportunity of observing in the wards of the hospital. She had been practising medicine in Boston a little over two years, but in this short time has already won for herself a deserved reputation among some of the best surgeons in the city. As resident physician at the New England Hospital she has already performed many important surgical operations. She had a certain flower-like beauty, a softness and elegance of appearance and manner, such as is abundantly lacking in the women most eager to denounce surgical accomplishments as outrageously unfeminine. I have wondered whether she did not resemble Angelica Kaufman. Underneath this softness, however, lay a decision of purpose, a Puritan austerity of character, that made itself felt, though unseen. 'She ruled her hospital like a little Napoleon,' said a lady who had been there under her care. The ideal steadfastness, which is only possible in characters of this kind, was shown to me at my first interview with her, when she came—a girl scarcely out of her teens—to Paris, on her way to Zurich. We urged her to spend a few days in the capital, for the sake of the recreation to which American students usually consider themselves entitled before they settle down to their studies. Miss Dimock alone refused, for the reason, which she gave with the utmost frankness, that she had been obliged to borrow money in order to prosecute her studies, and should not feel justified in spending a cent of it for amusement or sight-seeing. She put forward all amusements into the future, until she should have won her university degree, and should have fulfilled a pledge of hospital service in Boston. Towards this horrible voyage of April, 1875, converged the pleasurable anticipations of nearly seven years."

The Fraudulent Trading Protection Bill.

MR. SCLATER-BOOTH'S Bill for the encouragement of adulteration has passed through committee in the Lords without material alteration, and as it may now be considered the law of the land, the punishment of adulteration frauds may be said to be at an end. Earl Morley made a vigorous effort to strike out the word "knowingly," and thus put the onus on the retailer of obtaining a warranty of the purity of the article he sells, but he was defeated by a majority of 41 to 23. This is a much larger proportionate support than the "honesty" policy obtained in the House of Commons, probably because the shopkeepers have no *locus standi* amongst the Lords.

Henceforth *caveat emptor* is the *mot d'ordre*, and the public ought to know that the freedom of adulteration has been declared. The first fruits of this development of public opinion is in the acquittal of a grocer this week who sold Epps's cocoa which was sworn to consist of 43 per cent. of sugar, 16 per cent. of starch, and about a third of the whole cocoa.

Vaccination in Scotland.

SCOTLAND has always stood high as a country where medical science is cultivated with earnestness and assiduity. The tenth annual report on the vaccination of children in that part of Britain compares very favourably with the statistics of vaccination in England. During the ten years from 1864 to 1873, 1,149,352 children were born in Scotland, and no less than 1,011,524 of these were successfully vaccinated. Of the 137,828 cases not vaccinated, 97,699 died before vaccination, which is not compulsory until the expiration of six months after birth. In 5,811 cases the infants were said to be incapable of being vaccinated, either from severe constitutional peculiarity, from previous vaccination, or from having had the small-pox. The operation was postponed for medical reasons in 8,118 cases, and in the remaining 22,200 cases the children had been removed from their birth-place before vaccination. It is, we think, a pity that the period for non-performance of vaccination should be so long as six months; three months would be quite long enough. During the ten years from 1855 to 1864, 75 per cent. of the deaths from small-pox occurred in children under the age of five, whereas since 1864 only 25 per cent. of the deaths from small-pox were so caused.

A Statue to Morgagni.

ITALY is indeed reviving from her long lethargy and is beginning to take a pride in celebrating the lives of her truest heroes. A statue to the illustrious J. B. Morgagni has just been erected in his native town of Forli. Italy has ever been the favourite country in Europe as regards its climate and its music. Let us hope that it may very soon lead the van in all that ennobles the human race. Italy has had enough of priestcraft. It must be scientific.

Division of the Tendo Achillis in Certain Injuries about the Ankle.

DR. G. GAY (*Boston Med. and Surg. Jour.*, May 27) records the case of a labourer, *æt.* 45, who fell from a step two or three feet high, striking on the pavement on the left side. He was found to have fracture of the left fibula, an inch and a half from the lower extremity. The symptoms were crepitus, increased mobility, and local tenderness. The foot was dislocated on the tibia backwards and outwards, as was indicated by the undue prominence of the heel behind, of the lower end of the tibia in front, and by the inability to flex the foot to a right angle. The internal lateral ligament was partially ruptured, giving a deformity not unlike that seen in equino-valgus. The leg was placed in a fracture-box, but all efforts to remove either the lateral or antero-posterior deformity were unsuccessful. On the fifth day the

patient was etherised, and renewed but unsuccessful efforts were made to remove the deformity. The tendo Achillis was divided, and the foot restored to its natural position. The leg was replaced in the fracture-box, the foot kept at a right angle to the leg by a foot-piece, and the lateral deformity removed by side pads. The subsequent treatment gave very little trouble. The straps and pads required adjusting only once in two or three days, instead of two or three times a day, as before the tenotomy. The patient suffered no pain whatever after the operation. He was discharged five weeks after the injury, when he could walk with a cane, and had only a slight limp. Four months after the injury he reported himself quite well. There is no reason to fear a non-union of the divided tendon, for an ununited tendo Achillis is almost an unheard-of event.

Hospital Managers and Medical Staffs.

THE managers of a certain hospital in New York lately dismissed in a summary manner four members of the visiting staff of the hospital, it is said to please one of the gentler sex. They gave no reason for their course. Over sixty physicians of the city of New York have sent in the following protest:—

"To the Managers of the Presbyterian Hospital."

Gentlemen,—We, the undersigned members of the medical profession in New York, have heard with deep regret the late action of your board, whereby you have dismissed from your hospital four members of the visiting staff without assigning any ground for that course. So far as is known, these gentlemen were fully competent for the positions which they held, and discharged their duties with diligence and skill.

"We fully believe that you have failed to realise the full character of your action. In summarily rejecting these gentlemen you in effect proclaim your opinion that they are unfit for the position they held. By so doing you incur the responsibility of seriously injuring their reputation, and you have taken this grave step without preferring any charges, or assigning any reasons for so doing. We believe you will admit that while you have acquired certain rights in assuming the position of managers of an hospital, you have also incurred certain obligations.

"We believe, therefore, that, both as members of the medical profession and as citizens, we are justified in asking that you shall make public the reasons for your late action. If these gentlemen have in any way shown themselves unfit for their positions, let the facts be made known. If discharged solely from caprice, they have a right to demand that this should be made as public as their dismissal."

Well done, the doctors of New York!

Advance in Therapeutics.

DR. LATHAM, the well-known physician of Addenbrooke's Hospital, Cambridge, in an introductory lecture, says that many men pride themselves on an "enlightened scepticism" with regard to the action of drugs. This might sometimes be called "apathetic ignorance." What are the advances which have been made in therapeutics? In the first place, by our better acquaintance with the

nature and course of many diseases we have learned when to withhold our drugs, and by proper nutriment and adjustment of circumstances to promote the tendency to recovery. Take pneumonia, for example, which, if only affecting one lung in a previously healthy person, generally runs a favourable and very characteristic course. Take typhoid fever, and if the diarrhoea keep within bounds, and the pulse and morning and evening temperature keep within certain limits, we know that the condition of the patient cannot be further improved by any Pharmacopœial preparations. We have learned to consider digitalis as a cardiac tonic, and to distinguish those cardiac affections in which it may be useful or the reverse.

Take iodide of potassium, with its effects in various nervous disorders, in syphilis, &c. Take the bromides of potassium and ammonium, not long introduced into use, but whose influence in controlling epileptic attacks and curative effect in certain other disorders of the nervous system and sexual organs are most marked. Take cod-liver oil, with its influence in rickets and certain forms of phthisis. Take galvanism and faradisation in the treatment of some forms of paralysis and neuralgia, and certain other affections. Who that has suffered from a painful local affection can think of the alleviation to his sufferings which followed on the subcutaneous injection of an anodyne without gratitude? Dr. Latham is of opinion that typhoid fever, which every year in England kills so many persons, ought soon to disappear from every return of disease, whether in civil or military life. All cases that have come under his notice in Cambridge, with one exception, could be traced clearly and distinctly to patients drinking well-water contaminated by sewage containing typhoid excreta.

County Infirmaries Grants in Ireland.

We informed our readers that the question as to whether the Grand Juries have authority to refuse the usual grants in support of county infirmaries, would come before the full Bench of Judges. After lengthened argument the Court decided that they had such power—a decision which we quite anticipated. At the same time the Judges expressed their strong opinion that that power ought not to be exercised. The Chief Justice of the Queen's Bench said: "Having regard to the nature of the institution in question, and to its usefulness, they thought that a subject might be better chosen for extinction than a charity of *this kind*."

We entirely concur in this opinion, and firmly believe that the Irish county infirmaries have a function which can never be satisfactorily discharged by the workhouse hospital, and we deeply regret to observe the tendency of a few grand juries to save money by closing their doors.

Coroners' Law and Workhouse Management.

A CASE of poisoning has occurred in the Athy Workhouse, a patient having drunk a liniment in mistake for a mixture. Both the bottles were placed on the same bedside shelf, and she was allowed by the nurse to remain two hours without reporting the fact of her having taken the

wrong medicine. She died two hours later, and, incredible to relate, the medical officer swore that she probably died of "blood poisoning from disease," without having made any post-mortem examination. The jury—more intelligent than such conclaves usually are—returned a verdict "that Mary Ellard died from heart disease, but that her death may have been accelerated by taking the lotion; and that the guardians be recommended to put up a press in each ward, in which all poisonous medicines be locked up, the key to be in the possession of the paid nurse."

If the evidence be accurately reported, only one opinion is possible—that the woman was poisoned by misadventure and neglect, and it is astounding that a medical man could make such a statement on oath without the means of verifying its truth.

The Medical Council.

THE Medical Council in committee have decided to refer the Report of the Visitors to the Royal College of Physicians examination for consideration and remarks. After thirty-five minutes' discussion they decided to add a rider to the effect that special consideration be requested to be given to the imperfect arrangement for clinical examination, and to the deficiency in the examination of medical jurisprudence. The Council has since rejected by a large majority a somewhat similar resolution upon the deficiency of the examination in physiology, materia-medica, and chemistry, and in the clinical examination at the Royal College of Surgeons. After the rejection of the resolution relating to the College of Surgeons, Dr. Thompson gave notice that he intended to move in the Council that the resolution relating to the College of Physicians be rescinded.

We may be pardoned for venturing to differ in opinion from the majority of the members of the Council, but we cannot see why, in all cases where a deficiency is found in any examination, or where any improvement can be suggested, it should not be the rule to send to that particular examining body a direct notice of the error or deficiency. We think that the greatest result of the meeting of the Medical Council is the improvement which has taken place, and is now taking place, in the various examinations. It is, we believe, the duty of the Council not to leave it to the representatives of the various examining bodies to relate imperfectly to those respective examining bodies the discussion which has taken place, but at once by resolution to point out to those bodies what changes ought to be and must be effected. Surely such a proceeding would not be considered a censure, but only a statement that certain things could be improved, the carrying out of a duty for the due performance of which the Medical Council has in great part been called together.

Should the Council rescind the resolution relating to the College of Physicians, we cannot but think it will go far to stultify them in the eyes of the profession and the public, and by exposing an error in judgment, diminish the confidence which they now possess.

THE operation of ovariectomy was performed in the City of Dublin Hospital on Monday, June 7, by Mr. Croly, Senior, Surgeon to the hospital, in the presence of several

metropolitan and rural practitioners. The patient is a countrywoman, aged forty, unmarried, and had not been previously tapped. The tumour was polycystic, each cyst containing fluid of different colour and consistence. The operation was a prolonged one, in consequence of numerous anterior adhesions, as well as diaphragmatic attachments, and in consequence of the adhesion of a large portion of omentum to the cyst. The pedicle was secured by means of the clamp, and the actual cautery was applied. The patient has had no bad symptoms since the operation, and the clamp was removed on the twelfth day.

We hope to give a further report on the progress of this most interesting and instructive case.

In the House of Commons on Friday last Mr. Sclater-Booth, in answer to Sir C. Forster, stated that no communication had been received by him as to an outbreak of small-pox in Great Barr, Staffordshire. The last quarterly returns of the Registrar-General showed an unusual amount of mortality from fever in the Walsall union, in which this place was situated, and inquiries had been made of the sanitary authorities on the subject. If an outbreak of small-pox occurred in consequence of the occupation of a house without previous disinfection, the person letting such house would be liable to a penalty of £20. In default of the owner or occupier having the house disinfected, the sanitary authorities might order it to be done at his expense.

NOTICE has been given that an examination of candidates for ten appointments as Surgeon in Her Majesty's Indian Medical Service will be held in London in August, 1875. A further notice will be issued when the exact date of examination has been fixed.

THE Council of Queen's College, Birmingham, will proceed to the election of a co-Professor of Anatomy at their next meeting.

Correspondence.

THE NEW ELEMENT IN THE COUNCIL AND EXAMINATION OF THE IRISH COLLEGE OF SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Notwithstanding the remonstrances of your correspondent, who evidently was well coached on College matters, I find that as the result of the late election another F.R.C.S.I., who is actually engaged in grinding, has attained a seat as Councillor, who will bear his share in directing the educational system of the profession. As the interest of grinders must, it appears to me, be diametrically opposed to self-instruction, or the practical working up of one's professional studies, this is bad enough, and no doubt reflects the common or uncommon sense of the electors who are most interested in supporting their corporation as one "above suspicion;" but when I find that not only is the educational directorate committed to such hands, but that the *presiding over* examinations by such councillors is part of their duty, I tremble for myself, who am not so fortunate as to belong to either of the schools who have their grinders on the council of our national and representative institution, who thus enjoy the anomalous position

of to-day grinding you at some £2 or £3 a month, and to-morrow, or the same day, presiding at and directing your examination, which is to pass you to the public as a responsible surgeon. Nay, more, the very examiners may owe their election to the vote of these councillors. How can I, without some diffidence at least, present myself before those attached to rival schools, to which I do not belong, especially as I have not gone through the processes of being "ground," put "on the strap," and polished off to a keen edge by "private hour" workmanship by one who, it may be, chased me when but a little fish emerging from the school-room breeding-pond, snatched at me when sliding through the gap of the preliminary examination, cast a succession of various flies at me, but did not bag me, as I was eventually gulled by one who has not as yet attained the triple office of grinding me, electing my examiners, and presiding over and directing my examination. Is this fair? Will this hold water before the public, or the Medical Council of this kingdom? Is it honourable on the part of a corporation that frames and passes its own ordinances? Will not such a course tend to cause an exodus of those seeking licences? As it seems to me that ordinances or decrees of Council are so easily made, should not one be made that, as at present, no teacher can be an examiner? Surely the regulator of the examiners, as the president and supreme director of examinations, should not be a teacher, much less a "private teacher," "coacher," or "grinder," as he is variously termed.

I trust you will excuse my asking so much of your space for a remonstrance from one who fears he is,

Yours truly,

"IN THE WRONG BOX."

THE PARTURIENT TRACTOR.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Having made use of this tractor, or help, for more than thirty years, and sometimes one hundred times in the year, and as I find it is very seldom or never used by others (for so I find from the many nurses I meet with, as they had never seen it used before they had seen me apply it); it is really a great help, and very simple. It merely consists of a long or round towel, part of a sheet, or strip of linen or calico; it should be about five or six feet long, and about a foot, or a foot and a half wide, single or double, strong enough to bear hard pulling. This band should be placed round the patient, with the two ends of equal length brought behind the patient and tied together to form a nice handle to pull by, which will often be needed for some time. The band in front should be flat and smooth, and quite cover the abdomen, be kept well down, and not be allowed to slip up round the waist, which it will often do from the movements of the patient. When everything is ready, and the labour well advanced, each time the pain comes on the nurse may pull at the tractor, which will help the womb greatly. As to the force required, she may pull as hard as she can when the head is beginning to emerge. When the nurse has not pulled hard enough, I have pulled at it with my left hand, and with the right guided the head, and supported the perineum; and it is astonishing to find the power one has over the pain, and progress of the head.

The force is so equalised that it can do no harm; it is a great comfort and support to the patient, who will often exclaim, "Pull harder." It does not tire so much as pressure by the hand, and it is more soothing to the patient. Any one who would try it a few times would soon find the value of it.

Although it will not in all cases supersede the forceps, yet it will in many; for when the womb is nearly, but not quite able to finish her own work, a little extra help by the way is all that is needed.

I am, Sir, yours faithfully,

10 Bladud Buildings, Bath,

F. P. HOBLYS.

June 16, 1875.

"VIVISECTION."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As the subject of vivisection is now occupying much attention, I send you the conclusions I formed in 1864, as expressed in an essay sent in for competition for the best "Treatise on Vivisection," given by the Society for the Suppression of Cruelty to Animals.

Yours, &c.,

EDWARDS CRISP, M.D., M.R.C.S.

29 Beaufort Street, Chelsea,
June 14th, 1875,

Conclusions.

1. That the cutting and maiming of living animals is not necessary to ensure dexterity or skill on the part of the operator—that no operations performed upon our domestic animals require the practice of vivisection as pursued at the schools of Alfort, Lyons, and Toulouse; and that such operations should be condemned as inhuman, cruel, useless, and disgraceful to humanity.

2. That the assumption that vivisections performed under the influence of chloroform are generally painless is often erroneous, for in the majority of vivisections the greater amount of suffering is after the operation has been performed.

3. That one important fact has generally been lost sight of by those who have estimated the amount of cruelty inflicted by vivisectionists upon the lower animals, such as frogs, newts, rats, guinea-pigs, cats, and dogs—viz., that these poor animals are often confined in improper situations, half-starved and neglected, as testified by the author's experience.

4. That a great number of experiments performed upon the lower animals have led to very erroneous conclusions on the part of the operators, and have rather tended to retard than to advance science.

5. That, notwithstanding the vast amount of cruelty inflicted upon animals of various kinds by vivisectionists, but little real and positive good has resulted from these operations in the treatment of disease.

6. That the removal of organs, the ligation of arteries, the opening of intestines, the laying bare of the brain, spinal cord, heart, and other parts, are operations that have been too often recklessly and inconsiderately practised, without reference to the amount of cruelty inflicted, and the probable benefit resulting from them.

7. That all aimless and oft-repeated experiments upon the lower animals are to be condemned as useless, cruel, and inhuman, and that no lecturer nor teacher is justified in putting any animal to torture under these circumstances.

8. That if, after due and mature consideration, it can be fully ascertained that operations and experiments upon the lower animals are likely to improve our treatment of disease, and thus benefit human suffering and diminish human mortality, such experiments and vivisections are justifiable, care being taken in all cases to mitigate the sufferings of the animal by the employment of anæsthetics and by the use of all other means of a humane character.

Foreign Bodies in the Air-Passages and Œsophagus.

ANNANDALE (quoted by *Centralblatt für Chirurgie*, No. 16, 1875) remarks on the advantage obtained in searching for a foreign body in the larynx through a tracheotomy-wound, if support be given from the mouth by manipulation with the fingers. For the removal of foreign bodies from the bronchus he recommends, after tracheotomy and a deep inspiration, that the trachea be closed temporarily; the deep expiration following often drives the body out. Two cases are given by Annandale (see *Med. Times and Gazette*, February 27) illustrating the successful use of each of these methods.

Krishaber (*Séance de la Société de Chirurgie*, Nov. 11, 1874), in a case of foreign body in the œsophagus, caused the patient to drink a quantity of water, and then introduced a dry sponge at the end of a whalebone bougie. When the sponge had become swollen through absorption of water it was withdrawn slowly, and swept the œsophagus thoroughly from below upwards, carrying the foreign body, a piece of turkey-bone with it. Dr. Duplay remarked, apropos of this treatment, that it would be difficult to employ when the patient could not swallow water, and that if the sponge became greatly swollen it might be difficult and painful to withdraw it.

NOTICES TO CORRESPONDENTS.

SPECIAL NOTICE.

THE Publishers will be glad to send receipts for several hundreds of unpaid subscriptions. If those gentlemen whose subscriptions are in arrear for three, four, and five years will kindly send cheque or post-office order to either of the offices of this Journal they will be particularly thanked.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a distinctive signature or initials, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

DEA, MEEHAN AND SHEEDY.—On reference to the proceedings of the Medical Council in another column, our readers will observe that these names have been ordered to be erased from the *Register* for conspiracy to defraud. It is painful to record such a fact, as henceforth they cannot legally carry on the practice of their profession, for which they have been educated, and to which they were admitted years since.

COMMUNICATIONS, Enclosures, &c. have been received from—Dr. Pavy, London. Dr. Beale, London. Dr. Buzzard, London. Dr. Morell Mackenzie, London. Mr. Hublyn, Bath. Dr. Edwards Crisp, Chelsea. Dr. De Bassoncourt, Clermont, France. The Registrar-General. Mr. Frank Bolton, Local Government Board. Dr. Leeson, Wharfedale. Dr. Mulligan, Abersychan. Dr. Brown, Hesketh. Dr. Dobell, London. Dr. Burnes, London. Dr. Dowse, Skelmanthorpe. Dr. Grabham, Earlwood. Dr. Purdon, Belfast. Dr. Louis Pathault, Paris. Mr. Davy, London. Dr. Pal rey, London. Dr. Macnamara, London. Dr. Abrath, Sunderland. Dr. Andrew Clark, London. Mr. Watts, Bristol. Dr. Williams, Edinburgh. Mr. Blackley, Manchester. Dr. Churchill, London. Dr. Langley, London. Dr. Myrtle, Harrogate. Dr. Bayes, London. Dr. Jewell, Chicago. Mr. George Gaskoin, Westbourne Park. Mr. Mills, Bourne. Mr. Marshall, London. Mr. Lambert, Dublin. Dr. Luther, Cappelquin. Dr. Pennesfather, London. Dr. Carpenter, Croydon. Mr. Maceonchy, Down. Mr. Wilson, Lime-riek. Mr. Sandford, London. Dr. Johnson, London, &c., &c.

VACANCIES.

Royal Free Hospital. Surgeon. Applications, with testimonials, to be forwarded to Mr. Blyth, the Secretary. (See Advt.)
County Down Infirmary. Assistant Surgeon and Registrar. Salary, 60 guineas, with board and apartments. (See Advt.)
Kensington Dispensary. Resident Medical Officer. Salary, £150. Particulars of the Hon. Sec.
Portsea Island Union. Medical Officer. Inclusive salary, £250. Forms of application supplied by the Clerk to the Board, Portsea.
St. Bartholomew's Hospital. Assistant Physician-Accoucheur. Honorary. Full particulars of the Secretary.
Liverpool Northern Hospital. House Surgeon. Salary, £100.
House Physician. Salary, £90; and an Assistant House Surgeon. Salary, £50, all with residence and maintenance in the house. Applications to the Chairman of the Committee.
Worcester Lunatic Asylum. Assistant Medical Officer. Salary, £100, with board and residence. Address Dr. Sherlock, at the Asylum, Powick.
Bristol General Hospital. Physician's Assistant. Salary, £80, with board and lodging. Applications to the Secretary.
Surrey County Hospital. House Surgeon. Salary, £75, with board and residence. Particulars of the Secretary, at Guildford.
Bridgnorth Infirmary. House Surgeon. Commencing salary at £120. Applications to the Hon. Sec.

APPOINTMENTS.

ALLBUTT, H. A., L.R.C.P.Ed., Physician to the Leeds Dispensary for Diseases of the Skin.
CLOUTING, J. R., M.R.C.S., Public Vaccinator for the recently amalgamated Thetford and Croxton Districts of the Thetford Union, Norfolk.
COTTON, H. J., M.B., C.M., M.R.C.S.E., a Resident Physician to the Royal Infirmary, Edinburgh.
CURRIE, A. S., M.B., M.R.C.S.E., a Resident Physician to the University Clinical wards, Royal Infirmary, Edinburgh.
ELLIOT, H. P., L.R.C.S.Ed., L.R.C.P.Ed., a Resident Physician to the Royal Infirmary, Edinburgh.
GEORGE, H., M.R.C.S.E., Medical Officer for the Tetney District of the Louth Union, Lincolnshire.
GIBBONS, H. A., M.B., C.M., M.R.C.S.E., a House Surgeon to the Royal Infirmary, Edinburgh.
GLENNING, G., M.B., C.M., a Resident Surgeon to the Royal Infirmary, Edinburgh.
GUPPY, T. S., M.D., M.R.C.S.E., Medical Officer for the Constantine District of the Falmouth Union.
HOURIGAN, W. P., L.R.C.P.Ed., L.R.C.S.I., Medical Officer for the Freshford Dispensary District of the Kilkenny Union.
HUGHES, W. L., M.R.C.S.E., L.S.A.L., Junior Resident Medical Officer to the London Hospital.
JONES, C. H., M.B., F.R.C.P.L., re-appointed a Physician to St. Mary's Hospital, Paddington, upon the expiration of his second term of office.
MATHEW, C. G., L.R.C.S.I., Resident Medical Officer to Trinity College, Glenalmond, Perthshire.
MAY, B., F.R.C.S.E., Demonstrator of Anatomy at Queen's College, Birmingham.
MORGAN, G., L.R.C.P.Ed., M.R.C.S.E., Resident Accoucheur to the London Hospital.

MORISON, J. R., L.R.C.S.Ed., a Resident Surgeon to the Royal Infirmary, Edinburgh.
 RICE, G., M.B., C.M., a Resident Surgeon to the Clinical Wards, Royal Infirmary, Edinburgh.
 RICKARDS, E., M.B., Professor of Physiology at Queen's College, Birmingham.
 RONALDSON, M.B., a Resident Physician to the Royal Infirmary, Edinburgh.
 SAWYER, J., M.D., Professor of Pathology at Queen's College, Birmingham.
 SCOTT, J. H., M.B., a Resident Surgeon to the Royal Infirmary, Edinburgh.
 SMITH, R. D., M.R.C.S.E., I.S.A.L., Extra Junior Resident Medical Officer to the London Hospital.
 WARREN, Dr. M. A., Medical Officer and Public Vaccinator for the Tullaroan Dispensary District of the Kilkenny Union.

Marriage.

GRANT—JENKINS.—On the 16th inst., at St. Michael's, Coventry, by the Rev. Canon Baynes, Frederick Grant, L.R.C.P., &c., of Market Harboro', to Ellen Margaret, only child of Thos. Jenkins, J.P., of Coventry.

Deaths.

MERCER.—On the 9th June, at Leicester Villa, Brixton, John Thomas Mercer, M.B., aged 38.
 REYNOLDS.—Patrick B. Reynolds, L.R.C.S., L.K.Q.C.P.I., Medical Officer of the Claremorris Dispensary District.
 RIDGE.—On the 11th June, at Darnet Square, Joseph Ridge, M.D.
 WILLIAMS.—On the 31st May, at High Street, Bromley, Kent, Edward A. Williams, M.R.C.S.E., aged 74.
 WORTON.—On the 15th June, at Montague Place, sell Square, Henry Rendell Wotton, late of Cavenoish Square, his 66th year.

Advertisements.

MEDICINES.—THE BOARD OF SUPERINTENDENCE of the CITY OF DUBLIN PRISONS will receive tenders from LICENTIATE APOTHECARIES, duly registered, to SUPPLY MEDICINES for the Officers, their Families, and the Prisoners of the CITY PRISONS, and to discharge the duties heretofore performed by the Contractor for Medicines and Attendance. Particulars can be ascertained at the Prisons. Tenders, including a gross sum per annum for all the Prisons, are to be lodged in the Office of the Board in the City Hall, Cork Hill, on or before Tuesday, 29th June, 1875. The Board will not be bound to accept the lowest tender.
 By Order,
 JOHN MARTIN, Secretary.

DUBLIN STEAM PRINTING COMPANY.

(Printers of "The Irish Medical Directory")
 Respectfully invite the attention of the MEDICAL PROFESSION to the facilities they offer for the RAPID EXECUTION OF PRINTING AND BOOKBINDING of every description.
 WOODCUTS and DIAGRAMS of SURGICAL subjects, coloured or otherwise, carefully produced.
 HOSPITAL STATIONERY at reduced rates.
 94, 95, & 96, MIDDLE ABBEY STREET, DUBLIN, and 10 WARWICK LANE, LONDON, E.C.

The Medical Press and Circular

OFFERS UNUSUAL ADVANTAGES

FOR the Insertion of announcements, from its extensive and largely increasing circulation in each of the three divisions of the United Kingdom and the Colonies. Being also supplied to the Hospital Libraries, &c., it will be found a most valuable medium for Advertisements of Books, Vacancies and Appointments, Sales and Transfers of Practices, Surgical Instruments, Chemicals, and Trades generally.

The scale of charges is as follows:—

Seven lines and under	£0 4 0
Per line afterwards	0 0 6
One quarter page	1 5 0
Half-page	2 10 0
One do.	5 0 0

When advertisements are given for a series of insertions, a very considerable reduction from the above scale is made.

LONDON HOSPITAL MEDICAL COLLEGE.—
ENTRANCE SCHOLARSHIPS IN NATURAL SCIENCE.—Two Scholarships, of the value of £60 and £40 respectively, will be offered for competition at the end of September, 1875. The Subjects will be the same as for the Preliminary Scientific Examination at the University of London. Further particulars may be obtained on application to the Vice-Dean, at the College, Turner Street, Mile End, E.

ROYAL FREE HOSPITAL. Gray's Inn Road.—There is a VACANCY for a SURGEON in the Medical Staff of this Hospital, in consequence of the death of Mr. John D. Hill. The hospital contains upwards of 100 beds, 60 of which are appropriated to Surgical cases, and the Committee contemplate increasing the number. Candidates must be Fellows of the Royal College of Surgeons of England. The election rests solely with the General Committee of Management. Applications, with Testimonials, to be forwarded to the Secretary, at the Hospital, on or before Monday, the 28th of JUNE.
 JAMES S. BLYTH, Secretary.

TO INVALIDS, PARENTS, &c.—In September next a Medical Gentleman, accompanied by his wife, purposes starting by steamer for Melbourne, in charge of a Party, consisting of persons of delicate health, wishing to avoid the ensuing winter, or of those whose health might demand some period of relaxation in a genial climate.

Upon the arrival of the Party in Melbourne, a short stay would be made at an hotel previously engaged, preparatory to their departure on a nautic tour up the Bush, through the delightful and interesting mountain region of Gippsland, where the pleasures of Hunting, Riding, Shooting, Fishing, Botany, &c., could be pursued, associated with the luxuries and appliances of civilised life.

The Party would return to England in the following May or commencement of June.

For particulars and terms, apply by letter to "G. W.," care of J. Baxter Langley, Esq., 50 Lincoln's Inn Fields, W.C.

INDIAN MEDICAL SERVICE

India Office, 14th June, 1875.

NOTICE IS HEREBY GIVEN, THAT AN EXAMINATION of Candidates for ten appointment as Surgeon in Her Majesty's Indian Medical Service will be held in London in August, 1875.

Copies of the Regulations for the Examination, together with information regarding Pay and Retiring Allowances of Indian Medical Officers, may be obtained on application at the Military Department, India Office, London, S.W.

A further notice will be issued when the exact date of examination has been fixed.

T. T. PEARSON, Major-General,
 Military Secretary.

ARMY MEDICAL DEPARTMENT.

17th June, 1875.

AN EXAMINATION OF CANDIDATES FOR COMMISSIONS in the Medical Department of Her Majesty's Army will be held in London on the 9th of August, 1875, and following days. Candidates having the necessary qualifications to practise Medicine and Surgery under the Medical Act, and who are not under 21, nor above 28 years of age, are eligible to attend. Applications for admission to the examination should be made in writing without delay to the Director-General of the Army Medical Department, London, as the List will close on Saturday, the 31st July, 1875.

(Signed) W. M. NUIR, Director-General

LIMERICK UNION.

THE Guardians will, at their meeting, on WEDNESDAY, 23rd JUNE next, be prepared to receive applications from Candidates for the appointment of RESIDENT MEDICAL OFFICER of the Workhouse, at a salary of One Hundred and Fifty Pounds a year, with apartments and the following weekly rations:—Bread, 7 lbs.; Meat, 6 lbs.; Milk, 2 qts.; Tea, 3 lb.; Sugar, 2 lbs.; Potatoes, 1 stone; Butter, 1 lb.; Eggs, 3 doz.

Any person appointed must be qualified to practise as Physician and Surgeon, be a Licentiate of the Apothecaries' Hall, and have a Certificate in Midwifery—and be prepared to stand a competitive Examination, if required.

Copies of Testimonials, with Diplomas, must be lodged with the Clerk of the Union before 10 o'clock on said day.

Applications must be marked on outside "Resident Medical Officer."
 10th June, 1875.
 C. M. WILSON, Clerk.

COUNTY DOWN INFIRMARY.

THE GOVERNORS OF THE COUNTY DOWN INFIRMARY will, at a Meeting, to be held at Twelve o'clock on the 13th day of July, proceed to elect a duly qualified gentleman to fill the office of ASSISTANT-SURGEON and REGISTRAR to the Institution.

Salary—Sixty Guineas per annum, with Board, Apartments, and Washing.

Diplomas and Testimonials to be sent to me, on or before Eleven o'clock on that day, when the personal attendance of Candidates will be required.
 (By order) J. K. MACONCHY, Surgeon.

Board-room, Infirmary, June 4, 1875.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION. SESSION 1875.

MONDAY, JUNE 21 (*continued*).
APOTHECARIES' HALL, DUBLIN.

The Visitors' Report was to the effect that the examination in anatomy and physiology, and the clinical examination were deficient.

It appeared that the oral examination in anatomy was confined to osteology, and that in the clinical examination no questions were asked.

Dr. Leet, the representative of the Apothecaries' Hall, said that although he was not of the same opinion as the visitors, he was sure that alterations would be made in the examinations if it were the general desire of the Council.

Dr. A. Wood said that from the report it would appear that if the candidates who were rejected had been questioned they would have been successful. Sir Dominic Corrigan knew why the examination was imperfect, but did not know whether it could be remedied. When there was a vacancy in the Court of Examiners an advertisement like the following was inserted in the newspapers:—

FOR SALE, ONE SHARE in the Apothecaries' Hall of Ireland. Offers will be received to the 31st March. This Corporation has been paying a dividend of £20 per Share per annum. Apply to CORNELIUS CARLTON, Eden Quay, Dublin.

The candidates for the vacant post of examiner would, then, go to Eden Quay—a place noted for ship chandlery, tar-dealers, auctioneers, &c.—and bid for the share, because to be an examiner it was necessary to be a shareholder. It was not to be wondered at that the examiners put no questions, for not one was a teacher or hospital surgeon or physician, and he therefore doubted the ability of the Hall to improve its examination.

Sir Wm. Gull said this was an illustration of the importance of the Council formally expressing their views upon the manner in which the examinations were conducted. The whole clinical examination was a mere sham. Supposing Dr. Leet should be drowned whilst crossing the Channel, the opinion of the Council would never be conveyed to the proper quarter. He should move that "Attention is specially desired to the defects in the anatomical and physiological parts of the examination, and also to important deficiencies in the clinical examination."

Dr. Rolleston seconded Sir Wm. Gull's motion, and said that the whole labour was useless if they simply talked without acting.

The motion was negatived.

It was agreed that a copy of the Report of the Visitors should be forwarded to the Governor and Company for consideration and remarks.

The Council then resumed.

It was moved by Dr. Humphry, seconded by Mr. Macnamara, and agreed to:

"That the visitations of examinations be continued so as to effect the visitation of the examinations, in part or in whole, of some of the licensing bodies in each year, and that it be referred to the Executive Committee to consider in what manner this may best be done, and to report to the next meeting of Council."

Dr. Humphry said that in the visitations alone the Council had done a great work. They had therefore a sufficient reply to the sneering remarks sometimes heard, that the Council had done nothing. The examinations of nineteen licensing bodies had been reported upon, and both the public and the profession would know that steps were taken to ensure the entrance of qualified men only into the profession. A large number of bodies had modified their examinations. It had been an expensive work, but it was a satisfactory one, and he had the greatest pleasure in adding that the work had met with the heartiest and fullest co-operation from the licensing bodies, who had in every way aided the visitors.

It was moved by Dr. Sharpey, seconded by Dr. Rolleston, and agreed to:

"That the following be referred to the Executive Committee for their consideration and report:

"That, in the case of examinations not visited in any

given year, the respective licensing bodies be requested to furnish the Council with returns to the following effect :

- "(1) The names of the examiners.
- "(2) Copies of the written or printed questions ; the time allowed for answering them ; and the judgment passed on the answers.
- "(3) The time devoted to the oral and practical examinations ; the plan followed in conducting them ; the nature of the specimens, preparations, and other appliances made use of, and the practical exercises the candidates were called on to perform.
- "(4) An account of any changes introduced since the date of the last information received by the Council."

It was moved by Mr. Macnamara, seconded by Dr. Pyle, and agreed to :

"That the following motion be referred to the Executive Committee for their consideration and report :

"That it be a direction to the Executive Committee, in their future selection of visitors of examinations, so far as practicable to arrange it so, that visitors shall not be called upon to report upon examinations held in that division of the kingdom in which the visitors themselves may be resident."

The following letter and general order of the Local Government Board were read and entered on the Minutes :

LOCAL GOVERNMENT BOARD,

WHITEHALL, S.W.,

11th June, 1875.

I am directed by the Local Government Board to forward to you the accompanying copy of a general order which they have issued, amending the provisions contained in the orders in force in unions and separate parishes, with respect to the qualification of the medical practitioner by whom a certificate is required to be given to entitle a district medical officer to a fee for amputation, performed in the case of any pauper.

The regulation hitherto in force required that the certificate in any such case should be that of some Member of the Royal College of Surgeons of London, or of some Fellow or Licentiate of the Royal College of Physicians of London. Having regard, however, to the Medical Act, 1858, which was passed long subsequent to the general orders containing the regulation referred to, the Board are of opinion that the restriction imposed should be removed, and that the qualification should be extended in accordance with the principle of that Act. Hence the order now issued substitutes for the proviso on the subject in the previous general and other order one which makes the qualification the same as that prescribed with reference to the appointment of medical officers by the orders in force in that behalf.

The copies of the order intended for the district medical officers will be sent to the clerk to the guardians, in each case, for distribution amongst those officers.

I am, Sir, your obedient servant,

(Signed) H. FLEMING, Secretary.

To the Clerk to the Guardians.

To the Guardians of the Poor of the several Unions and separate Parishes in England and Wales ;—

To the District Medical Officers of the said Unions and separate Parishes respectively ;—

And to all others whom it may concern.

Whereas by certain articles contained in certain general and other orders addressed by the Poor-law Commissioners, the Poor-law Board, and the Local Government Board respectively, to the Guardians of the Poor of the several Unions and separate Parishes in England and Wales, provisions are made for payment to district medical officers of special remuneration for certain operations, including amputation, subject to the following proviso :—

"Provided that, except in cases of sudden accident immediately threatening life, no medical officer shall be entitled to receive such remuneration for any amputation unless he shall have obtained, at his own cost, the advice of some Member of the Royal College of Surgeons of London, or some Fellow or Licentiate of the Royal College of Physicians of London, before performing such amputation, and unless he shall also produce to the guardians a certificate from such Member of the Royal College of Surgeons, or such

Fellow or Licentiate, stating that, in his opinion, it was right and proper that such amputation should be then performed ;"

And whereas in certain unions and separate parishes the operation of the articles of the said several orders comprising the provisions for the special remuneration of district medical officers as aforesaid, has been wholly or in part suspended until further order in that behalf ;

And whereas it is expedient that the proviso above recited should be rescinded, and another proviso substituted in its stead :

Now therefore, we, the Local Government Board, in pursuance of the powers given by the Statutes in that behalf, hereby order as follows :—

Article I.—The above recited proviso in the said several orders shall, from and after the date at which this order shall come into operation, be rescinded.

Article II.—From and after the same date the following proviso shall be substituted in place of the proviso so rescinded :—

Provided that, except in cases of sudden accident immediately threatening life, no medical officer shall be entitled to receive such remuneration for any amputation unless, before performing it, he shall have obtained, at his own cost, the advice of some person who shall be registered under the Medical Act of 1858, and shall be qualified by law to practise both medicine and surgery in England Wales, such qualification being established by the production to the Board of Guardians of a diploma, certificate of a degree, licence, or other instrument, granted or issued by competent legal authority in Great Britain or Ireland, testifying to the medical or surgical, or medical and surgical, qualification or qualifications of such person, and unless he shall produce to the guardians a certificate from such person as aforesaid, stating that, in his opinion, it was right and proper that such amputation should be then performed.

Article III.—In any union or separate parish where the operation of the articles of the said several orders comprising the provisions for the special remuneration of district medical officers has been suspended with respect to amputations, the operations of the proviso substituted by this order shall also be suspended to the same extent until further order is made in that behalf.

Article IV.—In this order—

The term "separate Parish" means a Parish or place which is under a separate Board of Guardians ;

The word "Union" includes any Union of Parishes incorporated or united for the relief or maintenance of the poor under any Act of Parliament.

The word "Guardians" includes any Governors, Directors, Managers, Acting Guardians, Vestrymen, or other Officers appointed or entitled to act in the distribution or ordering of relief to the poor from the poor rates under any Act of Parliament.

Given under the Seal of Office of the Local Government Board, this tenth day of June, in the year one thousand eight hundred and seventy-five.

(Signed) J. SOLATER-BOOOTH,
President.

(LARE SAVELL READ,
Secretary.

TUESDAY, JUNE 22.

Present—Dr. Acland, President, in the chair ; Dr. Bennett, Mr. Quain, Mr. Bradford, Dr. Rolleston, Dr. Humphry, Dr. Pyle, Dr. Storrar, Dr. Haldane, Dr. Andrew Wood, Dr. Fleming, Mr. Turner, Dr. Thomson, Dr. A. Smith, Mr. Macnamara, Dr. Leet, Dr. Apjohn, Sir D. Corrigan, Bart., Dr. Sharpey, Dr. Parkes, Dr. Quain, Sir Wm. Gull, Bart., Dr. Begbie, Dr. Stokes, Dr. Francis Hawkins, Registrar.

The Returns from the Medical Department of the Army were entered on the Minutes.

It was moved by Dr. Rolleston, and seconded by Dr. Thomson and agreed to, as an amendment upon a motion by Mr. Macnamara, that at all anatomical examinations, candidates should dissect, and at all examinations in surgery should perform operations :

"That it is desirable candidates in examinations in anatomy should understand that they may be called upon to perform actual dissections, and that candidates in ex-

aminations in surgery should understand that they may be called upon to perform one or more operations on the dead subject."

Moved by Sir William Gull, seconded by Dr. Storrar, and agreed to:

"That a letter be addressed by the Registrar to the several examining bodies, to inquire if they have any observations to offer to the Council on their recommendations respecting professional examinations, and to inquire how far they have been able to carry into practice such recommendations."

A discussion here arose as to the Council communicating with schools.

The recommendations referred to are as follows:—

"17. That the Council recommend that, in the case of certificates presented before admission to the examinations of the several licensing bodies, each should include a statement from the teacher or teachers, that the candidate had satisfactorily attended examinations, from time to time, held on the subject of study to which the certificate relates. (Minutes of General Council, July 15, 1874, p. 51.)"

"18. That it is desirable that, in the examinations on several of the subjects of the curriculum—such, for example, as botany, zoology, chemistry, and materia medica—the area of examination should be limited and defined. (Minutes of General Council, July 15, 1874, p. 51.)"

"21. That it is desirable that observation with the microscope should form part of the examinations of candidates for a licence. (Minutes of General Council, July 16, 1874, p. 60.)"

A Statement, together with copies of documents and correspondence, between Mr. R. Vandeleur Kelly and the Council of the Royal College of Surgeons in Ireland, were read.

Mr. Kelly complained that the President of the College had permitted Dr. G. Stokes, a rival candidate for an appointment, to copy a record of the College to use to Mr. Kelly's disadvantage.

It was moved by Sir William Gull, seconded by Dr. Quain, and agreed to:

"That the receipt of Mr. R. Vandeleur Kelly's papers be acknowledged, and that he be informed that the Council do not consider his case to be one for their consideration."

STATE MEDICINE.

The following letter was read and entered on the Minutes from the representative in the Medical Council of the University of Oxford, respecting examination in State Medicine, referred by the Executive Committee to the General Council:

ANATOMICAL DEPARTMENT, MUSEUM, OXFORD,

February 9th, 1875.

SIR,—I have been requested, as the representative of the University in the Medical Council, to lay the following resolutions before the Medical Council.

Extract from Report of Committee on Medical Education of the Hebdomadal Council of the University of Oxford.

"That it is expedient to provide or to assist in providing an examination in the subject called State Medicine, or Sanitary Science.

"That it is thought best that such a qualification should not be granted severally by different licensing bodies, but like the qualification for general practice, should depend on an examination authorised by all, or as many as possible, of the licensing bodies acting conjointly.

Resolution of the Hebdomadal Council thereupon.

"That the medical representatives of the University be authorised to inform the Medical Committee of Reference, and the Medical Council, that the Council has adopted the recommendations of the Committee, and is prepared to recommend corresponding action to the University when the proper time arrives."

I am, Sir, yours faithfully,

GEORGE ROLLESTON,
Representative of the University of Oxford in the Medical Council.

To the President of the Medical Council.

MISS GREENSTREET.

It was moved by Dr. A. Smith, seconded by Dr. Thomson, and agreed to:

"That the Medical Council, acting under legal advice, decline to register Miss Greenstreet."

The following report of the Finance Committee was read and adopted:—

REPORT.

The Finance Committee report that the income of the Council during the year 1874 has been £6,004 6s. 2½., a sum which exceeded the income of the year 1873 by £666 5s. 7d. The expenditure of the Council during the same period has been £6,882 16s. 9d., a sum which exceeded the expenditure of 1873 by £1,757 13s. 8d.

It will be seen from the annexed Table (A) that the expenditure of the year 1874 has exceeded the income of the year by the sum of £878 10s. 7d.

The Table (B) shows the expenditure of the General Council during the years 1873 and 1874 under each head of expenditure, and also the increase and decrease under each item during the year 1874 as compared with 1873. It will be seen that the increase of expenditure during the year in certain items is £1,336 18s. 2½. Of this sum £688 18s. 6d. has been spent in reprinting the Pharmacopœia and Additions, an outlay which is in course of reimbursement. A second large item of expenditure is for house expenses incident to coming into possession of the new premises.

On the other hand the table shows a decrease in certain items of expenditure to the amount of £262 7s., leaving a nett increase of expenditure by the General Council during the year 1874 as compared with 1873 of £1,073 14s. 2½.

In former reports approximate estimates of the income and expenditure for the year ensuing were given. Little advantage has resulted from this practice, and as much uncertainty must for the present exist as to the expenditure in connection with the new offices and premises, it has been thought undesirable to present an estimate for the next year.

The Committee report that, in accordance with the resolution of the Executive Committee (January 21st, 1875), the accounts of the General Council were submitted for audit to Messrs. Quilter and Ball, professional auditors, and were found correct.

RICHARD QUAIN, M.D.,
Chairman.

June 21, 1875.

WEDNESDAY, JUNE 23.

THE business of the Council commenced with the adjourned consideration of the Reports of Visitors of Examination in

THE UNIVERSITY OF DUBLIN.

Dr. Apjohn, as the representative of the University of Dublin on the Council, desired to make a few remarks on the Report. It was extremely gratifying to him to find that the visitors were thoroughly satisfied with the mode of conducting the examination, and of recording the answering by numerical marks, so that the examiners were able to judge correctly of the absolute and relative merits of the candidates. With reference to the remarks on the number of questions given to each candidate, and the time for answering them, he conceived that a candidate who answers satisfactorily 8 questions out of 10, or 80 per cent., ought to be considered eminently well prepared. As to the presumed inadequacy of the time allowed for dealing with the ten questions, his opinion was that the student who could not answer one of a common run of questions on chemistry in six minutes would not be more successful in an hour. Dr. Apjohn then drew the attention of the Council to what he considered an erroneous statement in this Report—viz., that the resolution of the Board of Trinity College alluded to at the bottom of Clause 14 was "founded on the recommendation of the Professors." He had no recollection whatever of their having done anything of the kind, and the Regius Professor and the Professor of Materia Medica, whom he had consulted on the subject, were in the same predicament. He had no doubt, however, that upon inquiry it would admit of satisfactory explanation. There was but one other subject to which he wished to refer—namely, where fault is found with the paper questions on anatomy, which were considered by the visitors "as of a rather easy and elementary character." Against this objection he would place the fact that in the Medical School of Trinity College there is not only a written, but

an oral examination in anatomy, of which the visitor speak in the following terms: "It is impossible to over-estimate the care and patience exhibited by the examiners in the performance of their duty, which was in all respects executed in the most satisfactory manner."

Dr. Stokes expressed the gratification which he and Dr. Apjohn shared on reading the reports of the visitors upon the examinations held in the University of Dublin for the degree of Bachelor of Medicine. He desired, however, to remark that the visitors were not quite correct in stating that the examination for the degree of Bachelor of Medicine may be regarded as the final one. The exercises for the M.D. are performed three years after the taking of the M.B. With reference to the visitors' suggestion of having coadjutors, as in the previous examination, who were unconnected with the teaching in the School of Medicine, he remarked that so far as the practice of medicine goes, as well as the theory, the Regius Professor is not a teacher in the school, and he is associated with the Professor of the Practice of Medicine in the School of Physic. It is quite true that at the clinical examination the candidates are examined in class; yet the author of each essay has in the first instance to bear the brunt of the examination, which, like that of the remaining candidates, embraces a large number of points of investigation as to related disease. As to the opinion that the time devoted to the *visd voce* examination was too short, he thought that the judgment as regards the *mens medica* of a candidate is better arrived at by the clearness of a written history and description of any case for the first time brought before him than by the answering of even a very large number of questions. By such a course a stronger light can be thrown on his medical powers than by his having to answer even an extended series of questions on subjects which may not be ancillary to the disease under consideration. Dr. Stokes could not agree with the suggestion that the professorial or teaching duty should be completely separated from that of examination for licence, and that the duty of professors should be confined to teaching alone, as by the present system of tutorial examination the very best results are attained. Such an exclusive policy would imply a want of confidence in the morality of the examiners, whereas in an important matter of this kind there must be mutual confidence. He deemed it, however, a totally different question that teachers be called in to assist in the examinations, whether they be members of the corporation or not, or of the special faculty in the corporation. By such a course a great advantage accrues to science, to the student, and to the teaching bodies themselves.

Dr. Storrar suggested that the University might still improve its already high standard of examination by grouping the subjects upon which the student was to be examined, instead of allowing him to come up on five distinct occasions the interim, in his opinion, being often employed by grinders to cram their candidates, and so generating superficial knowledge.

Dr. Haldane, as one of the visitors, was highly pleased with the examinations in general at the University of Dublin; both the oral and clinical examinations were most thorough and practical: he would, however, suggest that a little more time be given to the oral examination.

Dr. Aquilla Smith differed from the previous speaker on the question of time; his experience as an examiner showed him that if a student could answer in an hour all the questions given him in an oral examination it ought to be sufficient for the purpose.

Sir Dominic Corrigan, Sir Wm. Gull, Mr. Macnamara, Mr. Turner, and Dr. Bennett also spoke upon certain points in connection with examinations and examiners, and the report was referred to the University for consideration and remarks.

The Report on the

UNIVERSITY OF DURHAM

was last on the list. In the discussion on this Report it was stated that a certain candidate who had passed the examina-

tion in arts presented himself for the M.D. degree, when it was found that he was deficient even in the most elementary rules of spelling; notwithstanding this he received his M.D. degree by a "narrow majority" of the Council of the University, and was thus let loose upon the profession and the public an uneducated and professionally an unqualified man, because of the opposing interests of the two examining boards. Dr. Andrew Wood spoke very severely upon this case, and Dr. Pyle, as representative of the University, regretted exceedingly that he could offer no excuse for such a proceeding; he, however, firmly believed it would never occur again. The report was then formally referred to the University for consideration and remarks, and the Council adjourned for an hour, during which three committees were sitting.

Upon resuming in General Council at 5 p.m., Dr. Thomson proposed to rescind a resolution, which was virtually one of censure, on the College of Physicians of London for its deficiencies in the Clinical Examination for the Licentiates, and in the Department of Medical Jurisprudence.

This led to a warm discussion. Dr. Thomson, in proposing to rescind the before-mentioned resolution, said he was only acting in a spirit of fairness to the College thus censured, because it was not just to single out this particular body when there were several others whose examinations had been shown to be equally open to criticism.

Some members suggested that all the corporations whose examinations had been proved to be inefficient should be included in one general resolution.

Sir Wm. Gull, as mover of the original resolution which Dr. Thomson now sought to remove, considered that the Council had got into a very vicious way of acting; last week they had passed this resolution, and now they were striving to stultify themselves by rescinding it. This blundering had already been noticed in one of the medical journals (*THE MEDICAL PRESS AND CIRCULAR*). He was heartily tired of the ever-recurring cry, "Wait till next year and all will be made right." He would like a statistical account of the principal words used in the Council during 1875; he was quite sure this wretched word "wait" would far outnumber all others.

Mr. Quain objected to the language Sir Wm. Gull was continually using in that Council, language totally different to that used by every other member.

Sir Dominic Corrigan was strongly opposed to Dr. Thomson's motion. One day they passed a vote of censure upon a particular college and the next day they were asked to withdraw it. Was this consistent? He perfectly agreed with Sir Wm. Gull. There were two ways of dealing with a matter of this kind, levelling up and levelling down. Dr. Thomson's proposal was to mete out justice to the College of Physicians; but because they had done one wrong in selecting this particular college, were they to commit another blunder in order to make things even? He would rather suggest that all colleges meriting censure be introduced into one general resolution not the withdrawal of the one.

Upon the vote being taken, Dr. Thomson's resolution was lost by a majority of two.

Letters were then read from Miss Jex Blake and Mr. Arthur T. Norton, upon the subject of the admission of women to the pass examinations; and from Dr. Shuttleworth, Superintendent of the Royal Albert Lunatic Asylum, Lancaster, on the registration of foreign degrees.

The hour of six having arrived, these letters were ordered to be placed on the programme for consideration on the morrow, when the whole question of the admissibility of women and the registration of foreign degrees would be gone into.

THURSDAY, JUNE 24.

The whole of Thursday was occupied in discussing the report of the committee appointed to consider the letter

written by the direction of the Lord President of the Privy Council by Mr. Simon to the President of the General Medical Council

The debate was adjourned.

FRIDAY, JUNE 25.

THE MEDICAL EDUCATION OF WOMEN

The following letters on the Medical Education of Women were read and considered by the Council:

32 BERNARD STREET, LONDON, W.C.

June 17th, 1875.

GENTLEMEN,—In the year 1869, we, the undersigned, were registered as students of medicine by the Registrar of the Branch Council of Scotland in the Government Register kept by order of the General Medical Council, and we inscribed ourselves as students of the medical faculty of the University of Edinburgh for that and the three following years.

In that University, and in the Extra-Mural School of Medicine of Edinburgh, we attended during five years all the classes comprised in the full medical curriculum, taking some of them also a second time. We also complied with the usual requirements respecting hospital attendance, and dispensary practice, including practical midwifery, pharmacy, and vaccination, and received clinical instruction in both medicine and surgery from recognised teachers of these subjects.

Having thus completed the full course of study usually required from medical practitioners, we are ready to submit to the ordinary examinations, with a view to placing our names on the Register as ordained by the Medical Act of 1858.

As, however, it appears that the examining boards are unwilling to admit women to their ordinary examinations, although we are not aware that the Act of 1858 gives them any authority to draw such distinction, we beg to apply to you, as the highest medical court in this country, for instructions respecting the course which it is now incumbent upon us to pursue with a view to comply with the existing laws regulating medical practice.

We have the honour to be, Gentlemen,

Your obedient servants,

(Signed) SOPHIA JEX-BLAKE.
ISABEL THORNE.
MARY EDITH PECHY.

6 WIMPOLE STREET,

18th June, 1875.

SIR,—As the General Medical Council will probably this day take into consideration the matter referred to the Council by the Lord President of the Privy Council concerning the registration of women as qualified practitioners of medicine, I beg to submit to your notice the following facts:—

1. That there is at the present time a school of medicine for women in London.
2. That the lectures and demonstrations given at this school are precisely the same as at other medical schools.
3. That the lecturers and teachers are for the most part teaching the same subjects at other medical schools as shown by the enclosed prospectus.
4. That since October last twenty-three women students have attended lectures at this school.
5. That application has been made to the several examining bodies in Great Britain and Ireland to register the names of students attending this medical school with a view to admit them to examination at the termination of the required curriculum. And that the replies have been to the effect that the examining bodies do not con-

sider themselves empowered to admit women to examination.

I am, Sir,

Your obedient servant,

(Signed) ARTHUR T. NORTON,
Dean of the School.

Dr. ACLAND, F.R.S.,
Chairman of the General Medical Council.

The following letter from Dr. Shuttleworth was read :
ROYAL ALBERT ASYLUM FOR IDIOTS AND IMBECILES
OF THE NORTHERN COUNTIES,
LANCASTER, 21st June, 1875.

SIR,—Having, on behalf of myself and several other registered practitioners, who are graduates in medicine of foreign universities, been in communication with Mr. Cowper-Temple on the subject of the Bill, which, I find, is now referred to the consideration of the Medical Council, I beg leave to bring to your notice, as President of the Council, the following facts and suggestions :—

1. That there is a considerable number of registered British practitioners, some occupying important public positions, who, for various reasons, have, since 1858, obtained degrees in medicine at foreign universities of repute.

2. That such degrees, though possessing no *legal* value, have been generally recognised, not only by the courtesy of the profession, but by many of the examining boards in this country as possessing *examinational* value.

3. That, were it lawful for the Council to register, as *additional qualification*, well-attested foreign degrees in the case of persons previously admitted to registration as qualified by British diplomas to practise medicine, no objection could be urged on the ground of public policy. The registration, under such conditions, of *bonâ fide* foreign degrees would, moreover, clear the way for the stringent suppression by law of the use, by unqualified persons, of medical titles, based upon worthless (so-called) degrees.

The concession suggested in the last paragraph, though not reaching the extent contemplated in Mr. Cowper-Temple's Bill, would probably be received with satisfaction by the promoters of that Bill, as recognising the medical qualifications already held by women, contingently upon their being hereafter admitted to examinations under the control of the Council. At the same time, it would satisfy the just aspirations of those who, like myself, possess a foreign degree, the examinational value of which is confessedly superior to that of the "minimum" British qualifying diplomas, but who, in the present state of the law, can require only the lower and not the higher class of qualification.

I have the honour to be, Sir, your obedient servant,

(Signed) G. E. SHUTTLEWORTH,
B.A. Lond.; M.D. Heidelberg;
M.R.C.S. Eng.; L.S.A. (Regd.);
Medl. Supt. Royal Albert Asylum.

H. W. ACLAND, Esq., M.D., F.R.S.,
Pres. Med. Council.

Resulting from the consideration of this letter, the following important resolution was moved by Dr. Sharpey, seconded by Dr. Rolleston, and agreed to :

"That it is desirable that the Council should take into consideration, at a future meeting, whether, with a view of furthering the desire of extended accomplishment in medicine and science among the members of the medical profession, it may be advantageous to make it lawful for the Council to insert in the "Medical Register," after the name of a person registered on qualifications in medicine and surgery obtained in the United Kingdom, the appropriate title indicative of a medical degree obtained, after study and examination, in a foreign or colonial university approved for this purpose by

Her Majesty's Privy Council on the recommendation of the Medical Council."

The following report of the Committee on Mr. Rickard's letter, referred to in our last (see page 530), was read :—

REPORT.

The Committee appointed to consider the proposed Repeals of parts of the Medical Acts, submitted for the consideration of the Medical Council by E. K. Rickards, Esq., the speaker's counsel, after consulting the solicitor to the Council, is of opinion that the repeals proposed are merely formal, and do not alter the principle or effect of the several Acts.

The only doubt the Committee has had is whether the whole of Section 46 of the Medical Act, 1858, should be repealed, or only that portion of it which relates to students who had commenced their studies before the passing of the Act. On the whole, however, the Committee is of opinion that no part of the section is now required, and that the whole may be repealed.

21st June, 1875.

JOHN STORRAR, Chairman.

It was agreed :

"That the Report of the Committee on Mr. Rickard's letter be adopted, with the exception of the proposed repeal of Section 46."

THE EXECUTIVE COMMITTEE FOR 1875-6.

After a ballot the following members were found to be elected :—Drs. Bennett, Humphry, Andrew Wood, A. Smith, Sharpey, and Quain.

THE CONJOINT SCHEME AND STATE MEDICINE.

The following motion was proposed by Dr. Parkes, seconded by Mr. Quain :

"That in reference to the communication from the University of Oxford, relative to qualifications in State medicine, the Council considers that in the interests both of the public and of the advancement of medical science, the principle embodied in the Conjoint Examination Scheme for licences to practise medicine and surgery should be extended to any licences or certificates in State medicine or public health."

This resolution, which was ultimately carried, occasioned considerable discussion, in which Mr. Turner, Dr. Storrar, Prof. Rolleston, Dr. Humphry, Dr. Wood, Sir Wm. Gull, Sir Dominic Corrigan, Dr. Parkes, and Dr. Smith took part :

The Council then resolved itself into a committee of the whole Council, for the adjourned consideration of the Report of the Committee on Mr. Simon's letter, which appeared in our last. (See page 530.)

The following paragraph of the Committee's Report was agreed to :

"In reply to the communication addressed to them by the Lord President of the Privy Council, the Medical Council have to state that they have felt bound to consider the whole question of the admission of women to the medical profession."

The further consideration of the report was adjourned until the following day.

THE PHARMACOPEIA COMMITTEE.

The Committee reported that 2,097 copies of the reprint of the Pharmacopœia had been disposed of, that 10,000 copies of the Additions had been sold, and 5,000 more reprinted.

The Committee, after much consideration, came to the conclusion that it would not be desirable to issue a new edition for some time to come.

The Committee was reappointed.

VISITATIONS OF EXAMINATIONS.

The report of the committee on the above contained the following general considerations, which were received and entered on the minutes.

The committee remarked that it was a source of gratification to them to observe in how good a spirit the licensing bodies had received the suggestions of the visitors, how almost uniformly they had given their suggestions full attention, and in how many cases they had adopted them. The committee had also observed with pleasure not only the thoroughness with which the visitors had inspected the examinations, but the freedom of their reports from anything like captiousness or unnecessary criticisms.

GENERAL CONSIDERATIONS.—1. It appears that there are still examinations conferring licences to practise which are only partial, *i.e.*, which do not include all the ten subjects which the Medical Council had recommended shall be tested before a qualification is granted. The committee think that when all the visitations are completed, it may be desirable to consider how to deal with such cases if they then exist. 2. The old question of teachers examining their own pupils has been raised in some of the reports. But as the custom of appointing non-professional examiners, and of giving them a large share in the examination, is now generally adopted in all the cases where professors are also examiners of their students, the point seems to the committee of less importance than formerly.

An entirely different practice is followed by one licensing body, the Royal College of Surgeons of Ireland, in which either by charter or by-law, it has been arranged that no teacher can be an examiner; and thus the Dublin College, by going to the other extreme, deprives itself of the very best examining power.

Teachers, and especially those who use examination in the instruction of their classes, must be the best examiners; but while teachers have to examine their own pupils, non-professorial aids must be introduced. But surely it is a great mistake to convert this necessary adaptation into a principle, and to refuse to make the best examining talent available, as is done in this instance.

The committee think it would be well if independent corporations in arrangements for the composition of their respective examining boards had regard to some plan for securing an interchange of personnel.

By such a course the advantages undoubtedly secured by having practised teachers to act as examiners would be obtained without the drawbacks sometimes found to attach to the working of boards in which teachers examine their own pupils.

3.—The question whether actual dissection should always be required in the anatomical examination is raised in some of the reports, but this point is now settled by a late resolution of the Council, which has decided that candidates may be called on to dissect, and, therefore, they will necessarily always prepare for the contingency.

4.—Several of the visitors have objected to so many subjects being taken too closely together; in one case 6 and in another 5 great subjects are examined upon in writing in one day. The committee agree with the visitors that this is putting too much pressure on the candidates, and that better answers would be obtained if these examinations were extended over two days.

The point will probably recur next year, and can be then dealt with.

5.—The method of conducting the clinical medical examinations is extremely diverse. In some instances the candidate is taken to the bedside, is left there for a definite time, and then writes out the case, on which he is then questioned. In another instance the candidate examines the case for himself, but does not write it; the examiner then goes to the bedside, and hears his diagnosis and the reasons. In another examination the examiner and candidate go together to the bedside, and the latter then examines the case under the eye of the former for any time deemed necessary by the examiner. Some Licensing Bodies do not take the candidates to the bedside at all, but bring the patients to the room where the candidates are.

In some cases the visitors have made remarks and recommendations to which the Licensing Bodies do not give

their assent, and the committee believe that in the present state of things it will be well for the Council to make no suggestion on this point, but it would be desirable that the Council should request the Licensing Bodies to direct their attention to these diversities of practice, in order that each body may review its own practice, and improve it if it sees cause.

The committee, however, entertain no doubt on one point—*viz.*, that the candidates should be taken to an hospital to be examined, and that the medical patients should not simply be brought to the Examining Hall.

6.—The methods of conducting the surgical clinical examination are also different, but the committee recommend that this matter should be discussed at the next Council Session, when the reports of all the Bodies will have been made and commented on.

7.—The committee has had under consideration the custom of allowing a candidate to pass only one portion of an examination, and of permitting him to be examined on a future occasion, only in a subject he has failed in before. This custom takes several forms; in one case a candidate who passes in surgery but fails in medicine, is allowed to present himself in medicine only at a future occasion; or a candidate who passes in *materia medica* but fails in chemistry, is subsequently only examined in chemistry; but in some cases this plan is carried farther, and a candidate who fails in the written and oral parts of the examination in medicine, but passes in the clinical examination, is not required to undergo the clinical examination a second time.

These several plans of residues or remanets appear to the committee to require some consideration from the Council, but, probably, as in two or three other cases, this matter had better be discussed next year, when all the reports of visitations are before the Council.

8.—A question has been raised in the committee with regard to candidates who have been rejected by one licensing body presenting themselves (without additional study) before another Examining Board. This question has often been before the Council, but without any satisfactory plan being suggested, by which a licensing body could know that they had a candidate before them who had shortly before been rejected by another board. A member of the committee has proposed that in all cases every candidate's schedule should be stamped by the licensing body admitting him to examination, and that the date should be inserted. A rejected candidate would receive back his papers, but these would inform any other Examining Board that he had been rejected at a certain date. In this way, without any record of rejection, and without any invidious distinction between candidates, the fact of previous rejection would be known.

9.—Another question has been raised in committee which does not fall within its power to consider, but which it thinks of importance enough to be reported to the Council. It has been asked whether the Council should not directly or by means of the Licensing Bodies inspect the schools of medicine, and see whether the appliances for teaching are sufficient. The committee conceive they have discharged their duty in passing over this question to the Council for consideration if it deems fit.

SATURDAY, JUNE 28.

The proceedings of this, the last day of the session, commenced with the adjourned debate on

THE ADMISSION OF WOMEN TO THE PROFESSION.

This debate, which in its nature and results is of such vital importance to the profession, has been specially reported for our columns, and will appear transcribed from short-hand notes in our next.

The following is the amended motion by Dr. Parkes, seconded by Dr. Pye, upon which the vote was eventually taken:

"The Medical Council are of opinion that the study and practice of medicine and surgery, instead of affording a field of exertion well fitted for women, do, on the contrary, present special difficulties which cannot be safely disregarded; but the Council are not prepared to say that women ought to be excluded from the profession."

For this there voted 14; against it, 7. Sir Dominic Corrigan was absent, and the President and Dr. Storrar did not vote. Dr. Andrew Wood demanded that the names should be taken down. They were as follows:

For the motion of Dr. Parkes, which in effect decided upon the admission of women to the profession, there voted—

Mr. Quain, Prof. Rolleston, Dr. Humphry, Dr. Pyle, Dr. Thomson, Dr. Smith, Mr. Macnamara, Dr. Leet, Dr. Apjohn, Dr. Sharpey, Dr. Parkes, Sir Wm. Gull, Dr. Beggie, Dr. Stokes.

Against the motion—

Dr. Bennett, Mr. Bradford, Dr. Haldane, Dr. Wood, Dr. Fleming, Mr. Turner, Dr. Quain.

Previously to putting the amendment from the chair as a substantive motion, Dr. Andrew Wood said he wished to propose an amendment thereto, as he desired to obtain a distinctive vote whether the Council were in favour of admitting women to the profession or not, for this was in reality the substance of Dr. Parkes's motion. Dr. Parkes and others who had voted for him might protest that it was not so, but the profession would see distinctly that the Council were not prepared to exclude, and therefore were willing to admit them. He wished it to go forth to the profession who had and who had not thus voted.

Dr. Quain, in seconding the amendment of Dr. Andrew Wood, entirely agreed with what had just fallen from the last speaker. When voting for the preamble of the committee, he was doing so under the impression that something even stronger against the admission of women would be brought forward in the Council than that contained in the recommendations of the committee. He was surprised that the Council should thus stultify themselves by favouring such a resolution as the one before them. He was entirely opposed to the admission of women, and had never been more impressed with their physical unfitness than from the speeches of Dr. Humphry and others on the Council who were now covertly voting against their arguments.

The amendment was then put, which was in effect, "That the Council do not recommend legislation with the view of removing the difficulties in the way of women entering the profession."

This amendment was lost, the members who voted for Dr. Parkes's motion voting against this.

The following recommendations of the committee on Mr. Simons' letter, somewhat altered in Council, were then agreed to: "With regard to Mr. Cowper-Temple's Bill considered by itself, and apart from its bearings on the general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men, as a profession and means of livelihood," the Council have found no difficulty in forming an opinion. By the Medical Act, 1858, the Council are precluded from registering persons holding foreign degrees, and, consequently have been compelled repeatedly to refuse to register foreign degrees held by men.

The reason for this is obvious, viz., that the Council have no means of exercising that supervision and control over the education and examination required for foreign degrees, to which the licensing bodies of this country, whether universities or corporations are, by the Act of 1858, subjected. But this privilege, which the Medical Act refuses (and the Council believe very properly refuses) to men, Mr. Cowper-Temple's Bill proposes to grant to women. To such a proposal the Council feel bound to offer a respectful but decided protest, as being subversive of the main principle of the Medical Act.

If it should appear to the Government and the Legislature expedient that women who desire to obtain a legal status as medical practitioners in this country should not be debarred from obtaining that status, the Council are of opinion that it should be under such arrangements as the following:—

1. That in the interests of public order, the education and examinations of female students of medicine should be conducted entirely apart from those of male students.
2. That with reference to the "examination" "rules or other conditions" which prevent women from accomplishing their wish, the Medical Council have to state

that under the provisions of the Medical Act those persons only can be placed upon the Medical Register who have been admitted to medical degrees in the universities, or who have been admitted fellows, members, or licentiates of one of the medical corporations of the United Kingdom. Should the Universities and corporations be unable or unwilling to admit women to their degrees, or to admit them as licentiates or members of the respective corporations, the Council are of opinion that sufficient provision would be made to enable women to obtain a "legal status as medical practitioners in this country," if an Act of Parliament were passed which should enable the Medical Council to recognise such examination or examinations as the Medical Council may from time to time deem sufficient, for the purpose of granting admission of women to the Medical Register under the title of "Licensed Practitioners of Medicine." The education and examination for these licences should be under the supervision of the Medical Council in the same way as is required, for the other licences of this country. The Council are of opinion that any course of legislation which would interfere with the free action of the Universities and corporations mentioned in Schedule (A), in respect of the medical education, examination, and licensing of women, is undesirable.

3. That the examinations of female candidates for a licence entitling their names to be placed on the Register, should be equivalent to those of male candidates.

The Council have already had their attention drawn to the importance of securing more efficient instruction for women who engage in the practice of midwifery, and whose services are largely employed, especially by the poor of this country. The Council feel very strongly that it is desirable that some means should be adopted for securing a better education, and granting certificates of competency to women who act as midwives. For, whilst fully admitting that, for the safe and efficient practice of midwifery as a branch of medical science, a full and complete education both in medicine and surgery is necessary, the Council believe that a much more limited and less expensive education might be afforded to women, who, after due examination, might, as midwives, render valuable services to the community, and supply a deficiency long felt and expressed. For women thus educated and certificated, it might be desirable that a special register should be provided.

Sir Dominic Corrigan withdrew his motion for a "Table of Instructions to the Visitors of Examinations" on the understanding that it should be brought up next year, as there were no examinations to be visited before then.

THE CONJOINT SCHEME AND THE ENGLISH COLLEGE OF SURGEONS.

Dr. Bennett then moved:

"That the President be asked to inform the Council whether he is able to state in what position the Joint Scheme for England now is, and whether there was any foundation for the report that the Royal College of Surgeons of England had virtually seceded from the Conjoint Scheme."

In answer to Dr. Bennett's question, the President replied that—

"No full information can be officially given without communication with the Committee of Reference, of which Sir James Paget is chairman, and with the bodies who have sent representatives to that committee. The Scheme cannot be completed till Sir John Lubbock's Bill is law.

"As to the College of Surgeons having withdrawn from the Scheme, that is a report as to the truth of which I have no evidence, nor have I any reason for believing it.

"There seems to be no ground for supposing that the College of Surgeons, which has taken much pains with a Bill that has already passed the third reading in the House of Commons, will do other than act in the same spirit as that which induced them to obtain the Bill.

"The College of Surgeons had, I believe, always maintained, or implied their right to secure the nomination of a certain proportion of the examiners in surgery and in anatomy.

"If this right be now insisted on, the consent of the co-operating bodies and of the Medical Council to the arrangements proposed by the College of Surgeons is obviously necessary.

"These circumstances show that the negotiation is one

which, in its very nature, requires time, but they do not indicate that the Scheme will come to an end."

THE CONJOINT SCHEME AND THE IRISH COLLEGE OF SURGEONS.

A question of a similar nature relative to the Irish College was then moved by Dr. Apjohn, to which Mr. Macnamara gave the following answer :

"The Council of the Royal College of Surgeons of Ireland have not withdrawn from the Conjoint Scheme of Examination for Ireland. The Fellows, the year before last, by a large majority, decided that they could not approve of the Scheme then submitted for their consideration, but did not express themselves as being hostile to the principle of a Conjoint Examination. The Council, nevertheless, remained pledged to the Scheme approved of by this Council, but during the past year the question has fallen into abeyance. The present feeling in Ireland would seem to be that we should be very much influenced by the steps which may be taken in England and Scotland in this direction."

THE TEACHING OF PHARMACY AND THERAPEUTICS.

A letter signed by the lecturers on materia medica at the principal metropolitan schools with reference to the unsatisfactory nature of certain existing regulations under which the foregoing subjects have to be taught was then read, and a recommendation that the teaching of pharmacy should be an early, and therapeutics a late course in the curriculum, an opinion to this effect to be forwarded to the various licensing bodies.

A memorial of certain medical practitioners in the county of Durham was next read, and ordered to be entered on the minutes.

After some routine business and the usual votes of thanks (a gratuity for extra services to the clerks of the Council not being amongst the usual votes this year) the Council finally adjourned.

QUACKS AND QUACKERY IN THE UNITED STATES.

[FROM OUR AMERICAN CORRESPONDENT.]

FROM medical journals, both domestic and British, recently come to hand, I see American quackery has been receiving a little attention of late on both sides of the Atlantic, and particularly in California. But what comes of all this talking and writing? Nothing. Quackery is not decreasing. It is as rampant as ever, and should be highly amusing as well as ridiculous were it not fearfully vicious and even diabolical. No conception of the number of American quacks and their evil doings can be formed by those living in Ireland. To the one legitimate practitioner there are doubtless four or five quacks in every city and town in America. What I say of Chicago is also true of each and every city (it is the same everywhere); what I shall say of one quack will hold good for the entire brood of these blood-suckers, robbers, and murderers.

Last summer one of the migrating species, named McBride, paid a flying visit to the Phoenix City. He was nearly six feet high, sallow complexion, small dark eyes, heavy black moustache; his hair reached as low down behind as the ridges of his scapulae. Nor did he disdain the sweet delicious luxury of a tobacco-quad. He was about as thin and as straight as a fishing-rod. He dressed in shining-black cloth, with spotless white vest, and wore a profusion of jewellery. This "bird of passage" rented a large store in the greatest thoroughfare in the city, and got the walls painted flesh-colour. Next, in large and prominent letters, were painted the words, "Dr. J. J. McBride's World's Relief;" while in brightest colours was printed what this "World's Relief" could do: "Cures neuralgia in three minutes, toothache in one minute, cholera in seven minutes, bloody flux in five minutes, and liver complaint in a day," and so with every disease in the nosology. Inside his "office" was

piled from floor to ceiling with pamphlets and packages of his "World's Relief." Every day he drove about town a large wagonette drawn by four grey horses gaudily caparisoned, and each with a huge red and white plume sticking up from his head. In the wagonette was a brass band playing all the time; while from the rear of the vehicle a red flag four feet wide by six feet long, and bearing the words "Dr. J. J. McBride," floated. Having made his circuit of the city after the fashion of any circus company, he returned to his "office," where he quietly fleeced his numerous victims. And here I will remark that, having travelled a great deal of the world, I find the Yankees, with all their boasted "smartness" and cleverness, the most gullible of all the gullible people on the face of the earth. Nothing dazzles them and so completely throws them off their guard as great show, display, "cutting a dash," as they call it. A few months ago the dupe of one of these quacks was dying, and sent for a physician. It was then discovered that the man was being poisoned by kerosene-oil, which he was taking in half-pint doses, from one who styled himself the "Good Samaritan," and who advertised that the "blind see and the lame walk" (in the other world, I suppose) by the use of "his remedy"—kerosene.

To all this buffoonery there is a sadly dark and serious side, for independent of the number poisoned and otherwise killed, these quacks are the notorious and detestable abortionists so plentifully met with in the United States, and so much called for. Thousands, yes, millions of infants, are yearly murdered by criminal abortion by these men. This shows forth most glaringly the shocking and awful depravity of American women, and men too. You are probably already aware that the Americans tolerate only one or two children at most. As soon as a wife discovers she is pregnant she either goes to the abortionist or sends for him, and without any more ado commits the abortion. These wretches commit such crimes publicly, and with bold effrontery. They make not the least secret of it. Some of them have actually announced their guilt in published pamphlets, in which the number of abortions committed by the author is stated. The Government is perfectly acquainted with all this, yet they walk unhung. Among this large and motley crowd of "dark and evil ways" must be classed most of the "female doctors." These are terrible-looking creatures—veritable witches, if such beings exist at all on this earth—and who do a thriving trade in abortion.

Chicago, with a population of 400,000, has about 1,000 "doctors." (!) Only 372 of these are given in the local Medical Register as being "in good and regular standing," according to the Chicago Society of Physicians and Surgeons, a body of highly respectable and educated gentlemen, and under whose authority the said Register is published. This list of 372 includes those who have a very good professional training, as well as those who have only a very inferior education.

Chicago rejoices in the possession of two medical colleges. What authority they possess, and whence they derive it, to confer diplomas, I do not know; but I do know that only a very limited knowledge of medicine is acquired in these colleges, simply because their laws and rules are not enforced. As long as students see a "short-cut" from the beginning to the conclusion of their college studies, at the same time stifling conscience and ignoring any responsibility for loss caused by their ignorance, with no hope of redress in law by the injured parties, so long will students avail of this short way. This exactly is how the case stands in Chicago. The curriculum of these colleges is not enforced—students "are recommended" to follow it. Clinical study seems to be optional. Just a year ago I saw the name of one individual among those who took their M.D. whom I chanced to know as having spent only a single session at study. Very likely only a small percentage of the students follow the curriculum. In diagnosis, and particularly in differentiation, these men make terrible mistakes, as the following will

show: The writer has seen a case of lead-poisoning in which all the symptoms were well marked with the characteristic blue line on the margins of the gums, unusually distinct, treated as typhoid fever. In a case of secondary cancer of the round ligament three of these men gravely discussed the propriety of plunging a bistoury into the tumour, believing it to be an abscess. In a case of ascites, under observation for a year and a half, the patient was left to burst or die for want of tapping. The fluid was making a spontaneous outlet at the umbilicus when the writer first tapped him. This trivial operation is terribly dreaded here. Cases of simple tonsillitis and ordinary hoarseness are constantly called and treated as diphtheria and croup. Hence the supposed prevalence and successful treatment of these dread diseases in this city. In diseases of women "falling of the womb" is invariably the diagnosis and the shield behind which these men shelter themselves when perplexed.

Last summer a man died suddenly in the Illinois State Prison at Joliet. Some suspicion of foul play being entertained, an inquest was ordered. The resident physician (?) made, or attempted to make, a post-mortem examination, and found what he called a rupture of the heart. The heart was examined by a practitioner in Joliet, and then sent to Chicago, where four other medical men also examined the wound in the organ. Some of them said they examined it with the microscope, but how, I must leave you to imagine. Not one of the five could tell, or at least would not tell, whether the wound in the heart was a rupture or a clean cut. No blood was found in the pericardial sac—at least, nothing was said about it. On the coroner's inquest, however, the resident physician acknowledged he never studied medicine, that he had practised dentistry for several years, and got appointed to the prison through influence (another name for bribery); that the retiring physician remained long enough in the prison after his resignation "to post him (the in-going man) in the plan of treatment." The truth is, this *highly educated physician* (?) not knowing where the heart was, sent his scalpel through it when opening the thorax! In a case of abortion ending in the death of the woman, committed about six months ago in Chicago by one Erall, the uterus was exhibited and examined at the inquest. The vagina was perforated in one or two places, and the uterus in several, by instruments. Two "doctors" testified that they could not say whether the holes in the vagina and uterus were natural ones or artificial!! Here is something new for anatomists. Most of the "doctors" are "self-made," or were at least hospital servants or ambulance-helpers during the late war. In America no qualification is necessary to begin "practice." All that is necessary is to hang out a "shingle"—a sign-board with one's name on it.

The standing of the profession is not at all high. A large majority of its members have little or no honour and self-respect. When called in to a case, they will not inquire if there be a family physician, or any attendant, but forthwith prescribe, take their fee, and leave. In this way as many as four, and sometimes six, "doctors" prescribe for the same patient without seeing one another, and caring still less. This utter disregard for professional etiquette is taken advantage of by the public. Wishing for a consultation, but shrinking from the expense, they call in several physicians one after another, and get their opinions separately, and finally follow whichever opinion suits their fancy best. A prominent practitioner and professor, being publicly accused last year of gross carelessness, and even of malpractice, on the occasion of the death of the wife of a well-known journalist, instead of prosecuting the paper for libel, wrote a letter to a morning paper in which he tried to exculpate himself by saying the deceased was a whore. For such infamous conduct he was not censured by the profession. He still holds his chair in one of the medical colleges in Chicago. The practice of taking commissions (percentage) on prescriptions is indulged in by most of the prac-

tioners of this city. They send their prescriptions always, if possible, to the same drug-store. In order to compel the public to go to the druggist indicated, some physicians order medicines by means of preconcerted and private signs or marks. If the prescription be carried elsewhere the hieroglyphics are not understood, and you cannot get the medicine. And this percentage is not deducted from the druggist's profits, but charged, in addition to the proper cost of the medicine, upon the purchaser. To such unprincipled conduct was traced the death of a child one night about last Christmas. I know one "doctor," now "retired," who, knowing no Latin, and not daring to prescribe in English—for then his patients would know as much as himself—was always obliged to go in person to the drug-store and whisper to the clerk what to give.

Such are the ways medicine is abused, disgraced, and brought into contempt, and medical gentlemen despised—looked down upon. They are greatly to blame for it themselves. There are in Chicago at least 200 doctors—gentlemen strictly and justly entitled to be so called—highly honourable and educated, and eminent in their profession. They are sufficiently numerous and influential to make themselves heard and felt if they would but try. They seem to be quite apathetic, and make no effort to purge the profession of "scalawags" by causing to be passed and enforced such rigorous laws as may be needed for that end. At least they could make an effort in this direction.

There is one thing to which I wish to draw particular attention—namely, a great desire to be considered British graduates, and the frequency with which men advertise themselves as such. This is done with the hope of speedily gaining practice, for the vast superiority of British University education over American is well enough known to the public. Apothecaries have recourse to the same plan. Now the sooner this mean dodge is cried down and stopped, if possible, the better, for it must sooner or later bring disgrace on the exalted status of the medical profession in the United Kingdom. There is a man in Chicago generally believed to be a "Dublin doctor," but in reality holding a Philadelphia M.D., who has a certificate of attendance on the clinical instruction in the Meath Hospital, Dublin, and a certificate from the Dublin Lying-in Hospital, however obtained, publicly exposed in his office as British diplomas, in order to dupe the public into believing him a British graduate.

A few months ago a man in Dumfriesshire was fined for appending his name, as a physician, to a certificate of death. He produced a diploma from the "Livingstone University, in America"—wherever that may be, in Patagonia, perhaps?—and one from the "Edinburgh University of Chicago." *There is no such institution in Chicago.* "Degrees in America are as plentiful as mushrooms," as the *Lancet* well remarked, and are freely bought and sold whenever desired. The Dumfriesshire man illustrates this point also. Nay, more. The "University of Philadelphia" would not seem to be guiltless on this score, for it was caught last summer selling diplomas, and a prosecution ordered. But as I have seen nothing of it since, I presume hush-money was liberally called into requisition.

"PERSONAL—WANTED, THE ADDRESS OF SOME Doctors' Widows having their Diplomas" is a copy of an advertisement in my possession. This is one plan of obtaining a hold of qualifications.

Antagonism of Jaborandi and Atropia.

M. VULPIAN has laid before the Académie de Médecine the result of his researches upon animals, showing the antagonism between these two drugs, and their inverse effect upon the biliary and pancreatic secretions.

Jaborandi excites these secretions actively, but an injection of sulphate of atropia causes their arrest, and the pancreatic fluid and bile are no longer observed to pass from the canals previously placed in the ductus choledochus and pancreaticus. *Le Progrès Médical*, No. 12, 1875.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, JUNE 30, 1875.

THE ADMISSION OF WOMEN TO THE MEDICAL PROFESSION.

THE absorbing interest centred in this important question which has occupied the attention of the Medical Council—the Parliament of the profession—during the past week can be readily imagined. For years past women have sought an entrance through the portals of our qualifying boards, and many a wordy battle has been fought for and against their cause, but law, the strongest of all obstacles, was against them. Still, their claim was not considered by some altogether a hopeless one. One corporation after another, it is true, refused to admit women to examination, and some moralists, with a good show of reason, held it to be indecent and highly improper, that “young ladies should be admitted to anatomical lectures and dissections with young gentlemen.” But women had their champions, who pegged away “in a language all their own,” with indomitable perseverance, until the dawn of success has broken upon their labours, and the Medical Council on Saturday last, by a majority of two to one, bequeathed to them the legacy that “they are of opinion that the study and practice of medicine and surgery, instead of affording a field of exertion well fitted for women, do, on the contrary, present special difficulties which cannot be disregarded, but the Council are not prepared to say that women ought to be excluded from the profession.” This resolution, arrived at after a debate worthy the importance of the subject, and the eminence of those who took part in it, virtually says to women who are now seeking a legal status as medical practitioners, we are anxious that you should not enter the profession, but we will not prevent you if you are so inclined.

On reading the debate it will be seen that several members spoke strongly against the physical unfitness of women for the duties of such a profession as medicine, and yet when the vote was taken they sided with the question that they ought not to be excluded. In vain did Professor Turner, Drs. Wood and Quain, point out th

anomalous position they were placing themselves in by voting for this resolution: the majority refused to see the matter in this light. The deed is done. Henceforth, the Council will offer no opposition, and as Dr. Parkes remarked “the ladies have gained the day.” We wonder to which of the sister professions they will next turn their attention?

THE POLLUTION OF RIVERS BILL

THE *sanitas sanitatum* cry with which the present Government came before the country bids fair to end in a less welcome and useful manner than was expected; indeed, we may expect in future the adoption of a motto of quite another kind. *Ex nihilo nihil fit* will, we fear, be found in every way to express the masterly inactivity and do-nothing policy of the Ministry.

It will be looked upon by the profession and those in charge of the health of the country that Lord Salisbury's announcement of his intention to withdraw the most valuable portion of the Rivers Pollution Bill is in every way inexcusable; there can be no possible reason for such a policy, for the Royal Commissioners of 1868 and 1869 fully reported upon the dangerous nature of the pollution of rivers by owners of mines and by manufacturers and suggested the remedy to stay the evil.

It has been thought that the difficulties presented in dealing with manufacturers who create the evils would be surmounted by adopting the suggestions of the Commissioners, and in those cases where numbers are concerned in the contamination of the stream, it seems only fair to compel them to act collectively, and in this way to secure greater efficiency. If it is found necessary to convey the refuse of mines or manufactures to a distance for purification or subsidense, why should it not be done at their expense? Certainly a very great hardship would be inflicted upon ratepayers by throwing the expense upon parishes and town councils, as all the expense should be borne by those who unwarrantably defile the public water-courses, and who derive large returns from their works improperly carried on. Again, when dye-works obtain water from wells sunk on their own premises, why should this be said to confer a right to carry polluted refuse into rivers?

As to the sewage part of the question for which he proposes to legislate, an almost unanimous desire has been often expressed by corporate bodies to cope with this part of the difficulty, but they have been prevented and thwarted in every way by moneyed and riparian interests, as seen in the unwarrantable opposition got up by Sir Robert Peel to the Birmingham scheme. The purses of the ratepayers have been found unequal to cope with powerful owners of property backed by Parliamentary influence, even when they express great willingness to purify the sewage of the town, and send effluent water back purified and sweetened. That manufacturers may defile it, renders it not only utterly valueless, but more dangerous in every way for all the purposes for which nature originally intended it.

The fact is, the Pollution of Rivers Bill is to be sacrificed to moneyed interests, and in obedience to the manufacturers of the country, who are largely represented in the House of Commons; the public health is thus to be made subordinate to the acquisition of wealth. The Government, when

it took office, professed to be willing to proceed in matters of public health very much in advance of their predecessors, and what have they done to redeem their promise? Next to nothing; and the success of what they have undertaken is made entirely subservient to conditions likely to make them valueless. It is the same with regard to other measures relating to the health of the masses: houses condemned as centres of disease will no more be pulled down under the New Dwellings Act than they were under Mr. Torrens' Act: adulteration will be permitted rather than checked by a Bill which allows the worst offenders to scape by the plea of ignorance of their business.

Notes on Current Topics.

The Harveian Oration.

THE delivery of this annually recurring oration at the Royal College of Physicians of London was entrusted on Friday last to Dr. Guy, who in a brief sketch of the life and times of the immortal discoverer of the circulation of the blood remarked that more than two centuries ago—in July, 1656, nine years before the great plague, and ten years prior to the great fire of London—the old College of Physicians in Paternoster Row was the scene of a touching meeting, when Harvey met the Fellows, his friends and pupils for the last time. On that occasion he was well stricken in years and worn with a terrible malady. He died the next year, making over to the College his paternal estate, to induce other Fellows to do the same, in order to promote the advancement of medical science and many other things, especially this oration, which had been for more than two centuries the occasion of gathering together the *élite* of the profession and many distinguished men connected with learning and literature. The lapse of time had brought about a change in the language in which the oration was delivered. Instead of Latin it was now delivered in our own tongue, which promises to be as generally used all over the world as Latin was formerly over the limited world of its day. Passing on to the consideration of Harvey in his professional character, Dr. Guy said that in his work of discovery he had very considerable advantages; he came of a wealthy family and had independent means of his own, so that he could command the very best education which England or Italy could give, beside which he could either purchase or secure through Royal favour, access to other sources of study beyond the general reach. Harvey combined the professions of physician, surgeon, and accoucheur, but he was not overwhelmed with the cares or anxieties which the demands of a large practice involve. He had for his contemporaries such men as Shakespeare, Milton, Bacon, Ben Jonson, and others. He was the first physician who largely practised vivisection to aid him in his studies, and it was worthy of remark that no thought of cruelty, no misgivings as to the lawfulness of the practice, seemed ever to have crossed his mind. After considerable and patient research Harvey discovered the circulation of the blood. He regarded the pulsations of the heart as the beginning of life, the microcosm of life, the foundation of

life, and the source of all action, and calculated from experiments that in half an hour the heart beat more than two thousand times, and by that means sent forth through itself more blood in that short space of time than the whole body contains. Dr. Guy next gave a technical analysis of Harvey's theory, and wound up an able address by an exposition of the chief features of his character, and a warm eulogium on the benefits which had resulted to medical science from his discovery.

The orator was frequently cheered, and a cordial vote of thanks was passed him for his address.

Election at the College of Surgeons of England.

A MEETING of the Fellows of the College will be held at the College on Thursday, the 1st July, at 2 p.m., to elect three Fellows into the Council of the College. The candidates for the vacant seats are Mr. Prescott Hewett, Mr. Spencer Smith, and Mr. Birkett—who are retiring after five years of office, but intend offering themselves for re-election—Mr. Cooper Forster, Mr. Hussey, and Mr. Snee. We are less able to form an opinion as to the result of the election this year than hitherto, but we think that it is scarcely just to a member of the Council who has held office only five years not to re-elect him. There is a considerable expense and an amount of labour in obtaining a knowledge of College business entailed upon members of the Council. If, then, a member has done good service during his term of office, he is of real value to the College, and it is only fair to re-elect him, though in justice to younger Fellows, who are daily growing older, we are bound to see that the tenure of office is not unduly prolonged.

Leeuwenhoek.

A COMMITTEE has been formed at Delft, in Holland, to make arrangements for the celebration, on September 8th, of the second centenary anniversary of the discovery of microscopic animals by Leeuwenhoek, a native of the town. It is intended to render the occasion especially interesting by the exhibition of the microscopes which the distinguished naturalist made, and of letters and memorials of him. The committee are also endeavouring to raise a fund for the purpose of founding a gold medal, to be awarded under the name of the Leeuwenhoek medal, every tenth year, to the Dutchman or foreigner who shall have done most for the advancement of microscopical science. The award is to be made by the Royal Academy of Sciences at Amsterdam.

The Influence of Syphilis on Pregnant Women Treated in Various Ways.

DR. WEBER, of St. Petersburg, has had great opportunities of seeing syphilis among pregnant women. He has published in the *Allgemeine Med. Central Zeitung* of the 3rd and 6th February, 1875, the results of some observations on 129 pregnant women affected with syphilis, admitted into the hospital of Obushow during the ten years between 1863 and '73. Of these women 35 were treated locally or by expectation; 35 were treated by external inunction; in 23 the inunctions were accompanied by internal treatment with iodide of potassium

and tincture of iodine; 19 were treated by iodide of potassium and corrosive sublimate taken internally; whilst in 17 cases the iodide of potassium was the sole remedy employed. He gives numerous statistics, which may be thus summed up:—

In general, the course of the pregnancy was interrupted in 20 or 25 per cent of these cases; this proportion, however, may be reduced by remembering that of these women 4 had erysipelas of the head, 1 had recurrent fever, and 1 typhus. All modes of treatment, he found, which took place by the digestive organs predisposed to premature births. When the patients were treated by expectation, there were 20 per cent. of births before term. Among those of these cases, however, attacked with typhoid fever, with relapsing fever, and with extensive abscesses, a violent attack of fever appeared to have been the cause of the premature labour.

In those pregnant women who were treated by inunction and local applications, there were no disturbances in the course of the pregnancy. This confirms the opinion of Dr. Sigmund, that the treatment by external inunction has no bad influence on the course of the pregnancy. In those women where the inunction was accompanied or followed by the internal use of the iodide of potassium, the proportion of premature births was 37 per 100; but this is reduced to 20 per 100, because of 2 severe cases of erysipelas of the face.

The general treatment by the solution of iodide of potassium and perchloride of mercury gave 15 per cent. of premature births. In the cases treated by the iodide of potassium there were 42 per cent. of premature births.

The disastrous action of general treatment did not at all correspond to its duration, but rather to its effects on the digestive organs. Hence we must conclude that the general treatment ought to be interrupted at the first signs of digestive impairment in the pregnant woman. The period of pregnancy at which the general treatment is commenced does not seem to have any influence on the production of premature labour. The degree of development of the syphilis appears to have some influence on the determination of the premature birth.

The puerperal period formed an abnormal course in 4 cases out of 14 treated locally; in 3 out of 8 treated by inunctions and the iodide of potassium; in 3 out of 4 treated by the iodide of potassium and corrosive sublimate internally; and in 4 cases in 10 treated by the iodide of potassium alone. These facts seem to point to the great importance of mercurial inunction in the treatment of pregnant women.

In an article in the *St. Louis Medical and Surgical Journal* of May, 1875, Dr. Coles quotes Cazeaux, to the effect that numerous observations show that syphilis at its commencement does not usually endanger the fetus, but that at a more advanced period it involves the greatest peril. Others have remarked that when the disease is in its tertiary stage the fetus may escape. Dr. Drysdale has seen many cases of abortion due to syphilis late on in the tertiary period. To say anything absolute upon this point, Dr. Coles says it is generally agreed that the fetus is not, as a rule, destroyed from syphilis before the fifth month. The fetus remains dead *in utero* some time before expulsion, and becomes putrescent. Fetuses aborted from this

cause not unfrequently exhibit no bodily marks whereby they can be distinguished from those lost through other agencies. In most cases, however, some morbid phenomena may be noticed in the placenta or membranes.

Dr. Drysdale has just seen a case where a lady, infected by her first husband (by kissing, before marriage, on the mouth), married a second husband 15 years afterwards, not having had any child by the first husband, who died in India. She became pregnant by the second husband, and had a dead child at full time. She had had syphilitic disease of the knee-joint.

Dr. Prosser James.

THE *Students' Journal* some time ago stated that this gentleman had so far recovered from a long illness as to be able to deliver his summer course of lectures on *Materia Medica and Therapeutics* at the London Hospital.

We understand that for the present Dr. Prosser James will not engage in any other public work, but devote himself entirely to his practice as a consulting physician. Even his editorial labours in connection with this journal, which have been suspended for many months, will not be resumed.

Unhealthy Condition of Ireland during the past Three Months.

THE mortality of Ireland as given by the Registrar-General for the last quarter was nearly 2,000 (1,910) in advance of that of the corresponding period of the preceding three years. This high mortality raised the death-rate 2.1 per 1000 over the average, and the Registrar-General considers it may be attributed to the inclemency of the weather and to the prevalence of scarlet fever. It would seem that the recommencement of the system of small-pox inoculation is also, to a certain extent, to blame for this heavy increase in the mortality, for it appears that, of 239 deaths from small-pox during the quarter, as many as 222 occurred in Connaught, in which province alone the inoculations took place. Scarlatina also caused 1,107 deaths against, 760 in the same period this time last year, the virulence of the disease in some districts being frightful.

The Irish Pharmacy Bill.

THE Irish Pharmacy Bill has passed its second reading, Sir Michael Beach having cleared the way for it by sacrificing the "reciprocity" clause, to which the London Pharmaceutical Society objected. Except as a matter of principle, the striking out of this clause does not much affect the settlement of the pharmacy question, for it is improbable that Irish dispensing chemists will care to go to England to open shop, and it is certain that they will be glad to get rid of the competition of English pharmacists. Neither will the medical profession in Ireland be dissatisfied with the concession, inasmuch as it will exclude from Ireland the counter-prescribing chemist, who absorbs in his illicit practice so much of the medical attendance upon the English public. The cession of this clause is, however, a display of weakness on the part of Sir Michael Hicks-Beach almost amounting to pusillanimity, and it is calculated to bring into contempt the

claim of his Government to firmness of ruling. He had most distinctly given the world to understand that he would stand by the clauses of his Bill at all hazards, and we here find him showing the white feather at the threatening of an opposition which need have frightened no courageous statesman.

The Coming Meeting of the British Medical Association.

THE provisional programme has been issued. The meeting will be held at Edinburgh on Tuesday, Wednesday, Thursday, and Friday, August 3rd, 4th, 5th, and 6th, 1875, the President being Dr. Copeman, of Norwich, and the President-elect Sir Robert Christison. The Address in Medicine will be given by James Warburton Begbie, M.D.; the Address in Surgery by James Spence, F.R.C.S.Ed., Professor of Surgery in the University; and the Address in Physiology by William Rutherford, M.D., F.R.S.E., Professor of the Institutes of Medicine in the University. The Presidents of Sections are as follows: *Public Medicine*—Right Hon. Lyon Playfair, M.P., C.B., F.R.S.; *Medicine*—Dr. Quain, F.R.S., London; *Surgery*—Professor Lister, F.R.S., Edinburgh; *Obstetric Medicine*—Dr. Matthews Duncan; *Psychology*—Dr. Lowe, F.R.S., Edinburgh; *Physiology*—Professor Burdon Sanderson, F.R.S., London.

The programme of business is as follows:—

Tuesday, August 3rd.—11 a.m. Service in St. Giles's Church; sermon by Rev. D. Macgregor. 1 p.m. Meeting of Committee of Council. 3 p.m. Meeting of the Council, 1874-75. 3.30 p.m. General Meeting—President's Address; Annual Report of Council; and other business. 9 p.m. Reception in University Library.

Wednesday, August 4th.—9.30 a.m. Meeting of Council, 1875-76. 11.30 a.m. Second General Meeting—Address in Medicine. 2 p.m. Sectional Meetings. 9 p.m. Soirée—*Conversazioni* given by the Royal College of Physicians.

Thursday, August 5th.—9 a.m. Meeting of the Committee of Council. 10 a.m. Third General Meeting—Reports of Committees. 11 a.m. Address in Surgery. 2 p.m. Sectional Meetings. 6.30 p.m. Public Dinner.

Friday August 6th.—10 a.m. Address in Physiology. 11 a.m. Sectional Meetings. 1.30 p.m. Concluding General Meeting. 4 p.m. Garden Party in the Royal Botanic Gardens.

Saturday, August 7th.—Excursions: Bass Rock, Melrose, Trossachs, Roslin.

Inoculation of Small-pox and its Results.

THE state of the West of Ireland as regards the prevalence of small-pox is a pitiable illustration of the incompetency of the law to deal with an offence perpetrated in the face of day, and hardly even denied by the guilty parties. The inoculation mania in Connaught has, in the last three months, cost 222 lives, and most of the registrars of that province refer to its prevalence in their districts, and to the terrible misery caused by it. At the same time we find it stated by one of the Ballina guardians that the inoculator, who plied his trade quite openly, could earn £14 in one day, and that even persons who occupied

a respectable position had no hesitation in committing deliberate and evident perjury to screen him from punishment. This terrible state of things will never be brought to an end until the parents themselves are held responsible to the law for the inoculation of their children. Pending such a change in the law, the Catholic priesthood of Ireland could stop inoculation by raising their fingers, and, strange to say, their fingers are not raised.

Unfounded Charge against a Surgeon.

ANOTHER of the many unfounded charges against members of the profession has been added to the long dismal roll, and it gives us sincere pleasure to record for once a common-sense magisterial decision in this case, which was brought under notice at Newark-on-Trent a few days since. A warrant had been issued against Mr. Buckby, surgeon of that town, for that he, being under the influence of liquor, was incapacitated from properly treating Mrs. Fletcher, a patient in child-birth, from which neglect she died. The magistrate, after fully sifting the evidence, came to the conclusion that there was nothing to warrant them in committing Mr. Buckby, who was thereupon discharged.

Laryngeal Phthisis.

THE Metropolitan Throat Hospital of New York, of which Dr. Clinton Wagner is the Medical Superintendent, has issued its first report, from which we learn that out of fifty-one cases of tuberculosis treated in the year, in ten the disease was confined to the lungs; in sixteen, to the throat, and in twenty-five it existed in both lungs and throat; in sixteen of the latter the disease predominated in the lungs, and in the remaining nine cases, the laryngeal symptoms were the more prominent.

Action of Eserina in Chorea.

DR. E. BOUCHUT (*Bull. Gén. de Thérap.*), from the results of four hundred and thirty-seven observations upon the action of the active principle of calabar bean, particularly in the chorea of children, says that eserina, while diminishing muscular contractility, augments that of the smaller vessels. It may be employed hypodermically or by the stomach, and should be given fasting. It may be given hypodermically in the dose of one-twentieth to one-twelfth of a grain, and, as its effect only lasts one to three hours, the dose may be repeated until one-fourth to one-third of a grain is given in twenty-four hours.

The effects of eserina are observed within a few minutes from its administration, and these are constant in the dose of one-twentieth to one-twelfth of a grain. It usually produces paleness, with contraction, occasionally followed by diminution of rate in the pulse. Nearly all the children to whom eserina was administered experienced malaise, burning pains in the epigastrium, with gastralgia, nausea, and rejection of stringy sputa. By its use choreal movements were moderated, and in ten days chorea was usually cured.

Eserina occasionally causes bilious vomiting; it does not modify the temperature sensibly. In the doses above mentioned, eserina never produces colic or diarrhoea. Given internally, it usually produces no effect upon the pupil. It frequently causes profuse perspiration of the face and body.

Paresis, and occasionally transitory paralysis of the diaphragm, are among the most serious and painful phenomena produced by this remedy.

Dr. Bouchut has never seen tremor or convulsions produced by the use of eserina, and believes these symptoms only occur when the remedy has been employed in toxic doses.

Dr. Latham on Medical Science.

DR. LATHAM, of Cambridge, in an introductory lecture delivered in that city, says that the clinical physician knows that the phenomena of disease are not explained by the phenomena of healthy texture, nor by the action of healthy organs. The medical man must have a sound knowledge of the groundwork of physiology to begin with; but all the minute portions, all the original investigations and experiments, had better be postponed until the student has obtained a certain knowledge and familiarity with the other branches of professional study. Among certain so-called purely natural science men we see little deference shown to the opinions, and little regard to the work of others, little of that humility which characterises the distinguished workers in other branches of science, but a bold and arrogant confidence in their own opinions, and a contemptuous disdain of the opinions of others. This may be modified in the course of years, when, humiliated by their fallacies being exposed by better-trained workers, they feel, though perhaps they do not confess, that less original research and more careful and extended acquisition of facts already established would have been better for their peace of mind, their usefulness, and their reputation. In your professional work you will find abundant opportunity for original research in its highest and noblest forms—the relief of pain and suffering, the repair of injuries, the controlling of disease, and the prevention of death.

Hydatid Disease.

DR. SPENCER COBBOLD, in a lecture to the students of Middlesex Hospital, says that, from his researches, hydatids of the liver constitute about 44 per cent. of the cases of the hydatid disease. In 6 per cent. of all his cases the hydatid had found its way into the brain and caused death, and in 3½ per cent. the hydatid was in the heart. Probably hydatids cause the death of about one-fourth of all persons they attack.

A Case of Syphilitic Sarcocoele.

A CASE of enlargement of the left testis is reported in the *Presse Méd. Belg.* of May 16, where a patient came to the Hospital Saint-Pierre, of Brussels, on the 6th March, 1875. At that time he had a tumour of the left testicle and enlargement of the corresponding spermatic vessels and cords. He said that this had come on after a gonorrhœa contracted in January. The testis was hard, the cord presented the same hardness, and was the size of the quill of a pen. There was no change in colour of the parts, and neither heat nor pain. The diagnosis made was simple chronic inflammatory orchitis, and a compressive bandage was applied, but did no good.

On the 8th May he returned, under the care of Dr. Thiry, when both testes were found implicated, as well as

the constitution. The body and lower limbs were covered in some places with plates of irregularly rounded form, of a dusky hue, which remained on pressure, and perfectly represented the characters of a parchment syphilitic eruption, in that they occupied the dermal tissue and did not go beyond it. In other places were seen lobular tumours occupying the subcutaneous cellular tissue, hard, not depressible, and also representing, on pressure, all the characters of syphilomata.

Among the tumours of this last kind, some had undergone a slight softening at their periphery, due to the suppurative inflammation caused by their presence. This suppuration was slow, and wanting in energy; it ended in a pus ill bound together, or bad aspect, and scanty, which became concreted in the form of crusts on the top of the tumours just described. In the right testicle the epididymis was hard, weight, chestnut-like. The volume of the left was quadrupled.

The patient, on being interrogated, said that more than a year before he had had relations with a woman of suspected morality, and had seen an ulcer of the prepuce after that intercourse. This soon healed, and the patient forgot all about it.

Dr. Thiry remarks that a peculiarity worth noting is, that in these cases of slow evolution of syphilis, it is the glandular organs, and especially the testes, that are affected. Syphilis concentrates itself for a long time in the testicle, and only attacks the other tissues later on. In this case the syphilis is not the less grave; the more time it has required for its development the longer it will require to disappear. A long and persistent treatment will be required. He prescribed four pills of five milligrammes of corrosive sublimate a day, one to be taken in the morning, one at noon, one at 4 p.m., and one in the evening in a glass of decoction of sarsaparilla. Mercurial friction of a quarter of an hour to be made on the internal aspect of the legs, thighs, and arms. After each two frictions a bath of starch to be taken. The diet strictly confined to roast meat, vegetables, and patient to abstain from acids.

As a general rule, we have found large doses of the iodide of potassium such a rapid cure in similar cases that we are a little surprised to find that Dr. Thiry has not made any use of this medicine in this case. Doses of one gramme, or fifteen grains, thrice or four times daily, in plenty of water, act marvellously well.

THE Society of Arts held its annual *conversazione* at the South Kensington Museum on Friday evening, there being an assemblage of between two and three thousand present, amongst which was a large sprinkling of the medical profession.

AFTER the Harveian Oration at the College of Physicians on Friday evening, the President announced that the Baly Gold Medal had been conferred on Professor Claude Bernard, a distinguished French physician, in recognition of his services in the cause of physiology.

DR. STOKES, Regius Professor of Physic in the University of Dublin, has just received, through Count Munster, from the Emperor of Germany, the honour of knight-

hood in the order instituted by Frederick the Great, "Pour la Merite."

ON Sunday night, a young woman named Ellen Palvey, aged 25, was admitted into King's College Hospital, suffering, it is feared, from an acute attack of hydrophobia. The unfortunate woman, about three weeks since was bitten by a ferocious dog. The wound partially healed up, but on Sunday morning symptoms of hydrophobia exhibited themselves.

WE recently reported a case of death occurring from an explosion in Ireland, the immediate cause being that sulphuret of antimony had been used instead of black oxide of manganese in the manufacture of oxygen gas for a magic lantern. The Irish Apothecaries' Company, whose servant made the error, have agreed to pay £1,500 compensation to the widow of the deceased.

THE Society of Public Analysts, at a general meeting on June 2, "feeling the deep obligations they owed to the Right Hon. Dr. Lyon Playfair, M.P., and Dr. Charles Cameron, M.P., for the strenuous and successful (!) exertions which they had made in the House of Commons for the improvement of the Sale of Food and Drugs Bill," unanimously elected those gentlemen honorary members of the society.

WE find in the public journals a memorial signed by the Chairman of the Enniscorthy Town Commissioners and by forty-two ratopayers, addressed to the Inspectors of Lunatic Asylums in Ireland, and complaining of the system by which the contracts for Asylum supplies were given away. The inspectors elicited that there was a little mistake of 2s. per ton in the price at which the coal supply was taken and might have been taken, but did not feel called upon to interfere further.

"FEARFUL CATASTROPHES" have forced themselves sadly upon the attention of the reading public during the past few days. Floods, resulting in the destruction of hundreds of lives and property to an enormous extent, have occurred in the South of France, Bohemia, Moravia, and the South Tyrol. Now, accounts reach us of terrible earthquakes in the Andes, with the loss of thousands of lives and the entire destruction of seven towns and portions of several others.

A REMARKABLE phenomenon has occurred at Clew Bay, Westport. An island, named Inishgowia, was discovered a few mornings previously, literally covered with herrings, much to the astonishment of the islanders, who are unable to explain from where their flight originated, or by what mysterious means they came upon the island, which is at present veiled in mystery. It is thought a tidal wave might have occurred during the night, and deposited them there, but it is not definitely ascertained as yet. The matter has created much surprise in the locality.

Literature.

THE PATHOLOGICAL ANATOMY OF THE NERVOUS CENTRES. (a)

THE author has not hesitated to avail himself of the writings of others, drawing largely on the scattered emanations of Jackson, Allbut, Ogle, Reynolds, Wilks, Lockhart Clarke, Bastian, Dickinson, Crichton Browne, &c., &c.; but, contrary to the fashion of many authors, he has had the good taste to acknowledge the source of his information.

The arrangement of the work is described as follows: "It is proposed to divide the subject into two parts; and first, to describe the pathological anatomy of the brain and spinal cord; and secondly, the mode in which these pathological results are grouped in certain conditions, which symptomatically have been given special names, as mania, melancholia, &c. In pursuing this plan, it will be convenient to divide the first part of the subject into—1. Congenital Abnormalities of the Cerebro-spinal Centres; 2. Abnormalities of the Vascular System; 3. Inflammations; 4. Degenerations; 5. Tumours: while the second part will include the pathological anatomy of mania, melancholia, dementia, idiocy and cretinism, general paralysis of the insane, delirium tremens, paralysis agitans, epilepsy, chorea, hydrophobia, tetanus, locomotor ataxia and progressive muscular atrophy, and various local paralyses." This arrangement is in many cases logically incorrect, and the author is evidently fully aware of this, for further on he says: "In making his division of the subject, it will be readily understood that it is simply for the sake of convenience; its imperfections are manifold." As an example, in the first part, the fifth section, on tumours, stands by itself, without any connection with the second section, on abnormalities of the vascular system; yet the tumours of the brain and spinal cord are pathologically divided into those connected with the membranes, those having their origin in the walls of the vessels, and those springing from the neuroglia, the connective tissue of the brain and cord.

The work is a good compilation, and no doubt Dr. Fox has succeeded in his desire "to bring together in a convenient and readable form much that is now scattered in publications of many kinds." Sufficient prominence has not been given to certain parts of the work, notably the histological portion; there is wanting that careful and minute description of pathological appearances which alone can render the work of great value to the student, the consummation of which appears from the introduction to be the great wish of the author; and although the work contains a fair series of carefully executed coloured plates, the majority illustrating the minute morbid anatomy, yet the descriptions of these are so meagre, and the references so slight, that several are almost passed unnoticed: thus, Plate 3 is described as "Myelitis—Swollen Nerve Fibres," and the only reference to it in the text is, "Plate 3 is an example of myelitis following fracture of the bodies of some of the vertebrae, and consequent hæmorrhage." Again, Plate 7, representing grey degeneration of the cord, is passed by in the text thus: "Plate 7 is a tolerably good example of grey degeneration affecting the cord." We might adduce further examples, but the above must suffice to show the almost total neglect of important minutiae. The drawings illustrative of the minute anatomy are chiefly from microscopical preparations of sections of nervous tissues; but Dr. Fox is silent as to the mode of preparation: this omission is to be much regretted, for certainly his method of preparation should have been a prominent feature in the work. The only hint one can gather from a careful perusal of the work is on page 122,

(a) "The Pathological Anatomy of the Nervous Centres." By Edward Long Fox, M.D., F.R.C.P., Physician to the Bristol Royal Infirmary, &c., &c. With Illustrations. London: Smith, Elder, and Co. 1874. Pp. 401.

where, referring to miliary sclerosis, it is stated that "after preparation in chromic acid the white matter shows a number of opaque spots." The vagueness of this statement may be gathered from the fact that the reagent in question is employed in solutions containing from $\frac{1}{10}$ per cent., or even less, to 3 per cent.

The volume will be read with profit by those who are interested in this special branch of pathology; but the value of the work as a book of reference is greatly diminished in consequence of the absence of an index: this defect will no doubt be remedied in the next edition.

MECHANISM OF NATURAL AND MORBID PARTURITION. (a)

THE fame of Dr. Matthews Duncan as an authority on matters relating to obstetrics is now so well established that we are certain to have some new views and important additions to science in every work that he writes. The work before us consists of a number of papers published from time to time, and among the chapters which are most interesting we notice one on the power called forth in ordinary labour, the maximum force in difficult labour, and the strength of the uterus, &c.

In his introductory chapter Dr. Duncan divides the question of the mechanism of parturition into three stages—the measurement of the passage and the body to be pushed through it, the way in which the fœtus traverses the passage, and the forces requisite to do the work. The second chapter is devoted to long delay after the escape of the liquor amnii. In the third the curves of the genital passages are described. Dr. Duncan here shows that there is usually a lateral curve in the genital passages which is due to the obliquity of the axis of the uterus towards the right side. He thinks that when the fundus uteri is inclined to the right, that part of the foetal head towards the left will be most pushed down, because the line of force will be nearer the outer side of the curve. He thus thinks that a face presentation may be produced when the occiput is towards the right, and he finds a confirmation for this explanation in the fact shown by statistics, that face presentations are relatively more frequent in the second than in the first position of the head.

The same mechanical point is involved in the question of the effect of anterior or posterior obliquity of the uterus in relation to the brim of the pelvis, in producing lateral obliquity of the foetal head.

In the seventh chapter the author speaks of the effective power of parturition, and he takes great exception to the calculations of Professor Haughton, which lead to the conclusion that the auxiliary forces exceed those of the uterine as ten to one. He finds that the whole force exerted is not much above fifty pounds.

In the ninth chapter Dr. Duncan shows that the spinal column of the fœtus gives way under a tension which varies from 90 to 150 pounds, and that 20 pounds more added will produce decapitation.

The tenth chapter treats of the motions of the foetal head in the maternal passages, and the author speaks of the description given by Kueneke of this mechanism, in which he asserts that the same plane of the foetal head, which at first coincides with the brim becomes coincident in turn with successive planes of the pelvis, so that the head descends as if fixed to a lever moving on a hinge at the symphysis pubis.

The sixteenth chapter speaks of the expulsion of the placenta, and Dr. Duncan shows that when no traction is made on the cord, it is the edge of the placenta, and not the point of insertion of the cord, which first presents. The placenta becomes folded on itself.

The remaining chapters are devoted to the important

question of placenta prævia. He does not agree with Barnes that this phenomenon is due to the excessive growth of the placenta, and shows that the spontaneous separation of the placenta is due to lateral stretching of the uterine wall.

All practitioners interested in the important questions relative to normal and abnormal parturition should study carefully this most learned and admirable treatise.

THE YEAR-BOOK OF PHARMACY FOR 1874.

IT was our privilege to pass an encomium on the "Year-book of Pharmacy for 1873," and it affords us sincere pleasure to speak now in equally favourable terms of the volume for 1874, edited by Mr. Louis Siebold.

We have a high opinion of the utility of these annual retrospects of the progress of a science, and we are confident that to the busy pharmacist the volume before us will be highly appreciated. The book opens with an admirable introduction from the pen of the editor. It is impossible to read this article without being struck with the evidences of the care which has been bestowed on the compilation of it; in it allusion is made to almost every paper of value published during the year. The subject-matter of the book is considered under the heads of *Materia Medica*, *Pharmaceutical Chemistry*, *Pharmacy*, *Notes and Formulae*, and the book concludes with the "Transactions of the British Pharmaceutical Conference," which are edited by Professor Atfield.

We congratulate the pharmaceutical profession on the publication of this admirable record of the progress of pharmacy during the past year.

TRANSACTIONS OF THE OBSTETRICAL SOCIETY OF LONDON FOR THE YEAR 1874.

THE London Obstetrical Society has during the past year fully maintained its reputation for usefulness, and illustrates the benefit which accrues from societies established with the view of discussing special subjects.

The London Obstetrical Society holds its meetings during ten months in each year, thus setting an example of energy which other societies, especially those of Dublin, would do well to imitate. The sessions of the Dublin societies are unnecessarily short; thus, that of the Surgical Society of Ireland extends over very little more than four months, that of the Pathological over but five. The Obstetrical alone, of the Dublin medical societies, holds its meetings during eight months in the year.

The volume before us contains communications on a variety of subjects, and these vary greatly in value and interest, but we do not think a single meeting passed without something of value being either recorded or elicited.

The first meeting of the year was opened by what was virtually a fresh discussion on Dr. Routh's paper "On the Use of Intra-uterine Stem Pessaries." We cannot say that anything novel was brought forward, nor that there is any thing startling in the fact that Dr. Edis was able to record four cases in which serious, and in one instance, even fatal, results followed the *injudicious* use of stem pessaries. Such results, on the contrary, are, in our opinion, only too likely to follow if these instruments be employed in unsuitable cases and without due precautions. To introduce a stem pessary while metritis or endo-metritis exists, or, under any circumstances, without keeping the patient for a time quiet, and under observation, is, in our opinion, a most hazardous proceeding, and almost certain to be followed by unpleasant, if not by serious, consequences. On the other hand, when suitable cases are selected and proper precautions adopted, a stem pessary is sometimes a valuable and efficient aid in the treatment of uterine disease, and this we deem to be the opinion implied, if not openly expressed, by the various speakers.

(a) Contributions to the Mechanism of Natural and Morbid Parturition, including that of Placenta Prævia. By J. Matthews Duncan, President of the Obstetrical Society of Edinburgh. Edinburgh: A. and C. Black. 1875.

Dr. Gray, of Armagh, communicated the particulars of an instructive case, in which the greater portion of the cervix uteri was torn almost completely off during labour, the remaining attached portion subsequently separating from the body, the patient nevertheless making a good recovery. A very similar case has recently been brought under our notice in which an inexperienced practitioner, desirous of imitating the practice advocated by Dr. Geo. Johnston in his "Report of the Rotunda Hospital" for the past year, of applying the forceps in cases where the os uteri is but partially dilated, tore off and removed on the blades of his forceps a complete ring of muscular tissue, which, on careful examination, proved to be the lower segment of the cervix uteri, which was torn off by the operator, the os uteri having been evidently undilatable as well as undilated. We call attention to Dr. Gray's case in the hope that the knowledge of the fact that under certain circumstances the cervix will be torn from the body before it will dilate, may deter practitioners from applying the forceps before the os uteri is dilated, unless very urgent symptoms make the proceeding imperative.

A paper on what was formerly termed "Vaginismus," but more correctly named by Dr. Barnes "Dyspareunia," communicated to the Society by Dr. Schnegierief, of Moscow, does not seem, judging from the brief discussion which followed, to have attracted that attention which it deserved. The investigation of the causes producing painful or imperfect sexual intercourse has as yet made little progress. We are satisfied that the views held by Simpson or Scanzoni are only in part correct. Dr. Schnegierief shows that there are at least two different forms of the affection. In our opinion he, too, fails to grasp the subject in its full extent, or to realise how numerous are the causes producing this not uncommon and often most distressing affection.

Dr. John Williams's paper "On the relation between Congestion of the Uterus and Flexion of the Organ" is worthy of a careful perusal, and though we are unable to agree with him in some of his conclusions, we look on his contribution as one of great value. Dr. Williams's researches with reference to menstruation have established his claim to be considered a careful and diligent observer, and as the paper we are now referring to is, to a great degree, based on the results of his previously recorded observations, "On the Structure of the Mucous Membrane of the Uterus" (*Obstetrical Journal*, vol. ii.), we attach considerable weight to them, and for that reason regret that his deductions tend to what we believe to be erroneous conclusions—namely, that flexion of the uterus is the nearly invariable cause of congestion of that organ,—a conclusion in our opinion as erroneous as its converse, that congestion of the uterus is a frequent cause of flexion. We have for a long time past carefully observed and registered the cases of flexion of the virgin uterus which have come under our observation, and we have never once met with a case in which we were able to satisfy ourselves that a flexion—no matter how acute—had *per se* given origin to congestion of the organ; but we have frequently observed that various exciting causes induced congestion in a previously flexed uterus, of which exposure to cold and the occurrence of sexual intercourse were the most common. We must point out that Dr. Williams contradicts himself more than once in the course of his paper—thus, at page 206 he says: "The period during which the menstrual discharge flows is the time in which the muscular walls of the uterus contain least blood;" while at page 113, when endeavouring to prove this theory, he says, speaking of painful menstruation: "The uterine walls contain a larger quantity of blood than usual." This contradiction exemplifies the difficulty of establishing a theory not fully supported by clinical facts. We believe—and our belief is founded on extensive clinical experience—that it is impossible for a healthy uterus to become flexed, but that flexions of the virgin uterus, either the result of disease, or congenital, are not

infrequently met with; that in either case, more especially in the latter, the flexion may for years exist without causing discomfort, but that any cause producing an augmented flow of blood to the organ, as in young women on the occurrence for the first time of sexual intercourse, or exposure to cold, when the menstrual flow is impending, may, by causing congestion of the uterus, give rise to a long train of distressing symptoms. We are unable from want of space to pursue this subject further; but we trust that Dr. Williams will be induced to proceed with his investigations, not with the view of supporting one view of this important subject, but of eliciting the truth. With Dr. Barnes, we deny that the profession is divided into two camps on the subject of flexions, and we are satisfied that the great majority of observers believe that a flexion may proceed or follow congestion, and *vice versa*.

Many other subjects besides those alluded to were brought before the Society, which we regret we are unable to refer to.

DISEASES OF CHILDREN. (a)

DR. STEINER'S work has become a favourite throughout Germany, and as it is very practical we are glad that it has been translated into English. For nearly twenty years the author has been at work in the Francis-Joseph Hospital for Children, at Prague, where, as a physician and teacher, his great merits are highly appreciated. The diseases of children have come to be recognised as well worthy of special study. The difficulties by which this study is surrounded, and the great success which rewards those who give it attention makes the subject important to every practitioner. He who succeeds with children is likely to succeed with adults; and as the work before us is of moderate dimensions, we anticipate success for the English version presented by Mr. Lawson Tait. We could have wished, in some instances, that the translation had been a little more free. Still a few Germanisms are not sufficient to destroy the interest of the work. At any rate, they are compensated for by the notes and additions made by Mr. Tait, chiefly relating to the surgical diseases of children. As an example of these additions we may mention the valuable observations on the after-treatment of tracheotomy. Dr. Steiner has omitted all directions for this. All operators find after-treatment more important than the operation itself, and therefore we think the translator has done well in inserting the necessary directions. Tracheotomy in children is seldom performed except in croup and diphtheria, though it is occasionally resorted to for the removal of morbid growths from the larynx. In four such cases under Dr. Steiner, one resulted in recovery, and also survived a subsequent attack of croup; two died of asphyxia after tracheotomy had been declined; and one was removed from the hospital unrelieved. He thinks children under three years of age are not fit subjects for the operation.

The first few pages of the work are occupied with general directions for the investigation of disease in children, and some brief but useful remarks are given on the examination of the thorax, the abdomen, and the digestive system. The second division is occupied with diseases of the nervous system, and will perhaps be more frequently referred to by practitioners than any other. The general diseases of nutrition are grouped together in the seventh division under the heads Rickets, Scrofula, Tuberculosis, Purpura, and Rheumatism. Dr. Steiner's work closes with

(a) "Compendium of Children's Diseases." A Handbook for Practitioners and Students. By Dr. Johann Steiner, Professor of the Diseases of Children in the University of Prague, and Physician to the Francis-Joseph Hospital for Sick Children. Translated from the Second German Edition, by Lawson Tait, F.R.C.S., Surgeon to the Birmingham Hospital for Women, Consulting Surgeon to the West Bromwich Hospital, Lecturer on Physiology at the Midland Institute. London: J. and A. Churchill. 1874.

a chapter on diseases of the skin, which we are glad to see is confined to eighteen pages. Mr. Tait has added in the form of an appendix some useful rules for the management of children, issued by the staff of the Birmingham Hospital for Sick Children, and freely distributed amongst the poor. The example might be followed by other hospitals for children. The work is well got up, and furnished with an index. It is a pity the edges are not cut.

DISEASES OF THE KIDNEY AND URINARY DERANGEMENTS. (a)

THERE are ten chapters with an introduction in this work of Dr. Dickinson, all of them replete with information and interest. In the introduction our author defines diabetes as a disease of the nervous system characterised by the secretion of saccharine urine. Excess of urine and thirst seem to have been recognised as far back as the days of Aretaeus; but Willis, who classified the cranial nerves, seems first, in 1674, to have mentioned the presence of sugar in such cases of wasting. He refers it to drinking strong wines, and to mental causes, sadness, or long sorrow. He considered it a disease of the blood rather than of the kidneys. The disease has for the most part been regarded as functional, not structural, in character.

Chapter I. treats of glycogenesis and glycosuria. Sugar is a necessary constituent of the milk even of carnivora, and hence, with animals who eat only flesh, it is evident that such sugar as they secrete must have been developed by their own bodies, since none enters from without. In 1848 Bernard and Barreswil showed to the Academie des Sciences alcohol made from liver sugar, and they inferred that sugar was developed in this organ. Bernard found sugar abundantly in the blood of the hepatic vein, though none in the blood of the vena portæ. The sugar, however, was not at once formed as such, but passed through an amyloid stage. A peculiar animal starch or glycogen was produced in the liver, even though the diet had been entirely restrained to flesh. This product was extremely unstable, continually passing into sugar, both during life and after death, by virtue of a kind of fermentation set up by the contact of blood, blood, saliva, or almost any animal fluid being sufficient to effect the transformation.

Dr. Dickinson then goes on to examine the point alluded to by Dr. Pavy, and by Dr. Robert McDonnell, and holds that neither of these observers have proved their point, that sugar is not contained in the liver during life, which was asserted by Bernard. Vivisections have been multiplied to prove both of these positions. Dr. Dickinson alleges that glycogen can be extracted by water from the healthy liver of almost any animal, forming a milky solution from which it can be thrown down by alcohol or glacial acetic acid. The contact of blood, saliva, pancreatic juice, or the liver tissue itself is sufficient to set up a sort of fermentation, by which it becomes transformed into sugar. The liver is practically its great source, and it appears to contain a maximum amount of this substance in the lower animals about six hours after a full meal. It attains its maximum when the diet is starch or sugar, and falls to its minimum with gelatine and oil for diet. In nitrogenous diet the food is broken up, he thinks, by the liver, into urea and glycogen.

Experiments on animals show that the hepatic glycogen attains its greatest amount with a diet of starch and sugar; that it is formed, though more scantily, from albumen, fibrin, and gluten; while animal oil or fat, vegetable oil, and gelatine fail entirely, or almost entirely, to supply means for its production. The sugar in the blood seems used up in the nutrition of the muscles and other tissues. Schiff thinks that glycosuria is the result of the excessive formation, not of glycogen, but of the ferment. This is

very improbable. Urine, when healthy, can hardly be said to contain a trace of sugar.

Bernard punctured the floor of the fourth ventricle immediately above the source of the pneumogastric nerve, and sugar at once appeared in the urine; but puncture of the medulla made the urine saccharine, even when these nerves were cut. Bernard hence inferred that the route lay along the spinal cord and splanchnic nerves to the vaso-motor nerves of the liver, causing relaxation of the blood-vessels. It is said that wounds of the medulla oblongata to produce glycosuria must necessarily involve the olivary fasciculi. Dr. Dickinson mentions that a lesion of these bodies is almost invariably present in persons who die of glycosuria.

Dr. Dickinson concludes that the superabundance of the circulating sugar essential to diabetes is a matter of increased supply, not diminished consumption; and thus the problem limits itself to the intrusion in excess of sugar into the blood. Clinical observation supports the view that this is a form of diabetes which depends not on the making of sugar within the organism, but on its passage as such from the stomach to the blood, depending on the ingestion of sugar and starch. This is the milder form of diabetes.

Bernard describes diabetes as an exaggeration of nutritive phenomena; but this seems disproved by the condition of the liver in diabetic patients. Dr. Dickinson thinks that in diabetes the liver forms sugar instead of glycogen. Both forms of diabetes in this view are owing to the failure of the liver to make glycogen. Nervous disturbance is the chief cause which excites the gland to the action necessary for diabetes. This irritation may arise in many parts of the sympathetic, in the cervical region of the cord, or anywhere in the great central tract lying between the cord and the crura cerebri. The cerebro-spinal nerve of the liver has its origin at the fourth ventricle, and irritation of this spot, if permanent, causes diabetes.

Chapter II. treats of pathology. Attention of late years has been directed to the brain in diabetic subjects, with the result of finding, in exceptional cases, softening, intra-cranial growths, &c., as complication. Dr. Dickinson, from his own experience, has found that diabetes is produced by substantial and constant changes in the nervous centres, none the less significant because, as with many other diseases of these structures, they are such as ordinarily to elude the naked eye. He has found excavations and tunnels in the nerve matter along the course of vessels in eleven cases of diabetes. When the disease has proceeded to its natural end the excavations are widely scattered through the brain, numerous, small, and closely set in the white matter of the convolutions, fewer and larger about the central parts. The corpora striata, optic thalami, pons, medulla, and cerebellum are the chosen seats for the largest and most striking holes.

In rapidly fatal cases the cavities, which in such are larger than when the disease has been more chronic, are sometimes filled with a translucent gelatinous substance, containing, besides vascular structure, the granular or globular products of nervous degeneration.

In diabetes the lung, and to a less extent the kidney, takes on inflammatory action: may not the nervous changes, more especially as they follow the course of blood-vessels, be attributed solely to the morbid influence of diabetic blood? Dr. Dickinson thinks not. He thinks that the nervous lesions of diabetes are original to the nervous system, and that they constitute the initial fact of the disorder, of which glycosuria is the leading symptom; and this is borne out by the common observation that the most frequent cause of diabetes is mental.

Every tissue has its own way of behaving under disease. Under the same influence, say of hyperæmia, one tissue may indurate, another soften, a third caseate, a fourth dissolve and disappear. Fibrous tissue thickens and indurates; muscle becomes fatty and softens; pulmonary tissue hepatises, caseates, disintegrates, and

(a) "Diseases of the Kidney and Urinary Derangements." By Howship Dickinson, M.D. Cantab. In three parts. Part I., Diabetes. Longmans, Green, and Co. 1875.

finally is spat up; nervous matter softens, and, if death do not interfere, melts away, and is removed by absorption, leaving simple vacuities as the only record of the morbid process. There are many diseases of the brain and cord in which disintegration, erosion, or excavation are found, to wit, such changes as produce insanity, more especially general paresis, the lesions of which are nearly akin to diabetes.

With respect to the liver, Dr. Wilks has noticed that the diabetic liver is tough, dark, and homogeneous. It was natural in only six out of twenty-seven cases recorded in St. George's Hospital. The peculiarities of the diabetic liver may be generally summed up as increase of blood and such changes in its tissue as chronic hyperæmia induces—enlargement, hardness, and overgrowth of epithelium and fibrous tissue. The alterations in this organ are such as concord with the view that it is not primarily affected in the disease, but that it is modified by an over-activity of circulation and function which is instigated by influences external to itself.

Dr. Wilks and Dr. Pavy have recognised the disease of the lung ensuing on diabetes as of inflammatory origin, and essentially different from that set up by tubercle, though resembling it in its course and results. Hepatisation, caseation, and excavation are common. Twenty-seven post-mortem examinations of diabetic patients in St. George's Hospital gave no instance in which tubercle-like changes were found elsewhere than in the lungs—general or scattered tuberculosis was unrepresented in the series. The rarity of grey tubercle is striking. Dr. Dickinson thinks that the lungs are affected with chronic, circumscribed, and caseating pneumonia; but he adds that it is not easy to distinguish with the naked eye the caseous nodules which result from them belonging to tuberculosis. Red and grey hepatisations are found, the latter tending early to break up and form sloughing cavities. The origin of the pneumonic change has been attributed to the contact of saccharine blood; but Dr. Dickinson doubts this. He thinks the changes in the lungs may more properly be ascribed to the nervous system. Dr. John Reid refers to the frequent occurrence of pneumonia in his experiments on the pneumogastric nerve, and Brown-Séquard found that lung disease was caused by injuries of the brain near the pons Varolii. He considers that just as the altered function of the liver is due to nervous hyperæmia originating in cerebral irritation directed to the gland ultimately by the sympathetic nerve, so we may with probability assign the state of the lung to a similar result of the same central influence.

The kidney of diabetic patients is usually found to be bulky, and more than naturally full of blood. The gland is often soft from fatty degeneration. The larger blood-vessels, as well as the least in the body, are usually smooth and natural to the naked eye, unlike what is found in albuminuria. The watery part of the blood seems increased in this disease. The leading peculiarity of diabetic blood is the presence in it of sugar, which is found most abundantly two or three hours after dinner. It appears to permeate the whole body.

Dr. Dickinson examined the urine of 106 insane persons in Bethlem Hospital, and found that in forty-seven of the cases copper was reduced, and in fourteen of the cases the amount of sugar was large enough to be recognised by boiling with liquor potassæ.

In Chapter III. Dr. Dickinson treats of the subjects, Distribution, and Causes of the Disease. Males are much more subject to diabetes than females. Nearly twice as many males as females die of the disease. It is commonest between thirty and sixty. It is very rare before the age of six or after sixty-five. Diabetes mellitus is all but unknown in childhood, although diabetes insipidus is common. The disease belongs to adult life, and is related, not to sexual, but to cerebral functions. It is most fatal and acute in youth. The disease is found more

frequently in agricultural counties and in the coldest counties of England.

Diabetes is often hereditary, and it can sometimes be traced to perturbation of mind, and also to mechanical injury of the nervous centres. Many members of the same family have been observed to become diabetic. But twenty-nine cases of fatal diabetes in St. George's Hospital gave only two in which any hereditary history could be traced. Grief, anxiety, protracted intellectual toil, violent anger, and mental shock are assigned as frequent causes. Sexual excess is mentioned among the more infrequent causes of the disease. But there is no evidence that this vice is other than a rare cause. Sexual excesses or abuse is apt to engender especially spinal lesions, such as are evinced by paraplegia and ataxy, rather than diabetes. Alcohol is not a cause of the disease, according to Dickinson. The disease has been sometimes thought to manifest itself as a sequel to some other complaint. Out of 225 cases, Griesinger assigns three to continued fever, one to scarlatina, one to pleurisy, one to acute rheumatism, and ten to intermittent fever.

In Chapter IV. the author treats of the general symptoms and course of the disease. The bowels are often obstinately constipated, and there are feelings of indigestion, flatulence, eructation, and gastric uneasiness; eczema of the vulva, irritation of the orifice of the urethra, and impotence in the male, are occasional symptoms. The mind deteriorates. The breath acquires a peculiar ethereal odour. The tongue is often red, and latterly is apt to become glazed and dry. The teeth are apt to fall out. The lower limbs may become highly œdematous. The patient has no pain, but becomes very weak, and complains most of the dryness of the mouth. Boils and carbuncles often occur spontaneously. Gangrene may occur. Albuminuria is among the later complications of the disease. Cataract is a late complication of the disease. The common sequel of the disease, pulmonary complications and excavations, is not to be distinguished in its symptoms from a rapid form of tubercular consumption. Fatal œdema of the lung is not unusual. Coma may be the cause of death, if the patient live long enough.

The temperature is somewhat lower than normal in uncomplicated diabetes. The general lowering of the temperature is probably due to the loss of the material which when oxidised produces heat. Among 225 cases of diabetes mentioned by Griesinger, twenty had cataract. Surgery in such cases is attended by unusual danger. In an instance within Dr. Dickinson's knowledge the patient sank after an operation for cataract, which was quite successful locally. Dilatation of the retinal vessels is noticed in diabetic patients, more especially in the veins, and atrophy of the optic discs with amaurosis has been noticed.

As a rule, diabetes is chronic, and may cause deaths at all periods, from six months up to fifteen years after its commencement; but, as a rule, the disease proves fatal within some four years.

To be continued.

Correspondence.

CORONERS' LAW AND WORKHOUSE MANAGEMENT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—My attention has been directed to your issue of the 23rd June, in which appears a notice of an inquest held at Athy Union Workhouse on the body of a woman who had, through mistake, swallowed a portion of anodyne liniment intended and ordered for a rheumatic patient occupying the bed next to deceased in the infirmary.

The facts elicited on the inquest were that, owing to imperfect local arrangement, any patient could get possession of the food or medicine intended for his or her next neigh-

hour without leaving his or her bed, and by merely extending the arm to reach it. The liniment swallowed consisted of about one drachm of simple camphor liniment, and not more than five drops of laudanum, and was duly labelled—"For external use—POISON." This draught may have acted prejudicially on a heart nearly worn out by disease, helped on its downward course by albuminuria. No evidence could be clearer than that of the union surgeon, whose accurate diagnosis left no doubt as to the cause of death.

It may be said "that the accuracy of diagnosis should have been tested by a post-mortem examination," to which I reply that in the absence of suspicion of any criminal intention, the coroner would scarcely be justified in ordering a post-mortem examination where he had no power to give the beggarly two-guinea fee to the union surgeon.

The jury, however, very properly recommended "that a press with lock and key should be erected in each ward of the union infirmary, in which all active or dangerous drugs should be kept, and that this press should be committed to the care of some responsible party."

In conclusion, I must request that you will kindly correct the erroneous view of the subject in your publication as an act of the merest justice to the union medical officer.

I am, dear Sir, yours truly,

ROBERT CARTER, Coroner.

Kilcullen, 25th June, 1875.

[If the newspaper report is to be trusted, it was plainly proved that the patient, who had been for a long time ill, and whose death at some not distant time was anticipated, drank a liniment in mistake. In a few hours the woman, who had appeared likely to survive for many days or weeks, was dead. The workhouse surgeon swore, with these circumstances before him, that the death was from heart disease, having had no opportunity whatever of satisfying himself by examination that such a statement was true.

Possibly the liniment might not have poisoned a healthy person; but it appears certainly to have caused the premature death of this patient. For that death someone was responsible, and it is monstrous that, without investigation, so rash a statement as that made in evidence should have the effect of relieving the responsible persons from proper censure or punishment.—ED. M. P. & C.]

Medical News.

Charing Cross Hospital Medical School.—On Thursday last the distribution of prizes for the Winter Session, 1874-5, and the Summer Session, 1874 took place. The following is the list:—

Winter Session, 1874-5.—Llewellyn Scholarship, P. B. Conolly. Governor's Clinical Gold Medal, W. J. Brookes. Anatomy (Senior), Silver Medal, A. Greenwood; Certificate, D. Colquhoun, H. Whitehead, F. S. Boreham. Anatomy (Junior), Bronze Medal, H. Hoole; Certificate, S. F. Newton, A. D. Leahy. Physiology (Senior), Silver Medal, D. Colquhoun; Certificate, H. Whitehead, J. L. Robertson. Physiology (Junior), Bronze Medal, H. Hoole; Certificate, S. F. Newton, A. D. Leahy. Chemistry, Silver Medal, H. Hoole. Medicine (Senior), Silver Medal, W. J. Brookes; Certificate, E. M. Rodwell, H. Packer, P. B. Conolly. Medicine (Junior), Bronze Medal, D. Colquhoun; Certificate, H. Whitehead, A. Greenwood. Surgery (Senior), Silver Medal, P. B. Conolly; Certificate, H. Packer, J. A. Phillips. Surgery (Junior), Bronze Medal, D. Colquhoun; Certificate, H. Whitehead, A. Greenwood.

Summer Session, 1874.—Botany, Silver Medal, S. L. Newton; Certificate, D. Colquhoun, A. Greenwood. Materia Medica, Certificate, W. B. Hodgson. Midwifery, Certificate, P. B. Conolly. Forensic Medicine, Silver Medal, W. J. Brookes; Certificate, D. S. E. Bain. Pathology, Silver Medal, W. J. Brookes; Certificate, J. G. Blackman. Practical Chemistry, Silver Medal, D. Colquhoun; Certificate, A. Greenwood, H. Whitehead, S. L. Newton. Psychological Medicine Prize, P. B. Conolly, D. S. E. Bain.

Gleanings.

Præputial Calculi.

Dr. F. W. ZAHN communicates the following case to *Virchow's Archiv.*, February 15, 1875:—

The patient, a peasant 52 years of age, was found on examination to be suffering from cystitis, and, in addition, congenital phymosis. The præputial sac was stuffed with stony concretions of various sizes, which rendered urination a matter of some difficulty.

The patient had formerly made use of a catheter, and more recently of a knitting-needle, to press the stones back and thus allow of urination. Quite lately one or more of the concretions had become dislodged, thus allowing a somewhat freer stream. As the cystitis seemed dependent upon the difficulty of urination, the operation for phymosis was suggested, which the patient refused. He was then put upon quinine, which relieved many of his symptoms, chill, &c., connected with the bladder-trouble.

Six months later, the patient came again under observation. The cystitis had continued, and he was weaker. Two more stones had been passed. An incision was now made, and the concretions removed. The largest of these, rough and convex on its surface and resting on the glans, caused a flattening of the glans, or rather an hour-glass contraction. The urethra was much narrowed to a point about three centimetres from its opening. This narrowing having been enlarged by a tent, the rest of the urethra was found of normal size.

Soon after this operation the patient began to show signs of renal disease, and finally died with symptoms of uræmic poisoning. Unfortunately, no post-mortem examination was allowed. The calculi, fourteen in number, weighed in all 28.5 grammes. The largest was egg-shaped, 29 millimetres long, 26 millimetres broad, and 22 millimetres thick, and had a volume of 9 cubic centimetres. This was the one referred to above as pressing upon the glans. The other concretions varied in size down to that of a peach-kernel, and were of various shapes and appearances. Section showed a central roundish nucleus, sometimes distinguished from the outer layers by being of a reddish colour, in other cases by its softer consistency, but always homogeneous. Outside of this the accretion was arranged in concentric layers. The nuclei contained much horny epithelium, which was only sparingly found in the outer layers. After a somewhat minute discussion of the origin of these concretions in general, Dr. Zahn states it as his belief that they are formed around the "epithell pearls" which are found in the smegma præputii of newly-born children.

Cirrhosis of the Liver in Young Children.

Dr. CAZALIS reports (*Le Progrès Medical*, No. 12, 1875) two cases of cirrhosis of the liver occurring in children seven and nine years of age respectively. The first child had suffered much from cold, hunger, and privation during the siege of Paris. She presented, on admission to the hospital, moderate œdema of the lower members, abdomen distended with ascites, the superficial veins distended, not painful on pressure; face not swollen, but emaciated. Sonorous râles could be heard in the lungs. The urine contained albumen. About a week later an acute attack supervened, accompanied by very severe abdominal pains, like those of peritonitis, and intense dyspnoea; pulse 130.

During the next few days the dyspnoea diminished, but the ascites increased. Puncture of the abdominal cavity was followed by relief. No more fluid formed there; but the lungs became œdematous, and diarrhoea, erysipelæ, and gangrene of the vulva supervened, followed by death. Post-mortem examination showed pleuritic effusion, moderate œdema of the lung with atelectasis of the lower border. The liver was very small, presented plaques of perihepatitis, was mammillated on the surface. The hepatic tissue was hard and resistant. The capsule of Glisson was enormously developed; the parenchymatous substance was circumscribed by fibrous tissue, hard and of a uniform dark brown colour. The branches of the portal vein were surrounded by an abundant mass of fibrous tissue. The peritoneum was covered with false membrane.

The second case was, in the main, similar to the first. The child had lived in a damp ground-floor apartment, and in a miserable way. The symptoms were very similar to those of the first case, and the autopsy showed, as in that instance, extreme atrophy of the liver, indications of perihepatitis,

mammillations of the surface, and, upon section, fibrous grey tissue, enclosing numerous patent vessels, islets of yellow, soft glandular tissue, and, in some places, intense congestion. In neither of these cases was there any suspicion of syphilis or malarial poisoning. Dr. Cazalis regards these cases as worthy of record on account of the extreme rarity of the occurrence of cirrhosis at such an early age.

The wholesale drug trade of Dublin has received recently a notable accession in the establishment of the firm of Messrs. Warren and Co., of Beresford Place, who represent some of the London houses in the trade of druggists' sundrymen and chemists, and in other cognate lines of business. Mr. J. V. Warren, the principal of the firm, was long known in Dublin as the enterprising and business-like manager of one of the largest houses in that line of trade, and as the patentee of "Warren's Sweet Essence of Rennet," and of a fluid extract of annatto for dairy use. Warren and Co. have established their firm in the spacious warehouses formerly occupied by Mr. Valentine O'B. O'Connor, and have collected a very handsome and complete stock of goods, which, in the extent of some of the departments, entirely distances any effort of the sort hitherto made in Dublin. The firm are representatives of the well-known house of Lynch and Co., of Aldersgate Street, and has in stock, in addition to a vast stock of the usual "druggist's sundries," all the well-known specialities of that firm—their spray producers, catheters lined with spiral wire, poison-bottles, and new obstetric stays being of special interest to medical men. In this line of trade Warren and Co. may be almost said to be its pioneers for Ireland, at least, in regard to the extent of their stock, which seems to comprise every article which could be possibly required. In the chemical trade the firm are representatives of the old house of Davy, Yates, and Routledge, of London, from whose factories they exhibit some very beautiful specimens of chemicals well worthy of inspection by the connoisseur in such matters. With the support of these firms and others of equal standing in lines of business in which we are not concerned, the new firm may be expected to take front rank, and will, we imagine, become yet as essential to the apothecaries and druggists of Ireland as such clients are to them.

NOTICES TO CORRESPONDENTS.

SPECIAL NOTICE.

THE Publishers will be glad to send receipts for several hundreds of unpaid subscriptions. If those gentlemen whose subscriptions are in arrear for three, four, and five years will kindly send cheque or post-office order to either of the offices of this Journal they will be particularly thanked.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a distinctive signature or initials, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

ERRATUM.—We regret that by an unfortunate error in our report of the Obstetrical Society in our last issue Dr. Tilt's speech was ascribed to Dr. Playfair.

DR. CAMPBELL BLACK'S letter is unavoidably held over.

OUR INDIAN CORRESPONDENT'S letter is also held over, on account of the Medical Council proceedings.

ST. THOMAS'S HOSPITAL.—The distribution of prizes to the students in the school will be undertaken this year by the Dean of Westminster, at 8 o'clock on Saturday next.

M. A. B.—The length to which the proceedings of the Medical Council have run in our columns preclude our referring to the subject brought under notice.

THE INDEX.—The Index which we usually give with the last number of each volume is unavoidably held over until our next, in consequence of the proceedings of the Medical Council.

THE "MEDICAL RECORD."—Our contemporary, the *Medical Record*, which was started as a weekly about eighteen months since, announces in its last issue that it will be discontinued in that capacity, and will appear only for the future as a monthly publication.

DR. GARLAND.—Your indignation is entirely gratuitous. If the allusion had been observed by the editor it would have been struck out in accordance with the policy of the journal not to express opinions on religious questions. We think it unnecessary and inexpedient to publish your letter.

VACANCIES.

Dispenser at one of H.M.'s Naval Hospitals. Particulars obtainable at the Admiralty. (See Advt.)

County Down Infirmary. Assistant Surgeon and Registrar. Salary, 60 guineas, with board and apartments. (See Advt.)

East London Hospital for Women and Children. Resident Medical Officer. Salary, £80 per annum, with board and lodging. Applications to the Secretary. (See Advt.)

St. Bartholomew's Hospital. Assistant Physician-Accoucheur. Honorary. Full particulars at the Clerk's Office.

Dental Hospital, London. Assistant Dental Surgeon. Applications to the Hon. Sec., Leicester Square, W.

Liverpool Northern Hospital. House Surgeon. Salary, £100. House Physician. Salary, £90; and an Assistant House Surgeon. Salary, £50, all with residence and maintenance in the house. Applications to the Chairman of the Committee.

Worcester Lunatic Asylum. Assistant Medical Officer. Salary, £100, with board and residence. Address Dr. Sherlock, at the Asylum, Powick.

Township of Manchester. Junior Assistant Medical Officer for the Workhouse Hospital. Salary, £120. Applications, endorsed "Medical Appointment," to the Poor-law Offices, New Bridge Street.

Amersham Union. Medical Officer for the Workhouse and for the District. Salary respectively, £50 and £63 per annum. Address the Clerk to the Board.

Carnarvon Infirmary. House Surgeon. Salary, £80, with board and lodging. Apply to the Secretary, the Infirmary, Bangor.

Swansea Hospital. Resident Medical Officer. Salary, £70 per annum, with board and lodging. Address the Secretary.

Marlborough Union. Medical Officer for the Second District. Salary, £80, exclusive of fees. Address the Clerk to the Guardians.

APPOINTMENTS.

BOOKET, T. L., L.K.Q.C.P.I., L.M., L.R.C.S.I., Medical Officer for the Lacey District of the Whitechurch Union, Salop.

BOUSKE, W., M.B., C.M., House Surgeon to the West Cumberland Infirmary, Whitehaven.

BRUCE, J. M., M.D., M.R.C.P.L., an Assistant Physician to the Hospital for Consumption and Diseases of the Chest, Brompton.

CANT, W. E., L.R.C.P.L., F.R.C.S.E., House Surgeon to the Hospital for Sick Children, Great Ormond Street, London.

COOKE, E. M., M.R.C.S.E., Senior Assistant Medical Officer and Deputy Superintendent to the Worcester Lunatic Asylum, Powick.

GREEN, T. H., M.D., F.R.C.P.L., an Assistant Physician to the Hospital for Consumption and Diseases of the Chest, Brompton.

HAMES, G. H., M.R.C.S., a House Surgeon to St. Bartholomew's Hospital.

HARVEY, R. J., M.D., M.B., C.M., a Physician to the Fever Hospital and House of Recovery, Cork street, Dublin.

INGLE, R. N., M.D., L.R.C.P.L., F.R.C.S.E., a Surgeon to the Brighton Hospital for Sick Children.

LANGAN, F., L.K.Q.C.P.I., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Longford.

LUCKY, W. C., M.D., C.M., Resident Physician to the Ben-Rhydding Hydrophatic Establishment, Wharfedale, Yorkshire.

RIDLEY, Dr. JAMES, Medical Officer to the King's County Infirmary and County Gaol.

ROE, Dr. R. G., Medical Officer to the Cliffoney (Carney) Dispensary District, Sligo Union.

SAMPSON, G. G., M.R.C.S.E., a Consulting Surgeon to the East Suffolk and Ipswich Hospital, on resigning as Surgeon.

SMITH, G. J. M., M.B., C.M., M.R.C.S.E., Demonstrator of Anatomy to the Westminster Hospital School of Medicine.

SPROULE, G. K., L.R.C.S.I., L.K.Q.C.P.I., Medical Officer and Public Vaccinator for the Frome or No. 1 District of the Frome Union.

THORNTON, W. P., M.R.C.S.E., a Surgeon to the Hospital for Diseases of the Throat, Golden Square.

Marriages.

CAMPBELL-BARTY.—On the 17th inst. at St. Mary's Church, Donnybrook, Arthur Robert Campbell, M.D., to Lucy Lee, eldest daughter of Frederic Barty, late of Dublin.

DAVIS-BEECH.—On the 17th inst., at Christ Church, Upper Tean, Staffordshire, Wm. Hancock Davis, M.D., Tean, second son of W. A. Davis, M.D., Newry, to Sarah, daughter of James Beech, Blythe House, Tean.

Deaths.

CLARIDGE.—On the 17th June, at Pershore, John Claridge, L.S.A.L., aged 71.

CLARKE.—On the 7th June, at South Hackney, R. L. Clarke, Surgeon, formerly of St. Albans.

CRICHTON.—On the 2nd June, at Woodside, Arbroath, J. Thomas Crichton, M.D., aged 63.

FRANCE.—On the 15th June, at Chesterfield, William H. France, M.R.C.S.E., aged 40.

HENDERSON.—On the 3rd June, at Fourdoun, Joseph Henderson, L.R.C.S.Ed., aged 69.

HEWITSON.—On the 15th June, at Weardale, Darlington, Wm. Hewitson, L.R.C.P.Ed., aged 50.

LATHAM.—On the 14th June, Alford Wm. Latham, M.R.C.S.E., of Darlaston, aged 40.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

DEPUTATION OF MEDICAL OFFICERS OF HEALTH FOR DUBLIN TO THE COUNCIL OF THE COLLEGE OF SURGEONS.

A DEPUTATION of the medical officers of the North and South Dublin City Districts was introduced to the Council of the Royal College of Surgeons by W. H. O'Leary, Esq., M.P. for Drogheda.

The accompanying letter from these gentlemen was read:—

TO THE LOCAL GOVERNMENT BOARD, IRELAND.

GENTLEMEN,—At a meeting of the dispensary medical officers of the North and South Dublin City Districts, held on October 27th, it was unanimously resolved to forward the accompanying statement, in order that it might be brought under the notice of the Local Government Board. We observe that a meeting of the urban sanitary authority was held on Monday, the 26th ult., and that they then proceeded to appoint officers under the provisions of the recent Public Health Act, when the following appointments were made, and at the salaries herein mentioned:—

	Per Annum.
Dr. Mapother, Medical Officer of Health ...	£309 0 0
Dr. Cameron, Consulting Medical Officer ...	300 0 0
Mr. Boyle, C.E., Secretary and Executive Officer ...	300 0 0
Two Sanitary Inspectors (Police) each ...	160 0 0
Three Sergeants (sub-officers) each ...	89 14 0
One Sergeant (nominal salary) ...	5 4 0
Five Acting Sergeants (nominal salaries) each ...	2 12 0
Two Acting Sergeants, each ...	84 10 0
Two Constables, each ...	81 18 0
One Clerk ...	52 0 0
Keeper of Disinfecting Chamber ...	39 0 0
Messenger ...	19 10 0
Disinfecter of Dwellings, at 3s. per disinfection	

The Committee fixed the salaries of the thirteen dispensary medical officers, who, under the recent Public Health Act, are medical officers of health, at £10 each per annum in addition to the other emoluments of their office. Now, with greatest respect, we protest against the scale of payment awarded to us, as medical officers of health, upon the following grounds:—

1st—On account of the utterly inadequate remuneration offered.

2nd—That the duties of the office are compulsory.

3rd—Any extra payment received by us for the carrying out of the Compulsory Vaccination and Registration Acts is very hardly earned, and involves much additional labour and responsibility.

4th—It is derogatory to our profession to accept any such payment as that offered; and we unanimously decline to accept same.

5th—That the Legislature, in their wisdom, have agreed to pay a proportion (one-half, probably) of the medical

salaries (under the 10th clause of the Act). In your recent circular as to the scale of remuneration for sanitary officers it has been laid down that the amount of payment of sanitary officers should not exceed one-fourth of the Poor-law salary. We beg you will, however, take into consideration the exceptional instances of large towns, such as Dublin, Belfast, Cork, &c., on the grounds of the onerous and vastly greater amount of sanitary work in comparison with rural districts; in proof of which we append the population of the various city districts, according to the last census:—

Dublin City.		Population by Census in 1871.
North side	No. 1 District ...	49,137
	No. 2 " ...	31,993
	No. 3 " ...	27,546
South side	No. 1 District ...	32,184
	No. 2 " ...	29,952
	No. 3 " ...	38,811
	No. 4 " ...	36,703

We submit that, in a large city, the dispensary medical officer visits daily many of the homes of the sick poor, and is, of necessity, the first to see zymotic disease at its onset, and to advise the preventive measures necessary to guard against its further spread. With regard to the sanitary requirements of Dublin, we would direct your attention to the accompanying reports of the Dublin Sanitary Association. A careful perusal of these clearly demonstrates the multifarious sanitary defects which must necessarily exist in every large city. The whole system of preventive medicine is now placed in the hands of the Dispensary Medical Officers of Ireland; and, from the tenor of the instructions already issued by the Local Government Board, the initiative must, in every case of sanitary procedure, be taken by those officers. Under all these circumstances, we trust that your board will take the case of sanitary officers of large towns into your special consideration. We unanimously and respectfully protest against the rate of payment proposed to be awarded to us by the urban sanitary authority of Dublin, and are strongly of opinion that, for the carrying out of these duties, as laid down in your Instructional Circular, that the minimum salary for the due performance of the sanitary work imposed upon us by the Public Health Act should be, at least, one guinea per week, or fifty-two guineas a year. In forwarding the above protest, we beg to state that we approach the Local Government Board of Ireland with the greatest respect, and have the utmost confidence that they will, on the present occasion, deal fairly and liberally with the members of a learned profession.—And we have the honour to remain, gentlemen, your very obedient servants.

[Here follow the names of thirteen of the medical officers.]

Professor Macnamara, in a very effective speech, referred to his experience of a city dispensary practice, and

proposed the following resolution, which was seconded by the Vice-President of the College of Surgeons, and carried unanimously :—

“That the Council of this College having had their attention directed to the very inadequate scale of remuneration in a very great number of instances fixed upon by the sanitary authorities, not only in this city but throughout Ireland, as salaries for the medical officers employed under the provisions of the Public Health (Ireland) Act, feel it to be their duty respectfully to urge upon the Local Government Board the propriety of their taking such steps as will secure for said officers a scale of remuneration more in accordance with their social and professional status, and with the important and arduous nature of the duties expected at their hands.”

Dr. Speedy spoke exhaustively upon the subject, and Dr. Maunsell and others took part in the conversation.

THE IRISH PUBLIC HEALTH ACT.

At three o'clock on Monday afternoon a deputation, consisting of the President of the King and Queen's College of Physicians and a number of Fellows, waited on Sir M. H. Beach, Chief Secretary for Ireland, at the Castle, for the purpose of presenting a memorial on the subject of the remuneration apportioned to sanitary medical officers under the new Public Health (Ireland) Act.

The deputation consisted of the following :—Dr. Duncan, President ; Dr. Henry Kennedy, Vice-President ; Dr. J. Magee Finny, Registrar ; Rev. Dr. Haughton, Dr. J. W. Moore, Dr. Sinclair, Dr. Duffey, Dr. Evory Kennedy, Dr. Johnson, Dr. Churchill, Dr. Grimshaw, Dr. Hayden, Dr. Banks, Dr. Cryan, Dr. Grattan, and Dr. William Moore.

Sir Alfred Power was also present.

The President, addressing Sir Michael Beach, said that the deputation felt greatly indebted to him for allowing them to appear before him with such promptitude. He regretted to state that some distinguished members of their profession were compelled to be absent : Sir Dominic Corrigan, Dr. Hudson, Dr. Stokes, and Dr. Head. After Dr. Finny had read the memorial, he (the President) would, with the permission of Sir Michael Beach, make a few observations in support of it.

Dr. Finny, Registrar, then read the following :—

TO THE RIGHT HONOURABLE SIR MICHAEL EDWARD HICKS BEACH, BART., M.P., CHIEF SECRETARY FOR IRELAND.

The Memorial of the President and Fellows of the King and Queen's College of Physicians in Ireland.

Humbly sheweth,—That your memorialists desire to express a general approval of the provisions of the Public Health (Ireland) Act. That they regard the appointment of the dispensary medical officers as sanitary officers, under section 10 of the Act, with much satisfaction, as a recognition of the necessity of placing the medical profession in the foremost rank of an organisation for purposes of public health. That they are fully conscious of the number, significance, and novelty of the duties which will have to be discharged by the sanitary officers under the Act—the most important of which duties can only be efficiently performed by medical men, in consequence of their education, qualifications, and training. That the responsibility of carrying into effect the principal of these duties—namely, the reporting upon nuisances, the investigation of outbreaks of preventable disease, the prevention of the spread of sickness, the examination of air, water, and food ; the drawing up of periodical reports on the health of sanitary districts, and the compilation of statistics of disease—is especially imposed upon the medical sanitary officers. That the remuneration so far offered by the local sanitary authorities to the medical officers of health is quite inadequate, when regard is had to the multifarious and very responsible nature of the duties to be performed by them, and to the qualifications required of them. Lastly and especially—that the interests of the community at large

imperatively demand—on the grounds equally of humanity, justice, and economy—that the Public Health Act should be carried into effect in the best manner, and by willing officers. For all these reasons, your memorialists respectfully pray that you will take steps to secure a favourable consideration of the question of the apportionment of equitable and sufficient remuneration to the sanitary medical officers of Ireland in their endeavour to advance the public weal. And your memorialists will ever pray. Signed on behalf of the College,

JAMES F. DUNCAN, President,
J. MAGEE FINNY, Registrar.

November 14th, 1874.

Dr. Duncan wished in the first instance to disclaim any sympathy with the language used by some medical men on this matter. The College of Physicians think that they are the natural guardians of the interests of the medical profession throughout the country. In that capacity they had taken this matter up. At the same time they wisd it to be understood that none of their fellows or actual members of the College were personally interested in the question whatever. None of those present were sufficiently involved to be interested. There were some members of the deputation who were *ex-officio* guardians themselves, and who therefore could have no feeling of sympathy with the language which had been addressed in a very improper way to the boards of guardians generally throughout the country. They were there before the Chief Secretary in the interests of the public. They felt that that very important Act was calculated to be of great benefit to the country, and therefore it was desirable that it should be carried out effectually. Now, possibly, as it appeared to them, with all the trouble and expenditure connected with the getting of that Act of Parliament, very heavy loss might be incurred by the country uselessly because of the omission that had been made with regard to the persons who were really to carry the provisions of the Act into effect. After referring to the visit of the College deputation to London on the subject of the Irish Public Health Act, he remarked that a considerable number of dispensary officers through the country were opposed to having this duty put upon them in the arbitrary manner prescribed by the Act. They thought the performance of the duties should be left to their option. They had, however, been obliged, in fact, to fulfil those duties whether they liked it or not. In addition to being extremely unpleasant, the duties were dangerous, owing to the liability the medical officer was subject to on the score of infection. They were also, in the course of the performance of their duties, brought in contact with persons upon whom they were more or less dependent in the way of practice in the country if they faithfully discharged their duties to the public in having nuisances for which those persons were responsible removed. The effect of that would be that they would lose their practice, and perhaps be exposed to actions at law for damages. They felt that the remuneration for these services should be commensurate with the arduous character of the work to be done. With regard to the cost to the country, he might mention that many members of the profession were not dependent on the incomes of their practice, but had properties in various parts of the country, and, therefore, were not desirous of having taxation increased. But it was really for the interests of the public that if these duties were to be discharged at all, it was only just that they should be properly paid for.

The Rev. Dr. Haughton entirely concurred in all that had fallen from the President. They felt bound to assist their dispensary brethren, and to express the grievance which was felt. The duties were such as could not be discharged by policemen or even solicitors, but required the training and skill of the medical man accustomed to track the sources of disease to their haunts, and accustomed to take precautions against its spread. When the College supported the view that the medical officers should be *ex-officio* sanitary officers, it certainly proved no part of their interests that they should be under paid. That they were now there was no doubt. He read a letter from a sanitary

medical officer who received a salary of £30, and who stated that he would gladly part with his salary and give as much more out of his own resources to anyone who would relieve him of the duties. He claimed to have considerable knowledge of sanitary medicine, and he believed all the money that was being spent on sanitation would be a perfect delusion unless a class of men were employed and paid whose advice would be worth following.

Dr. Grattan and Dr. Evory Kennedy having spoken in support of the memorial,

Dr. Grimshaw argued that he thought the remuneration should be fixed in proportion to the population, area, and number of houses contained in the district. Those were, they believed, the real elements upon which the proportion of salary to be paid should be calculated.

Dr. Wm. Moore having made some observations,

The Chief Secretary in reply, said that he fully admitted both the importance of the subject the deputation had brought before him and their right as representing the College of Physicians to deal with it. He thought it must also be admitted that the medical dispensary officers had a special claim as compared with other persons, to be appointed under the Public Health Act, on the consideration of the Government, for the reason that had been already stated, that they are appointed to these offices without their own consent. It was right, however, to add that the proposal as to their being *ex officio* sanitary officers, was, so far as he could learn, never objected to by them as being an unfair proposal, but was a proposition that commended itself to the support of everyone in and out of the House of Commons—at least so far as he could be led to conclude from the representations made to him. The bill had been passed with the unanimous concurrence of the Irish members. The dispensary medical officers were chosen to these positions for two reasons: first, because it was considered that they were better qualified to fulfil the duties of the position than anyone else who could be appointed; secondly, because they could be had more cheaply to the rate-payers than if fresh officers were appointed. It was obvious that the mere fact of their holding the appointment of dispensary medical officer enables them in the performance of the office to ascertain facts connected with sanitation which would not fall under the notice of anyone else, unless specially appointed for the purpose. He thought it was reasonable to conclude, therefore, that their appointment as sanitary officers would be most acceptable to the rate-payers. Well, then, when the bill was brought in, it contained a proviso that the Local Government Board should settle the salaries of these officers. He proposed this because he thought it the best and the simplest way. Then it was suggested to him by several members of the House of Commons that, as half of the salaries would have to be paid by the board of guardians or sanitary authorities, it was only right that the initiative as to the fixing of salaries should be vested in the local authorities. He could not resist such a suggestion. As the Act now stood that power was vested in the sanitary authorities, subject to the Local Government Board. What had been done by the Board up to the present had only been preparatory. It now became the duty of the Local Government Board, in pursuance of the Act, to consider how far they can improve these salaries. The ultimate decision must rest with them. In many cases he thought the salaries proposed were inadequate for the work to be done. They must further remember that each of the cases must fairly be judged upon its merits—(hear, hear)—and he thought he might remark that boards of guardians, not being sufficiently acquainted with the duties that their officers had to perform, and wishing to try what the actual work to be done might amount to, had only fixed upon the lowest figure as commencing salaries to be paid to those officers. It was, therefore, quite possible that in many cases the salaries at first fixed might require hereafter to be raised. It had been admitted that it had been impossible

to arrive at a definite conclusion, he supposed, in any case, as to the actual amount of work that had been done by sanitary officers before the Act was brought into operation. He could only say that he thought it was fairly the duty of the Government to see that, so far as depends upon them, the duties of the officers appointed under this Act should be efficiently performed, and that officers shall be fairly remunerated for those duties. His friend Sir Alfred Power would, he felt sure, devote to the matter that attention which he devoted to all questions relating to the local government of the country; and, in conclusion, he might say that he was extremely glad to hear from the deputation that they repudiated the language that had been made use of by some members of the profession towards boards of guardians. (Hear, hear.) He regretted very much that such language should have been used. The question which they had been discussing could only be settled by mutual concession and fair dealing on both sides. If the matter was fairly put before the guardians, he had no doubt the matter would receive impartial and just consideration.

The deputation having thanked Sir Michael Beach for his courtesy, then withdrew.

POLICE CALLS FOR DISPENSARY DOCTORS.

TO THE EDITOR.

SIR,—I have been long wishing to direct your attention to a grievance under which I personally suffer; it is this: I am dispensary doctor in a town in the south, where fairs are held monthly. On those occasions rows are constant, in which one fellow or more gets a cut head or other wound. The wounds are generally on the face or head. If on the latter organ, I have to get the part shaved for effectual dressing. The grievance I have to complain of in connection with those cases is that the parties are brought to me by the police with visiting tickets. I have to attend at the police barracks or at my own house, when they stagger into me drunk, it has frequently happened that the police knock me out of bed at night, although I stop up late on these occasions.

The explanation I have frequently got from the head constable in charge is that he is directed by circular from head quarters in Dublin to call on me as dispensary doctor with a visiting ticket to attend those cases, regardless whether they live in or out of my district, be they farmers or farmers' sons, tinkers or vagrants of any other class. Now, Sir, I am sure you will agree with me that this is unjust treatment and ought not to be submitted to quietly without remonstrance from you who are so friendly to the dispensary doctors.

Whilst I have to complain so strongly of the police authorities, I am glad to be able to say from personal experience that the authorities at Dublin Castle have always remunerated me for attendance at Petty Sessions. I have only to show that the magistrates required my attendance and evidence, when they at once direct the Crown Solicitor to pay me invariably a guinea.

Trusting that the ventilation of this matter in your influential journal may be of service to myself and my professional brethren, I am, Sir, your obedient servant,

A DISPENSARY DOCTOR.

The question at issue is one of those which would deserve and require careful investigation by the Irish Medical Association. We have no doubt that when once presented with a red ticket the medical officer must attend, but we are under the impression that he could in a suitable case raise the question of the legality of the issue of the ticket by applying to his committee to cancel it, and if they did so, he would then be in a position to apply to the Castle for payment. Most positively he may and should in any case refuse to give the authorities any information whatever.

BIRTHS AND DEATHS IN DUBLIN AND THE SUBURBAN DISTRICTS.

THE deaths registered in the Dublin district during the week represent an annual mortality of 27 in every 1,000. In London the death rate was 25.

In the Dublin district the births registered amounted to 112, and the deaths to 161. The average numbers were—births 166, and deaths 163.

The deaths from zymotic diseases numbered 32, including 2 from fever (1 typhoid, and 1 simple continued), 18 from scarlet fever, 1 from measles, 3 each from croup and diarrhoea, 2 from quinsy, &c.

In the Belfast district 22 deaths resulted from scarlet fever, 5 from fever, 3 from measles, a like number from diarrhoea, and 1 from whooping-cough.

In the Dublin district 11 children died from convulsions.

Forty-three persons succumbed to bronchitis, 2 to pneumonia, and a like number to lung disease unspecified.

Paralysis caused 5 deaths, apoplexy 2, insanity 2, brain disease unspecified 3, liver disease and hernia 1 each, stricture of intestines and enteritis 2 each, aneurism 2, and heart disease 7.

Fifteen persons fell victims to phthisis, 2 each to hydrocephalus and mesenteric disease, and 1 to cancer.

DR. ROBERT BARRY, of Limerick, has recently succeeded **Dr. Kavanagh** in the office of Registrar of Births, Deaths, and Marriages for St. John's City District. The appointment is especially interesting to Irish Poor-law medical officers, because it is, we believe, without precedent. The acceptance of the office of Registrar is by the Act of Parliament left quite voluntary to the dispensary medical officer, but practically it has always been compulsory. Sir Alfred Power, in his evidence before the House of Commons Committee stated, that the Local Government Board disapproved of a dispensary doctor refusing the Registrarship, or resigning it, and would prevent his doing so if possible.

CARLOW UNION.

SALARIES UNDER THE PUBLIC HEALTH ACT.

A COMMUNICATION from the Local Government Board, dated December 9, was read by the Chairman, from which the following is extracted:—

“SIR,—There remains the question of the additional salaries proposed for the sanitary officers—viz, £10 a year each; and the Local Government Board cannot look upon that as adequate remuneration for those officers. It is to be borne in mind that it is not optional with the dispensary medical officers, as in the case of other officers, to accept their appointments under the Public Health Act, and in the opinion of the Local Government Board it will not be for the advantage of the Union, nor promote the efficient working of the Public Health Act, if officers on whom devolve the execution of important duties under the Act were impressed at the outset with the apprehension that their services will be inadequately remunerated. The officers are now under an obligation to perform their duties, and no delay should take place in determining their salaries. The Local Government Board trusts that those views will be acquiesced in by the sanitary authorities, and lead to a further consideration of the part of their proposals, with a view to placing the salaries of the sanitary officers on a scale more in accordance with the basis suggested in the Board's circular letter of the 8th October last.

“(By Order),
“B. BANKS, Chief Clerk.”

Mr. Fitzmaurice said for the present they should not increase the sanitary officers' salaries. Outside the town the guardians were looked upon as sacrificing the ratepayers.

The Relieving Officer said it would be quite impossible for him to attend the sanitary business in his districts without some remuneration. Last week he was obliged to pay half-a-sovereign for a car, and in twelve months those expenses would amount to a considerable sum, as he had to visit and report on 191 townlands, and where necessary serve notices for the abatement of nuisances.

The subject then dropped.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

ATHY UNION.

Mr. LYONS moved that Dr. Moore, who has acted as temporary medical officer of the workhouse during the illness of the late Dr. Kynsey, be paid at the rate of £2 per week for his services. Dr. Kynsey had been the faithful officer of this house for nearly thirty-five years, and if the board did not now pay Dr. Moore, Dr. Kynsey's family would have to do so.

Mr. Reeves, in seconding the motion, said he would consider it a very great hardship if the board allowed the family of the late Dr. Kynsey to pay Dr. Moore.

Mr. Whelan proposed an amendment that as the matter had already been so fully discussed, it should not now be opened up again.

The amendment was lost by a majority of four.

DIRRAW DISPENSARY.

At a special meeting of Dirraw Committee, a letter was submitted from Dr. MacArthur, resigning the office of medical superintendent of the district, owing to his acceptance of a similar appointment at Greyabbey, after which the following resolution was unanimously adopted:—"In accepting Dr. MacArthur's resignation the committee express their regret at losing the services of a medical officer whose Christian character they so highly esteem, and of whose professional ability they have had the most satisfactory proof. They heartily wish him great success in his new and important sphere of usefulness."

A meeting of the committee was held for the purpose of electing a successor. As there were three candidates the voting was spirited, the result, however, being that Dr. MacKeown, Kilrea, was declared elected by a majority. Dr. MacKeown's friends in Kilrea testified their delight at his appointment by illuminating the street in which he lives with tar-barrels, and there were similar demonstrations in his new district.

OMAGH UNION.

It was moved that Dr. Fleming be elected as consulting sanitary officer. They all knew him long in connection with that house, and he considered it would not be fair to do otherwise than recognise his merits by appointing him.

Dr. Edward Charles Thompson was also proposed for the appointment. Dr. Thompson's testimonials, his proposer said, were of the highest order; he had made the subject of hygiene his special study, and had passed a searching examination in that department of medical science, having attended the lectures of Dr. Parkes, who was the highest authority in the kingdom on sanitary matters.

Mr. David Rodgers proposed the election of Dr. John Rodgers, late of her Majesty's Navy.

The Chairman proceeded to take the poll for the three gentlemen before them, and found that Dr. Fleming ob-

tained 14 votes, Dr. Thompson 17 votes, and Dr. Rodgers 3 votes. On a tie being taken between Dr. Fleming and Dr. Thompson, it was found that there voted for Dr. Fleming 16, and for Dr. Thompson 18.

Dr. Thompson was then declared elected by a majority of two.

BIRTHS AND DEATHS IN DUBLIN AND THE SUBURBAN DISTRICTS.

The deaths registered in the Dublin district during the week represent an annual mortality of 44 in every 1,000. The high death rates afforded by the returns for Dublin and the provincial towns for last week are partly due to irregularity in registration—arrears being generally entered up in the last week of the quarter. In London the death rate was 37 in every 1,000 of the estimated population, in Glasgow 59, and in Edinburgh 42.

In the Dublin district the births registered amounted to 205, and the deaths to 269. The average numbers were—births 150, and deaths 155.

The deaths from zymotic diseases amounted to 36, against 32 in the week preceding. Of these deaths only 2 were caused by fever (1 typhoid, and 1 simple continued fever); 11 were caused by scarlet fever, showing a decrease of 7 as compared with the preceding week; 1 each by measles, diphtheria, croup, whooping-cough, and dysentery, 4 by influenza, 3 by diarrhoea, 6 by erysipelas &c.

In the Belfast district 34 deaths were caused by scarlet fever, 1 by small-pox, 10 each by measles and fever, 3 each by whooping-cough and diarrhoea, and 2 by diphtheria.

In the Dublin district 12 children died from convulsions.

The cold weather has raised the deaths from diseases of the respiratory organs from 47 in the week ended the 26th of December to 88 in the past week.

Bronchitis proved fatal in 68 instances, pneumonia in 12, laryngitis and pleurisy each in 1, and lung disease unspecified in 6; apoplexy in 8, paralysis in 7, cephalitis and epilepsy each in 2, brain disease unspecified in 6, insanity in 1, jaundice and liver disease each in 2, heart disease in 7, and aneurism in 1.

Phthisis proved fatal in 27 instances, hydrocephalus in 3, mesenteric disease in 2, scrofula and gout each in 1, and cancer in 4.

Four deaths were caused by violence, 2 by fractures and contusions, and 1 each by burns and scalds.

C. E. CREAN, L.K.Q.C.P.I., &c., has been appointed Superintendent Medical Officer of Health for the Claremorris Union, and Sanitary Officer for the Ballyhaunis Rural Sanitary District.

TABLE showing for EIGHT LARGE TOWNS, &c., the AREA, in Statute Acres; the POPULATION in 1871; the ANNUAL RATE OF MORTALITY per 1,000 Inhabitants represented by the Number of Deaths registered during the Week ending Saturday, January 2nd, 1875; the Total Number of BIRTHS and DEATHS registered during the Week, with the Number of DEATHS at certain Ages, and from SEVERAL CAUSES, &c.

SANITARY SALARIES.—MORE SEALED ORDERS.

THE Waterford guardians have followed the lead of the Dublin Corporation, in fixing nominal salaries for their medical officers of health, and have been brought to their senses, after much fruitless remonstrance, by the Local Government Board sending them a sealed order. The order recited the salaries as follows:—Executive sanitary officer, salary as clerk of union, £160, ditto under Public Health Act, £25. Sanitary officers: salaries as dispensary officers, £120; salary under new Act, each, £20. Waterford dispensary doctors, for rural portion of their respective districts, each, £5. The Clerk explained that portion of the letter accompanying the order referring to the amount to be refunded from the Treasury in this way. The circular of the Local Government Board stated that half of the proportions of one-fourth of the salaries under the new Act would be recouped, but here the salaries were beyond that scale, and, therefore, they could only expect to be recouped "one-half of one-fourth," the proportions actually allowed. Mr. Clampett said that other sanitary boards to whom sealed orders have been sent under this Act had not received them as final, but had taken the opinion of counsel as to whether or not the Local Government Board had this absolute power. They should do the same, and even, if necessary, have the question brought before Parliament (oh, oh).

At the Board of Guardians of Kilkenny, last week, a letter was read from the Local Government Board, stating that the Board proposed to fix the salaries of the medical officers under the Health Act at £20 a year each, and for that purpose a sealed order will be issued accordingly. In Thurles the guardians raised the salaries of their six medical men, under the Health Act, from £10 to £20 each, and the Local Government Board have approved of same. In the South Dublin Union the doctors' salaries are struck at £25 each.

At the weekly meeting of the Cavan Union Board, a sealed order was read fixing the salary of the consulting sanitary officer at £25 per annum, being an increase of £15 on the sum fixed by the guardians, and increasing

the salaries of the remaining sanitary officers £10 each, being £20 each per annum.

At a meeting of the Guardians of the Longford Union, a letter from the Local Government Board was read, stating that if the guardians would not without further delay increase the salaries of the sanitary officers, a sealed order would be forthwith issued for that purpose compelling them to do so. At a former meeting, with Lord Granard in the chair, it was unanimously decided by a full board that ten per cent. on their present salaries was sufficient remuneration for these officers, but the Local Government Board did not approve of this arrangement, and asked the Board to reconsider their decision, and have the salaries fixed in accordance with their circular letter of the 20th October. The guardians, in the absence of Lord Granard, declined to take further steps in the matter.

The Cork Corporation has also received its ultimatum, and has "protested," which does not make much difference in the circumstances.

OUT-DOOR RELIEF IN IRELAND.

THE proceedings of the Mountmellick (Queen's Co.) guardians last week are significant and interesting, as indicating the notion which Irish guardians sometimes have of the honourable discharge of their duties. It was broadly stated by one of the board—with what truth we cannot say—that a brother guardian was in the habit of obtaining outdoor relief for persons whom he well knew to be capable of earning their living, in order that he might be able to secure the labour of these persons on his own farm at a reduced rate.

DEATH OF DR. COMERFORD, ESQ., OF KILKENNY.—Dr. Comerford, Esq., died in Kilkenny on Thursday night. Since Christmas he has been confined to his bed, suffering from a severe attack of typhus fever, which resulted in effusion of the brain and death at the early age of forty-six years. Dr. Comerford was a very popular citizen, and is universally regretted.

A DIGEST OF THE SANITARY LAWS IN FORCE IN IRELAND.

Prepared by W. D. WODSWORTH, Esq., Assistant-Secretary to the Local Government (Ireland) Board.

THE following abstract of the sanitary laws in force in Ireland has been prepared with a view to afford information and assistance to those engaged in carrying those laws into effect, or in the words of the tenth section of the Public Health Act, 1874, "in the discovery, or inspection, or removal of nuisances, in the supply of pure water, in the making or repairing of sewers and drains, or in generally superintending the execution of the sanitary laws within the district."

WATER.

Many duties are devolved on sanitary authorities in regard to the supply of pure and wholesome water for the inhabitants of the district, and also with respect to prevention of pollution of water.

In districts where no water companies are established by Act of Parliament, the sanitary authority may make agreements for the supply of water to persons, on such terms as may be agreed upon between the authority and the persons receiving such supply, and have power for recovery of water rents so accruing.

To provide water for public and private use, for drinking and for domestic purposes, the sanitary authority may dig wells, cleanse, and keep them in repair by paving, puddling, surrounding with proper stone or brick brims, or covering with stone or woodwork.

They may make and maintain reservoirs or cisterns, or purchase waterworks already established, and do any other acts necessary.

They may buy up any dam, mill, or weir which interferes with a proper supply of water, or may purchase land covered with water, or any water-right, but they must not injuriously affect any river or canal, or any legally established water supply.

In the sanitary authority is vested all property in wells, fountains, and pumps provided for the use of any place, not being the property of, or vested in any person or corporation other than officers of such place.

For the gratuitous supply of water to the public, the sanitary authority may continue, maintain and plentifully supply with water all existing public cisterns, pumps, wells, reservoirs, conduits, aqueducts, and works belonging thereto; or they may substitute other such works equally convenient; and may also construct any number of new cisterns, &c., for the gratuitous supply of any public baths or wash-houses, not established for private profit or supported under borough rates.

They may also supply water, and charge for it, to public baths and wash-houses, or for trading or manufacturing purposes.

To supply water "for private use" the sanitary authority may, with the approval of the Local Government Board, contract with any person or company, or may provide in other ways and maintain waterworks and "all things necessary and proper" to secure a supply of pure and wholesome water, laid on at such pressure as will carry it to the top of dwelling houses: Provided that there is no waterworks company in the district who would supply the water required; and before constructing waterworks themselves, the sanitary authority is bound to give due notice to any such company, in order that it may have an opportunity of agreeing, subject to approval of Local Government Board, to supply what may be reasonably required, and upon reasonable terms.

Section 76 of the same Act enables the sanitary authority, by notice to "owner," or by doing the work themselves, to furnish any house with water which may be reported by the surveyor to be without a proper supply; but this section limits the expense so to be incurred to 2d. a week. (a)

The Towns Improvement Act, 1854, making provision, amongst other things, for a better supply of water in towns with 1,500 inhabitants or upwards, directs meetings to be convened on application of twenty-one or more householders, with a view to carrying any part of the Act into operation, and after approval of Local Government Board of adoption of any part of its provisions, the sanitary authority (Town Commissioners) may take effectual steps for the supply of water for public and private use; may purchase, hire, construct, lay down, and maintain waterworks, main pipes, forcing apparatus, service pipes for private houses, and may supply public baths and wash-houses, works, manufactories, or other premises.

(a) See section 51, 21, & 22 Vic., cap. 98, Comp. p. 477, "owners" instead of "occupiers."

See also section 20, 24 & 25 Vic., cap. 61, Comp., p. 479, as to supplying water and charging for it.

Penalties of various amounts are recoverable for any damage to waterworks or supplies.

Penalties of £5, and £1 a day during continuance of offence, may be summarily imposed for wilfully or carelessly breaking, injuring, or opening any lock, cock, waste-pipe, or waterworks; or for unlawfully flushing, drawing off, or diverting or taking water from waterworks, or for wasting, or causing to be wasted, the water supplied by the sanitary authority.

The same penalties are recoverable for polluting the water supply, bathing in any waterworks or stream belonging to the sanitary authority; or for washing, cleansing, or throwing therein, or causing to enter therein, any animal (dogs or sheep, for instance), rubbish, filth, stuff, or thing of any kind; or for suffering to run, or be brought therein, the water of any sewer, sink, drain, engine, or boiler, or other filthy or unwholesome or improper water, or, in fact, doing anything whereby the water supply may be fouled.

Proprietors of gas works may be fined £200, and £20 a day, whilst offence continues, and costs of suit, for bringing or causing to flow into waterworks or stream under sanitary authority, or into any drain or pipe connected therewith, any washings or substances produced in gas manufacture; and £20, and £10 a day, whilst offence continues, for causing the water supply to be fouled in any manner.

For the purpose of ascertaining the facts as to the water being fouled, the sanitary authorities may open the gas proprietors' pipes, conduits, and works, and examine them, the expense being borne by the proprietors, if such fouling has taken place, and by the sanitary authority if it has not.

In case of pollution "arising from sewage," the sanitary authority may take proceedings by indictment.

If any well, public or private, or water supplied from any public pump is so polluted as to be injurious to health, the sanitary authority, on the fact being represented to them, may obtain an order from justices in petty sessions to remedy the same, or close the pump or well, or direct that the water be used for certain purposes only, and justices may order the water to be analysed.

Expenses incurred by "Rural" sanitary authorities are chargeable, firstly, as regards "general" expenses (as defined by sec. 13), on a common fund raised out of the poor-rate of the electoral division, or parts thereof, (a) in the rural sanitary district; and secondly, as regards "special" expenses (as defined in sec. 13), on the dispensary district, electoral division, or townland, as the case may be, and are to be defrayed out of rates assessed for the purpose, the Local Government Board having power to determine the area of taxation.

Money may be borrowed at interest by sanitary authorities, with the sanction of the Local Government Board, from any person willing to lend it, or from the Public Works Commissioners, with the consent of the Commissioners of Her Majesty's Treasury, on the recommendation of the Local Government Board, and either for general or for special purposes. Money borrowed is not, however, to exceed twice the net annual value of the premises assessable and is to be repayable within not more than 60 years, or if borrowed from Treasury for sanitary improvements, within 30 or 50 years, as provided by the Sanitary Acts, and at three and a half per cent. interest.

Limits as to rates imposed by local Acts of Parliament are not to apply to rates required for sanitary purposes; and in towns where the Towns Improvement Act, 1854 (17 & 18 Vict., c. 103), is in force, and the provisions as to supply of water have been adopted, assessment may be made up to but not exceeding 2s. in the pound.

Watercourses adjoining or near to any highway may be scoured, cleansed, and kept open by surveyors, and may be constructed if necessary.

Ditches, gutters, drains, or watercourses, are likewise to be dealt with by the sanitary authority, and covered in or improved, owners or occupiers of land or grounds, not being waste or common, being compensated for any damage done.

BATHS AND WASH-HOUSES.

Where the Baths and Wash-houses Acts are in force the sanitary authority has conferred upon them all the rights, powers, and duties attached to the Council, Town Commissioners, or other acting bodies.

Where the Baths and Wash-houses Acts are not in force "for promoting the voluntary establishment of such places in towns and boroughs," the sanitary authorities may adopt them, and then proceed to provide public baths and wash-houses, public open bathing-places, tubs and troughs, and drying grounds.

(a) The townland is the smallest area of taxation, and is not to be divided.

Loans for these purposes may be borrowed from the Public Works.

Land may be hired or purchased, or appropriated if vested in municipal authorities or Town Commissioners.

Buildings may be erected, converted, altered, and enlarged, and fitted up and furnished.

Existing baths or wash-houses may be purchased.

Supplies of water may be obtained from companies, bodies, or individuals, and the baths, wash-houses, and bathing-places may be sold, if after being seven years established, they are deemed unnecessary.

Bye-laws may be made to regulate such places, and charges for use arranged, and offenders be dealt with by the sanitary authority.

NUISANCES.

The sanitary authority is required to inspect the district from time to time, by itself or its officers, to ascertain what nuisances exist calling for abatement, and to enforce the provisions of the Nuisances Removal Acts.

If it should happen that a sanitary authority does not do its duty, and the default is proved to the satisfaction of the Local Government Board, they may give directions for delegation of the powers of the sanitary authority to the chief officer of police of the place, and expenses incurred thereby will be recoverable from the sanitary authority.

Nuisances are defined as follows in the Nuisances Consolidation and Amendment Act of 1855 and the Sanitary Act of 1866:—

Any premises in such a state as to be a nuisance injurious to health. (a)

Any pool, ditch, gutter, water-course, privy, urinal, cess-pool, drain, or ashpit, so foul as to be a nuisance or injurious to health.

Any animal so kept as to be a nuisance or injurious to health. (b)

Any accumulation or deposit which is a nuisance or injurious to health. (c)

Any house, or part of a house, so overcrowded as to be dangerous or prejudicial to the health of the inmates. (d)

Any factory, workshop, or work-place, not already under a Factory Act or Bakehouse Regulation Act, not kept in a cleanly state, or not ventilated so as to render harmless, as far as practicable, impurities generated in the work, or so overcrowded as to be dangerous or prejudicial to the health of those employed.

Any fireplace or furnace used in any manufactory or trade-process which does not, as far as practicable, consume its own smoke.

Any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such a quantity as to be a nuisance.

Candle, melting, soap, slaughter-houses, or places for bodies, blood, or burning bones; any building or place used for any trade or process "causing effluvia," certified by medical officer, or two medical practitioners, to be a nuisance, or injurious to health of neighbouring inhabitants, may be dealt with under section 27, 18th & 19th-Vic., cap. 121, as therein directed.

The sanitary authority (as stated above) is to cause inspection of its district, "with a view to ascertain what nuisances exist calling for abatement;" and this applies to furnaces and fireplaces, to consume their own smoke especially.

Notices of nuisances existing may be given to sanitary authority by any person aggrieved thereby, or by sanitary inspector, or two or more householders, or relieving officer, or constabulary officer.

The sanitary authority is to serve notice on the person causing, or suffering the nuisance to continue, or on the owner, or on the occupier of the premises. (c)

(a) For instance, any badly ventilated, or insufficiently drained house, or house without proper sewerage, or dilapidated and rotting premises. If houses are reported unfit for human habitation, any two justices may prohibit the use of them, and issue an order to the owner or occupier accordingly.

(b) For instance, pigs, or an ass, or goats kept in a house wherein human beings live and sleep, instead of having a suitable place constructed for them outside the house.

(c) For instance, an accumulation of filthy matter of any kind, house soil, slops, vegetable refuse, or other foul things.

Slaughter-house offal not sufficiently covered, or deodorised in the earth, or by earth, peat, mould, or other deodorising and disinfecting agent.

Stagnant holes in back premises—anything rotten, rotting, or offensive to sight or smell.

(d) See note a.

(e) Such notice should be signed on behalf of the sanitary authority by their clerk or executive sanitary officer (sec. 62, Public Health Act), and should require the owner or occupier to abate the nuisance within a time to be specified in the notice (sec. 21, Sanitary Act, 1866). If, at

Where the person causing the nuisance cannot be found, and it is not the fault of the owner or occupier, the sanitary authority may itself abate the nuisance.

If a medical practitioner certifies that articles of clothing or bedding in a house, or any part of it, need to be disinfected, the sanitary authority may do what is needed.

If the sanitary authority does any acts to abate nuisances it can recover costs and expenses from owner or occupier at its discretion, requiring payment in the first instance, as in the Act directed.

For carrying Nuisances Acts into effect the sanitary authority can demand entrance into premises to make necessary examinations.

In cases of "recurring" nuisances, steps may be taken before justices for abatement, or remedy.

CONTINUED SCAVENGING.

In any case where there is "urban" sanitary authority, if the Local Government Board should see occasion to issue an order for making due provision for the proper cleansing of streets, removal of house-refuse, cleaning earth-closets, &c., within its district, the urban authority would be bound to carry the same into effect, and would be liable to a penalty for default, if an occupier of a house sent notice to cleanse it, and it was not done within seven days.

DRAINS AND SEWERS.

Where the Towns Improvement Act applies, the sanitary authority has power to make and maintain public sewers, and may purchase rights in, contract for, or purchase any sewers within the town and alter and maintain the same.

They can also take compulsory steps under the Towns Improvement Clauses Act in regard to the drainage of houses, and also as to the level of foundations of any new house, constructing drains, outfall into cesspools, providing privies and ashpits, and their inspection.

Under the Sanitary Act, 1866, any owner or occupier of premises may cause his drains to empty into public sewers, after notice to the sanitary authority, and on terms and conditions to be agreed upon.

This may be done by owners or occupiers, both within and beyond the district. A penalty of £20 will be incurred if such drains be made so to empty into the sewers of the sanitary authority, without due notice to the sanitary authority, and their agreement, and the sanitary authority can close any drain made in contravention of the provisions of the Act.

Where there are no drains for houses, or insufficient drains, the sanitary authority can require the owner of a house to make drains into a public sewer, if not more than 100 feet distant, and may do the work themselves, at the owner's expense, if he fails to do what he is required to do by the sanitary authorities' notice.

Under the Sewage Utilisation Act, 1865, the sanitary authority can construct such main sewers as they may think fit for keeping their district properly cleansed and drained, and may combine with other districts for making main sewers, or carrying into effect a system of sewerage for the use of such districts.

They may also obtain the use of any such subjacent sewer for "outfall" by agreement and after inquiry by the Local Government Board.

A power of entry into any lands or premises is given to the sanitary authority for making, or for keeping works in repair, and the sanitary authority may borrow money for sewer purposes, or take land for the purpose, and may compensate for damage sustained by works for carrying sewerage powers into effect.

But sanitary authorities are prohibited from making a sewer so as to drain "direct" into any stream or watercourse.

Expenses, "special," for Sewer works incurred by a "Rural" are chargeable under the Public Health Act, 1874, on the contributory district, the Local Government Board first determining the area of taxation.

Expenses under previous Acts in regard to sewers and waters were chargeable on the electoral division only.

(To be continued.)

the expiration of the time named, the nuisance is not abated, the sanitary authority may cause complaint thereof to be made before a Justice of the Peace, who shall thereupon issue a summons requiring the person in default to appear before any two Justices in Petty Sessions assembled, who may make an order for the abatement or discontinuance and prohibition of the nuisance (sec. 12, 13 & 19 V., c. 121).

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

THE general meeting of the Association which was summoned by the President for the 6th of January last was held on that day at the Royal College of Surgeons. On the chair being taken by the President, Dr. Henry Smith, it appeared that, inasmuch as, in consequence of a secretary not having been appointed in the room of Dr. Quinan, resigned, sufficient publicity had not been given of the intention to hold the general meeting, the members present were therefore of opinion that it would be inexpedient to enter upon the business which was for the consideration of the meeting. Accordingly it was decided that an adjourned general meeting should be held on the 27th of this month, and it was remitted to a committee to make the necessary arrangements for the holding of the meeting, and for the issuing of invitations to all members of the profession whose co-operation in the reorganisation of the Association might be considered desirable, and who might be willing to give their assistance for that object.

The President and Council, therefore, earnestly solicit the co-operation of the profession, and especially of the Poor-law medical officers of Ireland, in this effort to reorganise an Association for the representation of their views and interests, and request the attendance at the general meeting of those who are willing to give their assistance for such object.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF DECEMBER, 1874.

- DECEMBER 1ST.—Kirkwood, Kingston Dodd Lloyd, Woodbrooke, Carrick-on-Shannon, Co. Leitrim, Lic. R. Col. Surg. Edin. 1873, Lic. R. Col. Phys. Edin. 1873.
- 3rd.—O'Dea, Patrick St. Laurence, Duras, Kinvara, Co. Galway, Lic. R. Col. Phys. Edin. 1874, Lic. R. Col. Surg. Edin. 1874.
- 8th.—Enright, Thomas, Castlematrix, Bathkeale, Co. Limerick, Lic. R. Col. Surg. Irel. 1873, M.B. Univ. Dub. 1874.
- 9th.—Moutray, Charles Drummond, Airmount House, Kilmainham, Co. Dublin, Lic. R. Col. Surg. Irel. 1873, Lic. R. Col. Phys. Edin. 1874.
- 11th.—Herapath, Charles Kynaston Coathupe, Sidney House, Brunswick Square, Bristol, M.R.C.S., Engl., 1874, Lic. K. Q. Col. Phys. Irel. 1874.

- 12th.—Ryan, Joseph Michael, Ardee, Co. Louth, Lic. 1874 and Lic. Midwfy. 1874, R. Col. Surg. Irel., Lic. Apoth. Hall, Dub., 1874.
- 14th.—Metge, Richard Toler, Banbridge, Co. Down, Lic. R. Col. Phys. Edin. 1874, Lic. R. Col. Surg. Edin. 1874.
- 15th.—Leader, Richard Radley, Keale House, Mill Street, Co. Cork, M.D. 1873 and M.Ch. 1873, Qu. Univ. Irel.
- 15th.—Johnston, John Somerville, 1 East Wall, Londonderry, Lic. 1874 and Lic. Midwfy. 1874, K. Q. Col. Phys. Irel., Lic. R. Col. Surg. Irel. 1874.
- 16th.—Purcell, Richard, Kanturk, Co. Cork, Lic. Apoth. Hall, Dub., 1856.
- 19th.—Lamprey, Joseph John, 4 Clifton Terrace, Monkstown, Co. Dublin, Lic. 1874 and Lic. Midwfy. 1874, K. Q. Col. Phys. Irel., Lic. R. Col. Surg. Edin. 1874.
- 22nd.—Guthrie, James, Greysteel, Eglinton, Co. Derry, Lic. R. Col. Surg. Edin. 1873, M.D. Q. Univ. Irel. 1874.
- 22nd.—Duke, Alexander, 2 Proby Square, Blackrock, Co. Dublin, Lic. 1874, and Lic. Midwfy. 1874, K. Q. Col. Phys. Irel., Lic. R. Col. Surg. Irel. 1874.
- 22nd.—Mulock, Frederick John, Kilnagarna, Athlone, K. Co., Lic. 1873 and Lic. Midwfy. 1874, R. Col. Surg. Irel., Lic. K. Q. Col. Phys. Irel. 1874.
- 26th.—Parker, Joseph, 10 Upper Mallow Street, Limerick, M.D. 1874 and M.Ch. 1874, Q. Univ. Irel.
- 28th.—Rooney, James, Shercock, Co. Cavan, Lic. K. Q. Col. Phys. Irel. 1874, and Lic. Midwfy. do. do. 1874, Lic. R. Col. Surg. Irel. 1874.
- 30th.—Jennings, William, Maternity Hospital, Cork, M.D. 1874 and M.Ch. 1874, Qu. Univ. Irel.
- 31st.—Weddick, John, Union Workhouse, N. Brunswick Street, Dublin, Lic. 1874 and Lic. Midwfy. 1874, K. Q. Col. Phys. Irel., Lic. R. Col. Surg. Irel. 1874.
- 31st.—Daly, Maurice C., Waterhouse Road, Cork, M.D. 1874 and M.Ch. 1874, Qu. Univ. Irel.

ABBEYLEIX UNION.

MR. DELANY moved that Mr. Finnegan's salary as executive sanitary officer should be £20. He thought similar salaries were paid in other unions, and sanctioned by the Local Government Board. If they fixed too small an amount the Local Government Board would send down a sealed order.

Captain Despard proposed that Mr. Finnegan get £25 a year as executive sanitary officer.

Captain Despard's motion to fix the salary at £25 a year was passed by a majority of 12 to 5.

Mr. Delany moved that the sanitary officers' salaries should be fixed at £15.

Mr. Fleming proposed the sanitary officers should get £25 a year each.

On a division, Mr. Delany's motion was carried by a majority of 10 to 7.

Captain Despard wished to know if the duties of the consulting sanitary officer were heavy.

The Clerk replied that the Local Government Board appeared to attach great importance to the office. He then read the duties of the consulting sanitary officer.

Dr. Edge proposed that Dr. Swan be paid £30 a year as consulting sanitary officer.

Mr. Delany moved that the salary should be £20 a year.

Mr. Kennedy proposed £15 should be the salary.

The proposal to fix the salary at £20 was carried by 9 to 7.

BIRTHS AND DEATHS IN DUBLIN AND THE SUBURBAN DISTRICTS.

THE deaths registered in the Dublin district during the last week represent an annual mortality of 46 in every 1,000 of the population. In London the death rate was 35, in Glasgow 66, and in Edinburgh 45.

In the Dublin district the births registered during the week amounted to 184, and the deaths to 276. The average numbers were—births 164, and deaths 182.

The deaths from zymotics numbered 42, showing an increase of 6 as compared with the preceding week. Of the deaths from zymotic diseases 6 were referred to fever (1 typhus, 3 typhoid, and 2 simple continued fever), 14 to scarlet fever, 7 to diarrhoea, 4 to erysipelas, 1 each to measles, diphtheria, quinsy, croup, whooping-cough, dysentery, &c.

In the Belfast district 20 deaths from scarlatina were registered, also 9 from measles, 3 from whooping-cough, and 1 from diarrhoea.

Fourteen children died in the Dublin district from convulsions.

Sixty-four deaths were caused by bronchitis, 12 by pneumonia, 1 by asthma, 1 by lung disease unspecified; 14 by heart disease, 1 by aneurism, 3 by apoplexy, 6 by paralysis, 2 by cephalitis, 4 by brain disease unspecified, and 4 each by liver and kidney disease.

Twenty-one persons died from phthisis, 1 from mesenteric disease, and 3 each from hydrocephalus and cancer.

The total number of deaths registered during the week from diseases of the respiratory organs, including phthisis, amounted to 109.

Seven deaths resulted from violence—viz., 4 from burns and scalds, 1 each from fractures, drowning, and suffocation.

TULLAMORE UNION.

THE following letter was read:—

“Dublin, 11th January, 1875.

“Sir,—The Local Government Board for Ireland have had before them the minutes of proceedings of the Board of the Tullamore Union on the 29th ult., and with reference to the guardians' resolution on the subject, ‘Whether it is the duty of the consulting sanitary officer to visit any place within the union when they consider it necessary in order to have his opinion upon disputed or doubtful points arising under the Public Health Act,’ I am to state that the Local Government Board consider it would be the duty of the consulting sanitary officer to visit any place within the union for the purpose of affording the sanitary authority his opinion upon any sanitary matter in which the sanitary authority should consider such visit and advice necessary for their guidance in the administration of the Public Health Act.—By order of the Board,

“B. BANKS, Secretary.”

DEATH OF DR. FITZPATRICK, OF NAAS.

WE regret to chronicle the death, at Torquay, where he had gone for the benefit of his health, of Dr. John Fitzpatrick, of Bolton Lodge, Naas. Dr. Fitzpatrick for a considerable time filled the arduous office of dispensary doctor of the Naas and Jarogh district, and earned the gratitude of the poor by the manner in which he discharged his duties. He is lamented by a large circle of friends.

WATERFORD DISTRICT LUNATIC ASYLUM.

At a meeting of the Board, held on the 13th inst., it was Resolved—“That the Board, on the occasion of Dr. Fletcher's promotion, desire to record their high sense of the ability and zeal which characterised his connection with this institution. They have been much gratified with the excellent order and discipline uniformly maintained in the establishment, and which have been the pleasing result of the doctor's close attention to the duties of the office of resident medical superintendent; and the governors feel confident that his future career will fully justify his selection for the more important duty to which he is now called. And in parting, they offer him the assurance of their sincere esteem, with best wishes for his welfare.

PARSONSTOWN UNION.

At a meeting of the Parsonstown Board on Saturday, a sealed order from the Local Government Board was read, fixing the following rates as the salaries of the local sanitary medical officers:—Consulting sanitary officer £20 per year; sanitary officer of Parsonstown district £25 a year; sanitary officer of Banagher district £25 per year; sanitary officer Frankford district £25 a year; sanitary officer for Riverstown district £20 per year; sanitary officer of Killyar district £15 per year. The sub-sanitary officers were each allotted £7 10s. per year. The guardians allowed their executive officer £20 per year. Mr. John Corcoran gave notice of his intention to move on that day fortnight that the sealed order be considered with a view to reducing the doctors' salaries under the Medical Charities and Sanitary Acts to a rate proportionate to that allowed in the neighbouring union of Tullamore.

ATHY UNION.

A COMMUNICATION was read from the Local Government Board, expressing their sanction of the payment of a sum of £32 to Dr. Moore for his services as temporary medical officer of the workhouse.

A Guardian expressed his surprise at the Local Government Board sanctioning what he designated an illegal motion. He said it was his fixed determination to resist payment of same.

The Chairman explained that the motion came before the Board, and was carried by a majority. The Local Government Board had to-day sent down an order sanctioning it. If he wished now to take any further steps in the matter, it should be with the Local Government Board, and not with the guardians.

The Guardian said, inasmuch as Dr. Moore was never appointed by this Board, the payment of his salary out of the rates was an illegal act, which he would resist to the utmost, even if necessary in a court of law.

The Chairman said, even if Dr. Moore were not regularly appointed, the fact of the Board actually allowing him to perform the duties, and in many instances giving him instructions, would render them liable, in a legal sense, to the payment of his salary.

The matter then dropped.

THE LATE DR. SHIELL.

The following resolution was recently passed at a meeting of the District Lunatic Asylum at Enniscorthy:—

“Resolved—That we cannot separate without recording our sincere regret at the lamented death of Thomas Wildridge Shiehl, M.B., who was the talented, kind, and courteous Resident Medical Superintendent of this Institution from its opening in January, 1868, to 19th October, 1874, during which period his continuous attention was devoted to the welfare of the patients, and to the interests of the institution generally, which frequently called forth the marked approval of the inspectors and this board; and we take the opportunity of expressing our deep sympathy with Mrs. Shiehl in her sad bereavement.”

A DIGEST OF THE SANITARY LAWS IN FORCE IN IRELAND.

Prepared by W. D. WODSWORTH, Esq., Assistant-Secretary to the Local Government (Ireland) Board.

SEWAGE AND UTILIZATION OF SEWAGE.

The Sewage Utilization and Distribution Acts, 1865, 1867; and Public Health Act, 1874, provide for the removal of difficulties as regards the disposal of sewage, so as not to be a nuisance, and also afford facilities for application of sewage to land for agricultural purposes; for receiving, storing, and distributing it; and making special drainage districts and arrangements for contributions to works either begun or completed.

The sanitary authority may construct sewers for keeping their districts properly cleansed and drained, and have control over them and over sewers previously constructed, and repair the same.

For this purpose they are empowered to carry sewers through, across, or under roads and streets; and through or under any lands whatsoever, and to do works within and without their district.

They may enlarge, alter, arch over, or otherwise improve any sewers vested in them, and may close up or destroy such as have become unnecessary, provided they do not cause a nuisance thereby: and also, if any one is deprived of lawful use of a sewer thereby, the sanitary authority shall provide him with other means of sewerage.

The sanitary authorities are bound to see that the sewers vested in them are neither a nuisance nor injurious to health, and are to cause them to be properly cleared, cleansed and emptied into suitable places, or may collect the sewage or refuse therefrom, for sale; but so as not to create a nuisance.

To effect such outfall and sale of sewage, and its distribution, further powers are conferred on the sanitary authorities by the Local Government Act, 1858; and the Public Health Act, 1874, enabling them to effect these objects within and beyond their district, also for giving compensation for damage.

But before outfall of sewage into a subjacent district is made, the sanction of the Local Government Board is necessary, after public inquiry, if requisite, and after proper terms, conditions, and precautions are arranged.

Owners and occupiers of premises may cause their drains to empty into public sewers. (See Drains and Sewers, p. 13).

If a house is without a drain the sanitary authority may require the owner to make one into a public sewer, if not more than 100 feet distant, and if more, then into a covered cesspool or other approved receptacle, not being under any house.

The sanitary authority may itself provide suitable sewerage from houses whenever any drain, ditch, gutter, or watercourse is a "nuisance," and may assess the expense on the houses, and recover it.

In case of new houses, or houses rebuilt, sanitary authorities (where there is no other enactment, public or private, to the same effect) are to have control as regards seeing that such houses have sufficient water, or earth-closets for the reception and deodorisation of faecal matter, and are bound to see that such places do not become a nuisance, and they may supply earth.

The sanitary authority has also power, conferred by Local Government Act of 1853, section 51, as to supply of water to houses, the removal of house refuse from premises, cleansing of privies, ash-pits, and cesspools.

If it should happen that the sanitary authorities make default in performance of their duties, the Local Government Board can cause the necessary works to be done, and charge all expenses on the district; or under section 37, 37 & 38 Vic., cap. 93, Public Health Act, 1874, this duty can now be enforced by writ of mandamus.

In "urban" districts if the sanitary authority has been required, in pursuance of the 39th section of the Public Health Act, to make provision for cleansing of streets, removal of house refuse, &c., it is liable to a penalty for default, payable to the occupiers of the house.

Expenses under Sewage Acts are chargeable on the borough fund or rate, or special poor-rate, as the case may be, and on the area to be determined (except where borough or urban authorities exist), by the Local Government Board.

Money may be borrowed for sewage purposes under the Public Health Act, and be charged on future rates.

LODGING-HOUSES.

The Local Government Board is empowered in its discretion, by notice in the *Dublin Gazette*, to declare the enactment in section

35 of the Sanitary Act, 1866, to be in force notwithstanding the restrictions contained therein.

After such notice the sanitary authority of the district is empowered to make regulations as to houses or parts of houses let in lodgings or occupied by members of more than one family, such regulations being subject first to confirmation by Local Government Board.

These regulations are (1) to fix the number of persons who may occupy such house or part thereof, and (2) provide for their registration, (3) for their inspection, and keeping them in a cleanly and wholesome state, (4) for enforcing therein the provision of privy accommodation and other appliances and means of cleanliness, and the cleansing and ventilation of the common passages and staircases; (5) for cleansing and lime-whiting the premises at stated times; and the regulations may extend to "ventilation of rooms, paving and draining of premises, and to notices to be given, and precautions taken in case of any contagious or infectious disease."

A notice board, with the words "Registered Lodging-House," is to be affixed to such houses, in some conspicuous place.

The Nuisances Removal Act, 1855, contains special provision also to guard against overcrowding houses occupied by more than one family.

The sanitary authority has power to enforce the regulations made, by means of fines of £2 and £1 a day whilst default continues, and after two convictions for over-crowding a house within three months, any two justices may order the house to be closed.

COMMON LODGING-HOUSES.

The sanitary authority has devolved upon it the duty of the local authority in regard to the acts as to common lodging-houses, which were enacted with a view to promoting "the comfort and welfare of many of Her Majesty's poorer subjects."

A common lodging-house is defined to be a house where persons are harboured or lodged for hire for a single night, or for less than a week at a time; and in places under the Towns Improvement Acts, at an amount not exceeding 4d. per head per night.

It is not lawful to keep a common lodging-house in towns with 3,000 inhabitants or upwards, not being a licensed victualling house, or unless the house is registered as a lodging-house.

The sanitary authority is to give notice to keepers of common lodging-houses to register them in the register which they are to keep, which is to particularise the name of the keeper of the lodging-house, situation of house, and the number of lodgers to be accommodated.

In houses in which vagrants or beggars are received, the keeper thereof may be required to furnish reports of persons resorting thereto.

The sanitary authority may make bye-laws or regulations for such houses, subject to confirmation by the Local Government Board, for their well ordering, number of lodgers, separation of sexes, cleanliness, ventilation, inspection, and may also secure a proper supply of water.

The keepers of such houses are to thoroughly cleanse the rooms, buildings, cesspools, privies and drains to the satisfaction of the sanitary authority; and are to limewash them twice a year.

Lodgers are not to be received until the houses have been inspected and approved by the proper officer, and registered, and the keeper must obtain and produce a certificate of character to the sanitary authority, if required to do so.

The keepers are to give immediate notice to the sanitary officer, medical officer of dispensary district, and relieving officer, of any case of contagious or infectious disease, and such notice is to be given if any person is confined to bed in the lodging-house "for 48 hours" by fever or any infectious or contagious disease, under penalty. Any such case may be removed by the sanitary authority to an hospital. Clothes and bedding may be disinfected, or may be destroyed, and compensation may be given out of the poor rates.

Keepers are bound to give "free access" for inspection of the premises "at all times" when required by any officer of sanitary authority.

Penalties of £5, and £2 a day during continuance of any offence against the Act, are recoverable, and after a third conviction the keeper is disqualified for having or keeping a common lodging-house.

Any person convicted of any offence against the Lodging-House Acts, may be imprisoned for a term not exceeding three months, in default of payment of penalty.

The provision in the Nuisances Removal Act, 1855, to prevent overcrowding of houses occupied by more than one family, applies to common lodgings also.

The sanitary authorities, on receipt of a certificate from a police constable, or inspecting officer, of the existence of any of the causes of complaint "specified in the 1st section of Nuisances Removal and Diseases Prevention Act, 1848," (a) in any common lodging-house are to take the necessary steps to remedy the same, which may be done in pursuance of the 10th section of Nuisances Removal and Diseases Prevention Act, 1855.

These causes of complaint are specified to be a filthy and unwholesome condition of the premises so as to be injurious to health: any foul and offensive ditch, gutter, drain, privy, cess-pool or ashpit; the presence of swine upon the premises; any accumulation of dung, manure, offal, filth, refuse, or other things so as to be injurious to health; and any cattle or animal kept underneath or upon the habitable part of the premises so as to be a nuisance or injurious to health.

ARTISANS AND LABOURERS' DWELLINGS.

The sanitary authority is to administer the Act for taking down, improving, or building dwellings occupied by working men and their families.

The Act applies to the the city of Dublin, towns corporate, or boroughs, towns having town commissioners or other governing body under any local Act, and having not less than ten thousand inhabitants.

If a sanitary officer finds premises in a state dangerous to health so as to be unfit for human habitation, he is to report the same to the sanitary authority in writing, and deliver the report to the clerk of the authority.

The sanitary authority is to refer the report to a surveyor or engineer, who is to consider and to report the cause of the evil and the remedy, if the evil be remediable.

These reports are then to be given to the owner of the house, who is thereafter to come before the sanitary authorities, and the matter is to be discussed and considered by them, and the necessary order be made thereon.

A plan and specification of the works needed is to be made, and the owner to be communicated with, and an order made for the necessary works, such order being subject to appeal to quarter sessions, if notice of appeal be given within a month, and recognisances be entered into with securities.

If the owner objects that he is not the person responsible for what is reported, but some other person, such other person being specified, may appear before the court and be heard, and further proceedings in the case are then to be taken.

Four or more householders may complain to the sanitary officer of the state of any premises, but he is responsible for the inspection of the premises whether he receives such representation or not.

If the sanitary authority does not attend to such reports, the inhabitants may memorialise the Local Government Board for inquiry, who may then peremptorily direct the sanitary authority to proceed in the matter.

Provision is made in sections 14 to 34 of the Act, as to orders for works, ownership of premises, ascertaining liabilities of parties to do necessary works, service of notices, performance of works either by owner, or on his default by sanitary authorities themselves, charging expenses on the premises, and interest thereon. Compensation for demolition of premises, as to taking down instead of improving premises at option of owner. Mode of dealing in case of joint owners, and charges on premises so as to compensate owner by way of annuity and assignment thereof.

Penalties not exceeding £20 for offences against the Act (obstructing sanitary officer, preventing execution of Act, &c.) are recoverable before any two justices.

The expenses of the sanitary authority under the Act are not to exceed 2d. in the pound, to be levied by local rate, and the sanitary authority may borrow money.

As regards "overcrowding" houses so as to be dangerous to or prejudicial to health, the 29th section of the Nuisances Removal Act, 1855, authorises and requires the sanitary authority to take proceedings before justices to abate the overcrowding whenever the medical officer of health, or any two medical practitioners certify to the authorities that any house is so overcrowded.

CELLAR DWELLINGS.

The sanitary authority is responsible for the execution of the laws in regard to places of habitation denominated as cellar dwellings.

The Sanitary Act, 1866, by the 42nd section, applied the provisions of the Public Health Act, 1848, as to cellar dwellings, to

every place where such dwellings are not regulated by any other Act of Parliament.

The Public Health Act provides that it shall not be lawful to let or occupy separately, as a dwelling, any vault, cellar, or underground room not so let or occupied before the passing of the Act.

The Sanitary Act, 1866, adopting these provisions in Ireland, was passed on the 7th August, 1866, so that unless cellar dwellings were occupied, in Ireland, as human habitations before that date, their occupation now is illegal.

Wherever, or whenever, occupied, all such places must be seven feet high, three feet being above the surface of the street or ground. They must have an open area two feet six inches wide, and springing not less than six inches below the level of the floor, and must be well drained and provided with outside window, capable of opening, a fire-place and flue or chimney, use of a watercloset or privy, and ashpit, furnished with proper doors and coverings.

Any person letting or occupying such places contrary to these provisions is liable to a penalty not exceeding 20s. a day as long as the offence continues after notice from the nuisance authority, and the penalty is recoverable before any two justices.

Churchwardens and overseers of the poor are from time to time to give notice publicly of the provisions of the Act in such manner as may be best calculated to make the same generally known.

Where there may have been two convictions in respect of such dwelling-places, within three months, any two justices may order the closing of the premises temporarily, or in case of cellars permanently.

BAKEHOUSES.

The sanitary authority is now responsible for carrying out the provisions of the Act for the regulation of bakehouses wherein is baked bread, biscuits, or confectionery.

The Act has in view the limitation of hours of labour of young persons employed in bakeries, and providing for the observance of cleanliness and ventilation therein.

No person under 18 years of age is to be employed between 9 o'clock at night and 5 in the morning, and if any person is employed contrary to this provision, the occupier of the bakehouse will be liable to penalties of £2 first offence, £5 second, and £1 a day additional for any third or subsequent offence, up to £10, by summary convictions.

The inside walls, ceiling, passages, and staircases are to be oil-painted and limewashed, or partly painted and partly limewashed, renewable periodically, and to be washed with hot water and soap periodically.

Bakehouses are to be kept clean, well ventilated, and free from any effluvia from drains, privy, or other nuisances.

A penalty not exceeding £5 will be incurred by neglect of these particulars, and the justices may order the bakehouse to be put in proper order in addition to, or instead of the penalty, if they see fit, and non-compliance with such order is punishable by fine of £1 a day during continuance.

No place on the same level as the bakehouse, and forming part of the same building, is to be used as a sleeping-place unless partitioned off from floor to ceiling, with an outward window for light and ventilation. (This in places with more than 5,000 inhabitants).

Any person occupying or letting a place contrary to the provisions of the Act is liable to a penalty of £1, or £5 for every subsequent offence.

Sanitary officers have power to enter bakehouses, inspect them, and examine whether they are kept in accordance with the Act, and may obtain a warrant from a justice, if there be refusal to admit, and may then enter with a police constable.

Expenses under the Act incurred by the sanitary authority may be paid out of rates.

HOSPITALS—PROVISION OF—CONVEYANCE TO.

A sanitary authority may provide temporary or permanent hospital accommodation by building, hiring, or contracting for reception of sick persons.

Every sanitary authority being a port nuisance authority, may, with the consent of the Local Government Board, purchase, hire, or erect an hospital, within or without the district, for the reception and treatment of persons affected by dangerous contagious disease, and may purchase or compulsorily obtain by purchase land for the purpose of erecting such a building thereon. (a)

(a) By orders issued under section 30, 29 & 30 Vic., cap. 93, the several boards of guardians have been constituted sole port nuisance authorities all round the coast of Ireland; but under section 5, 26 & 37 Vic., cap. 78, the Local Government Board can assess the expenses as may be deemed fit.

(a) This Act is repealed; but the specified causes of complaint remain the same.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

A GENERAL meeting of the Irish Medical Association and of those members of the profession who were desirous of re-organising the means at present existing of representing publicly the views and interests of medical men in Ireland was held in the Albert Hall of the Royal College of Surgeons, at two o'clock. The chair was occupied by Dr. Smith, of Donoughmore, President of the Association.

Amongst those present were—

Drs. Darby, Bray; Rawdon Macnamara, Martin; Portlaw; Craplin, Kildare; Jacob, Dublin; Hayes, Naas; Morgan, Morrogh, Minchin, H. G. Croly; Lyster, Kelly, Drogheda; Nugent, Duncan, Chapman, Pembroke-Road, &c.

A secretary *pro tem.* having been appointed, letters of apology were read from Dr. Ashe, Londonderry; Dr. Garland, Carrickmacross; Dr. Whistler, Bray; Dr. Davys, Swords; and other gentlemen.

The Secretary read the report, which referred to the circumstance that the Association was in debt to the extent of £76, balance of an indebtedness of £132, towards which the Members of Council had contributed £56, and entered at length upon the necessity for re-organisation of the Association. The Council expressed their complete confidence in the future of the organisation if an earnest and judicious effort at reorganisation were now made by its members and by the profession.

The President addressed the meeting, and referred *seriatim* to the objects which the Association had in view at the present time, and the urgent necessity for its action to maintain the influence and independence of the profession throughout Ireland.

Dr. Martin, of Portlaw, proposed, and Dr. Kelly, of Drogheda, seconded—

That, in the opinion of this meeting, the views and interests of the profession in Ireland, and especially of those members who are connected with the public medical services, are of such importance as to require for their public expression a special and influential association; and that, in this view, it is desirable to reorganise the Irish Medical Association.

Dr. Martin expressed his conviction that the medical men throughout the provinces were as earnest in their desire to support such an Association as the Council could desire, and he anticipated that the effort to reorganise the association would meet with a warm response from them.

Dr. Craplin, of Kildare, moved, and Dr. Morrogh seconded, a resolution having for its object the appointment of a treasurer and the initiation of immediate steps for liquidating the debt of the association before the annual meeting in June.

Dr. Jacob proposed, and Dr. Hayes, of Naas, seconded, a motion which was unanimously agreed to—

That this association is earnestly desirous of the co-operation of the profession generally towards the formation of one medical organisation for all Ireland, believing that the objects to which this association is devoted can be more effectually carried out by the agency of a single and comprehensive system.

THURLES GUARDIANS.

THE following resolution was proposed :—

“That the salary of Dr. Quinlan, Medical Officer of Borrisoleigh Dispensary, be increased from £100 to £120 per annum.”

The following resolution, passed by the Borrisoleigh Dispensary Committee, was handed in :—

“That, having regard to the greater extent of the area and population of the Borrisoleigh district as compared with Thurles, Moyne and Littleton districts, where the medical officers' salaries are respectively £120 per annum each, and taking into consideration the greater difficulty, expense, and danger incurred in discharging the dispensary duties of Borrisoleigh district, it being nearly all mountainous, with bad roads and dangerous river passes; and further, taking into consideration the satisfactory manner in which our medical officer has, for a period of over twenty years, discharged these duties, we deem it but an act of common justice to recommend that his salary be increased to the same standing as the above-named districts—viz, from £100 to £120 per annum.”

After considerable discussion, in which some of the guardians spoke against the proposed increase, the resolution on being put to the poll, stood as follows :—For, 12; against, 9. The resolution was then declared carried.

BIRTHS AND DEATHS IN DUBLIN AND THE SUBURBAN DISTRICTS.

WEEKLY SUMMARY.

THE deaths registered in the Dublin district during the week represent an annual mortality of 43 in every 1,000 of the population. In London the death rate was 29, in Glasgow 44, and in Edinburgh 34.

In the Dublin district the births registered amounted to 189, and the deaths to 261. The average numbers were—births 157, and deaths 183.

There were only 26 deaths from zymotics registered, being 16 under the number in the preceding week, and 10 less than in the week ended 2nd inst. Amongst the deaths 2 were from fever (1 typhoid, and 1 simple conti-

nued fever), 10 from scarlet fever, against 14 in the preceding week, 2 from influenza, and 1 each from diphtheria, croup, whooping-cough, erysipelas, and diarrhoea.

In Belfast there were registered 20 deaths from scarlet fever, 5 from fever, and 4 each from measles and whooping-cough.

In the Dublin district 15 children died from convulsions.

Bronchitis caused as many as 71 deaths, pneumonia 15, asthma 1, and lung disease unspecified 7.

Two deaths were referred to apoplexy, 4 to paralysis, 3 to epilepsy, 1 to inflammation of the brain, and 7 to brain disease unspecified.

Heart disease proved fatal in 7 instances, pericarditis in 1, liver disease in 1, and kidney disease unspecified in 2.

Twenty-nine deaths resulted from phthisis, 1 from scrofula, and 3 each from cancer, mesenteric disease, and hydrocephalus.

Three accidental deaths and 1 case of suicide were registered.

Fifty-eight of the persons whose deaths were registered during the week were under five years of age, and 82 were aged sixty and upwards.

QUARTERLY SUMMARY ENDING JANUARY 2.

BIRTHS.—In the Dublin district the number of births registered during the quarter amounted to 2,088, being equal to an annual ratio of 27 in every 1,000 of the population.

The ratio of births registered north of the Liffey was 32 in every 1,000 of the population, south of the river 25 per 1,000. In the suburbs 22 in every 1,000.

There was registered in London an annual birth rate of 37 in every 1,000, in Glasgow 36, and in Edinburgh 31.

DEATHS.—The number of deaths registered in the Dublin district during the quarter amounted to 2,138, or 27 in every 1,000. North of the Liffey was 844, or 31 in every 1,000; south of the river 926, or 27 in every 1,000. In the suburbs the annual death rate was 22 in every 1,000 of the population.

The deaths registered in Belfast during the quarter represent an annual ratio of 35 in every 1,000, in Cork, 24, in Limerick 23, in Londonderry 16, in Waterford 26, in Galway 23, and in Sligo 22. In London 26, in Glasgow 38, and in Edinburgh 27.

SANITARY SALARIES.

TO THE EDITOR.

DEAR SIR,—Perhaps you may have statistics by you which would verify a suspicion I am inclined to entertain at present, viz., that the inspectors of cattle throughout the district infected by the rinderpest in England, were allotted a more liberal remuneration than the unfortunate beings now dubbed sanitary officers by the Local Government Board.

In making a calculation of the rate at which I find I am to be recompensed for duties under the Public Health Act, it appears that about 2d. per head, per annum, is considered sufficient to secure the proper sanitation of one of the largest, the worst paid, and I may add one of the dirtiest rural districts in Ireland.

Surely, now, when every aspirant for political honours, to make use of a hackneyed phrase, declaims about the injustice to which the medical profession is subjected, some one member may be found to advance our claims in Parliament, and add another real grievance to the many known as Irish. It might find favour in English eyes as an argument against the popular cry "Home Rule," as evidence of what may be expected were the welfare of the country entrusted to such liberal agents as boards of guardians, or their scarcely more liberal masters, the Local Government Board.

Deputations to high officials in Dublin have proved unavailing, as they must always do, since those who really feel

where the shoe pinches—the rural dispensary physicians—cannot find time or very often means to leave their districts to advance their cause. I would, therefore, suggest a petition to Parliament being used as a last resort.

Let it be signed by the Poor-law medical officers throughout Ireland, for each and every one of us have like causes of complaint; confided to the care of one of the members who belong to our profession, or some other gifted being who is anxious to prove that in his case hustings declarations are something more than words; and backed by the influence of the press.

Should such a scheme prove feasible, I shall have great pleasure in forwarding you a guinea to form the nucleus of a subscription to meet preliminary expenditure.

I am, &c.,
DESPERATION.

LIMERICK UNION.

A LETTER was read from Lord Lifford, as Chairman of Stranorlar Union, County Donegal, asking the Board whether they intended taking any action in reference to the unconstitutional conduct of the Local Government Board in sending sealed orders to the Board of Guardians, fixing the amount of salaries under the Sanitary Act. The communication was referred to the Sanitary Board. Letters were read from Dr. O'Sullivan and Dr. Cullen, resigning their positions as visiting physicians to the Union, in consequence of the manner in which their request calling for a sworn inquiry had been treated by the Local Government Board. The two medical gentlemen subsequently withdrew their resignation, acting on the advice of the Board, pending the report of the Committee, at present engaged in inquiring into the state of the workhouse hospital.

CLAREMORRIS UNION.

APPLICATIONS FOR SMALL-POX PATIENTS' CLOTHES.

A LETTER was read from a man who applied to the Board for the clothes of his daughter, who died of small-pox. The writer wished either to have his daughter's clothes returned, or, if they were to be destroyed, to be given their value in cash, as they were very valuable.

It appeared the clothes had not been destroyed, but only washed.

The Chairman thought that if they had been washed they were disinfected quite enough.

There was another application from a man who declared himself "next of kin" to a man named Tarpey, who had also died of small-pox, and whose clothes and boots—or compensation for the same—he now requested.

The Clerk explained that in this case the clothes of deceased had been burned by order of the Guardians.

MULLINGAR UNION.

A VACCINO-PHOBIC BOARD OF GUARDIANS.

THE Clerk read the following circular from the Guardians of the Keighly (England) Board of Guardians:—

GENTLEMEN,—In consequence of the Bill of Lord Walsingham entitled "An Act to explain the Vaccination Act, 1871," you will have received a circular from the medical department of the Local Government Board urging you to more rigorous prosecution of those parents who object to have their children vaccinated.

This Board has for nearly two years refused to institute such proceedings, certainly with no detriment to public health, and now under the new Act stoutly refuse in any way to be made a tool of.

In the last two elections those candidates have been carried, and that by large majorities, who have been opposed to a policy of prosecution. This fact tends to show that the Acts have been passed and are carried out quite contrary to public opinion.

TABLE showing for EIGHT LARGE TOWNS, &c., the AREA, in Statute Acres; the POPULATION in 1871; the ANNUAL RATE OF MORTALITY per 1,000 Inhabitants represented by the Number of Deaths registered during the Week ending Saturday, January 16th, 1875; the Total Number of BIRTHS AND DEATHS registered during the Week, with the Number of DEATHS at certain Ages, and from SEVERAL CAUSES, &c.

SERIOUS CHARGE OF BARBARITY AGAINST A MIDWIFE.

DR. O'RYAN reported that on Sunday morning, 17th inst., he was sent for to see a young woman named Margaret Gorman, shortly after her admission from the house into the lying-in-ward. He attended immediately and found her, a little before 10 o'clock, am., in the pains of childbirth, Mrs. Smyth, the midwife, with her, and also the helper in charge of the ward, Bridget Kehoe. He was greatly displeased to find that this was in the same small ward, and within a few feet of the bed whereon lay the body of a woman, named Nano Irwin, who was dead since six o'clock, a.m. He immediately ordered the midwife to take the young woman, Gorman, into the ward adjoining, and told her he would report her conduct to the board. The clerk said the woman being merely employed by the doctor, and was not under the control of the board. It is for Dr. O'Ryan to deal with her as he deems fit. Mr. Shea: What salary is she in receipt of? Clerk: Of none, regularly; she gets 3s. in each case she's called to attend. Mr. Lalor: There can be no terms too severe for such inhuman conduct on her part. Mr. Richardson complained that though the whole occurrence took place before 10 o'clock in the morning, yet neither master or matron knew anything of it. It appeared they were absent during the whole transaction.

The Matron said she did not hear of the case until after it occurrence, and was not under the impression it was necessary to report it to the master. Mr. Lalor: Not necessary to report a case where a young woman in labour was placed in the next bed to a corpse! I cannot really understand you. Strange discipline there must be, certainly, where no report is made in a case of this kind.

Dr. O'Ryan felt a slight difficulty in dealing with the woman, Smyth, who was but temporarily employed in the capacity of nurse in the lying-in ward. Mr. Richardson said it would be well to have the doctor's report before them in writing.

OWING to the prevalency of small-pox in the Tubbercurry district, the authorities have deemed it advisable not to hold a petty sessions there for the present.

ENNIS UNION.

At the weekly meeting of the Board, a question of importance arose as to whether the dispensary officer of a district, being the sanitary officer under the Act, is bound to attend as a public prosecutor in court in cases where he has certified that nuisances reported and inspected by him ought to be removed. The case is one which is to come before the petty sessions court, and the sub-sanitary officer stated it was essential Dr. Frost should be present to give evidence. Dr. Frost said he objected to appear to give evidence, there being nothing in the Act to compel him to do so. He had furnished his reports upon all the cases brought under his notice, and so far performed the duties required by the law. It would be an invidious thing for him to appear as a public prosecutor. Mr. Thos. Greene, J.P., said it was essential the sanitary doctor should attend at the petty sessions to sustain his report, else the case could not be gone into. At the last petty sessions of Ennis there was a summons at the suit of the urban authority against parties for having polluted the river water by washing sheepskins therein. The prosecution was founded upon the certificate of Dr. Greene, the medical sanitary officer, who recommended this nuisance to be abated. Dr. Greene did not attend, and in consequence the case had to be postponed. Dr. Frost again said he did not consider he was in any way bound to appear as a prosecutor, and would not do so.

Lord Inchiquin—You only appear as witness in your capacity of sanitary officer. The Board of Guardians are the prosecutors.

Dr. Frost—But I consider I am not bound at all to attend at prosecutions.

QUALIFICATIONS FOR A UNION APOTHECARY.

THE Local Government Board has informed the Guardians of the Abbeyleix Union that the person who may be appointed to the office of apothecary of the workhouse must possess a licence from the Apothecaries' Hall of Ireland.

The next meeting will be held specially to consider the whole subject.

A DIGEST OF THE SANITARY LAWS IN FORCE IN IRELAND.

Prepared by W. D. WODSWORTH, Esq., Assistant-Secretary to the Local Government (Ireland) Board.

A sanitary authority may provide or keep a carriage or carriages for conveyance of persons in contagious or infectious disease to hospital or elsewhere, and pay the expense of conveyance.

Persons suffering from dangerous infectious disease, entering a public conveyance without notice thereof to the owner or driver, are liable to a fine of £5, and also compensation to the owner or driver.

A justice of the peace may order removal of persons in dangerous, contagious, or infectious disease to hospital at the cost of the sanitary authority, if such persons are without proper lodging, or in a room occupied by more than one family, or are on board ship.

The order is to be addressed to a police or other officer, as may be deemed expedient, and disobedience of it renders the party liable to a penalty not exceeding £10.

BURIAL OF THE DEAD.—DESTRUCTION OF INFECTED CLOTHING, &c.—DEAD-HOUSES.

The sanitary authority may provide a proper place for the reception of dead bodies.

Any justice may give an order on receipt of a medical certificate for removal of a body, at cost of the sanitary authority, from any living or sleeping-room in cases where death ensued from infectious disease, or where the body is in a state to endanger the health of the living.

If the friends or relations of the deceased person do not bury the body within a certain time, to be limited by the justice, the relieving officer is to bury the body, and the expense incurred by him may be recovered from any person legally liable to have effected the burial.

A Burial Board (as well as the sanitary authority) may make arrangements for facilitating conveyance of bodies to a cemetery, and may provide mortuary houses.

The Board of Guardians may provide for the burial of the bodies of persons drowned and cast ashore, or dying, or found dead, whose family or connections are unknown, and whose bodies are not claimed for the purpose of burial. The relieving officer, with sanction of a guardian, is to bury the body, and the expense is not to exceed seven shillings and six pence.

The guardians may also provide coffins for burial of bodies of persons in receipt of outdoor relief at time of death, and also "in cases of urgency," whether in receipt of relief or not.

PREVENTION OF CONTAGION.

The sanitary authority may provide a proper place, attendance, and appliances, for disinfection of woollen articles, clothing, or bedding, and may disinfect such articles free of charge.

It may also direct destruction of clothing, bedding, or other articles, which have been exposed to infection from any dangerous infectious disorder, and may give compensation for the same.

Persons neglecting proper precautions to prevent spread of disease, either as to lodging, clothing, bedding, letting of houses, or conveyance of parties suffering from infectious disorders, are liable to penalties of various amounts, according to the offence.

The sanitary authority, on a certificate from a medical practitioner, is to give notice to parties, owners or occupiers, to cleanse or disinfect houses, bedding, or clothing, and they are liable to penalties not exceeding 10s., nor less than 1s. a day for every day's default to take the necessary steps; and the sanitary authority may in certain cases (inability from poverty or otherwise) act for the occupier or owner at its own expense.

For the purpose of post-mortem examination, ordered by the coroner, the sanitary authority may provide a separate mortuary or dead-house, and may make regulations for maintaining, supporting, and managing the same.

Persons giving false information in letting or hiring a house or apartments, where infectious disease has been, are liable to penalty by fine or imprisonment.

LABOURING CLASSES' LODGING-HOUSES.

It is competent to the sanitary authority to adopt the Acts passed for the purpose of "encouraging the establishment of lodging-houses" for the labouring classes in Ireland, and for the better providing for the "health, comfort, and welfare of the inhabitants of towns and populous districts."

The sanitary authority are first to give not less than twenty-eight, nor more than forty-two days' public notice of their intention to adopt the Acts, and of the time and place when they will hold a meeting to take the same into consideration.

The expenses of carrying the Acts into execution are, under sec-

tion 6 of the Act of 1866, to be paid out of the rates, which the local authority has power to impose for paving, lighting, cleansing, or otherwise improving the place, and any increase of such rates is subject to approval of the Local Government Board.

The sanitary authority may provide the buildings suitable for the purposes of the Act, by erection or converting the same, and may alter, enlarge, repair, and improve them, and fit up, furnish, and supply them with all requisite conveniences, gas and water.

The net income derived from any lodging-houses or dwellings built under the Acts is to be paid to the local fund in aid of the rates made to meet expenses under the Act.

Money may be borrowed from the Commissioners of Public Works by the sanitary authority, or by companies, and by persons, for the purchase of land or buildings, and the erection, alteration, and adaptation of buildings to be used as dwellings for the labouring classes, and in providing all proper conveniences in connection therewith.

The Public Works Commissioners may, with the approval of the Local Government Board, make rules and regulations as to applications for loans under this Act, terms on which loans shall be made, guidance of parties applying for them or executing works, or rendering accounts, or regarding the class of houses to be provided, and as to their maintenance, repair, and insurance.

Loans are to be repaid within forty years, and with interest at not less than four per cent., and are to be made on mortgage on property of not less than double the value of the loan, and can be recovered through Court of Chancery in a summary way if not duly paid up.

There are also provisions for sale, exchange, &c., of premises, inspection of premises, making of bye-laws, separation of sexes, decent behaviour in lodging-houses, imposition of fines and penalties for offences, &c.

PUBLIC PROTECTION AGAINST FOOD UNFIT FOR HUMAN USE.

The sanitary authority is responsible by their officers for taking steps when necessary to protect the public from a supply of unfit food being sold for consumption in places under their control.

The Nuisance Removal Act, 1863 (applied to Ireland by the Act 32 & 33 Vic., cap. 108, August, 1869) authorises the medical officer of health, or the inspector of nuisances, at all reasonable times to inspect and examine any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, or flour exposed for sale, or deposited in any place of preparation for sale, and intended for the food of man; and if it appears to be diseased, unsound, or unwholesome, may seize the same, to be dealt with by a justice, who may order it to be destroyed, and the person to whom the same belonged, or in whose possession it was found, is liable to a penalty of £20 for each animal, carcase, or piece of meat, &c.; or, at the discretion of the justice, three months' imprisonment.

These powers of inspection and examination are extended by the Public Health Act, 1874, to "milk," in the same way as they apply to flour, &c., in the former enactment.

A penalty not exceeding £5 would be incurred by any person who in any manner prevents a medical officer of health, or an inspector of nuisances, from entering any house or place where articles of food such as are specified are kept for sale or in preparation for sale, or in any way obstructs or impedes such officer, or his servant or assistant.

Also on complaint made by a medical officer of health, or an inspector or other officer of a sanitary authority upon oath, a justice may grant a warrant to such officer to enter any building, or part thereof, or any place in which complainant has reasonable ground for believing that any of the things or articles of food described are diseased, unsound, or unwholesome, or so as to be unfit for the food of man, are kept concealed, and may search for, seize, and carry them or it away, in order to have it dealt with according to law; any person obstructing the officer charged with this duty would incur a penalty not exceeding £20.

EPIDEMIC, ENDEMIC, CONTAGIOUS DISEASES.

"Whenever any part of the realm is threatened with or affected by any formidable epidemic, endemic, or contagious disease," the provisions of the "Diseases Prevention Act, 1855" (extended to Ireland by section 62, of 29 & 30 Vic., c. 90) may be put in force throughout the country, or, in any particular place or places, and for this purpose the Board of Guardians is the exclusive authority, the whole expense being chargeable on the poor rates.

The Act provides for the speedy interment of the dead, house to house visitation, dispensing medicines, guarding against the spread of disease, and affording medical aid and hospital accommodation; and conveyance to hospital, or place of destination is provided for by the Nuisances Removal and Diseases Prevention Act of 1860.

Full powers for these purposes are given, subject to such regulations as the Local Government Board may issue, and for the purposes of this Act the Committees of Dispensary Districts are expected to aid the sanitary authority within their districts.

MOUNTMELICK UNION.

The following letter was read :—

DUTIES OF CONSULTING SANITARY OFFICERS.

“ Local Government Board, Dublin,
22nd January, 1875.

“ SIR,—The Local Government Board for Ireland had before them the minutes of the Board of Guardians of the Mountmellick Union of the 16th instant, relating to the course adopted by the Chairman at the meeting of the 14th November last respecting a resolution which was proposed in reference to the duties of a consulting sanitary officer, and in reply I am directed to state that although it may be the duty of this officer to visit any place within the union when on special cases required to do so by the sanitary authority, in order to enable him (by personal observation and inquiry) the more correctly to advise them on any matter or proceeding requiring medical knowledge and advice in the administration of the sanitary laws; still it appears to the Board to be at variance with the nature of his office that he should visit the several towns and villages of the union for the purpose of reporting as to the sufficiency of sewerage and supply of water to each. Those duties are clearly defined to be the province of the sanitary and sanitary sub-officers. I am, at the same time, to state that the Chairman at the meeting on the 14th November appears to have taken a similar view in regard to the resolution referred to.—By order of the Board.

“ B. BANKS. Secretary.”

LADIES' VOTES FOR POOR-LAW GUARDIANS.

At the meeting of the Rathdrum Poor-law Guardians, a letter was received from the Local Government Board enclosing a correspondence with Mr. Miles Kelly relative to the right of a lady to vote at the election of guardians, by proxy, out of property left her by a former husband. The Commissioners replied that a lady might vote by proxy if she held a separate estate, but they could lay down no rule as to the case in question.

BIRTHS AND DEATHS IN DUBLIN AND THE SUBURBAN DISTRICTS.

YEARLY SUMMARY FOR 1874.

Births.—During the year 1874 there were registered in the Dublin district 8,903 births, being equal to a ratio of 28 per 1,000 of the population. The average ratio in the preceding ten years was 28 per 1,000.

33 in every 1,000 of the population occurred in that portion of the city situated north of the Liffey. In that part of the city south of the river, 27 per 1,000. In the suburban districts the number of births registered amounted to 24 in every 1,000 of the population.

In London the ratio of births registered during 1874 was 36 in every 1,000; in Glasgow, 39 per 1,000; and in Edinburgh, 32 per 1,000 of the estimated population.

Deaths.—8,190 deaths were registered in the Dublin district during the year, being equal to 26 in every 1,000 of the population, which was also the average death-rate for the previous ten years.

On the north side of the river there were registered 29 deaths in every 1,000, and on the south side 27 per 1,000. In the suburban districts only 20 in every 1,000 of the population, the ratios being respectively, Rathmines, 19; Donnybrook (which includes 2 hospitals), 23; Blackrock, 18; and Kingstown, 17 in every 1,000.

Of the 8,190 deaths in the entire district, 2,112 were registered in the first quarter, 2,043 in the second, 1,897 in the third, and 2,138 in the fourth, the weekly average being 158.

The deaths registered in Belfast afford a ratio of 29 in every 1,000, in Cork 24, in Limerick 24, in Londonderry 20, in Waterford 25, in Galway 21, and in Sligo 17. As many as 604 deaths from scarlet fever were registered in Belfast during the year, of which number 401 were registered in the last quarter.

The deaths registered in London during the year amounted to 23 in every 1,000; in Glasgow 31; and in Edinburgh 24.

Diseases.—The deaths from zymotics in the Dublin district during the year exceeded the average of the preceding ten years by 63—the number for the past year being 1,916, or 1 in every 4.3 of the deaths, and 61 in every 10,000 persons living. Of the zymotics that which proved most fatal was scarlet fever, which has been epidemic in Dublin for the last fifteen months—this disease caused 834 deaths, or 10 per cent. of the total deaths, and 26.5 in every 10,000 of the population.

352 deaths resulted from fever (100 typhus, 189 typhoid, and 63 simple continued fever).

Two deaths from small-pox were registered, but neither of them occurred within the year.

Whooping-cough, which in the year 1873 proved fatal in 250 instances, caused but 40 deaths in the past year. Measles contributed 97 deaths against 66 in the year preceding. 203 deaths were referred to diarrhoea—the average for the previous ten years being 278.

Diphtheria killed 44 persons, or 6 more than in the year 1873; croup 113, quinsy 19, and erysipelas 49—an excess of 29 as compared with the year preceding.

The number of deaths ascribed to convulsions was 574. Bronchitis caused 1,000 deaths, or 1 in every 8 of the total deaths, and 32 in every 10,000 of the population, and pneumonia proved fatal in 206 instances.

Heart disease was the cause of 376 deaths, aneurism of 19, pericarditis of 9, apoplexy of 125, paralysis of 176, cephalitis of 58, epilepsy of 38, insanity of 19, and brain disease unspecified of 122; Bright's disease caused 44 deaths, nephritis 9, diabetes 5, cystitis 4, stone 3, ischuria 2, and kidney disease unspecified 55; liver disease 118, jaundice 15, hepatitis 5, and spleen disease 1.

Phtisis was less fatal than in any previous year. The deaths from this disease amounted to 862, or 138 below the average of ten years; mesenteric disease numbered 112 deaths, hydrocephalus 144, scrofula 59, cancer 152, gout 6. The deaths from all “constitutional” diseases numbered

1,452, or 46 in every 10,000 living—the average annual number of deaths from constitutional diseases in the preceding 10 years was 1,701, or 54 in every 10,000 of the population. The diminution of deaths from these diseases may be partly ascribed to the large number of children carried off by scarlet fever.

The deaths from violence were about the average, viz.,

194, or 6 in every 10,000 living—of these 173 were accidental, viz., 71 from fractures and contusions, 41 from burns or scalds, 37 from drowning, 8 from cuts or stabs, 5 from suffocation, 3 from poison, and 8 otherwise. There were 8 deaths from homicide, 7 from suicide, and 6 violent deaths were not classed.

CAUSES OF DEATH in Dublin and Suburbs in the Years 1864-74, with the Number of Deaths from each Cause to every 10,000 Persons living.

* The numbers for 1868 and 1873 respectively embrace the returns for 53 weeks, this arrangement being occasionally necessary in order that the annual series may correspond with the calendar year.

Ages.—While, as before stated, the general death rate last year was the same as the average for the previous ten years, there was a considerable variation in the rates at the several age periods adopted in these returns—thus, while the average annual mortality during the years 1864-73 amongst children under 5 years of age was only 74.1 in every 1,000 living at that age, and amongst those aged 5 and under 15, only 10.1; the corresponding rates last year were for the former age 76.6, and for the latter 12.5. This increase in mortality, which is due to the epidemic of scarlet fever, was counterbalanced by a corresponding decrease in the deaths amongst persons aged 20 years and upwards.

It will be seen that the low death-rate amongst females as compared with males, obtained through all the age-periods, except 5 and under 15, and 15 and under 20, at which period the deaths of females from phthisis always largely exceed those from that disease amongst males.

NAAS PETTY SESSIONS.

SANITARY PROSECUTIONS.

The executive sanitary officer of the Naas Union proceeded against Mr. Cunningham for being the owner of five houses, none of which had back-door or ash-pit, &c.

Dr. Hayes having been sworn, requested permission to say a few words before giving his evidence. He said as this was one of the first cases under the Sanitary Act brought before the Naas petty sessions, he wished to state as well, for the information of the bench as for Mr. Cun-

ningham, and others in court, that in these cases he was not a willing witness. The duty of giving evidence was imposed on him by Act of Parliament, and the orders of the Local Government Board. By the Public Health Act the dispensary medical officers throughout the country were appointed, without any option on their part, as sanitary officers, and no matter how disagreeable or invidious the duties devolving on them might be, they were bound to perform them. He merely made these observations that the public might know he was coerced to give evidence.

CARLOW GUARDIANS.

It will be remembered that some weeks since, as reported in the *Freeman*, the Local Government Board directed the guardians to hold a special meeting for the purpose of reconsidering the salaries which they had fixed, with a view to adopting a more liberal scale of remuneration. This meeting was duly convened, but the guardians were almost unanimous in adhering to their original decision, notwithstanding the explanation given by Mr. Robinson, one of the inspectors, who was present on the occasion by appointment. The result was that the Local Government Board determined the salaries at £20 each by sealed order, with the exception of Dr. Charles William M'Dowell, whose salary was allowed to remain at £10, that gentleman receiving £10 also from the Town Commissioners acting as an urban authority. The chairman and other guardians expressed themselves strongly on this arbitrary assumption of power by the

Board above, the former gentleman suggesting that he should endorse the order as read under protest. Mr. Roche renewed the subject to-day by asking if any action would be taken, or if they were obliged to submit calmly to the course adopted by the Local Government authorities, Mr. Kelly suggesting that at the meeting of Parliament they should adopt a petition protesting against the action of the Board, and seeking for some relief from the operation of the Act, in which they should solicit the support of the county and borough members. The other guardians fully concurred in these views, and ultimately Sir Thomas Butler gave notice that on Thursday, the 18th, he would call the attention of the Board to the late sealed order of the Local Government Board, fixing the salaries of the sanitary officers under the Public Health Act, 1874, contrary to the wishes of the great majority of the guardians, and would now move a protest to that effect. The remainder of the business was of the ordinary routine character.

THE "SWEATING" SYSTEM IN DUBLIN.

THE allusion in a recent report of the Dublin Sanitary Association to the dangerous condition under which a class of the tailoring work of the city is conducted has induced, says the *Freeman's Journal*, a spirit of active inquiry among those opposed on business or other principles to the "sweating system." It is asserted that this practice of the trade is at present adopted in a greater or less degree by the vast majority of 88 houses in Dublin. Of these, it is stated, only six get their work made on the premises, 26 get it done partly on the premises, and partly by sweaters, while 56 houses employ the sweating system solely. This, we are told, is carried on by the master tailor giving his customers' clothes to be made in the dwellings of poor workers, who, for the most part, have but one room to answer all the requirements of bedroom, sitting-room, workshop, &c. Here a number of male and female operators work all day and often all night. It has been known that persons sick with small-pox, measles, or other contagious diseases have lain in such apartments while the making of clothes intended for immediate wear by different customers of all classes was being carried on. Several instances of this have been related in sanitary reports. It is a significant fact, if it be a fact, that while 400 tailors are employed in masters' workshops, the amount of labour produced by the sweating system is represented by 2,000 hands. This work, moreover, is, we are assured, performed "in the lowest quarters of the city," the lowest quarters being synonymous with the most unhealthy.

The Public Health Committee of the Corporation, according to their uniform custom, consider it their duty to whitewash—metaphorically, not actually—the system of tailoring in the tenements of the poor. The Committee having directed, as it is stated, that with a view to ascertaining the sanitary condition of the dwellings in the localities referred to in a communication addressed to them by the Tailors' Society, a report was now submitted, from which it appeared that 56 houses had been inspected; that all in which tailoring was being carried on were provided with sanitary accommodation; and that in none of these was sickness found to exist. Of course! if the Public Health Committee were to be believed, the slums of the Dublin liberties are pure as the meadows of paradise, and the pestilential miasms of the fever dens of the city as the balmy of zephyrs.

ENNISCORTHY UNION.

THE following report from Dr. Furlong was read:—
"The master has informed me that in the detached ward the mothers have been in the habit of churning the milk allowed to their children, appropriating the butter to their own use, and feeding their infants on the result-

ing sour milk. I believe it my duty to ask the board to deal with those cases with the utmost severity, as it is a matter of vital importance that the food of young children should be of good quality. In the practice above alluded to, I find the solution of a problem that had long puzzled me: With a liberal allowance of the best nutriment, I remarked with considerable uneasiness that an unusually large percentage of the children born in the workhouse were ill-nourished, very many of them pining away and dying without any apparent cause."

It was moved, seconded, and passed—"That the master get summonses for the guilty parties and bring them before the bench of magistrates, and that the assistance of a solicitor be engaged."

THOMASTOWN UNION.

THERE has been a fearful outbreak of fever in the village of Graiguenamanagh, directly traceable to a neglect of the sanitary laws, it being without doubt in a most unenviably filthy state. In proof not only of this, but of the desire of some to remain in the state described, there are eleven cases of complaint for non-compliance with notices served at the instance of the sanitary authority. Dr. Johnstone, the sanitary officer of Inistiogue, and the sanitary sub-officer have each summoned to Thomastown Petty Sessions a man for assaulting them while in the discharge of their duty under the sanitary laws.

KILKENNY WORKHOUSE.

AN election for workhouse medical officer, in room of the late Dr. Comerford, took place last week. There were three duly qualified candidates, on whom the board divided as follows:—For Dr. Hackett, Ballyraggett, 24; for Dr. James, 4; for Dr. Phayer, 8. The Chairman then declared Dr. Hackett duly elected.

LOCAL GOVERNMENT BY RATEPAYERS.

THE following little episode, which occurred at the last meeting of the Waterford Corporation, illustrates the propriety of placing the administration of important and complex Acts of Parliament in the hands of "corporators" and guardians:—

It was moved that Dr. Cameron be re-appointed city analyst at a salary of £20 per year.

The resolution was put and declared carried.

Corporator No. 1.—The amendment should have been put first.

Ditto No. 2.—Question.

No. 1.—I am very happy to say you are not in the chair I am addressing a gentleman, and not you.

The original resolution was then about to be put, appointing Dr. Cameron during the pleasure of the council, amidst some confusion, when

No. 2 said (looking at No. 1)—"Shut up."

No. 1 (excitedly pointing to No. 2)—I call on you, Mr. Chairman, to have that expression withdrawn. It must be withdrawn, if I were to stop here till night. I am accustomed to the society of gentlemen, and not buffoons.

No. 2.—No one would take you for a gentleman.

No. 1.—I am a gentleman, and not a mud-scribbler. I am not a sneaking fellow like you.

The resolution was then put and lost by 13 against to 10 for.

At the meeting of the Newcastle West Board of Guardians, Dr. Ambrose, late medical officer of the Ardagh dispensary district, was allowed two-thirds of his salary—£87 odd, superannuation, on his retirement after a service of forty years.

REPORT OF HEALTH OF DUBLIN AND ITS
SUBURBS FOR THE WEEK ENDING JAN. 30.

Total registered deaths in Dublin and suburbs *	...	234
Ten years average of same week	...	201
Excess of mortality above average	...	33
Ratio of deaths, suburb of Rathmines	...	32 per 1,000.
" " " Donnybrook†	...	48 "
" " " Blackrock	...	22 "
" " " Kingstown	...	17 "
" " " Entire Dublin district	...	39 "
COMPARATIVE RATIOS—London	...	25 "
" " Glasgow	...	28 "
" " Edinburgh	...	29 "

The deaths from zymotics numbered 36. Of these 10 were caused by fever—2 typhus, 1 cerebro-spinal, 3 typhoid, and 4 simple continued fever. Scarlet fever shows a further decline, having caused only 4 deaths. Six deaths were caused by erysipelas, 2 by pyæmia, 3 each by diphtheria and diarrhoea, 2 each by croup and whooping-cough, 1 by measles, &c.

Ten deaths from scarlet fever, 7 from fever, 5 from whooping-cough, 4 from diarrhoea, and 3 from measles, were registered in the Belfast district.

In the Dublin registration district 8 children died from convulsions.

Bronchitis proved fatal in 63 instances, pneumonia in 16, pleurisy in 1, and lung disease unspecified in 4.

Heart disease caused 10 deaths, pericarditis 1, apoplexy 2, paralysis, insanity, and epilepsy 1 each, cephalitis, 3, and brain disease unspecified 3; liver disease 2, nephritis and kidney disease unspecified 1 each.

Twenty-four persons died from phthisis, 3 each from mesenteric disease and cancer, and 1 from gout.

Seven deaths were accidental—viz., 2 from fractures and contusions, 1 from burns, 1 from drowning, and 3 "otherwise."

A YOUNG girl having died of small-pox at the Castlebar Workhouse, co. Mayo, the relatives of the deceased had the body conveyed away with the intention of waking it. Dr. Walsh having been informed of the occurrence, at once asked for the intervention of the constabulary, and, accompanied by 23 policemen, proceeded to the place, and insisted on the immediate burial of the body. The Board of Guardians at their meeting passed an unanimous and well-deserved vote of thanks to Dr. Walsh for his praiseworthy energy in the discharge of his duties.

THE *Ballina Herald* says: Small-pox is spreading over this and the adjoining county, and so rapidly as to threaten soon to leave no place unvisited. We take the following startling account from the *Mayo Telegraph* :—

In the matter of figures, too—the most stubborn fact that facts can assume—the public may not have heard of the announcement in a Roman Catholic chapel a few Sundays ago, that in that parish alone *three hundred* people had *died* of small-pox within a short period. Dr. Blackwell, however, on last Saturday, reported that there were seventeen cases in Tannaghbeg, that inoculation was on the increase, and that "Dr." Prendergast, "Dr." Joyce, and the rest of the profession are now taking the inoculating matter from the dead bodies of their patients.

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

LIST OF ENTRIES IN THE REGISTER OF THE
BRANCH MEDICAL COUNCIL (IRELAND) FOR
THE MONTH OF JANUARY, 1875.

- JANUARY 2ND.—Murray, Henry George, 29 Crosthwaite Park, Kingstown, Co. Dublin, Lic. 1874 and Lic. Midwfy. 1874, K. Q. Col. Phys. Irel., Lic. R. Col. Surg. Irel. 1874.
- 5th.—Drummond, David, Dunfillan, Rathgar, Co. Dublin, M.B. 1874 and M.Ch. 1874, Univ. Dub.
- 6th.—Leader, Nicholas, Keale House, Mill Street, Co. Cork, Lic. R. Col. Phys. Edin. 1874, Lic. R. Col. Surg. Edin. 1874.
- 7th.—Blunett, George Augustus, 8 Anglesea Avenue, Blackrock, Co. Dublin, M.B. Univ. Dub. 1873, Lic. R. Col. Surg. Irel. 1873.
- 8th.—Dorman, John Cotter, Kinsale, Co. Cork, M.B. 1874 and M.Ch. 1874, Univ. Dub.
- 9th.—Hogan, Edward Michael Angelo, 30 Wentworth Place, Dublin, Lic. R. Col. Surg. Irel. 1873, Lic. K. Q. Col. Phys. Irel. 1874.
- 15th.—Bookey, David Brownrigg, Ballyisland, Carnew, Co. Wexford, Lic. R. Col. Surg. Irel. 1872, Lic. K. Q. Col. Phys. Irel. 1874.
- 15th.—Kellett, Leonard Henry, Dr. Stevens' Hospital, Dublin, Lic. R. Col. Surg. Irel. 1873, M.B. Univ. Dub. 1874.
- 16th.—Raa, Wm. Masters, Dungarvan, Co. Waterford, Lic. R. Col. Surg. Irel. 1874, Lic. 1875 and Lic. Midwfy. 1875, K. Q. Col. Phys. Irel.
- 18th.—Murphy, George Wvndham, Newcastle, Co. Dublin, M.B. 1874 and M.Ch. 1874, Univ. Dub., Lic. Midwfy. K. Q. Col. Phys. Irel.
- 18th.—Macnamara, Rawdon (Junn.), Alnwick, Northumberlandshire, Lic. R. Col. Surg. Irel. 1873.
- 19th.—McCloghry, James, Riverstown, Co. Sligo, Lic. R. Col. Surg. Irel. 1872, Lic. 1873 and Lic. Midwfy. 1873, K. Q. Col. Phys. Irel.
- 19th.—Murray, Chas. Fredk., Ashfield, Beaufort, Co. Meath, M.B. 1874 and M.Ch. 1874, Univ. Dub.
- 20th.—Cleary, Martin Francis, Nenagh, Co. Tipperary, Lic. R. Col. Phys. Edin. 1874, Lic. R. Col. Surg. Edin. 1874.
- 23rd.—Martin Samuel Edgar, 44 New Kent Road, London, S.E., M.D. Qu. Univ. Irel. 1874.
- 23rd.—Mullen, Douglas, Ardmullen, Tuam, Co. Galway, M.D. 1872 and M.Ch. 1873, Qu. Univ. Irel.
- 28th.—Hunter, Robt. Shaw, Newtownards Road, Belfast, Lic. R. Col. Phys. Edin. 1873, Lic. R. Col. Surg. Edin. 1873.
- 29th.—Dowling, Edward Joseph, 14 Thomas Street, Limerick, Lic. Fac. Phys. and Surg. Glasg. 1874.
- 30th.—MacLoughlin, Alexander John Maunell, Doone Rectory, Palles Green, Co. Limerick, M.B. Univ. Dub. 1874, Lic. R. Col. Surg. Irel. 1874.

University of Cambridge.—Scholarships in Downing College.—An examination for three minor scholarships will be held in Downing College on Tuesday, the 6th. of April next, and the three following days, and will begin at 9 A.M. on Tuesday. The examination will be in classics, elementary mathematics, law, and natural science. There will be two papers in law; one on jurisprudence and elementary Roman law, and one on international; including the relations of these to moral science. The examination in natural sciences will include chemistry, theoretical and practical and practical, physics, comparative anatomy, and physiology. Candidates in law and natural sciences will be expected to show such a knowledge of classics and mathematics as will enable them to pass the previous examination. Persons who have not been entered at any College in the University, or who have not resided one entire term in any such College, are eligible to these minor scholarships, which will be of the value of £60 per annum, and tenable for two years, or until their holders are elected to foundation scholarships. No one elected minor scholar will receive any emoluments until he has commenced residence as a student of the College. Satisfactory testimonials as to their moral character must be sent to the Master by all candidates on or before Thursday, the 1st of April, and each candidate is requested to state in which subject he desires to be examined. Further information will, if required, be given by John Perkins, Esq., Tutor of the College.

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

At the general meeting of the Association, on the 27th of January, the following resolutions, which have been inadvertently omitted from the report of the proceedings, were adopted:—

1. "That it is deemed essential to the existence of the Association that a Secretary be appointed during the interim between this and the General Annual Meeting to be held in June next, and that Dr. Chapman be requested to act as Hon. Secretary till the June meeting."

4. "That it is most desirable that our financial position be at once placed on a firm basis; and that to carry out this object a Treasurer be appointed, and means immediately taken to liquidate whatever sums this Society may be indebted before our next General Meeting, and that Dr. Morgan, 23 St. Stephen's Green North, Dublin, be now appointed."

LIMERICK UNION.

REPORT ON THE HOSPITAL MEDICINE SUPPLY.

LORD CLARINA read a very long and able report drawn up by a special committee of the Board appointed to inquire into the causes of the enormous increase of expenditure occasioned by the ordering and consumption of drugs and medicines in the hospital. The report attributed the increased expenditure in the main to the ordering of large quantities of medicine and surgical instruments by the resident physician, which were not specified in the authorised list by the Local Government Board, nor sanctioned by the Board of Guardians, and also to the alleged manner in which the committee believed the drugs and medicines were disposed of; but they in justice to the resident physician should also state that he had to labour under great disadvantages in respect to surgery accommodation and the absence of the assistance which his predecessor had received from a medical apprentice. The committee, while approving of the humane and thoroughly efficient manner in which the four visiting physicians treated the patients under their care, were impressed with the belief that they had allowed their zeal for the comfort of the patients to exceed their discretion in having ordered the floors of the hospitals to be washed with what is called soft soap, instead of free-stone or other cheaper material, which would be just as efficacious for the purpose required. They found from the examination of the accounts, &c., that in several instances contractors had charged double and even three times the price for drugs, &c., at which they were advertised in trade lists of wholesale houses. Several suggestions were made as to remedies for the future—one that the Government should

be asked to establish a central store for drugs and appliances in Dublin, or in the event of that not being acceded to, that the Local Government Board should draw up alphabetical lists of all medicines they sanction for use in workhouses printed in plain English instead of doctors' Latin, which few, if any, of the guardians can understand. The committee also suggested the appointment of two resident physicians with an apothecary, to discharge the duties connected with the hospital management, believing that more care should be bestowed on the patients by resident doctors than by visiting physicians, who could not be in attendance as regularly or continuously.

At the suggestion of the chairman (Lord Emy), two private letters from the resident physician to contractors were read; one letter opened by asking the opinion of the contractor as to the suitability of a medical hall, in reference to which the writer made inquiry, and then ordered large quantities of medicine, &c., without having got the sanction of the Board of Guardians.

WESTPORT GUARDIANS.

SMALL-POX.

THE clerk reported that pursuant to a report of Dr. Johnson, sent him by the Local Government Board, he stopped the wake of the remains of a person who died of small-pox. The deceased had refused entry to the hospital. The clerk makes the remarkably cheering announcement that no other case of small-pox has occurred in Westport, and naturally takes credit for the prompt and vigorous effect given to the law.

The following resolution was unanimously passed:—

"Resolved—That we commend and highly approve of the zeal and energy displayed by the executive sanitary officer, and the sub-sanitary officers in dealing with the fatal small-pox case. The sanitary officers are directed in all cases of death from small-pox or other infectious disease, where they are of opinion that the speedy burial of the body is necessary for the public health, to give the required certificate stating the necessary steps provided by sec. 27 of the Act of '66. The executive sub-sanitary officers are directed as soon as they receive the order of the justices of the peace to have the body removed into the workhouse dead-house, and buried as speedily as possible. The Local Government Board are requested to say whether there is any legal power to stop the wake in a case of death from small-pox, scarlatina, or other infectious diseases."

REPORT OF HEALTH OF DUBLIN AND SUBURBS
FOR WEEK ENDING FEBRUARY 6, 1875.

Total registered deaths in Dublin and suburbs *	... 189
Ten years average of same week	... 204
Mortality below average	... 15
Ratio of deaths, suburb of Rathmines	... 30 per 1,000.
" " Doonbrook†	19 "
" " Blackrock	22 "
" " Kingstown	14 "
" " Entire Dublin district	31 "
COMPARATIVE RATIOS—London	... 24 "
" " Glasgow	... 32 "
" " Edinburgh	... 21 "

The deaths from zymotics amounted to 21, showing a decrease of 15 as compared with the preceding week. There were only 2 deaths ascribed to fever, 1 to typhoid and 1 to simple continued fever. Scarlet fever caused 5 deaths, croup 4, measles 3, erysipelas and dysentery 2 each, diarrhoea 1.

Fourteen deaths from scarlet fever, 7 from measles, 5 from whooping-cough, 3 from fever, and 2 from diarrhoea were registered in Belfast.

In the Dublin district 12 deaths were ascribed to convulsions.

Forty-eight deaths were referred to bronchitis, 5 to pneumonia, and 9 to lung disease unspecified, 12 to heart disease, 1 to aneurism, 5 to paralysis, 3 to cephalitis, 2 to brain disease unspecified, 1 to nephria, and 4 to liver disease.

Thirteen persons died from phthisis, 4 from hydrocephalus, and 1 each from scrofula, cancer, and gout.

Two accidental deaths were registered.

LISMORE UNION.

INCREASE OF SALARIES.

AT a meeting of the Lismore Board of Guardians the following memorial advocating the claims of the medical gentlemen of the Union to an increased scale of remuneration, and signed by each of them, was read and considered:—

TO THE GUARDIANS OF THE LISMORE UNION.

MR. CHAIRMAN AND GENTLEMEN,—We, the medical officers of the Lismore Union, beg most respectfully to bring under your notice the following facts and statistics which have induced us to seek for an increase to our salaries. We have every confidence in your justice and impartiality, and in thus laying our case before you we feel sure you will exercise those qualities as you have always done, and that you will unanimously agree that the importance and responsibility of our posts are out of proportion to the remuneration we receive. We will not dwell long upon our arduous and oftentimes irksome duties—how frequently we are summoned at midnight, perhaps in the depth of winter, to the most remote

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

and wildest parts of our districts; the risks we run during those sad times when we are visited by epidemics of typhoid and other fevers (at which time, as everyone knows, the mortality amongst medical men is greatly increased); the severe and inclement weather we are oftentimes exposed to, thereby endangering our health and laying the seeds of future suffering. You, doubtless, are already conversant with these facts; but we will lay before you at once the grounds on which we ask for an increase.

In the first place—and we desire to draw especial attention to this—strange as it may seem, it is nevertheless true, that a dispensary doctor now-a-days is not nearly as well paid as his *confrère* of twelve or fourteen years ago. In the year 1862 the salaries of the medical officers of this Union were raised to £100 per annum, to meet the exigencies of the time, and despite the enormous difference in the price of provisions, fuel, house-rent, servants, horses, &c., &c., their salaries have ever since that date remained *in statu quo*. The quarterly return of the Registrar-General, just published, very clearly shows an increase of from 40 to 50 per cent. in the price of articles of food during the last quarter of 1873 as compared with the corresponding quarter of 1864. Now, if £100 a year was not considered too much to grant in 1862 it is plainly quite inadequate now. The same duties are ours! We incur the same responsibilities, and, as we shall presently prove, even a greater amount of work devolves upon us; yet the most onerous duties are expected at the minimum of reward!!! We cannot do better here than quote the words of Lord Granard, who lately said in the House of Parliament, "The Poor-law Union medical officers in Ireland are a most deserving body of men, doing good service to the State for a starvation allowance." Secondly, our duties are very much increased, for, according to the tables which the Local Government Board published in their annual report (see MEDICAL PRESS), "a most remarkable change in the dispensary system is gradually taking place, and a change which seriously affects the medical officers. In every province in Ireland there has been a considerable reduction in the number of patients who come to the doctor, and even a larger augmentation in the number to whom the doctor goes. The white tickets are less by 95,000 than last year; in Munster alone by 16,501; but at the same time the scarlet-runners have risen in number by 17,075; in Munster alone by 9,859. Now, we do not find in the gravity of the year's diseases enough reason for this change; but be the cause what it may, it is obvious that the Irish dispensary doctors have more travelling to do and more time to lose in looking for their patients than they used to have." Thirdly, the majority of the Poor-law Union in Ireland have raised, within the last couple of years, the salaries of their medical officers by sums varying from £20 to £40 per annum. We do not ask you, gentlemen, to double our salaries, we only ask you to give us fair remuneration for our services. As you well know, half of the medical officers' salaries is paid out of the Consolidated Fund, so that an increase of £30 per annum to each would be only £75 a year on the ratepayers at large, and a very small fraction in the pound. The Guardians of this Union have invariably acted towards us with kindness and consideration, and that alone is an incentive to us to do our work honestly and to the best of our abilities. We feel sure they will not, on this occasion, be behind so many other unions in that spirit of liberality which has induced them to allow an increase of salary to their medical officers, but that they likewise will show the same feeling, and "sine grano salis" grant our request.

We have the honour to remain, Gentlemen,
Your obedient servants,

RICHARD O'REILLY, Medical Officer, Lismore
Workhouse and Lismore Dispensary District.

WILLIAM HANNAN, Medical Officer, Tallow
Dispensary District.

J. C. BARRY, Medical Officer, Ballyduff Dis-
pensary District.

GABRIEL O'CONNELL FITZSIMON REDMOND,
Medical Officer, Cappoquin Dispensary
District.

It was ably proposed and seconded that the salaries of the memorialists be increased from £100 to £130 per annum. The resolution was opposed, and an amendment to grant an increase of £20 brought forward and carried by a majority of the Guardians present, a very respectable minority being for the original motion, which, however, was declared lost.

CASTLEBAR UNION.

A LETTER from the Local Government Board was read in reply to the Guardians' inquiry if they had legal power in cases of infectious or contagious disease of retaining the body in the workhouse, and preventing friends calling to see the body. The Local Government Board would not recommend the Guardians insisting on such regulations, referring them to Act 64, No. 15, of the Workhouse Rule, and to sec. 27 of the Digest of the Sanitary Laws.

Dr. Walsh reported that there was no case of small-pox in the Castlebar district, town or country.

Dr. Blackwell reported that the yards, &c., in Balla had been disinfected, &c., and that there were three cases of small-pox, in which the patients were recovering.

Dr. Jordan reported that the disinfecting chamber set up in the workhouse was utterly useless, being merely a "flea-closet," or closet for the destruction of insects in clothing. He recommended the burning of clothing and bedding, except in districts in which the disease had gained headway, and in which such a course was consequently useless.

Dr. Blackwell said he had made the statement about inoculators taking the "matter" off the dead bodies on the information of certain persons whom he would not however like to name.

Mr. Daly considered the statement a fabrication.

Mr. H. C. Larminie remarked that he heard an inoculator boasting of making £80 in one year in one district.

ABBEYLEIX UNION.

THE APOTHECARYSHIP.

"Local Government Board, Dublin,
"1st February, 1875.

"SIR,—With reference to a resolution of the Board of Guardians of the Abbeyleix Union of the 26th ult., I am directed by the Local Government Board for Ireland to state that they do not object, as a temporary arrangement, to the proposal to remunerate Dr. Swan at the rate of £30 per annum for discharging the duties of apothecary to the workhouse.—By order of the Board,

"B. BANKS, Secretary."

Mr. Delany said that a rumour was in circulation that Dr. Swan was about to resign, and this rumour may have something to do with keeping away candidates for the office of apothecary, because it was understood when Dr. Swan ceased to be their medical officer the apothecaryship would be dispensed with.

Mr. Walpole—Have we any ground for putting such a question to Dr. Swan?

Mr. Franks—I got three circulars from candidates.

Mr. Talbot said that the Local Government Board require now that the guardians should appoint an apothecary, while on a former occasion they refused to sanction the appointment of an apothecary.

Dr. Swan said he had no qualification to act as an apothecary.

Mr. Delany said that it would give some guardians much pleasure to have it under Dr. Swan's hand, whether he intended to continue or resign.

The Chairman said that the question was not one which should be put to Dr. Swan.

Dr. Swan said that he is a silent man.

MONAGHAN UNION.

OUTBREAK OF SCARLATINA.

DR. IRWIN, Medical Officer of the Scotstown dispensary district, reported that he found two cases of scarlatina,

and on inquiry he learned that other cases occurred to the children at the school there. He recommended that the school be closed, and that the schoolroom be thoroughly whitewashed and cleaned.

Mr. Rafferty said to order a school to be closed was a very summary way of proceeding. He did not think the guardians had power to do anything of the kind. He believed the best way they could take to remedy the evil would be to communicate with the patron of the school and ask him to close it for some time.

Mr. Rice believed that the case was one in which the board required the advice of Dr. Ross, the consulting sanitary officer. If the guardians did not take action in the matter at once the disease might continue to spread in the school for another fortnight. He (Mr. Rice) would suggest that Dr. Ross be asked to visit the school, and report to the board on the matter.

Mr. Rafferty was not at all sure that the law gave the sanitary authority power to close the school, nor did he believe the guardians had any right to ask Dr. Ross to go to look after the matter.

Mr. Rafferty could not see what right the board had to direct Dr. Ross to visit the school. That was a matter for Dr. Irwin, the sanitary officer. It would, he considered, be unfair to ask the consulting sanitary officer to do other than his regular duties.

After some further discussion, it was resolved to ask Dr. Ross to meet Dr. Irwin at the school, and report on the cases of scarlatina.

CORRESPONDENCE.

MIDWIVES.

TO THE EDITOR.

SIR,—In reference to the letter of "Practitioner" on Midwives, I wish to state my experience.

For more than four years I acted without one, but then made an effort and succeeded in getting a midwife under whose care I must state I have never seen any untoward event; and although it is natural to expect that I have in some cases lost my private patients and their fees, I consider I am fully rewarded by not being obliged to remain (as I often had to do) in a miserable bog cabin all or the greater part of a long winter's night, for it was generally towards night I was called on, the patients dreading it apparently more than the day, and to set out and travel some miles, it might be, after being out all day, and obliged to be up and doing next day, leaves me quite reconciled to some loss. Although I might be aware it would take several hours before labour would terminate, I would not leave, fearing accidents might occur, and to travel there and back would often be a thing to be unthought of. Now I have only to attend when instrumental aid is required, or when hæmorrhage or such urgent cases occur.

It has also been my fate to be called in sometimes to find women just departed, and sometimes to witness their last moments, for need of some one with the slightest knowledge of how to arrest hæmorrhage. I have found them with a fire on the bedroom floor, and a pot of hot water thereon, and assiduously stuping with flannels for flooding. I have felt it incumbent on myself sometimes to call an inquest for my own defence, and to try to arrest such gross maltreatment, so that humanity called for the appointment of a qualified person; but, fortunately, I have met with one who does not assume functions beyond her powers, or I might have cause for complaint, and can fully coincide with "Practitioner" as to the advisability of such a check as he mentions, when, after due

investigation, it was found cases recurred in their practice of such a nature as to leave no doubt as to maltreatment. Such a condition would probably be sufficient check, as few forfeitures would result.

Yours, &c.,

ANOTHER COUNTRY PRACTITIONER.

GLEANINGS.

Hydatid Cyst of the Liver relieved by Aspiratory Puncture.

At a recent meeting of the Société des Hôpitaux, M. Dumontpallier communicated the following case:—

A patient, after having presented for some time the various symptoms of dyspepsia, showed signs of a chronic pleuritic effusion on the right side. A series of blisters were applied, and aspiratory puncture was proposed, the diagnosis of hydatid cyst of the liver having been arrived at. The proposal of this treatment was negatived at the time by the patient and the consulting physicians. Some time afterwards the dyspnoea became very distressing; puncture was again proposed, and was practised with a No. 2 Potain's trocar, about half an inch below the nipple. The exit of a transparent, non-albuminous liquid, containing the débris of hydatid sacs, was the result. The operation was followed by immediate relief, and resulted in complete cure.—*Bull. Gen. de Thérap.*, Nov. 15, 1874.

Preventive and Exploratory Trepanning in Fractures of the Internal or Vitreous Table of the Cranium.

M. SEDILLOT read a note on this subject before the Académie des Sciences at a recent meeting. His conclusions were as follows:

1. Preventive trepanning is the surest method of treating all fractures of the internal table of cranium complicated by splinters.

2. The operation is demanded in cases of external or linear fracture with depression of the cranium.

3. Hesitation is permissible in simple linear solutions of continuity without displacement of the bones.

4. The means of diagnosis comprise the causes of the traumatism, symptoms, auscultation, percussion, thermometry, and of exploratory trepanning.

5. The absence of any exterior fracture does not contra-indicate the possibility of an internal one following direct traumatism of a circumscribed or violent nature; and if auscultation and percussion, the force of the blow, the nature of the wounding body (gunshot wounds) do not indicate the necessity of exploratory trepanning to the surgeon, it is his duty to watch the patient carefully, and to have recourse to this operation without delay, where new symptoms indicate the opportunity. This is understood to be in localities exempt from infectious influences which experience shows to be constantly fatal in similar cases.

6. Precautions and dressings founded upon the theory of ferments will modify, perhaps, this inability to operate, and seem already to promise most favourable results in wounds of the cranium.—*Gaz. Méd. de Paris*, Oct. 24, 1874.

Diet in Dahomey.

CANKIE, with a little animal food at rare intervals, constitutes the almost universal food of the poorer classes. It "reminds one of dumplings boiled with soapuds," whatever those experienced in such a dainty may decide the taste of that delicacy to be. Yams, cassava, and other fruits and vegetables are also occasionally eaten in season, or when they grow to perfection. They are fond of their food "high," even when the smell would completely upset a white man's stomach. The higher classes live much better, and have fowls and game frequently at their "tables," with abundance of fruits of all kinds grown in the country. Some of the grandees have even cooks brought up at the French factories

on the Coast, and affect articles of civilised diet. The fingers are used in lieu of forks, and tables are only to be seen in the houses of the highest nobles. After every meal the hands are washed, the mouth rinsed, and the teeth picked with a chewed stick. A man's wives wait at table, and present the dishes to their lord on their bended knees, none daring to partake until he has finished. Water is the usual beverage, and is dear. It will frequently cost 2½d. per gallon, in a country where people can live on 3d. per day. Intoxicating liquors are now even indulged in to excess by all classes. Every one's health must be drunk in public at all state ceremonies. The king, however, conceals his face while drinking, and it is not necessary to consume the fiery rum which invariably constitutes the toasting liquor on such occasions. The form is merely gone through, and the spirit handed to one of the mob around. The king even keeps a "drunkard," down whose leathern throat the king's surplus rum is poured at state ceremonies; his capacity for holding liquor is said to be something extraordinary.—*From "The Races of Man kind," by Dr. Robert Brown.*

The State of the Pupil in Chloroform-Anæsthesia as an Indication of Danger.

M. BUDIN (*Atlanta Medical Journal*), interne of the hospitals, in examining with care all the details of chloroformisation, with the end of discovering some sign which may guide the surgeon in its administration, has observed that there exists a certain relation between the state of the pupils and the more or less profound anæsthesia of the subject. . . .

1. There exists in the surgical anæsthesia produced by chloroform a constant relation between the state of the pupil and the period of anæsthesia.

2. During the period of excitation the pupil is dilated.

3. This period passed, the pupil contracts; its atresia, very marked for several minutes, accompanies in general, complete anæsthesia.

4. Dilatation of the pupil supervening during an operation indicates in general that anæsthesia is less profound, and that return to sensation is near.

5. The state of the pupil may then serve as a guide in the administration of chloroform.

6. During operations of long duration, if the patient is to be kept completely insensible and immobile, the pupils must be kept constantly contracted.

7. Finally, efforts at vomiting may produce dilatation of the pupils, dissipate the insensibility, and awaken the patient; they annihilate in part the effects of anæsthesia.—*Progress Medical—Gazette des Hôpitaux*, October 1, 1874.

Extra-Uterine Pregnancy.

DR. E. W. SAWYER (*The Boston Medical Journal*) reports the case of a married woman, who had had five children, and in whom all the usual symptoms of pregnancy came on, and persisted until the third month, when colicky pains began to trouble her, and continued throughout her gestation.

At the end of the ninth month regular labour-pains were developed, but subsided after two days. The head of the child could be felt high up in the pelvis; there was no dilatation of the os uteri. Twelve days later, regular pains set in, and continued for a day, at the end of which all motion ceased, after a most violent action of the child. She then had slight hemorrhage for three months, but for some time afterwards her menses returned with the strictest regularity. It being decided to operate, an incision was made through the abdominal walls, and the cyst containing the child was removed. The patient did not rally, but died twenty hours after the operation.

Requests to Medical Charities.—By the will of the late Mr. Roger Jones, of Prince's Park, Liverpool, the Liverpool Medical School receives £2000 to found a scholarship. The following bequests are from the same testator: Liverpool Royal Infirmary, the Royal Southern Hospital, the Blue-Coat Hospital, £1000 each; Liverpool Northern Hospital, £500; the Liverpool Children's Infirmary and the Ear and Eye Infirmary, £200 each; the Liverpool Cancer Hospital and the Consumption Hospital, £100 each, all free of duty.

Irish Poor-Law Intelligence:

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

LIMERICK UNION.

DR. PHAYER'S REPLY TO THE CHARGE OF ALLEGED MIS-MANAGEMENT AND NEGLECT.

THE Local Government Board forwarded a reply by way of exculpation from the charges brought against him by the Visiting Committee as to alleged waste and mismanagement in the surgery. In the course of his reply, the resident surgeon (Dr. Phayer) went on to say:—The charge made by the visiting medical officers that medicines were thrown about or wasted, I deny, as the only two articles mentioned—viz., camphor, which was in a paper, and not tied—having been using it at a late hour the night before; soda, which was in a paper bag near the fire, for the purpose of keeping it dry, the place being so damp, a particle of these drugs were not thrown about or wasted. My surgery was kept without a fire for over a month. It was not till after several applications I got a small American stove, which is scarcely sufficient to heat the place, in fact, up to the present moment the surgery is incomplete (see report of last visiting committee). Dr. Phayer then proceeds to deny seriatim each charge of waste, extravagance, and inattention imputed to him in the report, and he states that any medicines which he got without laying the requisition before the board for them were got in a hurry and to meet unforeseen emergencies. He stated, in fine, that he has been seven years and a half resident surgeon, performing the duties with zeal, energy, honesty, and efficiency, and that if he has committed an error it was one of judgment, which he trusts will be overlooked. Dr. Phayer's reply was reserved for consideration until the bringing up of Lord Clarina's report, which is in the hands of the printer, and which it is probable will be ready for the guardians before their next meeting.

COOKSTOWN UNION.

IN reply to a resolution passed last board day, stating that doubts had arisen as to the liability of dispensary medical officers to attend cases of midwifery, the following letter was read;—

“Local Government Board, Ireland.

“Sir,—The Local Government Board for Ireland have had before them a resolution of the Board of Guardians of Cookstown Union of the 6th inst., requesting to be informed whether it is the duty of a dispensary medical officer to attend upon a midwifery case in his district, and in reply I am to state that if a medical relief ticket be presented to the medical officer in a midwifery case, he is bound to attend upon it as in any other case.

“B. BANKS, Secretary.”

BIRTHS AND DEATHS IN DUBLIN AND THE SUBURBAN DISTRICTS.

The deaths registered in the Dublin district during the week ending 13th February represent an annual mortality of 32 in every 1,000 of the population. In London the death rate was 26, in Glasgow 36, and in Edinburgh 29.

In the Dublin district the births registered during the week amounted to 202, and the deaths to 192. The average numbers were—births 169, and deaths 197.

The number of deaths from zymotics was 23, against 21 in the preceding week. Of these deaths 11 were caused by fever (1 typhus, 8 typhoid, and 2 simple continued fever), 3 by scarlet fever, 2 each by group and dysentery, and 1 each by measles, erysipelas, and diarrhoea.

Four deaths from small-pox, 7 from measles, and 5 each from fever and scarlet fever, were registered in Belfast.

In the Dublin district 13 children died from convulsions. Bronchitis caused 53 deaths, pneumonia 3, and lung disease unspecified 2.

Three deaths were ascribed to paralysis, 3 to inflammation of the brain, 1 each to apoplexy, insanity, and epilepsy, and 2 to brain disease unspecified.

Heart disease proved fatal in 12 instances, aneurism, liver disease, and diabetes each in 1, and kidney disease unspecified in 2.

Nineteen deaths resulted from phthisis, 5 from mesenteric disease, and 3 from hydrocephalus.

Three accidental deaths—1 from scalds, and 2 from drowning—were registered.

WATERFORD LUNATIC ASYLUM.

A MEETING of the governors of the Waterford Lunatic Asylum took place on Wednesday, Sir R. J. Paul, Bart., in the chair. Dr. P. R. Connolly acted in his official capacity as superintendent. It was ordered that a visiting physician be advertised for at £100 per year, in room of Dr. Connolly.

The following is the address presented to Dr. Connolly on his assuming the duties of resident medical superintendent:

“To Pierce Connolly, Esq., Resident Medical Superintendent, District Asylum, Waterford.

“Dear Sir,—Permit us, the intern officers and attendants of the Waterford District Asylum, to offer you, upon the occasion of your taking possession of that honoured position, and distinctive mark of approval of his Excellency the Lord Lieutenant of Ireland, to accord you, with the fullest meed of sincere feeling, our warmest welcome and congratulations. The connection which exists between you and this asylum is not, dear sir, of yesterday; a score of years has elapsed since your first administration of this asylum, and now that it has grown much larger, and that your administrative care will be more intimately brought into requisition, we are confident that the ability and character from which emanates the recognition of your services will not be lessened.”

NORTH DUBLIN UNION.

ABUSE OF RED TICKETS.

THE Clerk read a letter from the Local Government Board in reference to the application of Dr. Ferguson, one of the dispensary doctors of the union, asking for assistance in the duties of his district, which he said were so much increased recently that they were now heavier than during the small-pox epidemic.

Mr. Tickell complained that many persons in good circumstances, and who were well able to pay a doctor, asked for dispensary tickets. He knew an instance in which a family with nearly £1,000 in the Three per Cents. got dispensary tickets. Within the last few hours two applications were made to himself for tickets—one from the wife of a mechanic who earned 40s. a week, and another by the wife of a gas-fitter who had 35s. a week. He did not think that these were proper cases of relief from the rates. He thought the Local Government Board should be consulted on the subject. If they were to give tickets to such parties they might as well open apothecaries' shops free all over the city. Referring to another matter connected with this subject, he said the guardians had asked the Local Government Board for a sworn investigation in reference to their account for medicines, which amounted to £860, while the bill for the South Dublin Union, where 11,000 more patients were attended, was only £164. They inquired into this subject,

and their medical officers stated that in the South Dublin Union the medical officers were restricted in regard to the number of items; but on examination it appeared that their contracts were unrestricted, and that they had in fact 235 more items in their contract than they had themselves, and their medical officers could not or would not give them any further information on the subject. The reply of the Local Government Board was unsatisfactory. It stated that the cost for medicine in the North Dublin Union did not exceed the average cost all over the country, but it made no allusion to the analogous case of the South Dublin Union, to which the guardians referred them.

The Chairman concurred with Mr. Tickell in reference to parties in good circumstances applying for dispensary tickets. The members of the committee and warders did not make sufficient inquiry into the circumstances of persons who applied for the tickets.

Mr. Bentley thought that the real remedy would be to obtain from the Local Government Board for every guardian who issued a ticket the power to cancel it immediately on ascertaining that the circumstances of the applicant did not entitle him to receive it. Under the present system the whole evil was done before the committee could meet and cancel the ticket. The doctors' time had been wasted and the medicine of the union distributed to persons not entitled to receive it.

After some discussion, the subject was referred to the Dispensary Committee.

The proceedings then terminated.

WESTPORT UNION.

The following resolution was unanimously passed :—

“That, without expressing any opinion as to the mode in which the Local Government Board have discharged its duties under the Public Health Act, 1874, we desire to record our strong conviction that the powers conferred by that Act on the Local Government Board are unconstitutional, as well as impolitic and injurious to the country. We think that as one of the first principles of the Government of Great Britain is that there shall be no taxation without representation, it is unjust that such extensive powers of taxation should be conferred on any public board in Dublin; and we regret this the more as the Inspectors of Prisons and the Inspectors of Lunatic Asylums have also most extensive and despotic powers over the local authorities who are supposed to manage those institutions. We conceive that as regards the salaries and the number of officers, the controlling powers of the Local Government Board should be limited to a veto on any increase of salary or multiplication of officers—that the Act of Parliament, and not merely the will of the Local Government Board, should determine the chargeability of every expense incurred. We believe that where there are Town Commissioners, that body, and not the Board of Guardians, should be the sanitary authority, and that it is unjust to charge any district but the Town Commissioners for the cost of bringing water for the exclusive use of the town inhabitants. Finally, we protest against the centralising policy which is being pursued in Ireland to an extent which we believe would not be tolerated if carried out to the same extent in England as it is in Ireland.”

ALLEGED ADULTERATION OF THE MILK.

On last day a report was received from Dr. Cameron, Dublin, stating that the milk supplied by D. McLean was, to a certain extent, adulterated with water. The Board, fearing that, owing to the circumstances under which the samples were taken and sent to Dr. Cameron, they might not be able to successfully prosecute, resolved to allow Mr. McLean the option of paying a fine of £1. Mr. McLean now wrote to the Board declining to pay the fine, insisting that the sample forwarded could not have been of his milk, in which he never put any water; and asking for an investigation into the matter.

The Chairman read a second report from Dr. Cameron, saying that having carefully analysed two samples of D. McLean's milk, he found they contained a smaller amount of fats than ever occurred in pure milk, and gave it as his opinion they could not prosecute on the second report, which was very different from the first, and the mildest complaint in reference to milk he had ever heard in his life.

Mr. Smith argued that the condition of the milk might have resulted from its being allowed to settle, and consequently giving off cream.

After a short discussion, it was resolved that the second analysis now handed in of McLean's milk differing materially from the first, the Board did not feel justified in ordering a prosecution in this matter.

On the proposition of the Chairman, it was also resolved—“That as to future proceedings, it is ordered that whenever it is suspected that the milk is skimmed or impure, two samples of it are to be taken out immediately on its delivery, and in the presence of the contractor or the person delivering the milk; also in presence of not less than two officers of the house, the clerk or the medical officer being one if possible—the samples of milk to be sealed up with a seal to be purchased and kept by the master, and the two samples to be kept locked up by the clerk.”

FEVER NEAR BALLYCASTLE.

(From the *Ballina Herald*.)

THE public generally are becoming alarmed at the continued presence of fever of a bad type in several townlands in the neighbourhood of Ballycastle. It has been there now for some months, and notwithstanding the medical skill and attention which were employed, has succeeded in carrying off very many victims, in some cases two, three and four members of a family. Dr. Madden, the medical officer of the district, caught the fever soon after it made its appearance, and he is not yet fully recovered from its effects; Dr. Bourne undertook the temporary charge of the district, and he also contracted the disease, and died of it. Dr. Macaulay, of this

town, next undertook the duties, and devoted himself un- sparingly to their discharge. But he could not either escape, and he is now, we regret to say, prostrated by fever. The disease still rages in the district, and we believe there is now no doctor and no nurse to attend the unhappy people. The Local Government Board have been asked to send down a doctor, but it seems that it is not their duty to provide one. A more distressing state of things has not been witnessed in this part of the country since the famine years. We must assume that the local dispensary committees have been aware of the gravity of the circumstances surrounding them, and have been doing their duty as far as they could; but the outbreak of typhus fever in that district and its subsequent course should serve as a warning, and dispensary committees throughout the county should see after the sanitary state of their districts, and on the appearance of infectious disease they should have the persons attacked removed at once to the workhouse hospital, and then have the locality thoroughly cleansed, and the houses disinfected.

CORRESPONDENCE.

TO THE EDITOR.

SIR,—I consider the present a fitting time for the following communication, as the period for the half-yearly visits to vaccination stations is approaching. I dare say mine is not the only district in which the people systematically neglect to obey that part of the vaccination law which enacts that the child shall be brought for inspection on the 8th day after operation, a neglect from which arises [the difficulty which my brother practitioners and I find in supplying ourselves with a sufficiency of lymph to answer the demands upon us, especially at the periodical vaccination season. Some years ago I read (in your pages, I believe) a suggestion that vaccine lymph would be effectual in producing the vaccine disease after a certain degree of dilution. I do not now remember what the specified degree was; but I have been for some time making experiments, the result of which is that I have fixed upon one. It is as follows:—I take twelve points charged in the usual way and place them points downwards in a minute measure and drop upon them five minims of distilled water. Having left them standing for a time sufficient to ensure complete solution, I remove the points and proceed to fill capillary tubes, as furnished to dispensaries generally, out of the minute glass. This solution is sufficient to charge more than a dozen tubes, and each tube contains enough to vaccinate many children. They are then sealed in the usual manner, and as the lymph will keep an indefinite time I am independent of the “Cow-pock Institution,” whose generosity I never could stimulate by any urgency of appeal to send more than some half-dozen points. As I have said, I write in the hope of removing one of the difficulties under which dispensary medical officers labour in their endeavours to carry out the compulsory vaccination law, and I feel called upon to do so, more especially now, when from the invasion of small-pox in several districts a large amount of lymph will be required both for vaccination and re-vaccination. I may add, in conclusion, that I have not yet found any failures from the use of lymph thus diluted, and hope others may be equally fortunate, which I have no doubt they will.

I remain, Sir,

Your obedient servant,

EDMUND P. SHARKEY, M.B., Dub.

Ballinasloe, Feb. 19, 1874.

TO THE EDITOR.

SIR,—The enclosed needs no comment, save that in the “ukase” of the guardians, or “ghouls” of the Newcastle Board, they make no allowance for the additional red-tapeism involved, and the paste-pot and brush, with perhaps a step-ladder to boot, required for the work of bill-sticker. The medical gentleman in question should feel grateful to the Local Government Board for protecting him from such injustice and degradation.

Yours, &c.,

A POOR-LAW MEDICAL OFFICER.

NEWCASTLE UNION.

THE following letter was read at the weekly meeting of the Board of Guardians of Newcastle Union :—

“Local Government Board,
“Dublin, 27th Jan., 1875.

“SIR,—The Local Government Board for Ireland acknowledge the receipt of the minutes of proceedings of the Board of Guardians of Newcastle Union, on the 21st inst., from which it appears, that a report in the form P was received from Dr. Bolster, medical officer, containing the names of 56 defaulters under the Compulsory Vaccination Act in the Broadford dispensary district; and with reference to the resolution directing Dr. Bolster to post copies of the lists of those defaulters on the dispensary doors (in two stations in the district) and on the chapel gates (six chapels and two Protestant Churches in the district), the Local Government Board desire to point out that this is not a duty which the medical officers of a dispensary district is called upon to perform. As regards the direction that four or five of the defaulters be summoned as an example, the Local Government Board would recommend the guardians to enforce compliance with the requirements of the law without delay in all cases of wilful default.—By order of the Board,

“B. BANKS, Secretary.

“To the Clerk Newcastle Union, Limerick.”

KILLADYSERT UNION.

PROPOSAL TO INCREASE DR. RYAN'S SALARY.

THE first motion considered was that given by Mr. Clancy to increase the salary of Dr. Ryan from £100 to £120 per annum. Concurrent with this motion was one brought forward by Mr. Henn, Q.C., to the effect—

“That we do request the Local Government Board to rescind the order made by them for the £120 a year; inasmuch as Dr. Ryan who receives from this Union £225 a year for his several duties, now requires the same increase of salary not for any extra duty performed by him, but simply in order that his salary as dispensary doctor should be placed on a par with Dr. Vaughan's.”

The notices of motion were then proceeded with. Agreeably to the notice of motion which we have given—“That the recommendation of the Ballinacally Committee of Management to increase the medical officer's (Dr. Ryan's) salary from £100 to £120 per annum be taken into consideration.”

Mr. Clancy proposed that the salary be increased from £100 to £120 per annum.

Mr. Molony—I feel very great pleasure in seconding the resolution of Mr. Clancy. Dr. Ryan, it is said, has been getting £225 per annum. If he gets that money, he earns it for the extra duties he has to perform. He gets £80 a year; 3s. 3d. a day for coming here every day to visit the workhouse. Certainly you will get no medical man, even the doctors who advertise in Dublin—those quacks will not come to see you under 5s. Dr. Ryan has to attend 153 patients in the house. He has 61 to attend to in hospital, and taking those things into consideration I ask you is the £80 a year which he gets sufficient remuneration for his services? If he is leaving his home, he has to provide a substitute at his own expense, and often to my own knowledge he has had to pay that substitute very dearly for his services.

Mr. Henn, Q.C.—I have a few words to say. Dr. Ryan has out of this Union £225 a year. He has a very large private practice besides, and this with the £225 a year he receives from the Union, he can with the greatest ease keep six horses to Dr. Vaughan's one. And, as Colonel Vandeleur says, he is a considerable land proprietor. Then, I ask you, what kind of analogy there is between Dr. Ryan and Dr. Vaughan's case? One actually requires the increase to keep a horse, another can keep a good—plenty of good horses. And really when we come to look into it we cannot help thinking that Dr. Ryan wants this increase simply that he should be placed upon a par with Dr. Vaughan, and that his sensitive feelings would not be hurt by his getting a lower salary, ignoring altogether the fact that he had £125 a year more than Dr. Vaughan before he (Dr. Vaughan) got the increase. First of all, the population of this little Union—this little dispensary district of Ballinacally, one of the very smallest in the whole county of Clare—is 4,500. The salary of our medical officer has been £100 a year. Carrigaholt dispensary district has a population of 5,117. The dispensary doctor of that place is paid exactly £100 a year. Kilmihil district has a population of over 6,000. The medical officer receives £100 a year, where he has a population of very nearly 2,000 more than the population of this district. Kilrush, 8,689. The salary received by the doctor there is £100 per

annum for very nearly double the population of this little district. Craigenock, 8,866. Still more than Kilrush, about double this dispensary district. Then let us take the dispensary district of Ennis. The population of the Ennis dispensary district is 12,186, and for the discharge of the duties performed by the dispensary doctor in that district he gets £110 a year; and we now have to give Dr. Ryan for duties which are exactly three times as small as the duties performed by the dispensary doctor at Ennis £10 a year more than that doctor receives.

Mr. Cannon—It is not alone that our present staff of officers receive a very large sum—£748, which takes 7½d. in the pound to pay them, but I have heard Dr. Ryan grumble and say that he thinks he must resign his appointment. If you increase his salary to £300 he will say “I am going to resign. You will pay me the retiring allowance on my salary,” and that will be £200 a year. Then the next officer going in will say, “You must be consistent and give me the same salary as my predecessor.” Why, what will be the fact? We will be paying £500 a year for a doctor which will take 9d. in the pound to pay them and our other officers alone, so that, in reality, our conduct will show that we are not deserving of the trust the ratepayers have imposed upon us if we grant these increases.

Colonel Vandeleur—This is not an isolated case, it is a case, as Mr. Cannon very properly observes, that will spread. It is a very catching mania—that of raising the salaries (a laugh), and the mania is increasing. In Ennis asylum there is a regular strike for wages, and I have heard from doctors in every part of the county that they are watching the turn of events here, and that if the Local Government Board be weak enough to sanction the demands made upon them there will be a regular strike for higher salaries. The mania, as I have before observed is a catching one, and if not checked I do not see where the end will be. We have one gentleman who retired—a medical officer of the Kilrush Union. He has retired, and I am happy to say with success, after a very long service. He sent in a strong certificate that he would not be able to do his duty any longer. I am happy to say that this gentleman is becoming perfectly well again, and I was glad to congratulate him the other day upon his good looks, and how much he had recovered his health and strength (a laugh). He may have been, and I have no doubt was suffering very much at the time, but it often happens that when people get a little relaxation they recover. There have been a number of additions to the medical officers' salaries lately, and I conceive that the medical officers ought to be well satisfied in getting their £40 and £50 additional, and I consider it a most unreasonable thing to bring these applications forward just at the time there is a move on foot to increase the other salaries. I think it a very unfair move; for when the Sanitary Act comes into force there will be very little for the doctors to do. They go about the country to see where there is a dung heap or a pool of stagnant water and they may report it to the sub-sanitary officer, and he takes out a summons against the offending parties. I repeat that it is a very unfair time to make these applications for an increase when there has been from £25 to £45 additional put upon different unions. I am told part of this money is to be recouped, but that is no reason why these applications should be made. The guardians should also take into consideration the superannuation demands that are likely to come upon them if they grant all these increases. I believe there is no doubt that superannuation may be applied for after a certain time, and there is no question but that you will determine by this fact that your doctors' salary should remain the same with its emoluments, for any future person who comes in. We all know that canvassing goes on, and persons are in the “eye” of the different guardians to be brought forward when a vacancy arises. I have known in several unions myself where So-and-So's son will look naturally for the appointment when a vacancy takes place, and it is the interest of his friends to raise the salary so that when he comes in he will say, “gentlemen, you won't give less than you did to your former doctor” (laughter). Dr. Ryan is a gentleman whom I esteem, a most active and zealous officer of the Union, and I for one would not say a word against him.

The Clerk then proceeded to take a poll on the motion—“for or against Dr. Ryan”—when the voting was as follows:—

For, 8; against, 9.

Clerk to chairman—The numbers are—8 for the increase and 9 against it. Do you wish to vote sir?

Chairman—I'll vote for it.

Clerk—The numbers being equal the motion is lost.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

VACCINATION PROSECUTIONS.

We find in a local paper the following report of a conversation at the meeting of the Guardians of the Swinford Union:—

Dr. Jamieson, Kilkelly, forwarded a list of ninety-six defaulters under the Compulsory Vaccination Act. The Local Government Board complained that the guardians postponed making any rule as to proceeding where small-pox prevailed in the union.

Dr. Jamieson mentioned the long distances he had to drive to three petty sessions in his district. When he asked his expenses he was told he would be paid out of the fines, and his bill was ignored by the guardians altogether.

Dr. Rougham—You must go in discharge of your duty, and give evidence in these cases. The question has been decided over and over by the Local Government Board. They think it the least the medical men should do out of the large sums given them from the rates towards vaccination.

Dr. Jamieson observed that the clerk stated to him that the rates were not liable for it, though he had the certificate of Captain Wynne, R.M.

Dr. Rougham wished Dr. Jamieson to understand him as speaking officially when he said it was not too much for a dispensary medical officer to go and attend and give evidence in these cases. The Vaccination Act was there, and they could not go outside it in his case, or in any case.

Dr. Jamieson—I do not think 'it too much to ask my expenses where the vaccination is paid for at a shilling a one. I will write to the Local Government Board, and if they say my expenses are to be paid out of the fines, I will resign.

We have the gratification of informing Dr. Jamieson and our readers amongst the Poor-law medical officers of Ireland, that—with every respect for the oracular enunciation of the law by Dr. Rougham—he is entirely unjustified, either by the wording of the Acts or by the regulations promulgated by the Local Government Board, or even of precedent, in the statement he made. The Vaccination Amendment Act, 26th and 27th Vict., cap. 52 (see Irish Medical Directory, page 468), clause 13, provides that—

“The Guardians may direct proceedings to be instituted for the purpose of enforcing obedience to the provisions of this Act; and as to all expenses incurred in such proceedings, if the Justice or Justices before whom such proceedings are had, certify that such expenses ought to be allowed, such Justice or Justices shall ascertain the amount thereof, and such amount shall be payable out of the poor-

rates; and such proceedings on account of neglect to have a child vaccinated may be taken at any time during the continuance of the neglect.”

There is not a word here as to any obligation upon the medical officer to attend, and if he is obliged to do so it is expressly set down that—on obtaining the certificate of the magistrate—he will be paid out of the poor-rates. Moreover, the definition of his duties as set forth in the official Regulations (Irish Medical Directory, page 226) imposes no such obligation:—

“He shall vaccinate all persons who may come to him for that purpose at the dispensary, and shall do and perform all such other acts and things as may be necessary for the purpose of causing such vaccination to be successfully terminated; and shall attend at such convenient places within each vaccination district formed by the Committee, at the times fixed and approved by them, for the purpose of vaccinating all persons resident in his district who may come to him or whom he may be requested to vaccinate, being fit subjects for vaccination; and he shall keep and duly enter upon a register, in the annexed form G, of all cases of vaccination performed by him as medical officer of the dispensary district; and submit the same to the Committee of Management at each ordinary meeting.”

The effort was made in the early part of last year by the Commissioners to impose this duty upon the medical officers, but after officially expressing the same opinion to the same effect as Dr. Rougham gave utterance to in their name, they were obliged to withdraw from their position by a subsequent letter, and since then Dr. Carleton, of Crossakeel, and other medical officers, have demanded and received their fees.

We repudiate *toto celo* the notion of Dr. Rougham that attending at vaccination prosecutions is “the least that medical men should do for the large sums given them from the rates towards vaccination.” When the medical man has completed a successful vaccination, he has already done much more than the payment deserves, and he is under no compliment whatever for the very miserable fee which he receives. There is no demand whatever on his generosity on the part of the public, and he owes it to himself and to his profession not to accept gratuitously an irksome duty which it is sought to thrust on him without any warrant—as we believe—in law, custom, or equity.

LISMORE UNION.

SALARIES UNDER THE PUBLIC HEALTH ACT.

ON the 23rd of December, 1874, a meeting of the Board of Guardians, acting as sanitary authority, was convened for the purpose of determining, according to 37 and 38 Vic., cap. 93, sec. 10, the amount of additional salaries to be allowed to the medical officers of the Union as sanitary officers. A lengthened discussion took place, one guardian declaring that only a few months had elapsed since the "doctors" received £20 per annum increased remuneration for their duties under the Medical Charities Act; evidently under the impression that, therefore, they should do work of a completely different character, involving much trouble, annoyance, and loss of time for nothing. A proposal to grant them £25 a year for sanitary duties was brought forward and seconded; but an amendment to allow £15 per annum to each of the medical officers of the Lismore and Cappoquin districts (R. O'Reilly and G. O'C. Redmond), and £12 to each of those of the Tallow and Ballyduff districts (W. Hannan and J. C. Barry), was ultimately carried, despite the decisive opposition of the supporters of the original motion. Against this low scale of remuneration the doctors protested, and without delay unanimously appealed to the Local Government Board in the subjoined memorial, which we give *in extenso* :—

MEMORIAL OF THE SANITARY OFFICERS OF THE LISMORE UNION.

To the Local Government Board.

26th December, 1874.

GENTLEMEN,—With feelings of very great surprise we heard of the proceedings of the Lismore Board of Guardians at their meeting on Wednesday last. Having taken into consideration the subject of salaries to be granted to us as sanitary officers under the new Act, the Board, opposed by a very respectable minority, passed a resolution to the effect that £15 per annum should be allowed to the medical officers of the Lismore and Cappoquin districts respectively, and £12 per annum to those of the Tallow and Ballyduff districts respectively, which, with our knowledge of the extremely arduous and unpleasant duties devolving upon us, we look upon as remuneration quite inadequate. The consulting sanitary officer, whose work will consist in attending meetings of the sanitary body, and aiding it with his advice upon matters hygienic whenever required to do so (very seldom mayhap in the year), has been granted £20 per annum. We are far from considering that he is overpaid; on the contrary, we cannot but think that his position, upon which much of the future success of the Act depends, merits a greater acknowledgment; but, as all the odium of carrying the law into effect falls upon us, and we without doubt risk the loss of our hard-earned private emolument by the

performance of these *obligatory* duties, few will deny our right to be even better paid than he!!! In the conscientious discharge of our calling as medical officers of health, trusted with the *lives* of those around us, we shall frequently be most unpleasantly situated. Called in professionally to attend the sick-bed of a private patient, we may possibly notice about his premises some neglect—a choked up sewer, a collection of decomposing animal matter (and it is not alone in the cabins of the wretched that such things are), which demands our attention. We report the fact as in duty bound, and with what result? The offence, of course, is remedied; and, doubtless, when paying our next complimentary visit to our patient, we congratulate ourselves upon the improved aspect of the farm-yard or dwelling-house, as the case may be; but he, unaware perhaps of the inestimable value of hygienic improvement, may consider a medical man, whose scope of duties is not so *intimately* connected with it, a much more convenient attendant, and we accordingly sacrifice *practice to theory!!!* Our districts are extremely large and densely populated, for the most part mountainous and difficult of access, thereby increasing the obstacles we must everywhere meet with in our endeavours to carry out the provisions of the Act. As professional men bound to the preservation of health, and interested in the well-being of the community, we shall work conscientiously and with zeal; and in efficiently obeying this useful measure it is to be hoped we may ere long banish much of preventible disease. But it is an old saying, "The labourer is worthy of his hire," and we most earnestly solicit the just and fair consideration of the members of the Local Government Board to our claims. Like most other districts in Ireland, ours are sadly in want of sanitary reform, and much trouble and annoyance will be our lot ere a satisfactory state of things is brought about. Three of the districts of this union contain a town of considerable importance—viz., Lismore, Cappoquin, and Tallow, and including the 2,000 inhabitants of Lismore, 2,000 in Cappoquin, and 2,000 in Tallow, each district averages a population of 5,000, and has an extended area of 28,000 statute acres! The health of these 20,000 souls, the comfort and ease of their homesteads, their future exemption from ravages such as typhus, typhoid, small-pox, scarlatina, and the thousand and one miseries and disorders which spring from vitiated atmosphere, impure wells, polluted water, &c., will henceforth be our care. The hygienic condition of villages and towns is of paramount importance, demands a greater degree of watchfulness and energy, and involves far more disagreeable and thankless work than can be imagined. These new duties have been forced upon us, and we cannot help thinking that boards of guardians being aware of this fact, and feeling that medical officers of health are more or less at their mercy, have fixed scales of salaries which do not at all reward them for the work they have to do; a system which in many ways tends to frustrate the wise intentions of our legislature. We now unanimously demand justice and fair dealing, and in thus petitioning your body we feel confident we shall obtain both. Gentlemen, we most respectfully ask of you to require the guardians of our union to reconsider their resolution, and to grant us generously "fair reward for a fair day's work."

We are, Gentlemen,
Your most obedient servants,
GABRIEL O'CONNELL FITZSIMON REDMOND,
Sanitary Officer, Cappoquin District.
RICHARD O'REILLY,
Sanitary Officer, Lismore District.
WILLIAM HANNAN,
Sanitary Officer, Tallow District.
J. C. BARRY,
Sanitary Officer, Ballyduff District.

The following letter in reply to the memorial was received some days after:—

Local Government Board, Dublin,
6th January, 1875.

SIR,—The Local Government Board for Ireland acknow-

ledge the receipt of a letter dated 26th ult., and signed by you and Drs. O'Reilly, Hannan, and Barry, on the subject of the additional salaries to be allowed you as sanitary officers of the Lismore Union, and the Local Government Board desire me to inform you that they are in communication with the Board of Guardians on the subject,

By order of the Board,
B. BANKS, Secretary.

To Dr. Redmond, Medical Officer, Cappoquin.

At their next weekly meeting the Guardians, in compliance with a request from the Local Government Board, reconsidered their former resolution, and finally arranged that the salaries should stand as follows:—

To the Sanitary Officers of Lismore and Cappoquin districts, £20 per annum. To the Sanitary Officers of Tallow and Ballyduff districts, £17 per annum.

This is still below the maximum allowed by the Local Government Board, being only one-sixth of their present salaries. It is to be hoped that time will show those who have the fixing of these salaries the great utility of the Act, and that they will reward better those who have the hard work of carrying it into effect.

VACCINATION AMONG MILL OPERATIVES.

DURING the middle of the epidemic of 1871 Mr. Baker, one of her Majesty's Inspectors of Factories (himself a medical man), seeing that the directions issued by the Poor-law Board were unsuccessful in checking the progress of the epidemic, and as he well knew that the factories were too often the hot-beds of the disease, which now assumed such magnitude as to cause a panic amongst the operatives, made such representations to the Secretary of State concerning the advisability of calling into action the services of the certifying surgeons for the purpose of checking its advance, that he was at once requested to draw up the following circular:—

"Factory Inspector's Office.

"DEAR SIR,—It appears that many persons employed in factories have never been vaccinated, and that the present spread of small-pox is, in some instances, due to this neglect. The certifying surgeons scattered over the country, and possessing considerable influence with the people among whom they reside, have peculiar opportunities incidental to the discharge of their duties in ascertaining and remedying this evil.

"The Secretary of State, therefore, directs us to suggest to you, whenever any person, under sixteen years of age, applying for a certificate, has not been vaccinated, to represent both to the parents and the employers the danger thus incurred. An employer would be showing only due regard for the interests of his workpeople if he made vaccination a condition of employment, for so indifferent are many people to the risk of infection that they may be found working, even though there may be one among them with the eruption out at the time.

"I shall be glad to hear from you the result of your efforts in this matter.—We are, Sir, yours truly,

"ALEX. REDGRAVE, } H. M. Inspectors
"ROBERT BAKER, } of Factories."

This was sent to each certifying surgeon, who at once followed the instructions, not only examining each applicant, and causing to be vaccinated those that required it (in which they were most cheerfully assisted by the mill-owners), but also in preventing those from returning to work who were infected. The beneficial effects of their exertions became soon manifest, and in a short time the disease passed away.

In Belfast the necessity of examining for the vaccination mark was very evident, for in 13,457 hands that were examined, 702 required to be vaccinated, and since the receipt of the circular upwards of 1,000 young persons have been detected who were never vaccinated or had spurious marks. Even now scarcely a week elapses

that from two to four are not detected who require to be vaccinated. The consequence is that in the epidemic which has just passed away, in one mill which had 150 cases in 1871, only ten were affected in 1874, and these were adults. The case was the same in every factory, and the good results show the necessity of careful attention to the workers by vaccination, for of those that were under sixteen only thirty-nine were attacked during the last epidemic.

WATERFORD UNION.

A LETTER—A DEATH—AN ANSWER.

The Clerk read the following letter :—

"GENTLEMEN,—The undersigned wishes to know whether the workhouse horse is a useful or ornamental auxiliary towards the relief of the sick poor of Waterford ?

"A poor man living in Bakehouse Lane was brought home on Monday night, labouring under a bad attack of hæmorrhage. Dr. Delandre visited him, and ordered his immediate removal to hospital. Mr. Rooney gave the order for the van, but Mr. Ryan, the master of the union refused to 'turn out either horse or man' for the relief of suffering humanity (time, half-past ten o'clock). All that could be done in a 'lodging-house' was done, but he died at four o'clock next morning, after a second and severe attack. The doctor suggested ice and plenty of cold milk, but I am sorry to say he got none of one, and very little of the other.

In answer to the Board, the Master said it was a quarter to eleven when the man, Fleming, came to the gate for the horse and van.

Capt. Power.—The master was bound to give the van when there was an order from the doctor for the man's removal to hospital.

Upon this point Mr. Rooney was questioned, and he said he got no ticket from the doctor for the man's removal.

Ald. Redmond.—Then Mr. Rooney should not have acted without a ticket from the doctor.

In answer to Capt. Power, Mr. Rooney said he sent a ticket to the master for the van.

Mr. O'Shea.—You should have got a ticket from the doctor.

Clerk.—A dispensary surgeon is bound to give a ticket where removal is necessary, and Mr. Rooney should not remove anyone without such a ticket.

Mr. Rooney.—For many years back there are no orders from the doctors, except verbal ones in such cases.

• Moved that the master's answer be ruled satisfactory.

The Chairman put the motion—For, 4 ; against, 1.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING FEB. 20, 1875.

Total registered deaths in Dublin and suburbs *	...	202

" " Edinburgh	...	31 "

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

ENNISKILLEN UNION.

POLICE AS SANITARY OFFICERS.

A COMMUNICATION was read from the Limerick Board of Guardians, containing copy of correspondence between them and the Irish Government, in which they urged the appointment of the constabulary as sub-sanitary officers. In a reply of Sir Michael Hicks Beach to the Board, he said that the Lord Lieutenant could not comply with the request, but the Inspector-General of Constabulary had given instruction that the police should report any cases to the sanitary officers which seemed to them to call for improvement.

COOKSTOWN UNION.

IN reply to a resolution passed last board day, stating that doubts had arisen as to the liability of dispensary medical officers to attend cases of midwifery, a letter was read from the Local Government Board in which it was stated, "if a medical relief ticket be presented to the medical officer in a midwifery case, he is bound to attend upon it as in any other case."

VARICOSE VEINS.

MR. MARSHALL, F.R.S., in a clinical lecture published in the *Lancet*, describes a new operation for the cure of this disease. Instead of obliterating the vein by one of the usual methods, he removes several inches of it altogether. In a case he exhibited to the class the success was complete. Mr. Annandale, of Edinburgh, has performed a similar operation with equal success. It would seem, therefore, that the new method is likely to prove serviceable. Mr. Marshall advises also the use of the elastic ligature and subsequent antiseptic dressing.

ABLATION OF THE INVERTED UTERUS TAKEN FOR POLYPUS.

A WRITER in *l'Union Médicale* mentions a case in which the inverted uterus felt to the finger like a polypus. The surgeon slipped the chain of the écraseur on the neck of the supposed polypus, and removed it. The mass proved to be the whole inverted uterus. The attacks of metrorrhagia ceased, and the patient did well. Petit is said to have made the same mistake. Vieussens also removed the uterus under the same impression; the patient lived for ten years after the operation. The post-mortem examination showed that a small piece of the cervix had been left. The same misfortune happened to Bouchet, Slevogt, Boyer, and Jobert de Lamballe. The latter surgeon, when pulling down the mass with the vulsellum, perceived that he had to do with the uterus; he desisted, but the traction caused peritonitis, which carried off the patient.

DR. NOTHNAGEL ON THE OPTIC THALAMI.

DR. NOTHNAGEL (*Centrabl. f. M. W.*) has published some experiments recently made by him on rabbits to ascertain the function of the optic thalami. It was held that these bodies are the motor centres of the upper extremities; this was disproved by clinical observation. Ferrier thinks that the optic thalami have no relation to motion, but that they are centres of sensation. Nothnagel employed a little canula and trocar, from the extremity of which, by pressure on a lever in the handle, small diverging arms can be protruded and the thalamus thus broken up. He found that when both optic thalami were completely disorganised, the animals, on awakening, jumped about with facility; nor did they appear to suffer from cutaneous sensibility, living for weeks after the injury, the only thing noticed being their growing emaciation. He therefore states that destruction of the thalami causes neither motor palsy nor anæsthesia of the surface.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

THE Council of the Irish Medical Association met on the 11th inst., and adopted some very important clauses, which they seek to have introduced into the new Coroners Bill for Ireland, the second reading of which in the House of Commons has been fixed for the 12th of May next, and have ordered that these clauses shall be printed and circulated amongst the members of the Association as soon as possible. It behoves every member of the profession in Ireland now to exert himself and bring all the influence in his power to bear upon our Parliamentary representatives, whilst the opportunity exists, with the view to having medical witnesses at coroners' inquests fairly dealt with. The pith and marrow of the clauses recommended by the Council of the Irish Medical Association are—

1. That whenever an inquest shall be held upon the body of a person who had been professionally attended during his last illness, or recently before death, by a qualified medical practitioner, such medical attendant shall be employed as the medical witness at the inquest.
2. That if no medical practitioner shall have been in such attendance then the medical officer of the dispensary district in which the person died, or in which the dead body was found, shall be the medical witness; unless in the case of an inquest held upon the body of a person who died in an hospital, or who had been brought into an hospital for medical treatment, when the medical officer of the hospital shall be employed as medical witness.
3. The medical witness shall receive a fee of one guinea for attendance and evidence given at an inquest.
4. The medical witness shall be paid travelling expenses at the rate of sixpence a mile, from his residence to the place where the inquest is held, both going and returning.
5. That the fee for an ordinary post-mortem examination be two guineas additional, and that the coroner may pay a fee, not exceeding five guineas, to the medical witness for a necessarily difficult and prolonged post-mortem examination.

6. When a medical witness has been summoned to attend and give evidence at an inquest, and no inquest be held, he shall be paid a fee of one guinea along with travelling expenses, if he attended at the appointed time and place.
7. That no person shall be qualified to give professional evidence at an inquest, or make a post-mortem examination, unless he be a legally qualified medical practitioner.
8. That the medical witness shall be paid the amount of his fees and travelling expenses immediately after the conclusion of the inquest.

These are the fair and moderate demands of the Council of the Irish Medical Association, and as such they must commend themselves to the members of the profession.

CASTLEBAR UNION.

THE Local Government Board acknowledged receipt of minutes relating to vaccination defaulters in Castlebar North and Balla districts, but thought a postponement of prosecutions dangerous under present circumstances.

The Local Government Board forwarded a letter received from Dr. Kisby, complaining of the want of a cart for conveying infectious cases to hospital.

The Chairman thought it a great liberty on Dr. Kisby's part to be constantly writing to the Local Government Board in this way over the heads of the guardians.

Mr. Daly thought the time spent by the doctors in writing to the Local Government Board might be better employed by them in checking the spread of small-pox.

A reply was ordered to be transmitted to the effect that on their next meeting the Board hoped to procure a vehicle.

MULLINGAR UNION.

A LETTER was read from the Local Government Board forwarding a copy of observations appended by Dr. Stokes, medical officer of the Mullingar Dispensary District, relating to the defective sanitary condition of Mullingar, and the local Government Board request that the Guardians will be so good as to furnish them with their observations in reference to the representations made by Dr. Stokes.

Copy of Dr. Stokes' observations:—

"The sanitary state of this town is exceedingly bad. The sewerage everywhere is defective, a large proportion of the houses of the poor are in a ruinous state, quite un-

fit for human habitation, and the streets and thoroughfares are kept in a most filthy state. This state of things, since the Sanitary Act came into operation, I have reported, but as yet nothing has been done."

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF FEBRUARY, 1875.

MARCH 1st, 1875.—Hearn, Richd. Thos., Merton, Sandford, Co. Dublin, M.B. Univ. Dub. 1874, Lic. 1874 and Lic. Midwfy. 1874, R. Col. Surg. Irel.
6th.—Maturin, Chas. Gabriel, Newtown House, Strabane, Co. Tyrone, Lic. R. Col. Surg. Irel. 1874.
10th.—Furrell, Peter Joseph, 41 Lower Mount Street, Dublin, M.B. 1875 and M.Ch. 1875, Univ. Dub., Lic. Midwfy. K. Q. Col. Phys. Irel. 1874.
10th.—Mason, Samuel Robert, 92 Harcourt Street, Dublin, Lic. R. Col. Surg. Irel. 1873, M.B. Univ. Dub. 1874.
10th.—Taaff, Robert, 19 Idrone Terrace, Blackrock, Co. Dublin, M.B. Univ. Dub. 1875, M.Ch. Univ. Dub. 1875.
16th.—Carleton, Arthur Wellesley, 4 Russell Place, Dublin, M.B. Univ. Dub. 1875, M.Ch. Univ. Dub. 1875.
20th.—Grier, Henry, Longford, Lic. 1873 and Lic. Midwfy. 1873, K. Q. Col. Phys. Irel.
22nd.—Pollen, Henry, 51 Lansdowne Road, Co. Dublin, M.B. Univ. Dub. 1874, M.Ch. Univ. Dub. 1875, Lic. Midwfy. K. Q. Col. Phys. Irel. 1875.
25th.—Holmes, John, Athlunkard, Limerick, Lic. R. Col. Phys. Edin. 1875, Lic. R. Col. Surg. Edin. 1875.

BALLYRAGGET DISPENSARY.

At a special meeting of the above committee, for the purpose of electing a medical officer in the room of Dr. John Byrne Hackett, who was elected to the city of Kilkenny dispensary and workhouse,

The following candidates appeared:—Dr. O'Kelly, Ballyroan, Queen's County, and Dr. Walsh, Ballinakill, Queen's County.

The testimonials and diplomas of each candidate having been read and approved of, a poll was taken, when there voted for Dr. Walsh, 3.

For Dr. O'Kelly, 8.

The office of Coroner for one district of the Queen's County will become vacant in consequence of the appointment of Dr. O'Kelly. Under the 21st section of the 9th and 10th Victoria, cap. 37, a coroner must reside within his district, or forfeit his emoluments.

IMPORTANT TO CERTIFYING SURGEONS.

A MEETING of certifying surgeons was held in the Adair Arnis Hotel lately at Ballymena,—Dr. C. D. Purdon, Esq., Belfast, in the chair—for the purpose of frustrating the attempt that is now being made to abolish the appointment of certifying surgeons. It was proposed and seconded, that the gentlemen connected with the above appointment should exert themselves by every means in their power to oppose the attempt referred to, and to secure the interest of both Houses of Parliament. It was further resolved that an association be immediately formed, to be called "The Ulster Certifying Surgeons' Association," to support the one in England already formed; that each member in Ireland shall contribute 5s. each per annum to cover expenses. Dr. C. D. Purdon, Esq., Belfast was duly appointed president; Dr. Hamilton, Esq., Cookstown, treasurer; and Dr. Kidd, Esq., secretary. The following gentlemen formed the committee:—Drs. Monks, Dublin; Corbett, Londonderry; Gray, Armagh; Carson, Coleraine; Peden, Ballyclare; M'Laughlin, Portadown; Drew, Drogheda; Taggart, Carrickfergus; M'Bride, Gilford; Musgrave, Lis-

burn; and Hawthorne, Banbridge. Mr. A. H. Balfour, Edinburgh, and Mr. Stansfield, Bristol, are to be solicited to summon meetings in Scotland and England. It is expected that there will be a large and influential meeting in Belfast and Dublin, of which there will be due notice given.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING MARCH 13, 1875

Total registered deaths in Dublin and suburbs *	...	213
Ten years average of same week	...	179
Mortality below average	...	34
Ratio of deaths, suburb of Rathmines	...	22 per 1,000.
" " " Donnybrook †	...	36 "
" " " Blackrock	...	29 "
" " " Kingstown	...	14 "
" " " Entire Dublin district	...	35 "
COMPARATIVE RATIOS—London	...	28 "
" " Glasgow	...	32 "
" " Edinburgh	...	26 "

Of the 20 deaths registered from zymotic diseases during the week, 7 were caused by fever (2 typhus, and 5 typhoid), 4 by scarlet fever, 1 each by measles and diphtheria, 3 by croup, 2 by influenza, &c.

In Belfast 10 deaths from scarlet fever, 7 from measles, 4 from whooping-cough, 2 from fever, and 1 from diphtheria were registered.

In the Dublin Registration District 6 children died from convulsions.

Seventy-one deaths were attributed to diseases of the respiratory organs (not including phthisis), of which 58 were from bronchitis (against 42 for the preceding week), 7 from pneumonia, 1 from pleurisy, and 5 from lung diseases unspecified.

Paralysis caused 6 deaths, apoplexy and cephalitis, 2 each, insanity, epilepsy, and brain disease unspecified, each 1.

Heart disease caused 6 deaths, and aneurism 1; liver disease 2, and jaundice 1; stone 1, and kidney disease unspecified 3.

Phthisis proved fatal in as many as 43 instances, and hydrocephalus, or water on the brain, in 4.

Two deaths resulted from cancer.

GALWAY PETTY SESSIONS.

A MILK contractor to the union workhouse was charged with having on the 6th ult. supplied to the establishment a quantity of adulterated milk. The executive sanitary officer, who conducted the prosecution on behalf of the board of guardians as the rural sanitary authorities, deposed that he received from the master of the workhouse a sample of the milk complained of, with which he proceeded to Dublin, to submit it to Dr. Cameron for analysis. The result of the analysis was that Dr. Cameron ascertained, and his certificate to this effect was produced and tendered in evidence, that the milk contained twenty-five per cent. of added water. There was no defence, and the magistrates imposed a fine of five pounds with an additional sum of £4 2s. 6d. costs.

* District extends over 10,050 acres, and contains 314,666 persons.

A NEW DUTY FOR DISPENSARY MEDICAL OFFICERS.

We find in the recent proceedings of the Tralee Board a piece of guardianism which, for its insolent audacity, almost takes away our breath. We find that an application was made by the relieving officer for a sum of £4 for his services in serving summonses on defaulters under the Compulsory Vaccination Act.

The Chairman really thought it was part of the relieving officer's duty.

Hickey said that some of the other officers were paid for similar duties.

Mr. Roche—There is no doubt but your salaries as sanitary officers will be increased one of these fine days.

Hickey—It is like the promise that the feathermonger made to the woman he was going to marry,—“When last of the geese were plucked he'd marry her.” She fancied he'd have an end to them every day, but he never could (laughter); so that is the way with our salaries. (More laughter.)

The Chairman said it was better to write a resolution requesting the Local Government Board to inform the guardians whose duty it was to serve these summonses.—Ordered.

Mr. Roche thought the medical officers should do so.

Abundant as was our belief in the pettifogging mean-

ness of squireen guardians, we hardly anticipated that ever the son of a village shopkeeper would go the length of proposing to make his betters, the medical officers, serve the office of union process-server. The employment would be a suitable and congenial one for “Mr.” Redmond himself, and we wonder that he did not set on foot a little job to make the office for himself.

CORRESPONDENCE.

MIDWIVES.

TO THE EDITOR.

DEAR SIR,—It is quite true that midwives save practitioners a good deal of troublesome work, but my point is that this is effected at the expense of a disproportionate money loss which might be saved.

My second point is that this saving of work is effected at the expense of risk to every, and certain injury to some patients. This injury is occasioned by the overweening conceit of these diplomatized women, which conceit is ever prompting them to retain exclusive possession of every save the most extreme case that comes within their hands.

My third point is that the practitioner might be saved at

one and the same time the trouble and the loss, and the patients the risk, if Messrs. Johnson and Ringland would only grant certificates to those so-called midwives on the condition of forfeiture in the event of their attending any case which should be entirely unseen by a doctor. The gain in fees to the practitioner would more than compensate for the additional trouble a mere flying visit would throw on him. The gain to the public could only be estimated by those who are aware of the peculiarities of country practice.

A COUNTRY PRACTITIONER.

COMPULSORY SUPERANNUATION.

TO THE EDITOR.

SIR,—The subject of this letter I have for a long time thought of bringing before the profession, but I hoped it would have been unnecessary, and that it would not have been overlooked by those who had influence, and whose province it was to attend to the matter. I allude to the necessity of urging in some way the desirability of obtaining a certain retiring allowance for poor-law medical officers, *workhouse and dispensary*, after filling office for say twenty-one or twenty-five years. I would suggest that it might be optional with a medical officer to retire after the period named, and that he would be then entitled to receive a certain portion of his salary without reference to the decision or interference of the guardians. As the matter at present stands, the hope of getting anything from that body is so precarious, and so grudgingly given, that there is little prospect of obtaining even what the law entitles us to. Some boards, however, differ widely from the shabby course adopted by others.

It is not my object to go further than simply to direct attention to the matter with the hope that it may be brought before Parliament, and that meetings be held and resolutions passed to aid the purpose I refer to. Your kindly inserting this brief note in your influential journal may attain my part of the object.

I am, Sir, your obedient servant,

A POOR-LAW DOCTOR.

[The Council of the Irish Medical Association and ourselves have refrained from urging the profession to agitate for the object which our correspondent suggests, not because we are insensible to the justice and propriety of such a demand, but because it was felt that putting forward such a claim just now would be not only futile, but injudicious. We do not believe that while the sanitary question is on hand the authorities would be ready to consider the necessity for *de jure* superannuation, nor the boards of guardians to listen to it, and it would only prejudice the chance of success at some future time to urge the demand at a conjuncture when there would be no hope of its being conceded.—ED.]

POOR-LAW GUARDIANS (IRELAND) BALLOT.

THE following are the clauses of the Bill brought in by Sir Coleman O'Loughlin, Bart., Lord Francis Conyngham, and Captain Nolan :—

1. From and after the first day of March, one thousand eight hundred and seventy-six, in all contested elections for Poor-law guardians in Ireland the poll shall be taken by ballot.

2. Before the first of January, one thousand eight hundred and seventy-six, the Local Government Board of Ireland shall frame and issue a sealed order regulating the mode in which elections of poor-law guardians in Ireland by ballot shall be carried out, and such sealed order may be varied or amended from time to time by the Local Government Board of Ireland by sealed order: Provided always, that every sealed order shall provide that the poll at an election for a Poor-law guardian in Ireland shall be taken in the electoral division for which the guardian is proposed to be elected.

3. The returning officer at an election for a Poor-law

guardian in Ireland may use, free of charge, for the purpose of taking a poll at such election, any room in any national school-house, constabulary barracks, or court or sessions house in Ireland, which may be convenient for the purpose.

4. Every voter entitled to more than one vote may give such votes to one candidate, or may distribute such votes among the candidates as he may think fit.

5. This Act may be cited as "The Poor-law Guardians Election (Ireland) Act, 1875."

WHO ARE PROPERLY QUALIFIED DISPENSARY PATIENTS?

AT a meeting of the Ballylesson Dispensary Committee, held on the 6th ult., after the transaction of the usual routine business, the medical officer brought under the notice of the chairman two visiting tickets with a view to their being cancelled.

It appeared from the doctor's statement that the first ticket for consideration had been presented with the space for "occupation" left blank, but verbal inquiry elicited from the messenger that the patient was the child of "Mr." So-and-so, and that the latter was land-steward and head-gardener to a gentleman of property and J.P. resident in the neighbourhood. The visit had been duly paid, but the ticket referred back by the doctor to the member of committee who issued it, in order that the occupation might be inserted, and when presented anew this was found to be "farm labourer."

Considerable discussion followed in committee regarding the medical officer's complaint, the gentleman responsible for the ticket under consideration urging that the applicant was a proper object for dispensary relief, and should not suffer because the ignorance of the messenger presenting the ticket led him to speak of "Mr. This" and "Mr. That," or to over-estimate his social position; yet in continuation of his remarks, the same gentleman spoke of the person whose title to Poor-law medical relief he defended, as "*Mr.*" He also questioned the right of the doctor to go about making inquiries as to the man's income!! Finally, it was resolved to take no definite action till next meeting of the Committee, and that in the meantime it be ascertained whether the "farm labourer" had, in addition to his free house, &c., 15s. per week, in which case the medical officer would not be required to continue attendance.

The next ticket the propriety of issue of which was called in question by the doctor was in favour of a woman in apparently respectable circumstances, who occupied a house with market-garden attached, for which she paid £18 per annum.

In the discussion of this case, also, the same member acted as counsel for the defence, and argued that the rent actually paid was no criterion of the real value of the holding. This statement was feelingly acknowledged by several of those present to be true in many other instances, if not in this, and further discussion of the case was postponed till next meeting, the medical officer commenting on the fact that the gentleman whose signature was appended to this ticket was residing at the time of its issue in another part of the United Kingdom. Several of the members of the Committee present on the above occasion expressed regret that they had no definite rules to guide them as to the eligibility of applicants for dispensary relief.

Irish Poor-Law Intelligence:

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

THE following letter has been addressed to us, and to a large number of the medical profession throughout Ireland :—

Royal College of Surgeons,
Dublin, 8th March, 1875.

DEAR SIR,—I enclose a copy of the clauses which are recommended by the Council to be introduced into the Coroners' (Ireland) Bill, 1875, the second reading of which, in the House of Commons, has been fixed for 12th May next.

As the time for working is so short, I request your prompt and earnest attention to this very important matter, and that you will urge the clauses upon those Members of Parliament with whom you have influence or acquaintance.

Yours faithfully,
JOHN H. CHAPMAN,
Hon. Sec.
60 Pembroke Road, Dublin.

THE CORONERS' (IRELAND) BILL, 1875.

The Council of the Irish Medical Association beg to recommend the omission of section 32 and section 33 of the Coroners' Act, 1846 (9th and 10th Victoria, cap. 37), and the insertion of the following clauses into the Coroners' (Ireland) Bill, 1875 :—

1.—Whenever an inquest shall be held upon the dead body of a person, who had been professionally attended during his or her last illness, or recently before his or her death, by a legally qualified medical practitioner, the coroner shall employ, as the medical witness, such medical practitioner; but should no such medical practitioner have been in such attendance, then the coroner shall employ, as medical witness, the medical officer of the dispensary district in which the death occurred or the dead body had been found: save and except in the case of an inquest being held on the body of a person who had died in a hospital or other public institution for the reception and treatment of sick persons, or who had been conveyed to such hospital or public institution for medical or surgical treatment; then, in such case, the coroner shall employ as the medical witness the medical officer of such hospital or public institution, provided that if any person shall state upon oath before the coroner, that, in his or her opinion, the death of the deceased individual was caused partly or entirely by the improper treatment or neglect of any medical practitioner, or other person, such medical practitioner or other person shall not be allowed to perform or assist at the *post-mortem* examination of the deceased.

2.—The medical witness shall be entitled to receive

from the coroner a fee of one guinea for his attendance and evidence at an inquest, or any adjournment thereof, together with travelling allowance, at the rate of sixpence per mile, to and from the place where the inquest was held to the residence of such medical witness.

3.—The medical witness shall be entitled to receive an additional fee of two guineas for making a *post-mortem* examination of a body, if directed so to do by the coroner; and whenever it shall appear to the coroner that a *post-mortem* examination has been necessarily difficult and prolonged, the coroner may pay to such medical witness, for such *post-mortem* examination, a fee not exceeding five guineas; and in the event of the coroner deeming it necessary that a chemical analysis should be made of the contents of the viscera of any dead body, the coroner shall pay a fee of five guineas to the legally qualified medical practitioner appointed by him and the majority of the jury sworn upon the inquest, for making such analysis.

4.—Should the coroner have summoned as medical witness a legally qualified medical practitioner to attend and give professional evidence at an inquest, and, subsequently, deem it unnecessary to hold such inquest, then the medical witness shall be entitled to receive from the coroner a fee of one guinea, together with the above-mentioned travelling allowance, if the medical witness shall have attended at the appointed place.

5.—No person shall be qualified to act as medical witness, or make a *post-mortem* examination of a dead body at any inquest, who shall not be a legally qualified and registered medical practitioner.

6.—Immediately after the conclusion of an inquest, the coroner shall deliver to the medical witness the amount of his fees and travelling allowance.

TO THE EDITOR.

SIR,—The enclosed circular of the Local Government Board reached me to-day, being headed "personal." I can only infer that it is paternal advice to us poor dispensary doctors, for which we must be truly grateful. The deep research and profound wisdom evinced must excite our deepest reverence. Such things never could have occurred to us poor country devils.

Of course, we who spend our days in the pursuit of red-ticket cases never get fresh air; we are too much given to adulterating our water with John Jamieson, and we abhor good beef and mutton. 'Tis true we are often now-a-days obliged to do without broadcloth, and put up with tweed and frieze, when our man and horse cost us £70 a year; and if some of my *confrères* did use a little more soap it would not be amiss. The only excuse for a breach of the 6th rule is when an executive committeeman annoys us; then it might be permissible to "drive away dull care" and seek for comfort in oblivion. As I understand the

board now keep a *poet*, may I venture, with a view to a future vacancy, thus to paraphrase the six rules of health.

1. Breathe fresh air whenever you can.
2. Pure water is best drink for man.
3. At beef and mutton be not slack.
4. Wear tweed and broadcloth on your back.
5. With soap and water wash your body.
6. Drink not too muck of whisky toddy.

I am, Sir, your obedient servant,

JOHN SAWBONES, M.D.,

Mudwaterdrink Dispensary District,

Epsom Hall.

March 11, 1875.

Possibly the four or five copies enclosed to me may have been for circulation amongst the people, but I am afraid I would be laughed at if I offered it to the public.

PERSONAL PRECAUTIONS AGAINST FEVER.

1. *Breathe Fresh Air.*
2. *Drink Pure Water.*
3. *Eat Wholesome Food.*
4. *Wear Proper Clothing.*
5. *Wash well and frequently.*
6. *Keep Sober.*

1. "*Fresh Air.*"—In the daytime be out of doors as much as you can. Never sleep at night in an air-tight room. If you breathe again the air which yourself or some other person has already breathed, you breathe poison; and if it does not escape either by a chimney, an open door, an open window, or some other opening to the outer air, you are in danger of being made ill, more or less, according to the number of persons sleeping in the room; and you may catch fever from this cause alone. The reason why fevers attack people who live in close streets with nasty smells about, is that "fresh air" seldom, if ever, enters the dwelling untainted. The sanitary officer will see to this if you should have occasion to apply to him.

2. "*Pure Water.*"—Nothing is more likely to make you ill than drinking bad water. It hurts the bowels worse even than bad air, and is very often the cause of a person taking fever. If you are not sure that the best water you can get to drink is clean and good, boil it and let it cool, and keep some always ready for use. Once boiled it is less likely to hurt you.

3. "*Wholesome Food.*"—You know what kinds of food agree with you best; probably those which you are accustomed to eat; if so, do not change them if you can help it. Take care not to eat unripe apples, pears, or plums, or any unripe fruit. Every year, in autumn, bowel complaints arise from this cause, and are often fatal. At all times of the year avoid stale shell-fish or other stale fish, or any kind of tainted food.

4. "*Proper Clothing.*"—That is to say, any clothing which is warm enough and dry. Never rest in wet clothes, especially in wet shoes and stockings. Colds caught in this way are very apt to attack the bowels, and may bring on fever, and end in death.

5. "*Wash frequently.*"—Not the hands and face only, but the whole body, with soap and hot water, at least twice a week. The object is to promote, by cleanliness, a free perspiration through the pores of the skin, and so to relieve the blood from refuse matter and to keep it healthy.

Personal cleanliness is good for the health of adults and old persons, but for children it is of the utmost value; wash them well every day.

Cleanse also with soap and water every corner of your dwelling, and every part of the surface thereof which is liable to accumulations of dust or dirt, and while besom or scrubbing-brush are at work let doors and windows be open.

Purify also, by the use of disinfectants, every room which has contained, and all bedding or clothing which has been in contact with, infectious disease.

6. "*Keep Sober.*"—Is good advice at all times; but in time of epidemic fever it is most dangerous to get drunk.—So "*Keep sober.*"

These precautions, if observed, will render a person less liable to take small-pox, as well as other fevers; but the chief protection from small-pox is, as all people know,

VACCINATION.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING MARCH 20, 1875

Total registered deaths in Dublin and suburbs * ... 200
Ten years average of same week 199

Mortality above average 1

Ratio of deaths, suburb of Rathmines ... 25 per 1,000.

" " " Donnybrook† 14 "

" " " Blackrock ... 29 "

" " " Kingstown ... 8 "

" " " Entire Dublin district ... 33 "

COMPARATIVE RATIOS—London 28 "

" " Glasgow... .. 37 "

" " Edinburgh ... 24 "

Of the 24 deaths registered from zymotic diseases during the week, 8 were caused by fever (1 typhus, and 6 typhoid), 2 by scarlet fever, 1 each from diphtheria, croup, whooping cough, &c.

In Belfast 15 deaths from scarlet fever, 4 from measles, 8 from whooping-cough, 1 each from fever and diphtheria, and 2 from diarrhoea were registered.

In the Dublin Registration District 13 children died from convulsions.

Several deaths were attributed to diseases of the respiratory organs (not including phthisis), of which 47 were from bronchitis (against 42 for the preceding week), 7 from pneumonia, liver disease 4, and 2 from lung diseases unspecified.

Paralysis caused 4 deaths, 2 to apoplexy, 3 inflammation of the brain, 1 to epilepsy, and 2 brain disease unspecified.

Heart disease caused 11 deaths, and aneurism 1; liver disease 4, and jaundice 0; stone 0, and kidney disease unspecified 2.

Phthisis proved fatal in as many as 23 instances, 4 to hydrocephalus, and 2 to mesenteric disease.

One death resulted from cancer.

MAYO ASSIZES.

THE COUNTY INFIRMARY.

CAPT. C. KNOX—I propose that you reduce the grant to the co. infirmary by £100.

Sir Geo. O'Donel—We should not do away with the County Infirmary. This comes upon us suddenly.

Sir George O'Donel again protested against doing away with an old institution that was appreciated in the county and without notice.

Mr. Blake—It is hardly fair to do away with an institution like the County Infirmary which is so generally useful.

The Foreman—I propose as an amendment that the full sum be granted £400.

For the amendment, 9; against the Foreman, 13.

Sir George O'Donel noted that they were now proposing to take £200 a year from the infirmary.

Mr. Charles O'Malley—On the same principle will many a presentment be traversed before a jury of Mayo.

Sir R. L. Blossc—I will propose that we take off £200 next time.

Mr. Walshe—Do away with it altogether. It is not required.

Sir George O'Donel—I strongly protest against this.

Capt. Charles Knox—There is an additional charge. It was £700 a year, it is now £800.

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

LOANS UNDER THE SANITARY ACT.

A CIRCULAR under the above heading, dated the 16th March, has been sent to the several boards of guardians in Ireland. It states that the Local Government Board had received a communication from the Commissioners of Her Majesty's Treasury respecting loans under the Public Health (Ireland) Act, 1874, which may be made by the Commissioners of Public Works, Ireland, on the recommendation of the Local Government Board, with the consent of the Treasury, in which it is stated that my lords are of opinion that the financial principles upon which the Irish Act is administered should correspond with those adopted under the English Act of 1872, and they have therefore furnished the Local Government Board with a copy of a letter, dated 11th January, 1873, to the President of the Local Government Board in England, respecting the rate of interest which their lordships are prepared to approve of for loans of varying duration. The following extracts are from their lordships' communication:—

“ Be it observed hat the longer the period allowed for

repayment the more difficult it is to forecast the average price of money to the Government; and (2) that short loans are generally less objectionable than long loans. My lords propose to lay down that advances under the Public Health Acts which shall have a currency of 30 years or less, shall bear an interest at 3½ per cent. per annum. As, however, the Act alludes to longer loans conformable to the Act 22 and 23 Vic., cap. 98, sec. 78, they will authorise the Public Works Loan Commissioners to entertain recommendations for periods in excess of thirty years, but at higher rates of interest, viz. :—

40 years and under, 3¼ per cent.
50 years “ 4 ditto.

It will be necessary to reconsider these terms if at any time the price of money should rise so as to disturb materially the average upon which the calculation is based. The effect of this rate is that the longer loans, though on higher interest, give less annual instalment to be paid for principal and interest together, so relieving the borrowers whose annual means are the most slender. The longer the time during which the annuity goes on makes up for the less proportion of each instalment which is due to repayment of principal.

QUARTERLY RETURN OF BIRTHS AND DEATHS REGISTERED IN IRELAND.

DURING the quarter ended 31st December last, there were registered in the 791 Registrars' Districts in Ireland 2,429 births—a number equal to an annual birth-rate of 24·4 in every 1,000 of the estimated population—and 22,705 deaths, representing an annual mortality of 17·1 per 1,000.

In England, during the same quarter, the birth-rate represented was 35·6 in every 1,000 of the estimated population, and the mortality 23·8 per 1,000.

In Ireland the birth-rate was somewhat under, and the death-rate considerably over, the average for the corresponding quarter of the preceding five years. The higher death-rate is owing partly to the increasing fatality of scarlet fever, and partly to the large mortality amongst old people, caused by the variable weather during the quarter. The deaths from scarlet fever in the province of Ulster last quarter were more than double the number in the September quarter; in Connaught, also, the disease spread considerably, while in Leinster and Munster it remained stationary.

The mean temperature at Dublin, 43·3°, was 0·7° under the average for the fourth quarter of the preceding five years.

From returns kindly furnished by the Local Government Board, it appears that the number of persons receiving in-door relief was slightly over the number in the fourth quarter of the previous year, and the average for the corresponding quarters of the years 1869-73. The number of persons in receipt of out-door relief was a shade under that in the previous quarter, but considerably over the average for the fourth quarter of the previous five years.

Births.—The births registered during the fourth quarter of last year amounted to an annual ratio of 1 in every 41·0, or 24·4 per 1,000 of the estimated population. The average during the corresponding quarter of the previous five years was 25·3 per 1,000.

The counties having the highest birth-rates were—Mayo, 29·8 in every 1,000 of the estimated population; Antrim, 28·1 per 1,000; Kerry, 26·8; and Carlow and Leitrim, each 26·6 per 1,000. The birth-rate was lowest in the following counties: Tyrone, 21·2 per 1,000; Meath, 21·3; Wicklow, 21·7; Westmeath, 21·9; and Longford and Queen's county, 22·1 per 1,000.

Deaths.—The deaths registered in Ireland during the quarter afforded an annual rate of 17·1 per 1,000 of the estimated population, which rate is 1·2 per 1,000 over the average. In Leinster the ratio was 19·9 in every 1,000; in Munster 15·9, in Ulster 17·6, and in Connaught 13·6 per 1,000.

The death-rate was highest in the following counties: Dublin, 25·5 per 1,000 of the estimated population; Antrim, 23·4 per 1,000; Westmeath, 20·0; Armagh, 19·1; and Down, 19·0. The counties having the lowest registered mortality were Roscommon, 12·4 per 1,000; Donegal and Monaghan each 13·2 per 1,000; Sligo, 13·3; Kerry and Mayo, each 13·7; and Clare and Cavan, each 13·8 per 1,000.

Health of the People.—The state of the public health during the past quarter has been far from satisfactory. The number of deaths registered exceeded by 1,147 those registered in the corresponding quarter of the previous year, and by 3,069 the number in the third quarter of 1874.

The excessive mortality is mainly attributable to the prevalence and fatality of scarlet fever, which disease destroyed not less than 1,427 persons; the words "not less" are introduced advisedly, for there can be little

doubt that very many deaths resulting from scarlet fever have been returned under the head of dropsy, a very common sequence of the scarlatinal poison.

The wave of scarlet fever broke with unequal force over the four provinces. Ulster suffered most, having lost 812 persons; next in order came Leinster, where 442 deaths occurred; then in Connaught there were 104 deaths, and the remaining 69 deaths took place in Munster.

During the first quarter of the year scarlet fever killed 760 persons; in the second quarter 731; in the third quarter 976; and as before stated, in the quarter under consideration, 1,427; thus making a total of 3,894 victims to this plague.

The report of the Registrar of the Kilrea District, Ballymoney Union, affords further proof, if such were needed, of the very contagious nature of the disease; and is also of great importance in demonstrating the tenacity with which the contagion or *materies morbida* clings to a habitation where scarlet fever had existed. His statement is as follows: "Scarlet fever caused 5 deaths in November. The contagion was brought from Coleraine into the family of a labourer of this town, with whose three young children it rapidly assumed a malignant form, and ended fatally. When the first case appeared the other children were removed from the house, but on their return within a month, they soon caught the disease, though the premises had been lime-washed and thoroughly ventilated."

The Registrar of the Rathcoole District, Celbridge Union, attributes the outbreak of scarlet fever in his district to contagion brought from a distant "wake-house."

Diphtheria caused 173 deaths, of which number 84 occurred in Ulster, 56 in Leinster, 28 in Munster, and 5 in Connaught. In the Coleraine Union there were 10 deaths from this disease, 8 of which took place in the Articlave District, where the total deaths amounted to 29. At Warrenspoint, in the Newry Union, of the 40 deaths registered 11 resulted from diphtheria. The Registrar complains of the sanitary state of the town, stating that "the lanes are overcrowded," and that "there is neither proper sewerage nor a constant supply of pure water."

Whooping-cough proved fatal in 376 instances, against 592 in the corresponding quarter of the previous year. This decrease may in some measure be ascribed to the great mortality amongst children from scarlet fever.

In proportion to the population the mortality from whooping-cough was greatest in Connaught. Of the 97 deaths registered in the Ballyshannon Union, 15 resulted from this disease; and of the 191 deaths registered in the Sligo Union, 18 resulted from whooping-cough. In Glengariff District of the Bantry Union there were registered 14 deaths, and of these 6 resulted from this disease; and in the Tullagh District, Skibbereen Union, 4 of the 14 deaths registered were caused by whooping-cough.

Fever was the cause of 634 deaths, against 640 in the corresponding quarter of the year 1873, and 705 in the third quarter of 1874. The deaths from fever were, in proportion to the population, pretty equally distributed throughout the provinces.

Small-pox numbered 148 deaths, against 128 in the preceding quarter, and 72 in the fourth quarter of 1873. Of the deaths from small-pox 108 occurred in the province of Connaught, 39 in Ulster, 1 in Munster, and none in Leinster.

In the Swineford Union 53 of the deaths took place. The Registrar of Kiltamagh District in that Union, states that 19 of the 46 deaths registered by him were caused by this disease, and further adds that the disease "is still making its ravages in the district, owing in a great extent to the practice of inoculation."

Irish Poor-Law Intelligence:

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

NORTH DUBLIN UNION.

THE DISPENSARY MEDICINES.

A LETTER was read from the Local Government Board in reply to an inquiry as to the requisitions for medicines, and for the information of the guardians the Board now stated that by the 26th Regulation the medical officers were the proper persons to sign the estimates for medicines, and were required in duty to do so by the Regulation referred to, but that in cases of urgency the estimates might be submitted by the committee to the Board of Guardians.

A discussion followed as to the cost of these items and the general treatment and privations of the poor, in the course of which Mr. Reilly stated that not even during the small-pox epidemic was the suffering or mortality amongst the poor so great as during the present winter, owing probably to the cold and severity of the weather. It was certainly, he said, the hardest season upon the unfortunate indigent population of the city that he could remember.

ALLEGED DISCREPANCIES IN THE MEDICINE ACCOUNTS.

The Clerk reported that he had discovered, in going over the tenders for the supply of medicines, and the bills of the contractors who had supplied them, that certain contractors (named) supplying several dispensaries, had been charging and were allowed 7d. per lb. for cod-liver oil, while their tender was 6d. per lb.; and that they had been charging and were allowed 4½d. per lb. for castor-oil, while their tender was 4d. per lb. He (the Clerk) said that it was not his business, but so far as he had looked these charges seemed to run through all the bills for medicine, and to have been going on since the month of May last.

A Guardian asked whose duty it was to check off the bills and see that they were right before payment was made?

The Clerk replied that it was the duty of the dispensary doctors, and he had himself always forwarded to the doctors for their guidance, at the beginning of each new contract, copies of the tenders approved of, so that they might fall into no oversight or mistake.

Mr. Fitzsimon—Whoever passed the bills should be sharply reprimanded, and the contractors ought to be called upon to refund the money overpaid.

Mr. Tickell said that little matters of this sort might give an insight into the discrepancies between the charges for medicine in the dispensaries of the North and South Dublin Unions. He had himself called attention frequently to these differences, and showed that while there were eleven thousand more tickets issued in the year at the south side than here the cost of the medicines and appliances was only something over £200 in the South Union, while in the North Union the cost was £880, with so many thousand less

patients. These figures were so glaring that it was difficult to understand them; and although the doctors had been called upon for an explanation, and the Local Government Board requested to order a sworn investigation, the latter body, as usual, stood up for the former, and the matter was neither explained nor investigated. Just when the matter was over the present circumstance came to light, and now confirmed him in his original opinion that they were paying very much more than they ought to pay under this head in this union; and one of the cleverest doctors in the city had told him that the sum paid at the south side ought to have been adequate for any amount of medicines they required here. It was well known that doctors had it in their hands to make the position of contractor for medicines too hot for any man if they thought proper, because they could order expensive medicines which could only be supplied at a loss. He thought their claims upon the Local Government Board for a sworn investigation now were stronger than ever, and he therefore suggested that their attention should be called to the circumstances in the overcharge for medicines, which should have been checked by the medical officers, and that their attention should also be called to the necessity for an inquiry in reference to the medicines, as before requested.

Mr. M'Court said he should be glad to move such a resolution, and having done so,

Mr. Tickell seconded it, and it was carried unanimously.

THE MEDICINE CONTRACTS.

The Local Government Board, referring to the guardians' resolution of the 24th ult., calling attention to a discrepancy or overcharge made by the contractors for medicines to the union, alluded to in the clerk's report, stating that the accounts should have been checked by the medicinal officers and apothecaries, and requiring an inquiry into the costs of medicines of the North City Dispensary district as compared with the cost in the South City Dispensary, stated: "As regards the examination of the accounts furnished by the contractors for the supply of medicines, the Board desire to point out that by the dispensary regulations, article 21, clause 7 ('Compendium,' p. 884), the medical officers are only required to compare the medicines delivered at the dispensary with the invoice relating thereto. It forms no part of their duty to check the prices charged in the contractor's bills. This is the duty of the clerk of the union. The clerk is responsible for ascertaining the correctness of the charges, and for that purpose is to cause examination to be made of the medicine bills, and to compare the prices charged with the prices in the contract, and to act with respect to bills for medicines in the same manner as he would act with any account presented to the guardians for payment. If the contractor places the contract price opposite the items charged for in his accounts, as he ought to do, there can

be no practical difficulty in their examination by the clerk and his assistants, and if the contractor does not affix the numbers he should be required to do so, and the accounts be returned for that purpose. With respect to the two items of overcharge or discrepancy which have been pointed out to the clerk, according to his report of the 24th ult., the contractors should be requested to furnish any explanation they may be able to afford, and the guardians will then be in a position to consider the matter. With regard to the request for an inquiry as to the cost of medicines in the North City Dispensary District as compared with the cost in the South City Dispensary District, the Board have to observe that the cost of each patient in the North City is considerably below the average of Ireland, although it is very much above the cost in the South Union City Dispensary District—namely, 6½d.; all Ireland, 8½d.; South City District, 1d. each patient for the year ending 1874. But it is also remarkable that while in the South City District the average cost per patient has remained nearly the same during the last ten years, the average cost in the North City District has nearly doubled. Under these circumstances, the Local Government Board will cause inquiry to be made into the cost of medicines in the North and South City Dispensary Districts, to endeavour to ascertain whether there has been undue expenditure of medicines in the North district, or insufficient use of them in the South district.

BOYLE DISPENSARY.

At an extraordinary meeting of the Committee of Management convened for the purpose of electing a properly qualified medical officer for the Boyle No. 1 district, in room of Dr. J. B. Fry, resigned, at a salary of £120 per annum, exclusive of registration and vaccination fees.

Mr. Hackett—Gentlemen, I submit no candidate be put forward who does not appear. He might be blind of an eye which would be very objectionable in a doctor.

Dr. Palmer and Dr. Fitzgerald were proposed, and these being the only candidates who attended, a poll was taken, and the voting was as follows:—

For Dr. Fitzgerald, 12; for Dr. Palmer, 12.

The voting being even, Mr. Hackett proposed an adjournment, but this proposition was not seconded.

It was here announced that Major Ffolliott was coming up to vote.

Mr. A. S. Kirkwood—Oh, no. The meeting is adjourned.

Captain King-Harman—If you move that I will move for a fresh poll, and I do not like to do so. I will take the Chairman's ruling on it.

Mr. A. S. Kirkwood said it would be very irregular to take Major Ffolliott's vote under the circumstances.

Mr. T. Y. L. Kirkwood quoted an instance which occurred in the case of his brother and Mr. Crofton as candidates for the grand jury secretaryship, in which a gentleman came in after the poll was declared and voted. Legal proceedings having been taken it was found that what had occurred was all right.

After some discussion it was proposed "That Major Ffolliott's vote be taken."

It was put to the meeting when a majority appeared in favour of the resolution.

Major Ffolliott then recorded his vote for Dr. Palmer, who was declared elected by a majority of one.

From observations dropped it would appear that the question will be raised as to the legality of this election.

WORKHOUSE MILK.

At the Antrim Petty Sessions, William Harper, a farmer, was summoned for selling a quantity of adulterated sweetmilk.

The defendant had been supplying the Guardians with milk, and several complaints had been made to him about the inferior quality, but without effect. A reduction was made in defendant's milk account, to which he paid no attention. A sample of the milk was afterwards sent to Dr. Hodges for analysis, who certified that it was adulterated by the addition of 30 per cent. of water. It gave only 3 per cent. of cream, and the bond said it was to give 8 per cent. The magistrates were of opinion that the case was clearly proved, and that the adulteration had been very serious. They came to the conclusion to fine the defendant in the sum of £5, and £6 16s. 6d. the costs incurred in the prosecution.

LIMERICK UNION.

PAY PATIENTS IN WORKHOUSE HOSPITALS—THE CONSTABULARY AND COUNTY INFIRMARIES.

MR. DELMEGE called attention to the necessity of establishing a paying ward in the hospital. A few days ago he met a grand funeral procession on the road—a hearse with four horses and plumes, and a number of mourning coaches following—and on inquiring who was dead, he was told that the funeral was that of a person who had died in the workhouse hospital. (Expressions of surprise.) The friends of this party were quite able to pay, and he thought an end should be put to such a state of things.

Mr. Bourke, Local Government Board Inspector, said that in connection with this subject he had a letter from the County Inspector of the Constabulary, asking if sick constables could be accommodated in the hospital, as the County Infirmary was now shut against them—(hear)—in consequence of the Grand Jury having refused to pass a presentment for its support. He doubted the propriety of taking in paying patients, which would involve the necessity of providing fresh accommodation, and the services of new officers, nurses, &c., &c.

After considerable discussion the guardians declined to entertain the question of admitting sick policemen for the present, or opening a paying ward.

Adjourned.

MEDICAL EVIDENCE AT INQUESTS.

TO THE EDITOR.

DEAR SIR,—Some time since I saw in your valuable journal the clauses which the Irish Medical Association are endeavouring to get inserted in the "Coroners Act" now before Parliament. The amendments proposed are admirable *per se*, but should be guarded with the proviso that the coroner must, in all cases in which a regular inquest is held by him (or two magistrates), have medical evidence, &c., tendered. Otherwise I am afraid the proposed changes will act injuriously on the profession. At present some coroners are slow enough in calling for medical evidence (I know of a late suicidal case where I believe the coroner had no medical evidence); but when the doctor can demand his fee and travelling expenses on the termination of the inquest, it is not unreasonable to suppose that his services will be dispensed with as often as possible. Moreover, there should be some provision in any amended act obliging the coroner to have some regular mode of summoning the medical witness, and not have his presence depend, as it must often now, on the fact of his proximity to the inquest, the amount of friendship of the coroner or the police, the fleetness of some messenger, or his own shrewdness. Hoping the publication of these few suggestions will tend to have the desired effect in the proper quarter, I am, dear Sir,

Your obedient servant,

DISPENSARIUS.

BALLINA UNION.

SMALL-POX.

On the Relieving-officer's book appeared a poor family residing at Carrower, four of the members of which were afflicted with small-pox, and to whom he had given 10s. 6d. in kind.

Dr. Nolan said that those four persons lay on a floor, in a filthy cabin, and could not be removed.

The Relieving-officer said the old woman attending the children came to town for the supplies, and was in danger of spreading the disease.

Dr. Thompson—These persons won't tell of the disease till the persons are too sick to be removed.

Mr. Joynt—You must continue the outdoor relief till the children are well.

Relieving-officer—It ought to be given in money, so as to prevent the woman coming into town, as she will be able to buy milk and meat in the locality.

Mr. Crean said the board had very little information about the state of health of either of the two districts of the union. He was aware that small-pox was very prevalent, and had crossed over the boundary of this union, as he was informed. It would be very important if this board could be advised of the certainty of this, or to the extent to which small-pox existed in the union, that steps might be taken to arrest, if possible, its progress, and save life. He had heard of 24 or 25 deaths from small-pox in one locality, and yet there was no official information.

Mr. Scott—That is not in this union.

Mr. Crean—The disease is spreading into this union, and the relieving-officers are not doing their duty when they do not ascertain the facts about it and report to this board.

THE PROMISCUOUS ISSUE OF RED TICKETS.

MR. BENTLEY, of the North Dublin Union Board of Guardians, has taken action upon this subject, which does him honour, and has elicited an important correspondence in the columns of *Saunders's Newsletter*. "One who has

devoted some attention to the subject" writes as follows:

The issue of dispensary tickets in Ireland is utterly indiscriminate; it is in the hands of the members of dispensary committees, wardens, and relieving officers, numbering in all some 30,000 persons; it does not even stop there. They very often depute the very members of their household, shop assistants, &c., to issue tickets, sometimes leaving blank books signed, very often not even going to that trouble. In country districts the status of the recipient of tickets for dispensary medical relief is generally very well known to the issuer of the ticket. In those districts, however, guardians of the poor occasionally issue tickets for themselves or members of their families, and it has been ruled by the late Poor-law Commissioners that the medical officers cannot even demand a fee. It is very difficult, it is true, to draw the line as to whom medical relief should be given or not, for the man earning £2, or even £3 a week, and living up to his means, might in two or three weeks of sickness be reduced to penury. However, it is well known that the system of indiscriminate issue of dispensary tickets in Ireland exists extensively. It surely is possible to draw the line somewhere. The Medical Charities Act was decidedly not intended either to injure the ratepayers, of the medical officers, or to demoralise the poor; yet, to a certain extent, it has this threefold action. In the first place, the cost of medicines to the various unions and dispensaries in Ireland is considerably over £30,000 a year; in fact, it amounts to more than one-fourth of the salaries paid to the medical officers. This is due in a great measure to the indiscriminate issue of dispensary tickets. For medicine alone the average cost of each ticket throughout Ireland is about 8d. If I might be allowed to make a suggestion it would be this, that the various boards of guardians should order the relieving officer to investigate every case in which the doctor asked for the cancellation of the ticket, report upon it, and if the persons were able to pay, either proceed against them or against the issuer of the ticket for payment for the medicines and such a fee for the doctor as might be arranged by them. This, in my opinion, would require a short Act of Parliament.

Another correspondent, who signs himself "Fair-Play," says:

In London, where similar dispensaries to ours have been established, the relieving officer issues the ticket. In large towns I cannot see what objection there could be to make this change, because it is notorious the system is much abused, to the detriment of the medical officer, who, as Mr. Bentley properly remarked, was only paid for attending to the sick poor. I do not for one moment state that guardians or wardens intentionally sign tickets for those who never were intended by the Medical Charities Act to obtain such relief. Experience and common sense tells me that if a guardian's place is inundated with twenty or more applicants of a morning for tickets, said guardian looks upon the duty as irksome, and, pressed by other responsibilities, he fills in the tickets or instructs his assistants to do so. How can a guardian or warden know the circumstances of such applicants? In a large city like Dublin it is quite a common practice to send ragged children to apply for tickets. Dispensary medical officers in Dublin are obliged frequently to attend people of the classes I am about to enumerate—viz., engine-drivers, engine-fitters, bricklayers, cabinetmakers, printers, clerks, and, not to be tedious, a number of persons earning from their calling far more than many a country curate, with not one-half of the clergyman's expenses.

THE following circular has been addressed to Treasurers of County Infirmaries in Ireland:—

"Dublin Castle, 22nd March, 1875.

"Sir,—I am directed by the Lord-Lieutenant to transmit to you the annexed copy of an order of the House of Commons, dated 9th inst.; and with a view to the preparation of the return therein required, I am to request that you will be so good as to fill up and transmit to this office at your earliest convenience the enclosed forms, giving the required information so far as relates to the county infirmary of which you are the treasurer.

"I am, Sir, your obedient servant,

"T. H. BURKE."

The return required to be set forth the total amount of voluntary subscriptions to the infirmary from the year 1836 to 1874, both inclusive; and the average number of patients relieved in the county infirmaries throughout Ireland since 1860, giving the yearly average, the amount of voluntary subscriptions for the use, support, and maintenance of the county infirmary or hospital for each year from 1860, distinguishing between life and annual subscriptions; the governors or members of the bodies corporate having control over the county infirmary.

PRESENTATION TO DR. T. H. SCOTT, OF DROMORE WEST.

On the removal of the above-named gentleman from Achill, some months since, a committee was formed for the purpose of presenting him with a memorial of the esteem and regard in which he was held during his long residence in Achill. On Tuesday last the presentation was made at a meeting of the committee and subscribers, held at Dugort, and consisted of a valuable piece of silver plate, bearing the inscription:—"Presented to T. H. Scott, Esq., M.D., by his friends in Achill, 1875." There was a large bonfire and other demonstrations of pleasure at the visit of Dr. Scott, who is very popular in Achill.

THE charge made against Dr. Ryce, a medical officer of the Listowel Union, for neglecting to attend to a man named Doran who had died, has fallen through. A meeting of the dispensary committee of Ballylongford was convened for the investigation of the charge made by the sons of the deceased; but these young men seem to have thought it prudent not to go into the matter, and consequently absented themselves. Dr. Ryce offered a vindication, but the meeting decided it was unnecessary, those who made the charge not having pressed it.—*Limerick Chronicle*.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF MARCH, 1875.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING APRIL 2, 1875

Total registered deaths in Dublin and suburbs *	182
Ten years average of same week	202
Mortality above average	90
Ratio of deaths, suburb of Rathmines	27 per 1,000.
" " " Donnybrook†	29 "
" " " Blackrock	22 "
" " " Kingstown	25 "
" " " Entire Dublin district	30 "
COMPARATIVE RATIOS—London	28 "
" " Glasgow	30 "
" " Edinburgh	22 "

The number of deaths registered from zymotic diseases was 30, including 6 from scarlet fever (2 of the deaths from scarlet fever occurred so far back as the month of August last year), 5 from fever—viz., 3 typhoid, and 1 each simple continued and cerebro-spinal fever, 6 from croup, 3 from diarrhoea, 3 from erysipelas, 1 each from quinsy and influenza, &c.

In the Belfast registration district 13 deaths were referred to measles, 9 to scarlet fever, 4 to diarrhoea, 3 to whooping-cough, 2 to fever, and 1 to diphtheria.

In the Dublin district 9 children died from convulsions. Bronchitis proved fatal in 35 instances, and pneumonia in 8, laryngitis in 1, and lung disease unspecified in 2.

Apoplexy caused 2 deaths, paralysis 3, cephalitis and epilepsy 1 each, brain disease unspecified 3, heart disease 11, aneurism 2, liver disease 1, Bright's disease 2, and kidney disease unspecified 4.

Twenty-four persons died from phthisis, 8 from hydrocephalus, 3 from mesenteric disease, 1 from scrofula, and 2 from cancer.

Four deaths resulted from accidents, and 1 was suicidal.

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Irish Poor-Law Intelligence:

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

BALLINA GUARDIANS.

DR. THOMPSON'S SUPERANNUATION.

THE Clerk read a sealed order received from the Local Government Board fixing Dr. Thompson's superannuation at £100 per annum.

REMOVAL OF SMALL-POX PATIENTS.

The Clerk stated that last board day a communication had been read from Relieving-officer Edwards, which was directed to be sent to Mr. Mitchell, R.M., for his explanation. The communication and reply are as follows :—

Ballina, 10th April, 1875.

GENTLEMEN,—I have the honour to report that on the 5th inst. I was informed that a case of small-pox had appeared in a house in Chapel Lane, Ardnaree. I forthwith went there, and without delay offered medical relief by the issue of a red ticket. The friends of the patient (a child of 12 years) refused to permit me to remove the case into the hospital, and a certificate was therefore obtained from the dispensary medical officer, upon which to ground a justice's order for the compulsory removal of the sick child. I took the certificate to the resident magistrate, to whom I also pointed out the Act of Parliament bearing on the subject. He declined to make an order, but advised that conciliatory persuasion should be tried. The result is that on the 7th inst. an application was made for the admission of the case into hospital, but it was too late, the disease having assumed so serious a type as to make removal—without danger to life—impossible.

I am, gentlemen, your obedient servant,
C. EDWARDS, R.O.

Ballina, April 16, 1875.

SIR,—Having received the enclosed communication from the Clerk of the Ballina Union, by direction of your Board, I beg to state that the jurisdiction of a justice of the peace is limited to cases where there is not sufficient lodging or house accommodation; and in that referred to, the relieving officer informed me (a fact which has been singularly omitted from his report) that he had no fault to find with the house accommodation of the patient. I accordingly told him I was powerless in the matter—directing his attention at the same time to the provision of the Act, in which view he seemed to acquiesce. I then suggested—as the only possible means—conciliatory measures to be adopted, and I am accordingly at a loss to understand the object or meaning of the enclosed report.

I have the honour to be, Sir,
Your most obedient servant,
A. M. MITCHELL, Resident Magistrate.

Chairman—I suppose the board is satisfied with Mr. Mitchell's explanation.

Mr. Joynt—Quite satisfied.

Chairman—Will the correspondence go on the minutes?

Mr. Bourke—I would say not. Mr. Mitchell is always disposed to do his duty efficiently. In future, however, I would not be over-scrupulous in a case of small-pox, but have the person removed if possible to hospital, as a means of resisting the disease and checking it.

Dr. Macnamara—It is the safer course.

Mr. Bourke—Isolation in a case of the kind is considered, I believe, the best means of checking the disease.

SUDDEN DEATH OF DR. ROBERT P. RUSSELL, J.P., OF CASHEL.

THE *Clonmel Chronicle* records the death of this esteemed and distinguished physician, which sad event occurred on Wednesday evening, near Cashel. The immediate cause of his unexpected demise was disease of the heart. For some few minutes before, while seated in his inside car, the doctor was engaged in giving directions to one of his labourers, when suddenly his head fell forward, and he ceased to exist. Upon the intelligence reaching Cashel, nothing could equal its painful effect upon the entire community. Several medical gentlemen hastened to Gortnakellis, but on their arrival they found that Dr. Russell had been some time dead. The deceased was for thirty-four years principal surgeon of the county infirmary, and for his skill in surgical operations, as well as in every branch of the medical profession, had earned the highest reputation. His practice amongst the gentry of the county was very extensive, by all of whom he was esteemed for his straightforward principle, his honesty of purpose, and kind-heartedness. His services were ever at the disposal of the poor, whom he attended with as much assiduity as his richer patients. In many an humble home they are suddenly called to mourn the loss of a true friend. By rich and poor alike his death is deplored—all sorrowing as if they had lost some near and dear friend.

VOTE OF CONDOLENCE—CASHEL BOARD OF GUARDIANS.

At the weekly meeting held on Thursday it was resolved—"That out of respect to the memory of the late lamented Dr. Robert Potter Russell, who was for many years a member of this Board, that we do now adjourn; at the same time, before separating, we desire to express our deepest sympathy with his sorely bereaved family and friends, and to place upon record the feelings, which we know to be universal, that not only this Board, but every other public institution with which he was connected, has received an irreparable loss, and the community of the whole county have to lament the loss of one of the ablest physicians and surgeons known in it at any time, while thousands mourn a kind and sympathetic friend. We desire that our clerk will send a copy of this resolution to the family of the late Dr. Russell."

CARNEY DISPENSARY DISTRICT.

ELECTION OF A MEDICAL OFFICER.

At an extraordinary meeting of the committee of management for this dispensary district Dr. John A. Spencer, of Dungloe, was elected to the office of medical officer of the district in the room of Dr. Popham, appointed medical officer of Bantry Workhouse.

FEEES TO A LOCUM TENENS.

Mr. Kerrigan said he received a letter from Dr. Kerr, stating that he would accept the post at two guineas per week, but asking to be allowed car hire in addition.

Mr. Barber was against giving more than the two guineas, on principle. That was the amount always paid.

Dr. Hamilton—They pay three guineas in other places.

Mr. C. G. Jones—We never heard of it in this part of the country.

After some discussion, it was found that as the present meeting was called for a special purpose, nothing could be done with regard to this matter; but it seemed to be the feeling of the meeting that the doctor should be paid 50s. a week, to include car hire expenses.

The following resolution was unanimously adopted:—

Resolved—We cannot separate on this occasion without giving expression to our feelings in reference to Dr. Thomas Popham, our late medical officer. We are unanimous in saying that no man could have performed his duties in a more satisfactory manner—his devotion to his profession was great, and his kindness and attention to the sick poor was all that we could have desired. We wish both him and Mrs. Popham all happiness in their new district.

BALLYROAN DISPENSARY.

A MEETING of the committee of management of the above dispensary district was held for the purpose of electing a medical officer in the room of Dr. O'Kelly, appointed to Ballyragget.

There were five candidates for the appointment of medical officer.

Dr. Edge proposed Dr. Walsh.

The Chairman said that it was a condition that whoever was appointed should live in Ballyroan. He would hold to the rights and privileges of the people, and for twenty-four years the medical officer of that district had to reside in the town.

Dr. Walsh came before the committee and said that he would, if elected, reside within half a mile of the dispensary house.

The Chairman proposed Dr. Charles D. Moutray.

Dr. Edge said that where a man or a woman was sick they should provide the best doctor. In fact, if they could get a Dr. Jacob or some equally eminent man they should try to secure him.

Finally Dr. Walsh was elected by eight votes against two for Dr. Moutray. No other candidate was proposed.

CLAREMORRIS UNION.

A LETTER was received from the Local Government Board acknowledging receipt of minutes of proceedings of the Board of Guardians of the 21st ult. with regard to the resolution of the dispensary committee of the Ballyhaunis dispensary district relative to Dr. Crean's refusing to attend the *employés* of the Midland Great Western Railway Company. The Local Government Board had to point out that the circumstances in no way exonerated a medical officer from affording medical relief to poor persons in his district who came provided with a ticket.

The letter was marked "read."

DEATH OF DR. ARMSTRONG, OF COLLOONEY.

It is with deep regret that we have to record the demise of this gentleman at a comparatively early age. He expired on Friday at his residence, after a brief illness—an illness which he contracted in the discharge of his duty as dispensary doctor. Dr. Armstrong was a young surgeon of much promise, whose zeal and devotion to his profession, and whose kindness and attention to the poor were well-known. He was beloved and respected by all who knew him, and his death has been a great source of regret to his many friends. For his young widow the greatest sympathy is entertained.—*Sligo Independent*.

TULLAMORE UNION.

TULLAMORE DISPENSARY COMMITTEE.

At an extraordinary meeting of the committee, held on Saturday, 17th inst., a letter was read from Dr. Ridley, medical officer of the district, tendering his resignation of the office owing to ill health.

It was resolved: "That it is with sincere regret we have learned from Dr. Ridley that, owing to impaired health, he is obliged to retire from the office which he so long held; his resignation be now accepted, and that the committee will proceed to appoint a successor on Tuesday, the 4th day of May next, at a salary of £100 per annum, together with £25 a year as sanitary officer, but exclusive of vaccination and registration fees."

It was also resolved: "That, Dr. Ridley having tendered his resignation as medical officer of the Tullamore dispensary district—the duties of which he has discharged for a period of twenty-three years—we, deeply regretting the necessity (in consequence of declining health), desire to place on record our acknowledgment of the attention, skill, and charity with which he has uniformly discharged the trying and onerous duties of that office—especially during the outbreak of cholera and other epidemics which had fallen during that time on our town and district; and likewise to offer to Dr. Ridley and his family our sympathy, and the expression of our hope that the release from these heavy duties may give him renewed health and the enjoyment of many years of an active and useful life."

SLIGO DISPENSARY.

THE APOTHECARY.

A SPECIAL meeting of the Committee of Management for this dispensary was called together to consider the resignation of Dr. Devany.

Some discussion followed with regard to the amount of salary which would be given—Dr. Devany being in receipt of a salary of £80 a year.

Mr. Rowlett at some length contended that it would be better for the interests of the sick poor to divide the apothecary's salary between the two doctors, who should be then called on to compound their own prescriptions. He said that if their apothecary practised privately he might be in the country when he would be required to compound a prescription.

Mr. Tighe—If you prohibit him from practising you will have to give a larger salary.

Dr. Tucker declined to take upon himself the duty of an apothecary. In every large populous place, like Sligo, there is an apothecary attached to the dispensary. The Commissioners had laid it down for the last twenty years.

It was agreed that the salary should be £90 a year, and that things should go on in the usual way.

BOYLE UNION.

A LETTER was read from the Local Government Board expressing their approval of the appointment of Dr. Thomas W. Palmer as medical officer of the district, at a salary of £120 per annum.

Resolved—"That the sum of £15 per annum be allowed Dr. Palmer as sanitary officer for Boyle No. 1 District, and £10 per annum be allowed Dr. Blakeney as sanitary officer for Ballinameen Dispensary District."

Passed unanimously.

ABBEYLEIX DISPENSARY.

A MEETING of the committee of management of the above dispensary district was held at Abbeyleix, for the purpose of electing a medical officer in room of Dr. Swan, resigned.

Applications for the appointment were received from Dr. Palmer, Rathdowney; Dr. Buckley, Dr. John H. Andrews, ClonghJordan; Dr. Curtin, and Dr. Stoney, medical officer at Durrow.

Mr. Staples proposed Dr. Stoney, and Mr. Marsh seconded the nomination.

There being no other candidate formally proposed, Dr. Stoney was declared unanimously elected.

SLIGO UNION.

RESIGNATION OF THE MEDICAL OFFICER.

THE Chairman read a letter from Dr. Powell tending his resignation as medical officer to the Sligo Workhouse.

The following resolution was moved and unanimously adopted:—

Resolved—That we sincerely regret the circumstances under which Dr. Powell has resigned office under this board, the duties of which he at all times—over a long period—discharged with zeal and assiduity, and to the entire satisfaction of this board.

The following resolution was also adopted unanimously:—

Resolved—That Dr. Devany be appointed *locum tenens* in room of Dr. Powell, who has been obliged to resign through ill-health.

Mr. P. O'Connor handed a notice that on that day six weeks he would propose that the application of Dr. Powell for superannuation should be considered.

CORRESPONDENCE.

TO THE EDITOR.

SIR,—Having, as requested by the Association, undertaken the office of Hon. Treasurer, allow me to remind your readers that subscriptions are absolutely necessary to carry on the printing of circulars and communications throughout the country. The energetic Hon. Secretary, Dr. Chapman, has sent out something like 1,000 circulars and copies of amendments of the proposed Coroners Bill, to be introduced early next month, the average cost to each member being about 2½d., to say nothing of the Hon. Secretary's great trouble; yet strange apathy, as I suppose it is, or possibly hopelessness, not half-a-dozen brethren have sent a hint or made a suggestion as to possible improvements in the present law, or have furnished any data supplying information, and this solely concerning their own benefit and improvement, social and financial. I would ask those who wish to subscribe 10s. 6d. per year, and to become members of the Association, to send me their subscriptions for this year, to defray such necessary expenses as I have mentioned, and if they will not subscribe, to oblige by spending ½d., in return for the 2½d. expended by the Association in giving them information, by sending a post-card saying "No" to

Yours truly,

J. MORGAN, Hon. Treasurer.

23 St. Stephen's Green North, Dublin.

RED TICKETS.

TO THE EDITOR.

SIR,—I see by the last issue of your valuable and influential journal that the indiscriminate issue of "red tickets" is just now engaging a large share of public attention. I think it is entirely in the hands of the "Local Government Board" to rectify this anomalous state of affairs, alike galling to the struggling Irish ratepayer and at present a systematised means of persecuting that wretchedly underpaid and overworked official, the Irish dispensary doctor. Here the shopkeeper and his assistants, the tenant farmer and the national school teacher, have a ready weapon at hand to annoy the doctor if any pique exists, or for the purpose of showing how the committeeman or warden can order that official by night or day, and in all weathers, in search of a patient throughout his district. Did I say patient? In many cases it is a healthy child, whose parents or guardians have had locomotive means to fetch their darling to the dispensary, or it may be a case where all is wanted is a proper supply of wholesome food. In many cases the committeeman or warden, when asked for a black ticket, may say to the applicant: "Why not get a visiting ticket, and bring the doctor to the house?" thereby exhibiting his importance to the peasant at the expense of the unfortunate doctor. I will conclude by asking one simple question: How is it that the "Local Government Board" and the "Board of National Education in Ireland" allow even a single instance of a national teacher being a warden in any district, thereby constantly interfering with highly important duties for which he is paid, and moreover obliging him to conciliate the parents and guardians of his pupils by giving the required tickets?

Your obedient servant,

DISPENSARIUS.

TO THE EDITOR.

SIR,—Will you kindly inform me in your next issue if the servants of gentlemen of property, and such like, are entitled to dispensary medical relief?

Yours, &c.,

M.D.

[It will be gratifying to our correspondent to learn that under the Regulations the "gentleman of property" himself is legally entitled if he holds a ticket, until the ticket is cancelled.—Ed. I. M. A.]

TO THE EDITOR.

SIR,—About two months ago you intimated that the Irish Government had drawn back from the prohibition they had put upon Irish medical men holding the Commission of the Peace, and had appointed Drs. Carson and Sharpe, of Coleraine, to the Magistracy; and you advised that other medical men who had previously been refused such appointments should have their names submitted to the Lord Chancellor for approval.

Acting on this advice, some gentlemen who last year forwarded a memorial to Sir Thos. M'Clure, Bart., Lieutenant of Down, in favour of Dr. Stuart, of Donaghadee, again addressed him, respectfully urging that Dr. Stuart's name should be submitted to the Lord Chancellor for his approval, at the same time directing his attention to the circumstance of two similar appointments being made in Coleraine as an evidence that the former *velo* had been removed. This Sir Thomas declined doing, on the ground that a magistrate must be an *ex officio* Poor-law guardian, and as such could not be a dispensary medical officer, and refused to be convinced that an individual might be a magistrate without being a guardian! This, nevertheless, is the fact, for in the same petty sessions district there are two *clergymen* magistrates who are not *ex officio* guardians.

Could you or any of your correspondents say whether any Irish medical men who hold the Commission of the Peace are paid officials under the Poor-law?

CORRESPONDENT.

REPORT OF HEALTH OF DUBLIN AND SUBURBS. FOR WEEK ENDING APRIL 16, 1875

Total registered deaths in Dublin and suburbs * ... 170
Ten years average of same week 177

Decrease below average 7

Ratio of deaths, suburb of Rathmines ... 17 per 1,000.

" " " Donnybrook † 41 "

" " " Blackrock ... 22 "

" " " Kingstown ... 20 "

" " " Entire Dublin district ... 28 "

COMPARATIVE RATIOS—London ... 25 "

" " Glasgow ... 30 "

" " Edinburgh ... 24 "

Twenty deaths from zymotic diseases were registered, including 3 from fever—1 each from typhus, typhoid, and simple continued fever—3 from diarrhoea, 2 each from scarlet fever and influenza, 1 each from whooping-cough, croup, &c.

In the Belfast registration district 9 deaths from measles, 9 from scarlet fever, 3 from diarrhoea, and 2 from fever, were registered.

In the Dublin district 12 children died from convulsions. Twenty-seven deaths resulted from bronchitis, 14 from pneumonia, 1 from asthma, and 2 from lung disease unspecified.

Five deaths were attributed to apoplexy, 4 to paralysis, and 8 to brain disease unspecified.

Heart disease proved fatal in 9 instances, aneurism in 1, liver disease in 2, and kidney disease unspecified in 1.

Phthisis caused 22 deaths, hydrocephalus 2, and cancer 2.

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

THE CORK GUARDIANS AND THEIR MEDICAL OFFICERS.

A MEETING of the medical profession in Cork was held last week to protest against the late resolution of the Board of Guardians in reference to substitutes for dispensary medical officers.

On the motion of Dr. Harvey, the chair was taken by Dr. Edward Townsend, sen.

The Chairman said they were all aware of the reason they were assembled, to vindicate the integrity of their profession (hear, hear). He called upon

Dr. D. C. O'Connor, who proposed the first resolution, as follows:—"That having read the resolution passed at the last meeting of the Board of Guardians in reference to the payment of substitutes for dispensary physicians who may be affected with illness, and having observed that the necessity for this resolution was founded upon disbelief in the assertions of the medical officers themselves, and in the truth of the medical certificates, we hereby repel in the strongest manner this charge against a body which has hitherto stood in such friendly and honourable relations with the public." He said the resolution well expressed the object of their meeting—to repel, namely, in the strongest language they could use with respect for their own character, the insinuation conveyed not only in the resolution of the Board, but in the observations made by several of the members (hear, hear). They did not stand here upon the old-fashioned idea of professional dignity. He was sorry to say all class privileges appeared to be passing away in this age. They simply stood here as honest men to say they were as incapable of telling an untruth or of putting their names to a falsehood as any persons in this city. Let them look to the frivolous pretext for passing this offensive resolution. It appeared that one gentleman who got a certificate of delicate health, disabling him from attending to professional duties, public or private, was summoned to Dublin to give evidence on an important trial. Some of them that were grown old in the profession remembered what they were in early days, their ardour, their earnestness to get professional work, how they passed their nights in a garret, or perhaps on the cold floor of a hovel, performing professional duties irrespective of contagion and regardless of money consideration, simply anxious that they should be making some advance in the profession to which they had devoted their lives, and in which all their hopes of a future position in life depended—the gentlemen now slandered in the way they had been were just in that position, and he could not imagine anything so hurtful to a man who had a wife and children as to say that that man would loiter at home idly for the mere purpose of getting a substitute paid out of the workhouse rates. He only hoped this Board of Guardians would erase the blot they had put upon their reputation by this resolution—a resolution that was as childish as it was offensive. That Board contained in its body some of the most respectable citizens of Cork and gentlemen of the

county, and he was quite sure they would see the justice of retracting this resolution (applause).

Dr. Wm. Townsend, in seconding the resolution, expressed his astonishment that so outrageous an act could have been committed by the Board, and he deplored very much indeed that a member of their profession, who happened to be in the room, had made no stand against it (hear, hear). It was a shocking thing to think that a body of men assembled there should pass so outrageous a resolution, and he said they indignantly hurled it back in their faces, and told them they would be incapable of the meanness they imputed to them (applause).

The resolution was carried.

Dr. Gregg, in proposing the second resolution, said the Board of Guardians had not only insulted the unfortunate dispensary medical officers, but had also passed an indignity upon the men who gave those certificates, and who were charged with backing up their falsehood. Such an insinuation they most indignantly repelled. He proposed the following resolution:—"That considering it to be the privilege of a physician, as well as of all others when ill, to select his own medical attendant, we deem it unwarrantable for any other physician to intrude, particularly for the purpose of a scrutinising inspection, and we do not believe any physician would discharge so odious an office."

The resolution was carried.

Dr. Harvey proposed the third resolution, which was, he said, of a more business character than the others:—"That we consider the resolution of the Board unjust, inasmuch as if the guardians had the power to carry it out, they would be compelling the medical officer, who has the misfortune to be disabled by sickness, to pay for union work a sum vastly exceeding his liability as a ratepayer. It appears to this meeting that the guardians are altogether unwarranted in attempting to make any individual ratepayer contribute so disproportionately for any emergency which may occur in the working of the establishment. Again we submit the Board have no right to inflict upon their officers this extravagant penalty for one form of sickness more than for another." They could afford to make the guardians a present of their resolution and of their insinuation that the medical officers were capable of a false representation, and that they had medical brethren who would support them in their falsehood. They could well afford to admit it was possible that in any body an individual might occasionally turn up who was unworthy of his brethren, and who would stoop to such an act as this, but he need hardly say how rare such things were, and the parties who had taken up this matter now had only ventured to make insinuations—they had not attempted to give any proof whatever of their charge (hear, hear). He spoke in the warmest terms of the honourable character of dispensary physicians in Ireland, and it was his experience that dispensary officers were oftener taken advantage of by the guardians than the guardians by them (hear, hear). It was a question now for them to consider whether the Board could do this. It struck him that the regulations of the Local Government Board would not bear them out, and he confidently anticipated they would not have the sanction of their superiors in Dublin in their unjust and unreasonable

attempt (applause). He also commented strongly on the injustice of making a distinction between a doctor struck by contagious disease, and one who was disabled by exhaustion or exposure in the service of the Union.

Dr. Tanner, in seconding the resolution, said he only hoped that in this matter they were all unnecessarily alarmed, for he could never conceive, from what he knew of some of the members of the Board of Guardians, that they would be parties to so outrageous a resolution (hear, hear). The man who was capable of giving a certificate that countenanced an untruth would not be tolerated in that profession. Therefore, when the Board reflected on this matter, he was sure they would see the error they had committed, and would withdraw their resolution.

Dr. Hobart moved the last resolution, protesting against the burden attempted to be placed on a body of men who frequently performed their duties when unfit for them, and who individually did more for their fellow-creatures without fee or reward than any other class in the community. In common with the other speakers he protested in the strongest manner against the unjust insinuation made against them singly and collectively as to their giving false certificates.

Dr. Shinkwin, in seconding the resolution, said the speeches to-day showed the feeling of the entire profession, and he hoped if the resolution were not rescinded they would go still further than they had gone to-day (applause).

The resolution was carried.

SLIGO UNION.

THE LATE DR. ARMSTRONG.

MR. R. DUKE proposed that the Board should express their regret at the death of Dr. Armstrong. He proposed the adoption of the following resolution:—

“The Sligo Board of Guardians heard with regret the death of Dr. Armstrong, of Collooney, who for several years was a most painstaking and efficient medical officer under this Board; and we beg to convey to his widow and family our sincere condolence.”

Anyone, Mr. Duke said, who knew Dr. Armstrong, and the district knew what a painstaking medical officer Dr. Armstrong was, how efficiently he attended to his duties and looked after the poor.

Mr. R. Duke—I never heard greater or more universal regret expressed for any man than I have heard for Dr. Armstrong.

Mr. Cogan bore testimony to the manner in which Dr. Armstrong attended to the poor by relating one act he did. He was going on a red ticket to attend a poor woman in her confinement, and on his way he was met by a farmer, who offered him a fee of £5 to go back and see his (the farmer's) wife, but Dr. Armstrong refused the fee, and went on and attended to his poor dispensary patient.

The resolution was put and carried unanimously.

THE ELECTION OF A MEDICAL OFFICER.

There were only two candidates—Drs. Murray and Devany, both of whom sent in their testimonials, diplomas, &c.

The Chairman asked if he would read over all the testimonials of the two doctors.

Several guardians thought it unnecessary.

Dr. Roughan, in reply to the Chairman, said both were fully qualified to hold the situation.

Mr. MacGill—I would ask Dr. Roughan, if we elect Dr. Murray, will the Local Government Board allow him to hold this post along with his two other situations?

Dr. Roughan—I know nothing about what the Local Government Board will do, but I see nothing to prevent Dr. Murray holding this situation.

Mr. Peter O'Connor proposed that Dr. Devany should be elected.

Mr. C. G. Jones proposed the election of Dr. Murray. The Chairman took the votes with the following result: For Dr. Devany, 17; for Dr. Murray, 29.

The Chairman declared Dr. Murray duly elected.

SLIGO DISPENSARY.

A SPECIAL meeting of the Committee was held for the purpose of electing an apothecary.

The Honorary Secretary announced that no applications were sent in by medical gentlemen offering to undertake the duties of apothecary, rendered vacant by the resignation of Dr. Devany.

Chairman—Apothecaries are getting scarce. I believe the examination for an apothecary is so stiff that the gentlemen who pass it have very little more trouble to pass the medical examination.

Dr. Laird—Apothecaries are getting scarce in Ireland.

Chairman—I suppose that we must advertise again.

Dr. Tucker suggested that the advertisement should contain a notice that there were other vacancies in the public institutions of the town. The fever hospital and the jail were vacant, as also there was a likelihood of the asylum wanting an apothecary also.

It was unanimously agreed to add this information to the advertisement which was ordered to be inserted in the newspapers, the election to come off on the 14th of May.

CASTLEBAR UNION.

THE following resolution, drawn up by the Chairman, was passed unanimously:—

“That whereas the practice of inoculation with *variola* matter has been, and is still, producing a terrible epidemic of small-pox in this district; and whereas from the present defective state of the law, it is almost impossible to get a conviction against the inoculators, this Board humbly beg that the Local Government Board will intervene and cause an alteration to be made in the existing Act of Parliament so as to make the parents whose children are inoculated amenable and subject to fine or imprisonment on conviction; this being the only apparent way of stamping out the practice of inoculation, and of ridding this and all other neighbourhoods of the pest by which they are affected.”

Dr. Walshe reported small-pox on the increase around Castlebar. He had visited, within the last fortnight, 14 cases, most of them of the worst or *confluent* form, and most of them traceable to contagion. He had little faith in any preventive measures, however, while inoculation was carried on.

KILKENNY UNION.

A LETTER was read from Dr. Carpenter, of Freshford Dispensary, resigning his appointment, and asking for superannuation. Notice was given to move that Dr. Carpenter be allowed two-thirds of his salary and other emoluments.

BALLINAKILL DISPENSARY.

AN extraordinary meeting of the Ballinakill Dispensary Committee of Management was held on the 24th ult., for the purpose of taking into consideration the appointment of a temporary medical officer for the district, in room of the late Dr. Fitzpatrick.

It was resolved—“That Dr. Thomas P. Walsh be appointed temporary medical officer of the Ballinakill district at the usual salary, in room of the late Dr. Fitzpatrick, and until the appointment shall be made permanent by the election of a medical officer for the said district.”

A VIRULENT form of fever is reported as on the increase in the Nenagh Union. There have been twelve admissions since the 1st of the month. Six were out of one house.

**THE DISCREPANCIES IN COST OF MEDICINE
IN THE DUBLIN UNION.**

NORTH DUBLIN UNION.

The Clerk read a letter, of which the following is an abstract:—

Dublin, 27th April, 1875.

SIR,—The Local Government Board have received the report of their inspector, Dr. King, transmitting the evidence taken at the inquiry made into the cost of medicines during the year ended September, 1874, in the North Dublin Dispensary District. It may be as well to premise that the cost for medicines and medical appliances for each ticket used in all Ireland in the year 1865 was 6½d., but that it now amounts to 8½d., being an increase of 2½d. During the year 1865 the cost for each ticket issued in the North Dublin District was 3½d., but it has gradually increased to 6½d., or nearly double what it was then; whereas the expenditure for the same purpose in the South Dublin Dispensary District has been for the most part a uniform charge of 1d., which it is at present, and there must, it would seem, be some cause to account for the very great disproportion that exists. In the south district 38,301 persons were relieved at a cost of £169; at the same time that 32,490 persons were relieved in the north district at a cost of £885. It has been contended, as a means of accounting for this difference, that in the South Union all the medicines required and used were contracted for, but that in the North Union the medical officers have been in the habit of ordering drugs which were not included in the tender, and which were consequently charged for at a high price, and this statement appears to be founded in fact, and will go some way in accounting for the difference, but not to any great extent. An extract from Dr. King's report relating to the forms of tenders for medicines, variations in the number of drugs contracted for, and difference in the manner of making requisition for medicines in the two unions is enclosed.

It has further been urged that the mode of selecting a contractor in the South Union was superior to that adopted in the North Union. The plan adopted in the South Dublin Union is as follows:—The tenders contain a heading in the columns, "Probable entire quantity required," and a calculation is made as to the cost of the quantity set forth therein at the price tendered for, for all the articles in the list, and then entered in a column headed "Total cost of entire probable quantity." The items in this column are then added up, and the contract given to the competitor whose gross total was the lowest. In the North Dublin Union only twenty or thirty of the drugs most largely used are taken into consideration, and the tender is accepted on a calculation made on this basis. There is a considerable difference in the number of visiting tickets issued in the north district as compared with the south during the year ended September, 1874. The number in the north exceeded that in the south by 2,535; and this may possibly have been caused by there being more hospital accommodation on the south side of the city than on the north, and it is reasonable to suppose that the quantity of medicine given to patients requiring to be frequently visited at their homes would be greater than would be required by ordinary dispensary patients. Besides this probable cause of the greater outlay for medicines in the north dispensary district, the following appears to be the principal reasons for the difference, namely—1. A number of medicines being ordered in the north district, which were not contracted for, as before observed, and for which high prices were charged. 2. Surgical instruments having been obtained in the north district during the year, none having been applied for in the south district. 3. The very large and possibly excessive quantity of lint used in the north compared with the apparently insufficient quantity used in the south district, where the total consumption was only 20 lbs. for all purposes, 152 lbs. being used in the north district in the year. 4. The free use of gutta percha tissue,

which is not used at all in the south district. 5. The large quantity of linseed meal and mustard for poultices and sinapisms being £50 in excess of the south district. 6. Excess to the amount of £30 in north over south in the use of hog's lard. 7. The free use of chlorodyne not contracted for, and supplied at a very high price. 8. Much larger quantity of sulphate of quinine and other preparations of bark and of iodine—all expensive medicines. 9. The free use of tinctures and ethers in the preparation of ordinary mixtures. All these circumstances combined are sufficient to account for the difference of expenditure between the north and south dispensary districts. Dr. King observes, moreover, that the medical officers in the north district also use a larger quantity of medicines, particularly the more expensive medicines, than the officers in the south districts. Some medical men have confidence in one description of drug, others in medicines of the same class, but of higher price; and, whilst caution must be observed in any endeavour to fetter the exercise of professional discretion, the medical officers might be requested to be as economical as possible in prescribing the more expensive drugs, and when drugs are applied for which are not in the contract, the instruction in the circular of the 4th July, 1862, requiring a statement of the reason, in writing in each case (Compendium, p. 934), should be strictly insisted upon. On a review of all the circumstances elicited at the inquiry which has been made, it appears to the board that the distribution of drugs and surgical appliances is too limited in the South Dublin District and rather free in the North. It would probably be of advantage to the sick poor if more liberality in prescribing were adopted in the south district, and the expenditure in the north district may admit of considerable curtailment without detriment to the sick poor, and with considerable relief to the ratepayers. Dr. King observes that, whilst conducting the inquiry, he had occasion to examine the contracts which had been accepted by both the North and South Dublin Unions, and also the several invoices furnished during the year ended September, 1874, and that he failed to discover any fixed principle upon which the prices set forth in the accepted tenders had been based. He states that they were not founded upon the fair trading prices of the open market, inasmuch as some drugs were charged for at high prices, some far beneath their commercial value, especially if they were drugs little used, and that in fact the tenders seemed to be framed in such a manner that it would be difficult to suggest any reason for such commercial eccentricities, except on the supposition that they were constructed in accordance with the amount of opposition expected from rival competitors or some other personal considerations. The same firm is the contractor for 1874-5 in both unions, and it might be expected that the prices would be the same in both tenders, which were sent in at precisely the same time in each union; but such is not the case. Of 412 articles tendered for in both unions there is a difference in price in no less than 287 instances. In 149 instances the prices demanded from the North Union exceeds that for which the same article is contracted for in the South, and in 138 instances the price charged in the South exceeds the price contracted for in the North for the same drug—the difference in price being in some cases double, in others treble, in others four times, or even six times the amount. Several articles were under contract in the South Union which were not contracted for in the North Union—for example, methylated spirits; and this, while supplied to the South at 3s. 8d. a gallon, was charged 5s. a gallon to the North. Chlorodyne contracted for in the South at 2d. an ounce, was charged 2s. to the North. Several articles contracted for in both, such as compound colocynth pill, hippo wine, and opium, and its several preparations, are given at a price so far below their commercial value that they could not be supplied at the price tendered for except at a serious loss to the contractor. Dr. King observes, as regards the compound colocynth pill, that the principal ingredient and possibly most important is "scammony," and if it be omitted the pill mass could

be sold at a low figure. This pill mass is contracted for at 3s. 6d. per lb., but any respectable trader is aware that the genuine drug could not be sold at the price. It will be seen from the trade lists enclosed that the selling price of this pill mass is 14s. per lb., and there is reason, Dr. King reports, to suspect that the colocynth pill supplied does not act as it should do. Again, as to opium, the genuine article could not be supplied with any profit at double the price charged in the contracts, 15s. per lb. in one and 16s. in the other. Any doubt as to the genuineness and strength of this important and dangerous drug must be productive of bad and possibly fatal effects.

(By order of the Board),

B. BANKS, Secretary.

To the Clerk, North Dublin Union.

On the motion of Mr. J. Reilly, it was ultimately resolved that a committee of the Guardians be appointed to examine into the medical tenders, and also to consider the letter of the Local Government Board in reference to the medical inquiry lately held; and that the medical officers be requested to attend the meeting of the committee.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING APRIL 24, 1875.

Total registered deaths in Dublin and suburbs * ... 139
Ten years average of same week ... 106

Mortality under average	37
Ratio of deaths, suburb of Rathmines	15	per 1,000.
" " " Donnybrook†	17	"
" " " Blackrock	7	"
" " " Kingstown	11	"
" " " Entire Dublin district	21	"
COMPARATIVE RATIOS—London	24	"
" " Glasgow...	31	"
" " Edinburgh	20	"

Only 16 deaths from zymotic diseases were registered, viz:—4 from fever (2 typhoid, and 2 simple continued fever), 5 from scarlet fever, 2 each from erysipelas and diarrhoea, and 1 each from small-pox, croup, and influenza.

In the Belfast registration district 11 deaths from measles, 11 from scarlet fever, 2 from whooping-cough, 3 from diarrhoea, and 1 from diphtheria, were registered.

In the Dublin district 7 children died from convulsions. Bronchitis proved fatal in 21 instances, pneumonia in 4, and lung disease unspecified in 1.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF APRIL, 1875.

- APRIL 1st, 1875.—Duke, Mansergh Place, 2 Belgrave Road, Rathmines, Co. Dublin, Lic. 1874 and Lic. Midwfy. 1874, K. Q. Col. Phys. Irel., Lic. R. Col. Surg. Irel. 1874.

† This district includes City of Dublin and Incurable Hospitals.

Irish Poor-Law Intelligence:

UNDER AUTHORITY OF THE IRISH MEDICAL ASSOCIATION.

ABUSE OF DISPENSARY TICKETS.

THE *Irish Times* says:—

There is a growing feeling at present that the system of medical relief afforded by the dispensaries is open to much abuse. We have received many communications on the subject, and we have taken some trouble to arrive at the true state of the case; and, if our information be correct, a state of things is disclosed which the Medical Charities Acts never contemplated. We learn that a class of persons now receive relief gratis through the dispensary who could very well afford to pay for it, and that a system which was established to provide medicine and attendance for the very poor and destitute is availed of by persons whose means raise them far above the necessity of charitable relief. For instance, we learn that Dispensary medical officers are commonly called on to attend skilled artisans, such as engine-fitters, blacksmiths, and cabinet-makers: while the still superior trades, such as engine-drivers, painters, dairy-house keepers, forage factors, and others are often on the list of the Dispensary Doctor's round. This statement is scarcely credible, but the particular instances which we will quote leave no doubt on the mind that a great abuse exists.

A short time ago the buyer in a large establishment, with a private residence, had his daughter receiving medical attendance at a dispensary in this city.

Again, we learn that a coffin-maker, who has a contract for supplying the military barracks in Dublin, whose wife owns a substantial provision shop and a well-furnished house, was very recently attended by one of the city dispensary officers free of charge.

A lodging-house keeper, well-to-do, and having over £500 in bank, was for some time on the books of another dispensary district; and

The wife of a man able to earn 34s. a week as a slater, and who is also in receipt of rent from tenement houses, availed of the medical relief system to get cured of the effects of a beating inflicted by her husband.

THE PENALTIES OF SANITARY DUTIES.

WE printed last week a most insolent and abusive threatening letter which had been addressed to Dr. Whistler, the Sanitary Officer of the Bray District, by a householder, a member of the Sanitary Board, because Dr. Whistler had found it to be his duty, acting on a formal requisition from the sub-officer, to condemn a water-closet in this person's house. This letter was forwarded to the Local Government Board with the following letter from Dr. Whistler:—

Bray, 6th May, 1875.

GENTLEMEN,—I beg to submit for your consideration the enclosed copies of a sanitary notice and my report thereon, together with the letter written to me in reference thereto by Mr. Murphy, a Town Commissioner, and one of the sanitary authority for this urban district.

It appears to me there was nothing whatever in my report to call forth a production so insolent and audacious in every particular, whilst I submit whether the sanitary

officer in the discharge of duties which, as at present prescribed, are of a nature the most repulsive and injurious, is to be thus subjected to the threats, insults, and loss, which he is unable to encounter.

The Bray Sanitary Authority meet on Monday next, at 12 o'clock, when I propose attending, and as these meetings are but monthly (by no means sufficient for the sanitary requirements of this district), I hope your Board will see the necessity for requesting the attendance of your inspector to investigate a charge and a threat made against me by a member of this sanitary authority.

I am, Gentlemen,

Your obedient servant,

THOS. L. WHISTLER, M.B.

The following is the reply of the Board:—

Local Government Board, Dublin,
8th May, 1875.

SIR,—The Local Government Board for Ireland acknowledge the receipt of your letters of the 6th inst., with copies of sanitary notice and report thereon, and a letter from Mr. Murphy, one of the Town Commissioners of Bray, relating to a nuisance arising from imperfectly constructed water-closets in two houses in Goldsmith Terrace, Bray, and with reference to your request that the inspector may be instructed to attend the meeting of the sanitary authority on Monday next, to investigate a charge and threat brought against you by a member of the sanitary authority, the Board desire to state that they do not think the matter is one requiring investigation. The Board will forward the correspondence to the sanitary authority, who will no doubt direct such steps as may be necessary to be taken on the report which you have made in the discharge of your duty as sanitary officer.

By order of the Board,

B. BANKS, Secretary.

We understand that the Bray Sanitary Board has accidentally or intentionally omitted to attend in sufficient number since this occurrence to form a quorum, and therefore the matter remains as it was.

CORRESPONDENCE.

MEDICAL WITNESSES.

TO THE EDITOR.

SIR,—You would oblige me very much by answering the following question:—Am I obliged as dispensary medical officer to attend as a medical witness in a case of assault at a Petty Sessions Court on a magistrate's summons? I attended the case on a red ticket, and when summoned to petty sessions court I refused to attend. The case was postponed in consequence, and I am determined to refuse again, if your opinion be in my favour. I saw a decision given in England some time ago by either a magistrate or barrister, in which it was stated that a medical man was not obliged to appear, but *having appeared*, was compelled to give evidence.

[In case of a criminal prosecution a dispensary medical officer *must* at his peril attend on the legal summons of a magistrate as must any other member of the community. In a civil action he is also under legal responsibility to attend, but with the difference that in the criminal procedure the magistrate might issue a warrant to bring him up by force, while in a civil case the judge would not do so, but would leave him to abide the risk of his refusal to come. If he refused, and the party for whom he was summoned lost his action in consequence of his absence, he (the medical man) might be sued for damages, and would be held responsible if the evidence conclusively proved that his evidence would have carried the case. This, however, it is almost impossible to prove, and therefore such a remedy against a medical witness in a civil action is seldom resorted to.

If the medical man is called to the witness-box he must depose to all matters of fact of which he is cognisant, and once he is sworn we believe he cannot refuse to answer questions involving his professional opinion. If he did so refuse it would be in the discretion of the judge to commit him for contempt of court; but many judges would not exercise that discretion if they were informed that the witness refused his opinion because he was not paid a fee; and if the judges did not order him to answer the examining counsel would have no remedy. The best course is to make terms as to a fee before being called into the box, and if the fee be refused, to appeal to the magistrate or judge before being sworn.

We believe that the police authorities at Dublin Castle are always willing to pay a proper fee in these police cases when applied to directly, but the magistrates of the locality have no power except to give a certificate upon which such application to the Castle may be made.—Ed.]

FEEES ON CANCELLED RED TICKETS.

TO THE EDITOR.

SIR,—Would you kindly inform me at earliest convenience in your valuable MEDICAL PRESS if, after cancelling a ticket, you can process for a fee on the strength of the visit paid before the cancelling; or if it is necessary you should be called in again after the ticket was cancelled to justify your claim.

P. S. O'D.

[No case of the sort has ever been tried; but we believe the law to be that a red ticket requires attendance under all circumstances, no matter who the holder may be, and the moment it is cancelled a second may be issued to the same person, and must be attended until cancelled. We believe that, inasmuch as the attendance of the medical officer is given by virtue of a legal summons, no fee could be recovered against the holder of the ticket for such attendance, even if it were proved that the ticket was improperly granted. Its legality would not be affected by such impropriety. But we believe that the committee man or warder who granted the ticket would be obliged to pay for attendance given on his order if it were shown that that order were illegal, being granted to a person not entitled to receive it. In fact, the illegality of granting a red ticket to a person not entitled to it lies not upon the person who accepts and uses the ticket, but upon the person who improperly grants it. This is one of those legal questions which an individual can hardly be expected to try for himself, and which the newly organised Irish Medical Association will find it proper to take in hand, and to obtain a legal decision for the benefit of the profession.—Ed.]

PAYMENT OF MEDICAL WITNESSES.

REARDON V. M'CARTHY.

THIS was a cross case for assault.

Mr. Fahil, resident pupil of the North Infirmary, who dressed Reardon's wound, said, addressing the Bench, gentlemen, I respectfully object to giving evidence in this case unless Mr. Reardon, who has summoned me here, gives me a fee for my loss of time. This man was dressed gratuitously at the Infirmary, and ought to have been satisfied with that without bringing me away from my business.

Dr. Corby addressing the Bench, said—Gentlemen, it is at my request Mr. Fahil, who is my resident pupil, has objected to give evidence in this case. We object on principle, as if we were compelled to give evidence in the case of every cut we dress at the Infirmary we should soon have no time at our disposal to attend accidents at all, in fact, a second house-surgeon would have to be appointed.

Mr. Starkie—It is certainly very unreasonable that a medical man should be asked to attend here without being paid for his trouble.

Mr. M'Ostrich—Very unreasonable, indeed.—(To plaintiff) Why don't you pay the doctor?

Plaintiff—I am not ably now, sir.

Dr. Corby—He has been able to pay for legal professional assistance, and ought to be able to pay a doctor. We would be very sorry to throw any obstacles in the way of justice, but in this case I will, if necessary, raise a technical objection—the summons is informal, being addressed to "Dr. Fahey," and not to Dr. Fahil.

Reardon's solicitor, Mr. O'Connell, said he sympathised with the doctor's grievance, and thought there ought to be special legislation on the subject.

A solicitor (Mr. Julian) observed that the Chairman of Quarter Sessions always requires that the doctor be paid before giving evidence.

Mr. M'Ostrich—We certainly think the doctor should be paid.

NEWCASTLE (WEST) POOR-LAW UNION.

THE MEDICAL OFFICERS.

MR. HARTNETT said that a matter had been just represented to him about which he felt there must be some mistake. He had a few minutes before met two of the union medical officers leaving the house, and they told him that they had come there in response to an order of the Board, but when they came on the premises they were told they could not go up to the Board-room, and that they should wait in the Probationary. They accordingly left. He (Mr. Hartnett) felt that there must be some mistake in the matter, for surely their medical officers could not be treated in this manner.

The Chairman said that he knew nothing of the doctors having come to the house. He supposed there could be no objection to their coming up to the Board-room. It is very unfortunate that there should be such a mistake, and I suppose the Board will be unanimous in offering an apology to the doctors (hear, hear).

Porter—Well sir, if they come again?

Chairman—Let them up.

BALLINA UNION.

SMALL-POX.

RELIEVING-OFFICER EDWARDS reported that he had had a house in Garden Street whitewashed and fumigated in which a death from small-pox had taken place.

Mr. Joynt said that another death had occurred that morning in Ardnaaree, and the relieving officer should look after the house.

Mr. Thompson—The disease is raging in some parts of the country districts, and steps should be taken to prevent wakes. There was a death from small-pox in Curlummen, and a wake held, and owing to that wake several families had become infected.

The Chairman—What steps can be taken to prevent wakes?

Clerk—If a family persists in holding a wake, a magistrate can direct the police to attend and prevent its being held.

Mr. Perkins—In Rathona a wake was being held, but Major Knox sent the police and prevented it.

Sub-sanitary officer Farmer mentioned that a policeman came from Bonnyconlan to him, and brought him out to that village, to put a stop to a wake there, but he could not stop it.

Relieving-officer Edwards—I don't know what the police mean. One of them came to me the other day and said, "There is a dead dog in the river Moy." I replied, "If there is, you fish him out." They seem to consider that they are relieved of all duty, and that everything is now to be done by the sanitary officers.

DROMAHAIR DISPENSARY.

ELECTION OF A MEDICAL OFFICER.

A MEETING of the committee for the purpose of electing a medical officer in the room of Dr. Palmer, who has been appointed to the charge of Boyle Dispensary district.

Three candidates offered themselves, viz.:—

Dr. Jolly, Dr. Moore, and Dr. Molony.

The latter gentleman was the only candidate who was proposed and seconded, and he was elected unanimously.

CARRICK-ON-SUIR UNION.

SANITARY DUTIES.

Mr. SADLEIR took the chair at the sanitary board. The correspondence was then read.

The Local Government Board, referring to the minutes of the proceedings of the Board of the 8th inst., forwarded to be laid before the guardians the accompanying copy of a letter which they had received from Dr. Martin, Medical Officer of the Portlaw dispensary district, relating to his duties as sanitary officer, together with a copy of the Board's reply:—

"Gentlemen,—May I ask your opinion on the following points as to my duty as sanitary officer: A sub-sanitary officer serves me with notice of a nuisance, and I make a report to the Board thereon, or make an order *ex proprio motu*. A notice is served by the sub-sanitary on the offender. Is it my duty in all cases to visit again and report the result to the executive officer? I am very anxious to carry out the Act properly, and would be far from wishing to raise unsubstantial objections, and feel that there are many cases where the executive officer, basing his opinion on the second clause of his duties, as laid down by you, wishes to place double duty on me, which I think unfair. In most other unions the sub-sanitary officer is called on to report whether the notice of the Board has been complied with, and such I consider to be the proper course."

The Local Government Board in acknowledging the receipt of the letter, stated that there was no regulation requiring a sanitary officer to revisit or certify as to the abatement of a nuisance, and they thought that in ordinary cases the subsequent inspection should be made by the sanitary sub-officer as regards nuisances reported by the sanitary officer or himself. Special cases might, no doubt, arise in which it would be necessary to call upon the sanitary officer to inspect and report further as to the nuisance; and should proceedings at law become necessary, the Local Government Board were of opinion that the sanitary officer should attend and assist by his evidence. The Local Government Board at the same time desired to refer the guardians to the terms of the 9th September last (part 2, executive duties), by which every sanitary officer and sanitary sub-officer was requested to attend, and assist in all proceedings where his attendance or assistance might be required.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING MAY 1, 1875.

Total registered deaths in Dublin and suburbs * ... 164
Ten years average of same week ... 153

Mortality under average	11
Ratio of deaths, suburb of Rathmines	25	per 1,000.
" " " Donnybrook†	26	"
" " " Blackrock	22	"
" " " Kingstown	20	"
" " " Entire Dublin district	27	"
COMPARATIVE RATIOS—London	22	"
" " Glasgow	28	"
" " Edinburgh	20	"

Sixteen deaths from zymotic diseases were registered, including 5 from fever (4 typhoid or enteric, and 1 simple continued fever), 2 each from scarlet fever, diphtheria, croup, and diarrhoea, &c.

In Belfast, 8 deaths from measles, 5 from scarlet fever, 3 from whooping-cough, 2 from fever, and 1 from diphtheria, were registered.

In the Dublin district 9 children died from convulsions. Bronchitis proved fatal in 16 instances, pneumonia in 11, pleurisy in 1, and lung disease unspecified in 3.

Three deaths were ascribed to apoplexy, a like number to paralysis, 2 to inflammation of the brain, 1 to insanity, and 4 to brain disease, unspecified.

Ten deaths resulted from heart disease, 1 from inflammation of the liver, and 2 each from liver disease and Bright's disease.

Phthisis caused 22 deaths, scrofula 2, and mesenteric disease, cancer, and hydrocephalus, each 3.

Three accidental deaths and one case of suicide were registered.

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

DROMORE WEST UNION.

DISGRACEFUL STATE OF THE HOUSE.

The following letter was read:—

Dublin, 8th April, 1875.

Sir,—the Local Government Board have received Dr. Roughan's periodical report on the Dromore West Union, the workhouse of which he inspected on the 30th ult. He states that the supply of bedding is neither sufficient nor good; that in many instances the ticken is quite worn, and in a state of disrepair most discredit-able to the matron; that in other instances the ticks were dirty and wet, and that the dresses of the school girls were in a ragged condition. The master informed Dr. Roughan that he applied for a supply of material for dresses for the girls on the 12th Feb., but it appears that no order was made with a view to providing the much required supply. Dr. Roughan informs the Local Government Board that in the infirmary there have been two wards set apart for cases of fever and other contagious diseases, but that they are totally unprovided with bedding or furniture of any kind, and the Board request that the guardians will, without delay, provide a supply of the necessary articles. Dr. Roughan reports that the medical officer lately appointed resides about six miles from the workhouse, and on reference to the porter's book he found that his attendance was neither regular nor timely; some days he comes very late, other days his place was supplied by other medical men, and on two or three days there was no medical attendance; and the board have to draw the attention of the guardians to their letter of 11th February last, in which they questioned the possibility of the medical officer discharging efficiently his duties at the workhouse while residing at such a distance; and they request that the guardians will have the goodness to furnish them with their views on the matter. Dr. Roughan, in his report, states that he attri-

butes much of the irregularity that existed in the Dromore West Workhouse to the incompetency of the master, and to the carelessness and want of energy on the part of the matron, as well as to the want of proper supervision by the guardians, who, the Board observe with regret, do not hold their meetings with the necessary degree of regularity. It would seem to the Board to be a matter for the guardians' consideration whether they should permit the master and the matron to continue in their respective offices, and the Board are desirous of receiving the views of the guardians on this point also.—By order,

B. BANKS, Secretary.

The following resolution was unanimously adopted :—

In reply to the letter of the Local Government Board, in which the inspector complains of the bedding and other matters in connection with the house, a committee to inspect the house is named on each board day, whose report is handed in. A few ticks were a little worn, but these had been repaired since their report was handed in, as will be seen by report of visiting committee on April 16. We are of opinion that the school children present no such ragged appearance as that described in the report, but can contrast favourably with the appearance of the children in many of the workhouses in Ireland. As to the supplies of clothing required by the master, the matter may have been overlooked in consequence of the time for taking tenders for the yearly supply being near. The ward set apart for contagious diseases in the infirmary had never been thoroughly furnished, but contains some stretchers, to which will be added the bedding and furniture required, and the master and the matron are cautioned to be more exact in future. Dr. Mahon is willing to resign his position as medical officer of the workhouse, provided his salary be raised to £100 per annum as medical officer of the upper portion of the Easkey dispensary district, as recommended by the committee at their meeting on the 16th instant.

Notice was given to increase Dr. Mahon's salary as suggested.—*Ballina Herald.*

DROMORE WEST UNION.

DR. MAHON having resigned his appointment as medical officer of the workhouse, it was resolved that tenders be advertised for to fill the situation, salary £40 per annum.

The mover not being present to move the motion of which he had given notice, to increase the salary of Dr. Mahon, as medical officer of the Kilglass dispensary district from £80 to £130 per annum, the notice fell to the ground.

SLIGO DISPENSARY.

A SPECIAL meeting of the Committee was held.

Dr. Henry King Nixon, of Ballyfarnon, was unanimously elected as apothecary, in the room of Dr. Devany, who resigned. He was the only candidate in attendance.

STIMULANTS IN WORKHOUSES.

At the last meeting of the Cork Board of Guardians the Chairman made a statement as to the consumption of strong drinks in that establishment, which is rather astounding. He said :—We have consumed in this workhouse during the year 726 gallons of wine, 219 gallons of whisky, 4,766 gallons of porter, 212 bottles of brandy—all of these at a cost of £685 15s. 7d. That is our contribution for one year in aid of the great national vice, and it would be very much larger were it not for the good sense of Dr. Callaghan, one of the physicians of our workhouse. No wonder brewing is profitable when the paupers in one house can consume "4,766 gallons of porter" in the year, besides hundreds of gallons of wine, and gallons of whisky, and bottles of brandy. The number of inmates on the 27th March was 2,231, of whom 1,058 were "patients," and the return of stimulants shows that there were given to them during the week 1,046 glasses of wine, 411 glasses of whisky, and 705½ pints of porter; and, lest it might be supposed that they did not eat anything, we may state from the "return" that the supply of meat to those "patients" was 2,078 lbs., and of eggs, 1,990!

BALLINAKILL DISPENSARY.

A MEETING of the committee was held for the purpose of electing a medical officer in the room of the late Dr. Thomas J. Fitzpatrick.

The Hon. Secretary stated that there was only one application for the appointment, namely, Dr. Thomas P. Walshe. The election of Dr. Walshe was carried unanimously.

DURROW DISPENSARY, QUEEN'S CO.

ELECTION OF MEDICAL OFFICER.

A MEETING of the Committee of Management of the above dispensary was held for the purpose of electing a medical officer in the room of Dr. Hugh B. Stoney, who was lately appointed medical officer of the Abbeyleix dispensary district.

There were four candidates for the office:—

Dr. Lionel H. Smith, Dr. Robert Sterling, Dr. John B. Drapes, and Dr. Richard Palmer.

Mr. Mercier proposed Dr. Drapes.

The proposition was not seconded.

Mr. Stubber—In proposing Dr. Lionel Smith as a fit and proper person as medical officer of this dispensary, I have much pleasure indeed in doing so, amongst other reasons for these—he is the son of Dr. Smith, we all know as a gentleman, who possesses the confidence, and very justly so, of a large portion of this community. I wish to see his son rising up as successor of his father.

Professionally and socially, Dr. Lionel H. Smith stands very high indeed. I can trace his career for the last 11 years, and can show that he has given general satisfaction. He has taken very high honours. Mr. Stubber then read Dr. Smith's testimonials, and concluded by saying that owing to the high reputation of Dr. Smith's father in this county, he hoped the son would rise up to be his successor.

Mr. Staples proposed Dr. Sterling, and read a number of private letters addressed to himself, and testimonials in favour of Dr. Sterling, who was referred to in these in the highest terms of praise, all of which, Mr. Staples said, were very satisfactory, and proved Dr. Sterling to be a competent practitioner.

Mr. Talbot proposed Dr. Palmer, and read the testimonials, all of a high order, and he said it speaks well for Dr. Palmer's abilities, that without the aid of any public appointment he was able to hold his ground with private practice in Rathdowney.

A division took place with the following result:—

For Dr. Smith—8.

For Dr. Sterling—8.

For Dr. Palmer—1.

A second division took place between Dr. Smith and Dr. Sterling, and Mr. Talbot gave his vote in favour of Dr. Smith, who was then declared duly elected by a majority of one over Dr. Sterling.

Dr. Sterling appeared before the meeting, and said that he objected to the election, as the advertisement should

have been published ten clear days before the election, in a local paper.

Mr. Staples said that he thought everything was done in a legal and proper manner.

The Chairman said that the objection could not be entertained.

Dr. Smith was then informed of his election, and he returned thanks.

The proceedings then terminated.

LIMERICK UNION.

THE Clerk read the following letter from the Local Government Board in reference to the death of James Murphy :—

Local Government Board, Dublin,

May 11, 1875.

Sir,—I am directed by the Local Government Board for Ireland to acquaint the Board of Guardians of Limerick Union that they have received a report from their inspector, Mr. Bourke, together with the minutes of evidence taken at the inquiry which he held on the 8th inst. respecting the conduct of Dr. Barry, medical officer, and the master of the workhouse, in relation to the death of the boy James Murphy. The minutes of evidence are enclosed herewith for the Guardians' information. The conduct of the parties immediately concerned in the violence which produced the death of the child will be subjected to judicial notice—that the Board abstain from making any comment on that part of the case. Meantime it appears to the Board that the account given by Dr. Barry of the course which he adopted when the illness of James Murphy was made known to him on Monday, the 12th ult., is by no means satisfactory. To the omission to send the boy to hospital, and have him properly nursed and taken care of there, must be attributed the fact that opportunity was afforded for the inhuman treatment which he received at the hands of his school-fellows, which resulted, according to the post-mortem examination, in the personal injuries which accelerated, if they did not actually cause, his death. The Board request that the Guardians will take the conduct of Dr. Barry into their consideration. The master and matron of the workhouse appear to have been in total ignorance of all that was going on in the boys' school; but it will probably become necessary hereafter to take this point into consideration in reference to the general complaints made of irregularities in the Limerick workhouse, with respect to which Mr. Bourke is making inquiry. The evidence discloses a state of things which could not occur in any ordinarily conducted establishment of the kind. You will be good enough to preserve the minutes of evidence, and to return them to this office when no longer required by the Board of Guardians.

By order of the Board,
B. BANKS, Secretary.

KILKENNY GUARDIANS.

THERE were two candidates for the office of doctor for Freshford Fever Hospital—Dr. Hourigan, of Tullaroan, who is now medical officer of Freshford Dispensary, and Dr. Delaney, of Freshford.

On a division there voted—

For Dr. Hourigan, 9; for Dr. Delaney, 13.

Dr. Delaney was accordingly elected by a majority of four.

ABSTRACT OF THE REPORT OF THE IRISH CENSUS COMMISSIONERS RELATING TO DEATHS.

FROM the days of Sir Wm. Petty, Surveyor-General of Ireland, and the period following, when bills of mortality were published for the city of Dublin alone, no effort had been made (except by computation) to arrive at anything like a fair estimate of the average annual mortality in this country until the attempt in 1841 was made to collect and register the deaths for the period intervening between 1831 and 1841 by means of the census returns. Since then the Commissioners have continued their investigations in this respect.

In 1864 an Act for the Registration of Deaths in Ireland came into operation, but has not yet been carried out to its fullest extent even in the cities and some of the large towns.

As, however, it is believed that the deaths returned by the various registrars are still defective, and as they only extend over a portion of the decade which it is our province to report upon, we have pursued the usual inquiry as regards the annual mortality of the country during the past decade by means of the census forms throughout the civic and rural districts, so far as they could be obtained through the police enumerators, and also from the returns of coroners' inquests, and from all hospitals and other sanitary institutions of the country, and likewise from the various cemeteries and graveyards.

It is now our pleasant duty to announce that during the ten years ending upon the 2nd April, 1871, this country has been (with the exception of a partial outbreak of cholera in 1866) remarkably free from those pestilential constitutions which have affected Ireland from the earliest recorded period to the middle of the present century. So far as the census returns have enabled us and our predecessors to judge, a steady improvement has taken place in the sanitary condition of Ireland, of which the following table affords a fair estimate :—

Decades.	Average Annual Population of Decade.	Deaths during the Decade returned on Census Forms.	Average Annual Rate of Mortality per 1000 of the Population.
1831-41 . .	8,003,276	1,187,374	14·8
1841-51 . .	7,763,370	1,361,051	17·5
1851-61 . .	5,988,793	819,768	13·7
1861-71 . .	5,546,692	767,909	13·8

SECTION I.—REPORT ON CORONERS' INQUESTS.

The first attempt in the British Isles to collect and record in a tabular form the deaths upon which inquests were held was made in Ireland by the Census Commissioners in 1841, and since then the subject has been investigated at the taking of each census, so that we now have the results of the three preceding investigations to compare with those of the present. The power of making judicial investigation into the circumstances of unknown, sudden, or suspicious deaths was confined to coroners until the passing of the Act 9 and 10 Vic., cap. 37, when it was extended to any two magistrates. This power the magistrates seem to have exercised to a greater extent for the first few years subsequent to the passing of the Act than latterly, for during the portion of the decade ending in 1851 in which the Act was in force they held 400 inquests, whilst during that ending in 1861 they held 95, and during the past decade but 91.

Before entering into the details of the tables we here give a few of the general results to be learned from comparison of the returns for the past with those for the three preceding decades :—

NUMBER OF INQUESTS FOR THE LAST FOUR DECADES.

PROVINCES.	Number of Inquests held during the decade ending				Ratio of Inquests to Deaths returned on Census Forms for decade ending			
	1841.	1851.	1861.	1871.	1841.	1851.	1861.	1871.
Leinster . . .	6,200	9,352	9,586	10,267	1 in 52·2	1 in 38·0	1 in 25·9	1 in 22·0
Munster . . .	6,611	9,475	6,533	6,322	„ 55·0	„ 49·7	„ 36·1	„ 30·9
Ulster . . .	4,695	6,187	7,884	8,287	„ 62·7	„ 50·2	„ 29·6	„ 30·3
Connaught . .	2,828	4,251	2,579	2,415	„ 72·5	„ 52·7	„ 39·3	„ 39·3
Ireland	20,334	29,265	26,582	27,291	1 in 58·4	1 in 46·5	1 in 30·8	1 in 28·1

The foregoing comparison shows that there were a greater number of inquests held during the decade ending in 1871 than during those ending in 1841 and 1861, but less by 1,974 than during the decade ending in 1851. The greater number of inquests held during the decade 1841-51 than 1861-71 is attributable to the large number (3,150) held on deaths from starvation, cholera, dysentery, and fever during the former period, which was characterised by famine and disease, whilst inquests on deaths from the same causes during the latter decade numbered only 195; during the past decade, however, there were no such causes to influence the number of inquests, but as will be hereafter shown the increase, irrespective of the above-mentioned causes, is to be assigned to an increase in the number of sudden deaths attributed to apoplexy and heart disease.

The number of inquests returned for the year 1866 is 195 above the annual average for the decade, and the number returned for the year 1869, 139 below it.

Medical evidence was given in a greater proportion of inquests held during the past than any previous decade; thus it was given in 62·7 per cent. of the cases for the decade ending 1841; in 67·8 per cent. of the cases for that ending in 1851; in 62·1 per cent. of the cases for the decade ending in 1861; and in 70·2 per cent. of those for the past decade. In the province of Leinster the percentage for the past decade was as high as 79·6, but in the province of Connaught it was only 58·1.

In the province of Leinster during the past decade, the inquests held upon "unknown infants" formed 5·5 per cent. of the entire number held in the province; in Munster 4·2 per cent.; in Ulster 4·1 per cent.; and in Connaught 3·2 per cent. "Unknown infants," shown separately at the foot of each table, are also included in the body of it, principally under the headings "Infanticide," "Desertion or Exposure," "Still-born," "Found Drowned," and "Found Dead." The decrease in the number of "unknown infants" is probably attributable to the deterrent influence of punishments inflicted for the concealment of births.

CLASS I.—Deaths caused by Violence, Neglect, Evil Intent, or Design.

Medical evidence was given in 84·7 per cent. of cases of homicide during the decade ending in 1841; in 79·8 per cent. of the cases during that ending in 1851; in 91·4 per cent. of the cases for the decade ending in 1861; and in as many as 93·5 per cent. of those for the past decade.

Infanticide and Desertion or Exposure.—There were 317 cases of infanticide, and 7 the results of desertion or exposure, during the past decade, compared with 394 of the former and 291 of the latter, during that ending in 1861. The decrease in the number of cases ascribed to desertion

or exposure is most probably compensated for to some extent by the increase in the number of open verdicts. Taking infanticide and desertion or exposure together there is a marked decrease in the number of cases returned; thus, according to the returns of the census of 1841, there were 934 cases; according to those of 1851 but 848; in 1861 there were 685; and during the past decade only 324.

Unskilful Medical Treatment.—The verdicts returned by juries, in such terms, in cases of deaths resulting from the ignorance or interference of quacks and non-qualified persons during the past decade numbered 23, five of the inquests being held on males and 18 on females. The greater number of females may be attributed to the ignorance and interference of midwives, or those who follow this occupation without sufficient qualification. In 1861 there were 26 cases attributed to unskilful medical treatment, 22 in 1851, and 18 in 1841.

Inoculation with Small-pox.—To this cause only 2 cases were attributed by coroners' juries during the past decade, whereas in 1861 there were 20 cases, and 9 in 1851.

Poison.—Cases of homicidal poisoning numbered only 3 during the past decade; whereas during those for 1841-51 and 1851-61 there were 28 and 9 cases respectively returned. This decrease is in some degree attributable to the greater caution observed by chemists in the sale of poisonous drugs.

CLASS II.—Suicides.

The number of suicides for the past decade exceeds the number returned for any previous ten years, except that ending in 1851; thus during the decade ending in 1841, there were 755 suicides; in that ending in 1851, 841; in that ending in 1861, 757; and during the past decade 791.

The ratio of suicides to the population at the close of each decade shows that self-destruction is on the increase, and that this increase has occurred to a greater extent in the rural than the civic districts. In the civic districts, however, the ratio of suicides to the population is nearly twice as high as in the rural upon the present occasion, whilst in 1861 and 1851 it was more than twice, and in 1841 more than three times as high.

In 1841 there was one suicide in every 10,828 of the population of Ireland, whilst upon the present occasion the ratio has increased to 1 in every 6,842. In the rural districts the ratio on the former occasion was 1 in every 14,277, and in the latter 1 in every 8,161, but no such increase has taken place in the civic districts, the ratio being very similar on all occasions.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

REPORT OF COUNCIL, 1874-75.

MR. PRESIDENT AND GENTLEMEN,—Your Council have to report that, at the early part of the year just ended, they found the financial condition of the Association in a deplorable state, and, after attempting (unsuccessfully however) to liquidate the liabilities of the Association out of their own pockets, they found it necessary to convene a special general meeting of the members, on the 27th of January last, to consider what steps should be taken to discharge the debts of the Association then due, when it was agreed upon that the members generally should be appealed to contribute; but your Council regret to have to report that the appeal for such assistance was not responded to as they had expected, and, through the apathy of the members at large to support the Association in its difficulty, its very existence became seriously imperilled; but they are proud of being able to meet the members to-day and report that not only has the crisis passed, but the Association—which had narrowly escaped annihilation—has now paid off all its old debts, and, with the exception of current expenses, has no liabilities whatever; and they have taken care to secure that, in future, no liabilities can possibly be incurred exceeding the amount to the credit of the Association in the honorary treasurer's hands. Such being the case, your Council earnestly appeal to the members to pay in their annual subscriptions at the beginning of each year (which commences on the 1st day of June) instead of, as hitherto, at the end of each year, in order that the objects of the Association be not frustrated from want of funds.

Your Council have agreed upon a new organisation scheme which they have had printed, setting forth the objects of the Association, and the rules by which it shall be governed in future, which, they trust, will meet with the support and approval of the whole profession.

Your Council cannot but deeply regret that every medical practitioner in Ireland is not a member of the Association; and they cannot understand why any Poor-law or dispensary medical officer holds aloof, as it is undeniable that our Association is not only well calculated, but competent, to support, promote, and protect the interests of the profession—collectively and individually—and especially those of the Poor-law and dispensary medical officers of Ireland; and, as a yearly list of the members shall in future be published and forwarded with a copy of the annual report to each member of the Association, your Council would suggest that each member should urge his neighbouring professional brethren, whose names are not on the list of members, to join the Association at once. "Union is strength," and if this Association were but properly supported, as it deserves to be, it would be a much more powerful and valuable organisation, capable of obtaining redress of many of the grievances which the medical officers of the public services are now compelled to endure; but as, unfortunately, so little can be done

without expenditure of money, its powers of usefulness must be commensurate with the amount of its funds.

Under the circumstances (already referred to) in which the Association was placed during the past year, it must be apparent that your Council have been unable to devote as much time to the proceedings of Parliament, relative to matters affecting the interests of the members of this Association, as they should have done had no such obstacles stood in their way; they, however, considered it to be their first duty to endeavour to relieve the Association of its debts, and next to place it upon a sound footing for the future, both of which objects have now, in their opinion, been attained; but, notwithstanding the great amount of time and attention your Council had necessarily to bestow upon these important duties, they have had under their anxious consideration the new Coroners (Ireland) Bill, and have drawn up certain clauses affecting materially the interests of medical witnesses in Ireland, for introduction into the new Bill—although it was not intended by the promoters of that Bill to refer to this subject. A copy of the suggested clauses, along with an explanatory circular letter, has been sent to each Irish Member of Parliament, besides which a special manuscript letter on the same subject has been addressed to each of the promoters of the Bill as well as to every medical Member of Parliament, and each of the members of this Association has been sent a copy of the clauses referred to, and also a copy of the circular letter addressed to each Irish Member of Parliament.

Your Council propose, in the coming year, to take up the subjects of the several grievances of the Poor-law and dispensary medical officers of Ireland, and to consider the best means of having them remedied, under the following heads—viz., those of—

1. Poor-law and dispensary medical officers.
2. Public vaccinators.
3. Registrars of births, deaths, marriages, and vaccinations.
4. Sanitary officers and consulting sanitary officers.

And, as under the new scheme, each of these departments is separately provided for, they request that each of the members of the Association will, through communication with the honorary secretary, give such assistance as he can, in pointing out those grievances as they occur to him, and by suggesting how, in his opinion, they can best be removed; and they are of opinion that, if this suggestion be generally acted upon, much good must result.

In the month of January last, the hon. secretary of the Poor-law Medical Officers' Association proposed to your Council that that Association should be amalgamated with the Irish Medical Association, and, in order that every facility might be afforded for the attainment of this desirable object, your Council requested two of its members to receive the representatives of that Association and to hold a conference with them on the subject; the conference accordingly took place on the 22nd of January, and resulted in the suggestion of certain terms of amalgamation being drawn up to be submitted to both

Associations for their consideration, one of which was "that the amalgamation should not be ventilated or made known until the month of May;" the subject, therefore, did not come before your Council for consideration until very recently, when, after devoting to it much time and attention, they drew up the following resolution, viz:—

Resolved—That this Council having carefully considered the correspondence which has recently taken place between Dr. Maunsell and our hon. secretary on the subject of amalgamation of the Poor-law Medical Officers' Association with the Irish Medical Association, as well as the scheme for carrying out same suggested by Drs. Macnamara, Chapman, Maunsell, and Speedy, is of opinion:—

1. That the objects of both Associations, so far as they affect the interests of the Poor-law and dispensary medical officers of Ireland, being the same, could be more effectively and economically attained by a single united organisation.
2. That this Council does not approve of the terms of amalgamation recommended at the Conference.
3. That this Council, having recently adopted a new scheme of organisation which it considers will prove to be perfectly satisfactory in its operation, is of opinion that any change in the arrangements made would at present be undesirable.
4. That this Council considers that the interests of the profession, and the objects for which amalgamation is suggested, would be best served by the Poor-law Medical Officers' Association recommending its members individually to join the Irish Medical Association, under whose new constitution the fullest opportunity is afforded for making any desired modification of the arrangements already decided upon, and this Council is of opinion that no other or better form of amalgamation can be carried out.
5. That copies of the new scheme of organisation of the Irish Medical Association be forwarded, with this resolution, for the information of the Poor-law Medical Officers' Association.

In concluding their Report, your Council can plainly see that the Association has entered upon a new era of usefulness, and, if only well supported by the profession, must soon be able to show satisfactory results. Their efforts on behalf of the profession, despite the most earnest anxiety and painstaking on their part for the advancement of its interests, can effect but little, unless they receive that warm and universal support from the medical men of Ireland, which the objects of this Association pre-eminently deserve. They trust that each member will not fail to recollect that his individual aid, though perhaps but small in amount, is valuable to the Association, not only for its intrinsic worth, but as an example to others; and they therefore look confidently for the universal support and co-operation of those in whose interest this Association labours.

Your Council now desire to submit their scheme for the re-organisation of this Association alluded to in their Report.

ABSTRACT OF THE REPORT OF THE IRISH CENSUS COMMISSIONERS RELATING TO DEATHS.

Accidental Deaths caused without Design or Intent.

DEATHS, the results of accidents, into the circumstances connected with which judicial investigation was made, numbered during the past decade 10,389.

The ratio of accidental deaths in rural districts to their populations in 1871 was lower in 1861 or 1851, but in the civic districts it was higher than on any of the previous occasions; also the ratio in civic is much higher than in rural districts. The ratios computed on the total population of Ireland at each census period do not present

any striking difference, except that in 1841 it was about half that on the three subsequent occasions.

Drowning.—Cases of inquests on deaths from accidental drowning during the past ten years numbered 2,693, compared with 3,016 during the decade ending in 1861. In the rural districts 1,882 cases occurred, and 811 in the civic. The more extensive distribution of lifeboats round the coast of Ireland of late years has probably aided in reducing the number drowned in cases of shipwreck; the large number of cases of accidental drowning returned for the summer and autumn seasons would lead us to infer that the majority of them were boating and bathing accidents.

Burns and Scalds.—The inquest returns of 1841 contained only 532 cases of deaths from burns and scalds; those of 1851, 1,580; those of 1861, 2,046; and those for the past decade 1,891. The winter months afford the largest return of cases as might naturally be expected from the greater use of fires during that season. On this as well as the three previous occasions the female sex formed the majority, their domestic duties bringing them more immediately in connection with fires and boiling fluids, and the nature of their dress being more inflammable and liable to contact with fires.

Suffocation.—This means of death has been divided into suffocation by the poisonous effects of carbonic acid gas in limekilns, by foul air in wells, sewers, vats, &c., and suffocation by a crowd; there is also a heading for cases of suffocation where the particulars thereof were not stated in the returns. There were 553 cases of "suffocation" during the past decade, and 537 for that ending in 1861. The returns of 1851 afforded 226 cases of suffocation in limekilns, whereas during the past decade there were only 11 such cases; before and during the famine period limekilns were a common resort for the homeless and destitute, who frequently fell asleep near these fires, and were destroyed by the pernicious influence of the polluted air. Deaths from suffocation by foul air have increased from 15 in 1851 to 45 during the past decade—37 males and 8 females. There was 1 case of suffocation by a crowd.

Crushed.—During the past decade 1,061 persons were crushed to death, 150 by machinery, 619 by wheeled carriages, 108 by the falling of masonry, 62 by banks of earth, and 122 by means not stated in the returns. Cases of crushing by machinery have decreased from 178 in 1861 to their present number, probably owing to the greater protection now placed round machinery in manufactories, and the greater care observed by those working it. A large proportion of the machinery accidents were probably inflicted by agricultural machinery now so largely used in this country; for of the 150 cases as many as 112 occurred in the rural, and only 38 in the civic districts.

The deaths from crushes inflicted by wheeled carriages have increased from 446 in 1861 to 619 during the past decade, the result probably of the careless and reckless manner in which drivers proceed through public thoroughfares and roads of late years.

The falling of masonry caused the death of 108 persons. This is a smaller number than was returned for any of the preceding decades. The number of deaths from the falling of banks of earth is also considerably below that returned for any previous decade from the same cause.

Falls.—During the past decade there were 1,422 inquests held on persons whose deaths were caused by falls. The returns of 1861 contain only 1,145 deaths from falls, the increase on the present occasion having taken place chiefly in "falls unspecified."

Railway Accidents.—During the past decade 250 inquests were held on the bodies of persons who met their deaths by railway accidents, and during that ending in 1861 there were 174. These accounts have been divided into those the result of collisions, or over-running, and those by leaping-off; the latter during the past decade numbered only 3, and in the preceding decade 4. On the

31st December, 1851, there were only 580 miles of railway open in Ireland, and at the close of 1860 there were 1,364—the average annual number for the decade being 966. On the 31st December, 1870, there were 1,975 miles of lines open, the average number for the decade being 1,811—the ratio of deaths to the number of miles of lines open on this occasion is consequently much lower than on the preceding.

Starvation.—Returns of coroners' inquests for the decade ending in 1851, which included the famine period, contained 2,148 cases ascribed to this cause, whilst those for the past decade have enumerated but 69; those for the decade ending in 1861 afforded 272 cases. These returns give a satisfactory proof of the beneficial results obtained by the Poor-law system in Ireland as well as of the more prosperous condition of the population. As many as 15 cases occurred in 1862, and 10 in 1863.

Exposure or Cold.—"The greater number of these inquests," say the Census Commissioners of 1851, "were held on bodies found dead, and believed to have died from the general effects of exposure when the persons were in a weakened condition." The cases ascribed to this cause reached their maximum (805) during the decade ending in 1851, the effects of the then recent famine. During the past decade, however, which comprised a much more healthy period, the deaths ascribed to this cause numbered only 434, and of that number as many as 229 cases occurred during the winter seasons.

Poison.—The accidental introduction of poisonous substances into articles of diet, mistakes respecting medicines, and vermin poison, and children eating poisonous berries, &c., formed the subject of judicial investigation in 121 cases during the past ten years, and in 111 instances medical evidence was given at the inquest.

Killed by Animals.—The inquests held on deaths the result of injuries inflicted by animals—kicks of horses, gored by horned animals, injuries inflicted on children in the cradle by pigs—have gradually increased from 214 in the decade ending in 1841, to 278 in that ending in 1871. As the occupation of males brings them more in contact with animals, so they form 227, and the females only 51 of the latter number.

Gunshot Wounds.—The number of accidental deaths produced by "gunshot wounds" numbered 193 during the past decade, being a slight increase on the numbers returned in 1861 and 1851.

Injuries of the Head.—A most remarkable increase has taken place in the number of inquests held on the remains of persons whose deaths resulted from "accidental injuries of the head," from 117 in 1851, and 114 in 1861, to 239 upon the present occasion, or more than double the number on either of the two other occasions. This increase it is difficult to account for; it has taken place more particularly in Munster and Leinster, and in the rural than the civic districts. The county of Tipperary presents the remarkable increase from 14 in 1861 to 49 in 1871.

Dislocations.—To this cause 3 deaths were ascribed during the past ten years. This heading does not appear in the tables of coroners' inquests of any of the previous censuses.

Fractures.—Inquests were held on 82 persons who died from the effects of fractures. The returns of 1861 afford 36 cases, and those of 1851 only 25.

Amputation.—Two deaths after amputation were the subject of judicial investigation.

Explosion of Gunpowder.—25 males and 2 females were killed by the accidental explosion of gunpowder during the past decade.

Explosion of Paraffin Oil.—1 male and 4 females were killed in 1870 in the county of Kerry by the explosion of paraffin oil.

Eating Improper Food.—To eating improper food, the nature of which is not stated, 6 deaths in the rural districts were ascribed. In 1861 there were 13 such cases returned.

Lightning.—Inquests were held on the bodies of 22 persons whose deaths were caused by lightning. The years 1866 and 1867 each afford 4 cases, and, according to seasons, 14 occurred in summer, 7 in autumn, and 1 in spring. During the decade ending in 1861 as many as 52 cases were returned.

Fright.—4 males and 3 females were said to have died from fright, and in 6 of the cases medical evidence was produced.

Unspecified.—The decrease in the number and percentage of accidental deaths, on which coroners' inquests were held, and the nature of which was not specified in the returns, have been before alluded to.

SLIGO UNION.

THE APPOINTMENT OF DR. MURRAY.

THE Local Government Board wrote to say that they approved of the appointment of Dr. Murray as medical officer to the workhouse, and also as consulting sanitary officer.

A SERIOUS CHARGE.

Dr. Murray, who was in attendance, reported that on Saturday night a girl was removed to the workhouse hospital in typhoid fever, in a dying state, and that she died since.

Chairman—What have we a county fever hospital for? Mr. O'Connor thought it was a serious thing to bring such a case into the workhouse.

In reply to the Chairman, the Relieving Officer said it was on his ticket the girl was admitted. He did not know it was fever she had. John Henery, who keeps a lodging-house in Pound Street, came to him on Sunday evening, and asked for a visiting ticket to get Dr. Tucker to visit his servant girl, who, he said, was sick. Henery returned shortly after saying Dr. Tucker refused to visit the girl; but he came again and said Dr. Tucker had been to see the girl, but refused to tell him (Henery) what her complaint was, or anything about her.

Dr. Roughan—Evidently Dr. Tucker did not think she should be removed. Did you give a ticket for her removal without seeing Dr. Tucker?

Relieving Officer—I did not think it necessary to see him.

Dr. Roughan—I dare say Dr. Tucker said the woman was not fit to be removed, but this man wanted to get her out of his house.

Chairman—Is it the business of the doctor to order the removal or not of such a patient?

Dr. Roughan—To be sure it is. Dr. Tucker was treating the woman in the house, thinking, no doubt, that was the best thing to do, and it would have been well if the relieving officer had gone to the doctor before giving her a ticket to the workhouse.

Dr. Roughan—And the patient was brought here in open car?

Relieving Officer—Yes.

Relieving Officer—If the man asked for the covered van he had it to get. I thought the girl was only just ailing.

Dr. Murray stated that when the woman was brought to the workhouse she was in a dying state. She could not be removed to the fever hospital. In his opinion it was not a proper thing to remove her at all.

KILRUSH UNION.

RESIDENCE WITHIN DISTRICT.

MR. PATRICK O'DEA, guardian for Kilmihill, moved that the medical officer of that district (Dr. Sullivan) be compelled to live in his district at Kilmihill according to the resolution adopted by them six months ago, and in which he got this time to provide himself a residence.

Mr. O'Dea said he need not remind the board of the dissatisfaction and inconvenience felt in Kilmihill in

having the doctor reside out of his district, as that was fully discussed when the resolution was adopted, and he would now propose to have the Local Government Board carry out their resolution.

Mr. Cox, J.P., asked how could they do impossibilities—compel a man to live where he had no place to live in?

Mr. Jourdan warmly—That is not the board's business, it is for the doctor to look out for himself and for the board to see that their resolutions and orders are carried out and not winked at. It is well known when a situation becomes vacant what landlord influence and tyranny candidates bring to bear on their behalf, and they are then satisfied to live in their districts. This is regular nonsense to say there is no place for him to live there, it is his business to provide it and not the board. I say we are no board. When we adopt resolutions we do not arry them out. This is a regular humbug, and there is no unanimity amongst us.

Mr. Studdert—Is there a law to compel the doctor to live in his district?

Mr. Jourdan—There is a law to compel guardians to carry out their resolutions.

After some further remarks the resolution was adopted.

LIST OF ENTRIES IN THE REGISTER OF THE
BRANCH MEDICAL COUNCIL, IRELAND, FOR THE
MONTH OF MAY, 1875.

MAY 3RD.—Forsyth, Geo. Crompton, Templeard, Culmore, Londonderry, M.B. Univ. Dub. 1874, Lic. R. Col. Surg. Irel. 1875.

3rd.—Anderson, James Fisher, Newtownards, Co. Down, Lic. R. Col. Phys. Edin. 1874, Lic. R. Col. Surg. Edin. 1874.

6th.—McLaughlin, Thomas, Bessvale House, Killaloo, Co. Derry, Lic. R. Col. Phys. Edin. 1875, Lic. R. Col. Surg. Edin. 1875.

10th.—Bond, William James, Londonderry, M.B. Univ. Glasg. 1875, Lic. R. Col. Surg. Edin. 1875.

15th.—Perrier, Wm. Deane, 14 South Mall, Cork, Lic. R. Col. Phys. Edin. 1875, Lic. R. Col. Surg. Edin. 1875.

17th.—Phillips, Edward, Edgeworthstown, Co. Longford, Lic. R. Col. Phys. Edin. 1875, Lic. R. Col. Surg. Edin. 1875.

19th.—Butler, Arthur, 20 Leinster Square, Rathmines, Co. Dublin, Lic. R. Col. Surg. Irel. 1873, Lic. K. Qu. Col. Phys. Irel. 1875.

20th.—Alexander, Thos. Arthur, 21 Middle Gardiner Street, Dublin, Lic. R. Col. Surg. Irel. 1875.

22nd.—Eaton, James Bond, Trillick, Co. Tyrone, M.B. 1874, and M.Ch. 1875 Univ. Dub.

29th.—Thompson, William, Fenit House, Tralee, Co. Kerry, Lic. R. Col. Surg. Irel. 1874 Lic. 1875, and Lic. Midwy. 1875 K. Qu. Col. Phys. Irel.

31st.—Hayes, John Shaw, 22 Burlington Road, Dublin, Lic. R. Col. Surg. Irel. 1875.

31st.—Sharpe, Samuel, Cootehill, Co. Cavan, Lic. R. Col. Surg. Irel. 1874.

COLLOONEY DISPENSARY.

ELECTION OF A MEDICAL OFFICER.

A SPECIAL meeting of the committee was held, for the purpose of electing a medical officer for the district, in the room of the late lamented Dr. Armstrong.

The two candidates, who were before the committee, were—Dr. Michael Loughnan, dispensary medical officer, Gweedore, and Dr. Ayers Moore, who had acted as temporary medical officer to the Athy Workhouse.

A poll was next taken. There voted for Dr. Loughnan—7. For Dr. Moore—11.

Chronic Alopecia.

DR. PINCUS (*Berlin K. Woch.*, Feb. 1) says that nineteen out of twenty of all cases of baldness are due to the disease known as alopecia furfuracea, or calvities senilis or prematura. Some ascribe the accompanying atrophy of the cutis to a primary atrophy of the vessels, others to atrophy of the peripheral nerve-cells. Dr. Pincus thinks that the condensation of the connective tissue of the lower layers of the cutis takes place in the earlier stage of the disease, accompanied by a loss of the typical length on the part of the hairs, but not in their diameter. At the same time certain alterations take place in the amount and character of the glandular secretion, possibly depending upon the irritation of the condensing connective tissue surrounding them. In the second stage the hairs become thin, and this is particularly noticeable in the thickest and woolly hairs, which are situated deep down among the connective tissue. In the first stage of the affection the whole head is equally affected, and the hair becomes equally thinned throughout. In the second stage it is the vertex and forehead which are most severely affected, and, while the sides remain stationary, the diseased process goes on in these localities. By the slow and gradual destruction of the nerve fibres by the condensing connective tissue, the relative sensibility of the skin is much diminished in the affected parts, but without pain.

In the earlier stages of the disease Dr. Pincus recommends the use of a solution of caustic potash or soda, one part to two hundred and fifty, or five hundred of water; or carbonate of soda, four parts to one hundred to two hundred; or bicarbonate of soda, four parts to fifty parts, or up to one hundred and fifty parts of water. Of these solutions, two or three tablespoonfuls are to be rubbed into the head for several minutes, at first daily, afterwards oftener. Unfortunately, the prolonged use of this remedy, although of great service, tends to discolour the hair. A solution of iodide of potassium, one part to one hundred of water, will avoid this, but is not so rapid in its effects as the other washes. In the latter stages Dr. Pincus uses stronger solutions of these alkalis, with a very weak solution of corrosive sublimate, 1 part to 7,500. He has used all the various irritating and astringent washes, oils, and pomades without success.

Irish Poor-Law Intelligence;

UNDER AUTHORITY OF THE

IRISH MEDICAL ASSOCIATION.

IRISH MEDICAL ASSOCIATION.

THE annual meeting of this Association took place last week, at the Royal College of Surgeons.

Dr. Henry Smith, of Donoughmore, President of the Association, occupied the chair.

The President said the Association had been a source of great benefit to the profession throughout Ireland—especially to the Poor-law medical officers; and there never was a time when its services were more urgently required than at present. He hoped the Poor-law medical officers would see it to be to their advantage to come forward and join the Association. The President then called on the Secretary to read the annual report of the Council.

Dr. Chapman (Hon. Sec.) then read the annual report which we published last week.

Dr. Chaplin moved the adoption of the report. He regretted that the amalgamation of the two associations had not been carried out. He thought it was necessary that they should let it be known through the press that it had been through no fault of the Council of this Association—that they had held out the right hand of fellowship, and it had not been received; and he thought that, with regard to their dignity, no more need be said about it. As your report stated, the Association had passed through a right busy time, and but for the exertions of Dr. Morgan and Dr. Chapman this meeting would not have been held and the Association would have been annihilated. The cordial thanks of the Association were due to these gentlemen, and to the members of the Council in Dublin, who had attended from day to day, and used every exertion to bring about the reconstruction of the society. There were nearly 1,000 Poor-law medical officers in this country, and he was sorry to say that their apathy towards the Association was something astonishing. It was only through the exertions of the Association that the salaries of the dispensary medical officers in Ireland were placed at all on anything like an adequate footing (hear). He would appeal to each member present and absent to do all in their power to promote the well-being of the society. He moved that the report, and also the scheme for the reorganisation of the Association be adopted, and circulated amongst the members (applause).

Dr. Croly seconded the motion.

The motion was then put and agreed to.

Dr. Taggart, in moving the next resolution, observed that the Poor-law medical officers of Ireland had to a great extent to answer for the meagre funds and dwarfish numbers of the Association (hear, hear). The resolution was as follows:—"That the Irish Medical Association deserves the support of every member of the profession in Ireland, and especially of the Poor-law and dispensary medical officers."

Dr. Nolan (Gort) seconded the motion.

The resolution was unanimously adopted.

Dr. Hayes moved the next resolution as follows:—"That the interests of the public and justice to the Poor-law and dispensary medical officers require that a scale of superannuation allowance shall be fixed and be claim-

able as a matter of right by all such officers who can prove to the satisfaction of the Local Government Board that they have held office for 30 years or have attained the age of 70 years, or through illness or infirmity have been rendered unfit to discharge their duties, and that such scale should be proportionate to the emoluments of all their public offices and payable as salaries are—half from local rates and half from money voted by Parliament." Before speaking to the resolution Dr. Hayes expressed his regret that a fusion of the Irish Poor-law Medical Officers' Association and the Irish Medical Association had not been effected. He thought it was foolish for two bodies belonging to the same profession and pursuing the same line of action not to be united so as to form one strong body. With reference to the resolution which he begged to propose he found that out of 1,019 dispensary union officers there were only 51 enjoying a superannuation allowance under the Act of 1869. He felt sure that if some alteration were made in the law it would prove of great benefit, especially if it enabled men to retire after a certain number of years' service, which many would do, and so make way for younger and more active men. In his opinion men ought to retire after 30 years' service; or if a man arrived at 70 years of age, and had 20 years' service, he should be permitted to retire on superannuation.

Dr. M'Dowell (Carlow) seconded the resolution, which after a brief discussion was agreed to.

Dr. Whistler proposed the next resolution, which was as follows:—"That the fees paid to registrars of births, deaths, and marriages, and to public vaccinators in Ireland, are inadequate to the duties required to be performed, and being less than those paid in England for similar services, the Council of this Association are requested to give this matter special attention, and, at the same time, to inquire into the unnecessary clerk work imposed upon those officers, with the view to adopting such measures as may appear most advisable for the improvement of their position in these respects."

Dr. Davys (Swords), in seconding the resolution, said that when they considered the payments made in England for similar duties, the grievances of the Irish medical men became intensified. One of the greatest grievances they had to complain of was the great amount of office work imposed upon them for the very small sum allotted to them as remuneration. He also complained of the loss of time they incurred by attendance at the petty sessions courts. He concluded by expressing a hope that Dr. O'Leary, M.P., would bring before Parliament the grievances of which they had complained (hear, hear).

The resolution was then put to the meeting, and passed unanimously.

Dr. O'Leary, M.P., then moved the following:—"That the remuneration offered for the services of the sanitary officers of Ireland is not only derogatory to their professional status, but totally inadequate as compared with the duties required to be performed; that, whilst those officers are determined to discharge faithfully and impartially the duties imposed upon them—which in many instances incur odium and pecuniary loss—this Associa-

tion is of opinion that they should be fairly requited for inspections and reports, and that whenever they shall be required to attend at or assist in any proceedings they should be specially remunerated for the loss of time involved in such attendance." The pay of the sanitary officers of Ireland was ridiculously out of proportion to the salaries of the sanitary medical officers in England received for identically the same duties. The amounts given to medical officers in England as sanitary officers ranged from £50 to £400, £500, and £600 per annum. Every one of those officers was in the same position as the sanitary officers in Ireland are. The average pay of English sanitary officers—taking a similar area to what they found in average Irish districts (8,000 acres and a population of 3,000)—was £60 per annum. Some time since he moved in the House of Commons for a return showing the amount advanced by Parliament to the local authorities in Ireland as a rate in aid. The difference between the Local Government Board in England and the Local Government Board in Ireland was as great as between good and bad. The rate in aid in England furnished by Government sometimes amounted to as much as the sum provided by the local authorities. If the local authority in England voted £50, Parliament voted another £50, whereas the same Parliament had the hardihood to declare that the maximum of the sum in Ireland should be £25. In a pamphlet which he had in his hand it was shown that a medical officer in the North Dublin City Dispensary district received as remuneration for attending and reporting 160 cases a sum of six guineas—something over a shilling a case. If such instances as that were brought under the notice of the House of Commons, he felt sure the grievance would be redressed. He would be very glad to receive information on these points—as to work done and remuneration received—from members of the Association, and if they supplied him with facts, which were worth any amount of oratory, to bring before the House of Commons, he would be their faithful servant (applause). The matter of attending at police-courts for the purpose of giving evidence, and the pecuniary loss incurred thereby should also be made a subject of special consideration.

Dr. Martin seconded the motion, which was unanimously carried.

Dr. Darby moved the next resolution:—"That, as it is an apparent fact that medical men, during their lifetime, are seldom enabled to make sufficient provision for their widows and orphans, we are of opinion that the objects of this Association would be much enhanced by the adoption of a scheme adequate to meet this deficiency, and that the Council be requested to consider this important matter, with a view to framing a practicable scheme applicable to the case. Dr. Darby considered the machinery suggested by Dr. Jacob perfect in its way, but, in the first place, he objected to it because Dr. Jacob suggested a voluntary system, and, in the next place, because he suggested the principle of an insurance office. He (Dr. Darby) thought they should combine a benevolent feeling with a provident one, and that was what he advocated, together with a compulsory system.

Dr. Jacob seconded the resolution, and defended his plan. As a member of the Council of the Medical Benevolent Association, he had had thrust upon him the conviction that a great number of medical men throughout the country had been totally unable to provide for their families. He wanted to make this provision for the widows and orphans of medical men a source of great practical good, and therefore, he thought it necessary to impose certain restrictions, or else, like the constabulary fund, they would find themselves involved in a most unsatisfactory way. After a careful calculation that a contribution of 15s. per quarter would enable the Association to give £10 to the widow and £10 to each child, he was opposed to its being a compulsory system at present, but eventually it would become a compulsory arrangement, because all the young dispensary practitioners, on obtaining appointments, would become subscribers to the fund.

However, if the meeting adopted the resolution and left the matter to the Council, doubtless a satisfactory plan would be established (hear, hear).

The resolution was passed unanimously.

Dr. Grimshaw moved the following resolution:—"That the Association deprecates the insufficient remuneration given by the Government to medical practitioners for their attendance and professional evidence at courts of law."

Dr. Bellew Kelly seconded the motion, which was agreed to.

On the motion of Dr. Fisher, seconded by Dr. Brown, the following resolution was unanimously passed:—"That the system of dispensary medical relief is constantly abused by well-to-do persons obtaining tickets for same; that persons who can afford to fee a medical practitioner for his services were never intended to receive it; that by obtaining it they not only tend to their own degradation, and increase the expenditure of the poor's rate, but unfairly occupy the time of the dispensary medical officers; and that they and all persons who have provided for medical attendance upon themselves and their families, by becoming members of any society which provides same, should, in every instance of receiving dispensary medical relief, be brought under the notice of the proper authority."

Dr. Nugent Duncan moved the following resolution:—"That this Association considers it a monstrous injustice to dispensary medical officers that they should be compelled to examine the mental condition of persons alleged to be dangerous lunatics, and certify as to same, without fee or reward."

Dr. Carte seconded the motion, which was adopted.

Dr. Morgan proposed the next resolution:—"That the clauses recommended by Council for introduction into the new Coroners Bill, with the object of removing the flagrant abuses at present existing, are warmly approved of, and that the Council be requested to persist in their efforts to have them introduced into the new Bill." He strongly condemned the practice of the selection of medical men for post-mortem examinations at inquests being left to coroners, and also the rule of paying no fee to hospital surgeons for post-mortem examinations carried out within the walls of public institutions.

Dr. Darby seconded the resolution, which was adopted after a short discussion.

The following resolution was also unanimously agreed to:—"That this Association considers the existing restrictions as to the qualifications of compounders of medicines unsatisfactory, not only to the public, but to physicians and surgeons, who, not being themselves general practitioners, are of necessity obliged to have their prescriptions compounded by those who are competing with them in the practice of their profession; that this Association approves of the Government Pharmacy Bill now before Parliament, and that the Council be directed to take measures to support this Bill."

Cordial votes of thanks were accorded to Dr. Morgan (hon. treasurer), Dr. Chapman (hon. secretary), and the Press.

The Council and Officers for the ensuing year were elected, and the new President, Dr. Chaplin, took the chair.

A warm vote of thanks to the outgoing President brought the proceedings to a close.

OBJECTS AND RULES OF THE IRISH MEDICAL ASSOCIATION.

THE objects of the Irish Medical Association are—

To unite the members of the medical profession in Ireland, and so form an influential and highly useful body competent to protect and promote the interests of the profession generally, but especially those of the Poor-law and dispensary medical officers of Ireland, in the various departments under which they hold office.

To watch carefully the proceedings of Parliament upon matters affecting the interests of the members of the Association, and to take action with regard to same, with the

object of promulgating its views amongst the members of Parliament.

To inform the members of the Association by circulars, to be issued from time to time, as occasion may require, of all matters affecting their interests, and so afford them an opportunity of expressing their opinions, and offering any information or suggestions they think fit.

To obtain, when considered necessary, legal advice as to the interpretation of the law upon matters involving the interests of the profession, and, as it may seem expedient, to institute legal proceedings for the purpose of obtaining judicial decisions upon such matters.

To arbitrate in disputes between individual members of the profession, when such arbitration may be requested.

RULES.

I. That any duly qualified physician or surgeon may become and continue to be a member of the Irish Medical Association, subject to the approval of its Council.

II. That the annual subscription of each member shall be at least 10s. 6d., payable at the beginning of each year; but any person who wishes to become a member after the 31st of March of any year, shall, upon payment of his subscription, be entitled to all the privileges of membership, not only for the unexpired portion of that year, but also for the ensuing year.

III. That each year shall commence on the 1st day of June, and terminate on the 31st day of May following.

IV. That the administration of the Irish Medical Association shall vest in the Council, who shall consist of the following:—

One President—to represent all Ireland.

Four Vice-Presidents—to represent the four Provinces.

Thirty-two Members.—Who shall, at their first meeting, to be held at the Royal College of Surgeons, in Dublin, at four o'clock, p.m., on the Friday next after the day of the annual general meeting, appoint the following officers:—

One Honorary Treasurer.

One Honorary Secretary.

One Honorary Secretary of Council.

Who shall be *ex-officio* members of Council.

V. That the Council shall meet at least once in each quarter, and also from time to time, as occasion demands, when summoned by the honorary secretary.

VI. That the Council, at their first meeting in each year, shall appoint from amongst their number a Chairman of Council, and also a Committee consisting of seven members, including the honorary treasurer, the honorary secretary, and the honorary secretary of Council.

VII. That the duties of the Committee shall be—

To transact the financial business of the Association.

To direct meetings of the Council to be convened when they see fit.

To watch carefully all matters affecting the interests of the members, and to report on same to the Council.

To draw up and issue, from time to time, such circulars to the members as may be approved of by the Council.

To receive and deal with all matters of business and correspondence, not demanding, in their opinion, the special attention of the Council.

To carry into effect the instructions of the Council; but they shall not enter into any engagement which will make the Council, or the Association, liable for any sum beyond the amount which would remain in the honorary treasurer's hands to the credit of the Association, after providing for all previously existing liabilities.

VIII. That the various departments of the work of the Association shall be, by the Committee, so divided amongst its members that each shall specially be the province of one of them, viz:—

To take cognizance of all matters affecting the interests of the profession generally; to watch carefully all Parliamentary proceedings affecting the interests of the members of the Association, and to bring same under the notice of the Committee.

To take cognizance of all matters affecting specially the interests of Poor-law and dispensary medical officers, and public vaccinators, as such, and to bring same under the notice of the Committee.

To take cognizance of all matters affecting the interests of registrars of births, deaths, marriages, and vaccinations, and to bring same under the notice of the Committee.

To take cognizance of all matters affecting the interests of sanitary officers, and consulting sanitary officers, under the Public Health Act, and bring same under the notice of the Committee.

IX. That an annual general meeting of the members shall be held on the first Monday of June in each year, at such time and place as may be appointed by the Council.

X. That the order of business at the general meetings shall be—

1. The minutes of last annual general meeting, and of all special general meetings (if any) since held, shall be read and confirmed.

2. The meeting shall appoint three scrutineers of the ballot, who shall decide, by lot, between candidates having an equal number of votes.

3. A ballot shall be opened, and shall remain open until the other business to be brought before the meeting shall have been disposed of, for the election of—

One President,

Four Vice-Presidents, and

Thirty-two Members of Council.

4. The report of Council for the preceding year shall be read, setting forth the steps taken by them towards carrying out the objects of the Association.

5. The Council shall then submit an account of the whole income and expenditure of the Association, for the year ended the 31st day of May then last past, showing all arrears of income due, and any current liabilities unpaid, which account shall be signed by the honorary treasurer, and the accuracy of which shall be certified by the auditors.

6. The resolutions recommended by the Council shall then be separately brought before the meeting, and dealt with.

7. Any member of the Association may then propose any resolution which he desires to bring under the notice of the meeting.

8. All resolutions must be proposed by one member, and seconded by another, before being put by the Chairman to the meeting.

9. The result of the ballot shall then be declared by the Chairman.

10. Two members of the Association—not being members of the Council—shall then be elected to audit the accounts during the ensuing year.

XI. That at the meetings of the Council five members shall form a quorum.

XII. That at the meetings of the Committee three members shall form a quorum.

XIII. That the Honorary Treasurer shall receive all subscriptions, and issue receipts for same, and shall (with the sanction of the Committee) discharge all the liabilities of the Association, and submit the accounts of the Association to the Committee, to be examined by them when so required, at least once in each year.

XIV. That the Honorary Secretary, and Honorary Secretary of Council, shall discharge all secretarial functions required by the Council or the Committee.

XV. That the Council may, whenever it appears to them expedient, direct that a special general meeting of the members of the Association be convened by the Honorary Secretary, to be held at such time and place as they appoint, to consider any matters deemed by them to be of such importance as to require an expression of the opinion of the members at large.

XVI. That the Council shall have power to make any by-laws they deem necessary for the regulation of their own business, and to fill up any vacancy which may occur amongst their body.

XVII. That the Committee shall have power to make any regulations they deem necessary for the transaction of their special business, subject to the approval of the Council.

XVIII. That notice of each general meeting shall be given to each member of the Association, by circular, at least one week previous to the day of meeting.

XIX. That an annual dinner of the members of the Association shall be held on the first Monday of June, in each year, at such time and place and under such regulations as the Council may approve.

XX. That none of these rules shall be altered or repealed, nor shall any addition be made thereto, unless at an annual general meeting of the Association, and notice of any proposed change, signed by its proposer and seconder, shall be communicated to the Honorary Secretary at least two weeks before the day of such meeting.

N.B.—All communications relating to subscriptions and

financial business should be addressed to the Honorary Treasurer. Those concerning all other matters should be addressed to the Hon. Secretary of the Irish Medical Association, Royal College of Surgeons in Ireland, Dublin.

ROYAL MEDICAL BENEVOLENT FUND SOCIETY.

THE twenty-eighth annual meeting of the Royal Medical Benevolent Fund Society was held last week at the Royal College of Surgeons.

Mr. Jolliffe Tufnell, President of the College, presided.

There was an unusually large attendance of members.

The Chairman congratulated the meeting on the advancing prosperity of the society, and said that whereas last year they distributed 1,330*l.*, they were this year enabled to give away over 1,600*l.* in relief of distress amongst medical men and their families. He was sure the founder of the "chair" would be much gratified if he knew of this, and if he could find that the Society which he had planted, like a grain of mustard-seed, had now extended its branches abroad throughout the world. For himself, he voided his position as President of the College to-day, and he was sorry for it, for this reason—that he regretted that he had not an opportunity, before retiring, of fulfilling one matter about which he was anxious. It was this, that when the diplomas of the College of Surgeons were about to be issued it would be his desire, as used to be done by Sir James Macgreggor, to induce every licentiate to join his excellent society for the relief of the widows and orphans of the medical men who joined it. Such an occasion was an impressionable time with the licentiates, and hardly one of them would refuse to join if asked to do so at such a moment, and if properly impressed with the fact that the best operations of the medical man did not always consist in the reduction of a dislocation or the setting of a fracture of the human body, and that in setting their hands to such a document as he mentioned, they would be solacing the wants of the widow and setting bread before the orphans (applause).

The Hon. Secretary (Dr. M'Clintock) then read the annual report, from which the following are extracts:—

"It may very thankfully be said that the working of this Society continues to yield results that are eminently satisfactory from whatever point of view we look at them. Its funds are steadily improving; its auxiliary branches, home and foreign, continue in active operation; the benefits it confers are increasingly appreciated, and it seems to possess the confidence, if not the support, of the entire profession. At the last annual meeting a bequest of £200 from Mrs. Kirby was announced. Of donations there were received during the year about £200. The total amount of subscriptions and of interest received up to the auditing of the accounts was £1,877, minus £20 from Dr. Wilson, of Baggot Street, that morning. The number of applications this year is ninety-eight. On analysis we find that fourteen are from medical men, seventy-two from the widows of medical men, and twelve from children of medical men. In eleven instances no grants were awarded, the applicants being either ineligible for receiving aid from the Society under its fundamental rules, or else were found, on careful investigation, not to be so necessitous as to give them a claim for sharing in the relief which the Society bestows. Twenty of the applications are new ones, and four of these come from medical men. Two medical men who had been relieved by the fund have died within the year. Since last general meeting thirteen cases came before the Central Committee of so urgent a kind that they felt it necessary to grant some assistance without waiting for the general distribution, and in this way £182 15*s.* was administered, four of the recipients having been medical men. The total sum that will have been distributed in grants this year is upwards of £1,600, which far exceeds that of any former year. It may be interesting to state that of this sum £392 goes amongst medical men, £1,044 amongst widows, and £168 among orphans. As the number of applicants this year is not above the average all the grants are consequently larger than on any former occasion, and in the case of medical men some of the individual grants amount to £60."

The statement of accounts was next read in detail, and showed that a sum of £5,000 was invested with the capital, not to be touched, but only the interest utilised.

Dr. Duncan (President of the College of Physicians) moved the adoption of the report and statement of accounts, and that 2,000 copies be printed and circulated. The statements which had first been read, he said, showed well the advancing progress of the Society, and although doubts were at one time entertained as to its future prosperity, the worst was now passed

and success seemed all before them. It depended altogether upon the exertions of the profession throughout the country to make the Society an institution of permanent good. The number of applications for aid during the year was so large—98, of which 87 were relieved—that some might be disposed to think that the Society was too liberal, and encouraged improvidence. But this was a mistake, for there was a feeling of independence amongst most of those relieved that only drove them to seek for help when all other hope seemed gone. The existence of the fund, then, so far from encouraging carelessness, had only helped to bring out the amount of intense misery which often existed when the outer world little suspected it (hear). The existence of the fund, at the same time, had given the means of relieving much of that distress, and had enabled the Society this year, for the first time, to raise their grants as high as £60, although but few applicants got so much, and eleven applicants were refused altogether. Complaints were, not without reason, made that those who were to benefit most by the charity—the Irish country doctors and their families—subscribed very little.

Dr. Martin seconded the resolution, which was adopted.

Dr. Purdon proposed the next resolution, namely: "The necessity for the Royal Medical Benevolent Fund Society becomes more apparent as the circumstances of the applicants for relief are year by year investigated; and while a large amount has been distributed in grants, the Committee feel painfully conscious how inadequate it is to do more than supply some mitigation to the distress brought before them. They would therefore earnestly remind our non-subscribing brethren that there is an incredible amount of real want in our midst, the removal of which calls for our most self-denying exertion." Speaking from an experience of over fifty years as a practising physician he fully endorsed what the last speaker stated, and deplored the custom, which seemed extending, of many medical men doing themselves permanent injury by yielding to pressure in their patients' houses, and joining them in a "drop of something." Many did not like to refuse for fear of being called proud, but the result too often was that they contracted habits of drinking which caused them irreparable mischief. (Hear.) He liked also to see tangible results in place of mere talk, and thought if country practitioners and others gave one tumbler of punch or 6*d.* each week to the Society they would effect a large amount of good. 5*s.* a year from 1,500 men would be something respectable.

Dr. Little seconded the resolution.

The resolution was passed unanimously.

Dr. Churchill moved the next resolution: "That this meeting desires to express its warmest thanks to the honorary officers of the parent society, as well as to the honorary secretaries and treasurers of the provincial and Indian branch associations, to the latter of whom especially our gratitude is justly due for their generous and hearty co-operation; and also to the medical students of Belfast and Dublin, for their valuable aid in the cause of the Society."

Dr. Smyly seconded the resolution, and impressed upon the meeting the importance of cultivating a system in contributing, which was in the end much more effectual than an impulsive mode of donation. Even 2*s.* 6*d.* from each man regularly paid would be worth a great deal, for they saw what was done in Scotland by sums as small as 3*d.* a week. Mention had been made of the gratitude which was due to the students of Belfast College for their contributions. The gratitude here, however, seemed to be understood in the sense in which Mr. O'Connell used to hold it, as "a lively sense of favours to come," for all that the Belfast students have done for them in this case was very small. There were many hospital surgeons now present, and if they could get each of their students to contribute a little, even 6*d.*, it would be a great help. (Hear, hear.)

The resolution having been adopted,

The following were constituted the Central Committee and officers (about 80 names), and the honorary secretaries and treasurers of the branch associations for the ensuing year: Hon. Treasurer, J. Magee Finny, M.D., 19 Lower Baggot Street, Dublin; Hon. Secretaries, A. H. M'Clintock, M.D., 21 Merrion Square N.; James Little, M.D., 24 Lower Baggot Street; Acting Secretary, A. H. Marks, M.D., 26 Hatch Street, Dublin; Trustees, Drs. John M'Donnell, James F. Duncan, and James H. Wharton; Collector, Mr. James M'Dougall, Royal College of Surgeons.

Dr. Brady, Dr. Benson, and other gentlemen addressed the meeting, and a vote of thanks to the Press and to the Chairman concluded the proceedings.
